THE

GARDENERS' CHRONICLE

A Weekly Illustrated Journal

OF

HORTICULTURE AND ALLIED SUBJECTS.

(ESTABLISHED IN 1841.)

VOL XLVIII.—THIRD SERIES.

JULY TO DECEMBER, 1910.

LONDON:

41, WELLINGTON STREET, COVENT GARDEN, W.C.

1910.

INDEX OF CONTENTS.

JULY TO DECEMBER, 1910.

(FOR SPECIAL HEADINGS SEE UNDER BOOKS; CERTIFICATES; LAW NOTES; NURSERY NOTES; OBITUARY; PLANT PORTRAITS; PLANTS, NEW; SCIENTIFIC COMMITTEE; SOCIETIES; AND ILLUSTRATIONS.)

A

ABERDEEN, College of Agriculture at, 184; Cruickshank Botanical Garden at, 163; proposed Chair of Agriculture at, 465; rainfall in, 432; University, forestry at, 164
Absorption of copper by leaves, 124
Abutilon Schwartzii, 489; *A. Thompsonii*, 266, 297, 340, 353, 427, 457, 488
Accident, fatal, to a gardener, 164
Adansonia digitata (Baobab Tree), 392
Advertisements and weed-seeds, 358
Aerial roots on vines, 64
Agapanthus umbellatus, treatment of, 404
Agricultural College, South-Eastern, 102, 357, 436
Agricultural Science, Advisory Committee on, 103
Agricultural Society's Show, 1911; horticulture at the, 394
Agriculture, Aberdeen College of, 184; and bacteria, 293; proposed Chair of, at Aberdeen, 465
Aird, Mr. Quinton, presentation to, 201
Ajuga reptans on lawns, how to destroy, 420
Aldenham House, Elstree, rare plants at, 196, 275
Alectorurus yedensis, 353
Allamanda fruiting in Birmingham Botanic Garden, 445
Allobaphora Hermannii (new garden worm), 390; *A. similis*, 98
Allotments, 259; urban, at West Ham, 163
Almug or Algum tree, 131
Alpine flowers, pictures of, 37
Alpine garden, the, 56, 94, 118, 135, 210, 261, 279, 311, 483; hoar frost in the, 466; house at Kew Gardens, 94
Alpine gardens some noted British, 13, 34
Alpine valleys, Briga, 454; Borçon, 365; Gesso, 213; Roja, 407; Vesuvio, 385
Alps, Cottian, flora of the, 175; Maritime, botanising in the, 213; endemic plants in the, 297; Mont Cenis in June, 53; in July, 461; Saxifragas of the Maritime, 426
America, gardening employment in, 460; Gladiolus Society in, 43
American Gooseberry mildew, 248
American weeds, 122
Anapelopsis (see Vitis)
Annals, 232
Anopteris glandulosus, 195
Anthemis Aizoon, 135
Anthurium acule, fruits of, 153
Anthuriums, large-leaved, 119
Ants in glasshouses, 271, 308
Apgar, Austin Craig (*Ornamental Shrubs of the United States*), 276
Apiary, the, 4, 61, 101, 121, 160, 181, 247, 281, 355, 393, 469
Apple, Charles Ross, 422, 456; Hounslow Wonder, 338; Miller's Seedling, 474; bacterial blight of, 103; scab of, 396, 432; show in Canada, 183; a single fruit sold for 14 guineas, 301; scoty-blotch disease of, 443
Apple trees, pyramidal, 440
Apples, a profitable plantation of, 143; at the R.H.S. autumn fruit show, 353; commercial varieties of, 436; eaten by carrion crows, 286; home-grown and Colonial, 453, 474; large, 318; suitable for growing in Cumberland and Westmoreland, 341

Appointment of a head gardener in Paris, 473
Apricot culture, notes on, 59
Arber, Ed. Newell (*Plant Life in Switzerland*), 368
Arbor Day at Eynsford, 358; at Sandgate, 413
Arch, "ruined," in Kew Gardens, 202
Argemone grandiflora, 138, 166, 204
Arnold Arboretum, U.S.A., 349, 369
Artificial manures for tree-nurseries, 473
Arundinaria nitida, 396, 415
Aster diplostephioides, 57, 139
Aster Falconeri, new habitat of, 2
Aster Lustre, 318
Asters, perennial, at The Hermitage, 353
Astilbe simplicifolia, 294
Australian Grapes for the English market, 414
Austrian tree nurserymen, an association of, 184
Autumn flowers in the south-west, 409

B

BACTERIA and agriculture, 293
Bacterial blight of Apple, Pear and Quince, 103
Bacteriosis of Tomatos and Potatos, 283
Bagatelle, Roses at, 63, 389
Bamboos, hardy, 396, 415, 489; in the south west of England, 422
Banana industry, the, in the Canary Islands, 473
Bananas at Lavington Park gardens, 464
Bankruptcy statistics, 183, 413
Baobab Tree, the, 392
"Barr" memorial fund, 123, 143, 353, 453
Baronsalt, Twickenham, Orchids at, 386
Bateson, Prof. W., 164; honour for, 184; (*Journal of Genetics*), 461
Battersea, flower-gardening by municipal tenants at, 301
Battersea Park, flowers at, 183
Bees and colour choice, 453
Bees as an aid to fruit culture, 359
Bees, the management of, 4, 61, 101, 121, 160, 181, 247, 281, 355, 393, 469
Beet culture in England for sugar production, 184, 316, 340, 470
Begonia Martiana grandiflora, 64
Belsize Court, Hampstead, fruits at, 284
Belvoir Castle, Grantham, 102
Benevolent Institution, Gardeners' Royal, 201, 358
Benthamia—(See "Cornus")
Bequest for acquiring public spaces and parks, 143; public, by a market-gardener, 266
Bidens dahlioides, 226, 250
Big-bud mite, maggot that preys on the, 271
Bird sanctuary, the Brent Valley, 415
Bird trap, Mr. Knight's, 453
Birds and fruit, 193
Birmingham Botanic Garden, 445
Bisulphide of carbon, application of, to soils, 328
Black Currant, pests of, 193; in an exposed garden, 475
Black stripe disease in Tomato, 197
Blister mite of Peach leaves, 301

Blossoming of fruit trees, lecture on the, 376
Bog and waterside plants, 391
Bog slides, 105

BOOKS, NOTICES OF:—Adam's Luxury and Eve's Cookery, 421; Agricultural Bacteriology (*John Percival*), 293; Alpine Flowers and Gardens (*G. Flemwell*), 35; Alpine Flowers and Rock Gardens (*Walter P. Wright*), 368; A Simple Method of Bottling Fruit at Home (*J. Stoney*), 312; Book of the Flower Show (*Charles H. Curtis*), 75; Book of the Rose (*Rev. Foster-Melliar*), 74; Botanical Magazine, 63, 123, 201, 301, 395, 413, 487; British Rainfall (*Hugh Robert Mill*), 311; Bulletin de la Société Française d'Horticulture de Londres, 234; City, Suburban and Window Gardening (*D. Grant McIvor*), 58; Daffodils (*Rev. J. Jacob*), 443; Diseases of Cultivated Plants and Trees (*George Massee*), 58; Encyclopædia Britannica, 201; Flora of New Guinea (*Dr. H. A. Lorentz*), 136, 388; Fruit-growing in Arid Regions (*Wendell Padlock* and *Orville B. Whipple*), 156; Gardening for All (*James Dale*), 53; Garden Planning (*W. S. Rogers*), 261; Handbook of Tropical Gardening and Planting, with Special Reference to Ceylon (*H. P. Macmillan*), 331; Heredity in the Light of Recent Research (*L. Doncaster*), 387; Journal of Genetics (*W. Bateson*), 461; Making Horticulture Pay (*G. Kains*), 195; Morphology of Gymnosperms (*Coulter & Chamberlain*), 414; Ornamental Shrubs of the United States (*Austin Craig Apgar*), 276; Our Inheritance (*C. L. Thomson*), 62; Plant Life in Switzerland (*Ed. Newell Arber*), 368; Profitable Fruit Growing (*John Wright*), 137; Publications received, 44, 64, 84, 164, 202, 284, 317, 338, 395, 415, 432, 451, 473, 488. Rock Gardens: How to Make and Maintain Them (*Lewis B. Meredith*), 242; Root and Stem Vegetables (*Alex. Dean*), 331; Summer Flowers of the High Alps (*Somerville Hastings*), 136; Syon House Trees and Shrubs (*A. Bruce Jackson*), 276; The Orchid World (*Garney Wilson*), 249, 395, 442; The Faculty of Reading (*George Redford*), 62; The Profitable Art of Gardening (*Thomas Hill*), 209; The Story of My Old-world Garden in a London Suburb (*G. Hillgard Swinstead*), 178; The Trees of Great Britain and Ireland (*H. J. Elw's and Dr. A. Henry*), 162; Town Gardening (*B. C. Ravenscroft*), 465. Uitkomsten der Nederlandsche Nieuw Guinea Expeditie in 1907 (*Dr. J. H. Lorentz*), 388. Window and Indoor Gardening (*P. W. Sanders*), 58
Books, notices of old garden, 209, 421
Bordeaux mixture, how to make, 240
Borçon Valley, the, 365, 426
Boskoop Exhibition, 1911, 337
Botanical exploration in the Malay States, 284
Botanical Institute at Buitenzorg, 44
Botanic Garden, Brussels, 43; Cambridge, 23; Edinburgh, 333; Singapore, 212

Botanists, French, visit La Mortola, 143
Bottled Grapes, 250
Bottling fruit, lecture on, 323
Bougainvillea glabra, hardness of, 100
Bouquets, shower and wedding, 132
Bournemouth parks and gardens, 38
Bowerman, Mr. J., 7
Bower, Professor F. O., 374
Bowling greens, Lancashire crown, 112; public, in Scotland, 490
Brassia Forgetiana, 463
Brasso-Laëlia Lellieuxii, 442
Brent Lodge Estate, Finchley, as a proposed garden village, 8
Brent Valley bird sanctuary, 415
Briga Valley, Maritime Alps, 454
Bristol, Mr. G., presentation to, 395
British Association's meeting at Sheffield, 124
British Columbia, fruit-growing in, 103
British Ferns of the future, 166
British Heaths in the garden, 245
Broccoli, club disease in, 171
Bromeliaceæ out-of-doors at Cambridge Botanic Garden, 390
Brussels Botanic Garden, 43
Brussels Exhibition, awards at the, 223
Brussels, the Market Square at, 83
Budding Cocoa trees, 103
Budding Roses, 3
Bulb Exhibition, the prizes offered at R.H.S., 200
Bulb garden, the, 134, 454; planter, a new, 419

C

CABBAGE, Spring, 18, 64
Cabbage trials, National Vegetable Society's, 38
Calcium cyanamide and nitrate of lime, 488
Californian Irises, some, 57
Calvat, Ernest, monument to the late, 63; Chrysanthemums raised by, 164
Calystegia dahurica, 483
Camberwell public parks superintendent, 164
Cambridge Botanic Garden, 23
Campanula barbata, 14; at Monroith, 398; *C. Portenschlagiana* var. Major, 58; *C. pusilla* alba, 96
Canadian Apple show, 183, 474
Canary Islands, Banana industry in the, 473
Candle manufacture, refuse from, 72
Canker in fruit trees, 352
Cant, Mr. Frank, elected Mayor of Colechester, 375
Carnac, Brittany, lecture on, 307
Carnation Her Majesty Queen Mary, 265
Carnation rust cured by sulphide of potassium, 416
Carnation Souvenir de la Malmaison at Enville Hall Gardens, 18
Carnations, perpetual-flowering, in the north, 234; in the open, 105
Carranthal, botanising on, 293
Carrion crows and Apples, 286
Carrots, the best method of storing, 254, 249
Carruthers, the late Dr. J. B., 70, 104
Carson, Mr. James, presentation to, 442
Cassia javanica in the Botanic Garden, Tobago, 392

- Catalpa speciosa* as a timber tree, 460
Catasetum longifolium, 424; *C. Russellianum* and *C. thylacochilum*, 54
 Cattle Show at Islington, 458
Cattleya Mme. Paquin, 296; *C. Mendelii* Stuart Low, 34, 87; *C. Portia* Larkin's variety, 386; *C. Warszewiczii* alba in America, 34
Cattleyas, simple method of gathering flowering-spikes of, 395
Ceanothus Gloire de Versailles, 249, 267
 Cedars at Eastbury Manor, 415; at Peper Harrow Park, 456
Celsia cretica as a bedding plant, 267, 286
- CERTIFICATED FRUITS AND VEGETABLES:**—Apples Ard Cairn Russet, 361; Red Victoria, 221; Rev. W. Wilks, 221; Hounslow Wonder, 302, 371; Lettuces: Green's Favourite, 107; Heartwell, 107; Leehead, 107; Supreme, 107; White Favourite, 107; Melons: Early Favourite, 145; Golden Beauty, 189; Peas: Exhibition, 145; Magnum Bonum, 145; Moneymaker, 107; Prestige, 107; Prince of Peas, 107; Satisfaction, 145; "Seedling 225," 221; Windsor Castle, 145; Yorkshire Hero, 145; Peach Salwey, 302, 371; Potatoes Dalmeny Early, 221; Den's Favourite, 107; Faithful, 107; Prima Donna, 221; Selected Ashleaf, 107; Walker's Seedling, 107; Tomatos: Ailsa Craig, 189; Ayrshire, 189; Carrick, 189
- CERTIFICATED PLANTS:**—*Angraecum pellucidum*, 434; *Asters*: Peggy Ballard, 252; Novelty, 319; Perfection, 287; *Astilbe Arendii*, 66; *Begonia Gloire de Lorraine* "Rochford's variety," 433; *B. Mrs. W. L. Ainslie*, 27; *Brassia Forgetiana*, 434; *Buddleia variabilis gigantea*, 188; *Bulbophyllum exaltatum*, 145; *B. polyblepharis*, 220; *B. rhizophora*, 67; *Calanthe Cooksonia gigantea*, 361; *C. densiflora*, 320; *Calendula* (strain), 66; *Carnations*: Forester, 106; Gloria, 128; Hecla, 128; Lady Alington, 252; Mrs. Angus, 151; Mrs. C. W. Ward, 360; Mrs. J. A. Reynolds, 106; Peter Pan, 128; Regina, 319; Robert Berkeley, 66; Scarlet Glow, 287; Shasta, 287; White House, 287; *Catasetum ambriastrum aureum*, 283; *Cattleya Adula* King Edward VII., 220; *C. Adula Thwaite's* variety, 220; *C. Adula Vale Bridge* variety, 189; *C. Artemis*, 67; *C. Basil*, 283; *C. Dietrichiana*, 28; *C. Dorce* magnifica, 253; *C. Hardyana* Holford's variety, 189; *C. Lucida*, 398; *C. O'Brieniana* alba, 67; *C. Luegee*, 253; *C. Mendelii* King George V., 28; *C. Mendelii* "Stuart Low," 28; *C. Rhoda* "Fairlawn variety," 189; *C. Warszewiczii* Othello, 107; *C. W. Low's* variety, 67; *Chrysanthemums*: A. Welham, 50; Betty Spark, 252; Brightness, 397; Cannell's Crimson, 459; Cannell's White, 459; Butler Caprice, 347; Caledonia, 459; Ceddie Mason, 347; Countess of Granard, 347; Cranfordia, 287; Crimson Jewel, 397; D. B. Crane, 347, 397; Debutante, 270; Ernest G. Mocatta, 397; Ethel Thorp, 347, 397; Harry Parton, 128; Hilda Blick, 319; Hollicot Golden, 252; Hollicot Pearl White, 252; Hollicot White, 219; Hollicot Yellow, 219; Japan, 270; J. H. Greswolde Williams, 319; Joan Edwards, 319; Lady Furness, 433, 459; Mary Poulton, 287; Mand Williamson, 270; Mikado 1910, 270; Miss Mary Pope, 319; Miss Dorothy Ashley, 270; Miss F. Collier, 287; Mrs. Foot, 397; Mrs. Frank Hill, 360; Mrs. G. C. Kelly, 319; Mrs. Gilbert Drabble, 433, 459; Mrs. Greening, 347; Mrs. Richard A. Witty, 347; Mrs. Robert Cannell, 459; Mrs. Tresham Gilby, 319; Mrs. Sam Nash, 319; Mrs. W. Roots, 347; Peter Plant, 397; Sandown Radiance, 397; Snowflake, 347; Strawberry, 397; Victorian, 360; William Turner, 397; *Codiaeum* Golden Ring Lynwood variety, 319; *Cosmos* Rose Queen, 66; *C. White Queen*, 151; *Coxcomb* (strain), 151; *Cypripedium* Angela, 220; *C. Ceres magnificum*, 476; *C. Curtisii* Sander's variety, 23; *C. Dante rotundiflorum*, 476; *C. Gaston Bultel*, 476; *C. Iolanthe*, 398; *C. King George V.*, 238; *C. Minotaur*, 397; *C. Reginald Young*, 320; *C. Shogun*, 233; *C. Waterloo*, 454; *Cyrtopodium* Andersonii, 145; *Dahlias*: American, 258; Bridal Crown, 219; Butterfly, 219; Cardinal, 219; Clarissa, 219; Crystal, 187; Flagstaff, 258, 252; Garden Yellow, 187; George Ireland, 219; Golden Eagle, 256; Guinevere, 187; H. L. Brousson, 219, 258; Kingfisher, 256; Mrs. Douglas Fleming, 187, 238; Hon. Mrs. Greville, 219; Leander, 187; Loveliness, 219, 256; Mineva, 219; Mrs. Joynton-Hicks, 219; Mrs. Landale, 219; Mrs. Usmar, 219; Model, 258; Ouida, 219; Pink Beauty, 258; Princess Juliana, 219; Rosette, 219; Sam Barlow, 187; Sweet Briar, 219; The Earl, 219; The Moor, 256; Theresa, 187; White Ensign, 258; William Pemberton, 250; *Delphinium* Belladonna semiplena, 27; *D. Lamartini*, 27; *Dendrobium Bullenianum*, 107; *D. Karoense*, 189; *D. speciosum nitidum*, 134; *Fuchsia* Sylvia, 66; *Gladioli*: delicata, 151; Edward VII., 27; Europa, 145; Grafm Degefeld, 145; Karl Luz, 145; La Luna, 187; primulinus, 145; Ruthline, 219; Safrano, 187; Snowden, 151; *Gesneria* Orange King, 287; *Gypsophila* carminea, 66; *Laelia Degestiana*, 253; *Lalio-Cattleya* Berthe Fournier magnifica, 220; *Olivia*, 361; *L.-C. Golden Oriole* superba, 288; *L.-C. Golden Oriole* var. tigrina, 189; *L.-C. Ortrude* magnifica, 288; *L.-C. Pauline*, 476; *Ligustrum* Henryi, 287; *Liparis rhodochila*, 67; *Lobelia cardinalis* "Gloire de St. Anne's," 252; *Miltonia vexillaria* Lambeauiana, 28; *M. Warszewiczii* leucochila, 476; *Nepenthes nobilis*, 319; *Nerine elegantissima* Mansell Seedling, 319; *Odontodia* Bradshawie Westonbirt variety, 320; *O. Cecilia*, 220; *Odontoglossum*: Ceres Plumpton Hall variety, 434; Circe, 320; Rouge Dragon, 434; *Oncidium* Mantinii Lowii, 145; *O. Sanderi*, 67; *Papaver nudicaule* (strain), 151; *Pescatorea lamellosa*, 67; *Phaius Cooperi*, 253; *Phlox* Elizabeth Campbell, 187; *P. Ellen Willmott*, 252; *P. Frau Antonin Buchner*, 106; *Polystachya paniculata*, 145; **Roses**: Daphne, 188; Dorothy Ratcliffe, 252; Edward Mawley, 46; Ethel Malcolm, 252; Lady Hillingdon, 46; Joseph H. Welch, 46; Juliet, 27; Mary Countess of Ilchester, 27; Mrs. Foley Hobbs, 27, 257; Mrs. Herbert Stevens, 237, 252; multi-flora Flame, 66; Rayon d'Or, 46; **Scabions** (strain), 151; *Senecio glastifolia* var. Hon. Vicary Gibbs, 66; *Solidago spectabilis*, 252; *Sophrano-Cattleya* Doris, 369; *Sophrano-Lalio-Cattleya* Alethra, 398; *Stanhopea saccata*, 145; **Sweet Peas**: Arthur Green, 67; Cherry Ripe, 67; Edrom Beauty, 50; Elfrida Pearson, 66; Federation, 49; Earl Spencer, 50, 66; Iris, 66; Marian Cuthbertson, 66; Masterpiece, 50, 67; Mrs. F. A. Wellesley, 66; Mrs. H. Dickson, 50, 67; Stirling Stent, 67; Tortoise Shell, 151; Sunproof Crimson, 50; *Symphoricarpos mollis*, 287; *Theodorea gomezoides*, 145; *Vanda coerulea* Blue Beard, 454; V.c. "Westonbirt variety," 145; *Viburnum* Henryi, 252
 Ceylon, a flower show in, 193; Hakgala gardens in, 193
 Chalk as a dressing for light soils, 217
 Chelsea, Physic garden at, 245
 Chelsea Polytechnic, horticultural instruction at the, 249; Royal Hospital, old soldiers' gardens at, 217
 Cherries, Japanese, 33
 Chilling cut flowers, 414
 Chinese plants, new, 34; at Aldenham House gardens, 196
Chionoscilla, "The Queen," 454
Chlorophytum comosum, 261
 Christie, Mr. James, appointment of, 164
 Christmas Roses, mulching, 396, 416
 Christmas trees, 470
Chrysanthemum tomentosum, 210; *C. Alice M. Love* and the rust fungus, 254; *C. A. Welham*, 64; *C. Pink Delight*, 453; *C. Shoreham Pink*, 453
 Chrysanthemum conference at Essex Hall, 437; rust, 411
 Chrysanthemums, a trial of early-flowering, 221; at Southwark Park, 396; damping in, 412; flowering period of, 440; hybridising, 404; incurved, lecture on, 466; in the London parks, 234, 317; late-rooted, lecture on, 456, 480; mature for, 492; methods of exhibiting, 437; propagating, 466; stem cuttings of, 308; the late E. Calvat's, 164
 Cider and Fruit Institute, the, 301, 357
 Cider and Perry fruits, 288
Cimicifuga racemosa, 218
Cistus purpureus, 118; *C. recognitus*, 236
 Citrus genus, works on members of the, 460
 Clandon Park, Guildford, 115, 394
 Claremont, trees at, 54
 Clarkias as honey plants, 430
 Classification of Daffodils, 405
Clematis nutans, 310
Clerodendron trichotomum, 296
 Clifton, Mr. F., presentation to, 249
 Cloches, the use of, in French gardening, 406
 Clabbing in Broccoli, 171
 Cobham Hall, specimen trees at, 106
 Cocoa plants, budding of, 103
 Codiums at Aldenham House gardens, 554
Colchicum veratrifolium, 242
 Colonial exhibition, R.H.S., 434, 474
 Colonial notes, 229, 392, 444
 Conference of fruit-growers at Hexham, 323, 341; at Wye College, 436
 Coniferae, transplanted, mortality of, 203; the natural history of, 75, 95, 115
 Coomber, Mr. Thomas, appointed V.M.H., 453
 Co-operation in fruit growing, 436; in the marketing of produce, 359
 Copper absorption by leaves, 124
Cornus capitata, 475; in its native home, 447; *C. macrophylla*, 33; *C. Slavini* in Seneca Park, Rochester, 388
 Corsican plants, rare, 210, 262
 Cottian Alps, flora of the, 175
 Coulter and Chamberlain (*Morphology of Gymnosperms*), 444
 Crinums, hardy, 59
 Croquet ground, to lay out a, 172, 492
 Cross-fertilisation of the Potato, 279
 Croton (see *Codiaeum*)
 Crown gall of fruit trees, 414
 Cruickshank Botanical Garden, Aberdeen, 163
 Cryptogamic Society, Scotch, 266
 Cucumbers, ridge, 328
 Culham, Mr. Arthur Brook, appointment of, 102
 Cultural memoranda, 106, 133, 197, 294, 483
 Culture for show purposes, 18, 142
 Curculionid, Black, 193, 474; bud mite, maggot preying on, 271
 Curtis, C. H. (*Book of the Flower Show*), 75
Cuscuta Epithymum (Dodder) prevalence of, 166, 185
 Cyaniding glasshouses, 171, 490
 Cypher, Mr. John J., appointed V.M.H., 451

- Pears, malformed, 272
- Pearson, Mr. Alfred H., appointed V.M.H., 451
- Pecunia asperiflora, hidden beauty in, 234
- Pelargonium, Ivy-leaved, as standards, 273, 297, 318, 371
- Pemberton, Rev. J. H., 457
- Pentstemon azureus, 155; P. triflorus, 290
- Pentstemons, choice varieties of, 282
- Peper-Harrow Park, Cedars at, 476
- Perceval, Prof. John (*Agricultural Bacteriology*), 293
- Pertume in Roses, prizes for, 234
- Perowskia atriplicifolia, 423
- Perry and cider fruits, 283
- Pests in soil, the destruction of, 358
- Philadelphus York-hama Satsumae, 83
- Phoenix dactylifera, a monoecious tree of, 371
- Phoenix Park, Dublin, 259
- Phosphatic manures and Mushroom culture, 284
- Photographing flowers, 425
- Phylloxera laws in South Africa, 234, 482
- Physic Garden, Chelsea, 245
- Pictures of Alpine flowers, 37
- Pink, the Mule, 140; the Sweet William, 19, 64, 88
- Pinus sylvestris, seed experiments with, 215
- Pits for soil-sterilisation, 201
- Plane trees and throat troubles, 105, 185
- Plant foods, 273
- Planting fruit trees, 112, 352
- Plant notes, 3, 17, 76, 100, 173, 261, 274, 296
- PLANT PORTRAITS:**—Alecturus yodensis, 201; Aquilegia flabellata var. nivea, 487; Aristolochia moupinensis, 63; Aster Falconeri, 187; Begonia Martiana var. grandiflora, 63; Betula Maximowiczii, 391; Bulbophyllum vire-cens, 123; Chirita rupestris, 201; Cladostamnus pyrolleiflorus, 437; Columnea Oerstediana, 395; Craylopsis Veitchiana, 413; Dendrobium Dartersianum, 487; P. Sanderae, 413; Ganogync pulchra, 123; Houletia Sandei, 395; Iris Clarkei, 63; I. Wilsonii, 301; Micromelasma caloneura, 201; Neoglaziovia concolor, 413; Patrinia triloba, 123; Phaedranassa Carmiolii, 437; Philadelphus De-lavayi, 63; Pinus Armandii, 413; Pleiocarpa mutica, 395; Primula Littoniana, 301; Psoralea affinis, 123; Pterostyrax hispidum, 123; Pyracantha angustifolia, 395; Rhododendron flavidum, 63; R. Ungermii, 201; Rosa Moyesii, 301; Styxax Hemsleyanus, 301; Tistel-lata australis, 201; Xeronema Moorei, 395
- Plants in congenial positions, lecture on, 393
- Plants in the same latitude, effect of frost on, 8
- PLANTS, NEW OR NOTEWORTHY:** Aster Falconeri, 2; Anthium acule, fruits of, 153; Cistus tenebrum, 229; Iris tulvala, 2; Mermodes Wolteriana, 229; Nymphaea Fammu, 2; Paeonia japonica, 366; Paliosota Albertii, 423; P. Elizabethae, 423; Pectunia asperiflora, 174; Sobralia blanda, 273; Tulipa Hoogiana, 53
- Plants of Southern Nigeria, 84
- Plants on window-sills, danger from, 201
- Plants under glass, 5, 20, 40, 60, 85, 100, 120, 140, 161, 181, 199, 215, 230, 247, 265, 280, 293, 315, 334, 355, 372, 393, 410, 429, 449, 463, 485
- Plants, water requirements of, 431
- Plough for turf-cutting, 307
- Plum Coe's Golden Drop, 266
- Poisonous trees and shrubs, 480
- Poisons and Pharmacy Act, 1908, 83, 474
- Polemonium carneum, 134
- Pollen, fruit tree, and frost, 164
- Pollination and fruit-formation, 102, 140, 204
- Pollination, effects of, on Orchid Flowers, 309
- Pollination of green flowers by insects, 164; of "Spencer" Sweet Peas, 257, 285, 340
- Polygonum, origin of the, 12
- Polystachya golubensis, 463; P. paniculata, 462
- Poplar, the European black, 483
- Poppy with parti-coloured flower, 416
- Potash salts, three manurial, 343
- Potato blight in Ireland, 23
- Potato crop, the, 432
- Potato, the cross fertilisation of the, 279
- Potato, variation in, influenced by soil, 313
- Potato, wart disease of, 165, 217
- Potatoes, bacteriosis in, 285; hybrid, 217; manure for, 420; National Vegetable Society's trial of, 167; seedling, 245, 267, 286; variation of, in different soils, 267, 313, 354
- Potentilla lanuginosa, 296
- Prague Exhibition, 164
- Primrose, origin of the double-flowered, 38, 88
- Primula elatior, 87; P. japonica, raising seedlings of, 214
- Primulas, proposal for a national collection of, 8
- Privet injured by a leaf mining maggot, 267, 297
- Prize money, Scottish Society's non-payment of, 253
- Prizes at the International Horticultural Exhibition, 1912, 349

Prizes for the best-kept gardens at Kirkcubright, 143
Prizes for bulbs at R.H.S. Show, 200
Prizes, why need there be equal, 297, 318, 339, 353, 371
Pruning fruit trees, 422; results of experiments at Woburn in, 1
Puya chilensis in Cambridge Botanic Garden, 390
Pyracantha angustifolia, 395
Pyrus coronaria, double-flowered variety, 228

Q

QUEENSLAND, fruits and flowers in, 283
Quercus Ilex, a large specimen of, at Wilton House, 6; at Ynys-y-Maengwyn, Wales, 64
Quince, bacterial blight of, 103

R

RAILWAY stations, prizes for best-kept gardens at, 249
Rainfall in Aberdeen, 432; in Cornwall, 454
Ramsbottom, Mr. John, appointment of, 103
Rats, the destruction of, 446
Ravenscroft, B. C. (*Pawn Gardening*), 465
Redford, George (*The Faculty of Reading*), 62
Red Spider on vines, 132
Registration of novelties, 266, 286
Rhenm inopinum, 391
Rhododendrons, hybrid Javanese, 133; the culture of, 8
Rhus toxicodendron, poisonous properties of, 404
Ridge Cucumbers, 323
Ridgmont, experiments at, 1
Rochea falcata, 217
Roe garden at Edinburgh, 355
Rogers, W. S. (*Garden Planning*), 261
Rojia valley, the, 407
Rosa Wichuriana, 228
Rosary, the, 3, 15, 54, 75, 119, 137, 159, 177, 197, 211, 228, 261, 275, 330, 368, 385, 409, 424, 463
Rose blooms, scarcity of, on the Riviera, 432
Rose Congress at Paris, 63
Rose season, features of the present, 119, 159; in Scotland, 15
Rose show, a private, at Fimborough Hall, 33; the National Society's Metropolitan, 7
Rose: Dorothy Perkins, sports from, 119; Caroline Testout, raised from cuttings, 97; Edmond Proust, 8; Frau Karl Druschki, annual lifting of, 267, 286; Frau Karl Druschki as a bedder, 267; Konigin Carola, 3; Leuchstern, 200; Professor C. S. Sargent, 351, 470; Simplicity, 55; Souvenir d'un Ami, sports of, 208
Roses, some difficult, 465, 489; at Bagatelle, 65, at King's Walden Bury, 139; autumnal flowering, 211; budding, 3; choice bedding, 240; early-flowering, 3; in autumn, 395; for forcing, 275; hybrid perpetual varieties for forcing, 197; Noisette, and their hybrids, 54; old and new varieties compared, 228; on their own roots, 137; on the Manetti stock, 204; some of the best hybrid Wichuriana, 261; some new varieties, raised at Waltham Cross, 25; suitable for forcing, 292; the scent of, 234; trial of, at Bagatelle, 389; weeping, as pot plants, 15; Wichuriana and their hybrids, 464; Wichuriana, hardness of, 250; white-flowered, 410, 432; yellow-flowered, 363, 424
Rompellia grata, fainting of, 229
R.H.S. Fruit Show, 353, 371

Rubus Barkeri, a non-flowering species, 374; R. ichangensis, 275; R. Lambertianus, 276
Rural Education, 7, 38, 396

S

SALADS, a lecture on British and Continental, 265
Sale of Orchids at Bristol, 104
Saltmarsh, hailstorm at, 39
Sambucus, the genus, 33
Sanders, T. W. (*Window and In-door Gardening*), 58
Saxifraga crustata, 483; S. florulenta, 118, 166, 340, 371; S. lantoscana, 311, 416, 426, 474, 489; S. lingulata and S. lantoscana, 311; S. trifurcata, 295; S. t. ceratophylla, 354; S. valdensis, 261
Saxifragas of the Maritime Alps, the, 426
Schedule, flower show, an old, 87
Schizanthus, the culture of, 106, 485
Schomburgkia Lyonsii, 139
School-gardening in Scotland, 184; in Surrey, 453
Schroder, Baron, will of the late, 64; memorial to, 122
SCIENTIFIC COMMITTEE:—Acer, variation in, 268; Antirrhinum, aberrations in, 126; Apples, pollen of, 376; Buds on leaves of Verbascum nigrum, 307; bulb mite destroying Narcissi, 268; Calanthe foliage, spotting of, 167; Campanula lactiflora, seminal variation in, 88; Carnation sporting in, 167; coloration in Sweet Pea tendrils, 9; Coprinus radicans growing on a church roof, 9; Crypt stemma calendulaceum, 307; Dendrobium formosum, triple flower of, 376; Erica cinerea with modified flowers, 307; Eucalyptus and allied plants, fruits of, 457; Euphorbia Cyparissias, fasciation in, 265; Fodder plant, a Mexican, 344; Fruits of Eucalyptus and allied plants, 457; Gall on Willow, 126; garden warblers attacking Pears, 204; Gentiana Pneumonanthe forma alba, 117; Hippastrum calyptarum, fruit of, 235; Iris, a dimerous, 167; Kale with outgrowths on leaf, 457; Lycoris anrea, 307; Macaranga sacifera, 344; Maize inflorescence, abnormal, 235; mal-formed Orchids, 344; Mendelian and plant breeding, 344; Mentha, aberrant branching in, 204; Mentzelia, dissected, 204; Musa ventricosa, fruit of, 376; Museum preparations, fluid that renders them transparent, 268; Narcissi and bulb mite, 268; Oak galls, 268; Oncidioda x Charisworthii, 204; Orchids, mal-formed, 344; Pear with lateral proliferation, 344; Pears, mal-formed, 376; Peloric Antirrhinum, 126; Petaloid calyx in Rose, 204; Phlox spotting, 126; Pinks, cross-bred, 9; Pinus Pinex, seeds of, 417; Plantago media bractata, 235; Plane tree with adventitious root, 204; Plant breeding, Mendelian and, 344; Pollen of Apples, 376; Primula x Buissoni, 235; Radish, reversion in, 235; Rhododendron ponticum bud with petaloidy, 204; Rose, fasciation in, 344; Rose with petaloid calyx, 204; Rye Grass, variations in, 268; Saxifraga tellimoides, 88; Saxifraga umbrosa, seedling variety of, 9; Sex, influence of starvation on, 235; Spiraea Atanens with staminate and hermaphrodite flowers, 88; sporting in Carnation, 167; Stachys ambigua, 457; far water and plants, 457; tendrils of Sweet Pea showing colour variation, 9; Tropaeolum, double-flowered, 207; Vegetable

Marrow, fasciation in, 235; Verbascum nigrum, buds on leaves of, 307; Wallflower, fertility of the green-flowered, 344; Willow, gall on, 126
Scotland, beginning of the Rose season in, 15; forestry in, 212; notes from, 138, 184, 258, 332, 442, 465, 490; public bowling greens in, 490
Seakale, extensive culture of, 482
Seaweed, the monetary value of, 164
Seed crops in America, 164
Seed experiments with Pinus sylvestris, 213
Seedling Potatoes, 267
Seedlings of Primula japonica, 214
Seeds of Arctium lappa used as advertisement, 358
Seeds, germination of unripe, 19, 64
Senecio Doronicum, history of, 56; S. glastifolius, 43; S. g., comparative hardness of, 371
Senecios, some handsome, 14
Sheffield, gift of a park to, 183
Shows and exhibitions, culture for, 18, 142
Shrewsbury Show, the decorated dessert tables at the, 184; Grapes, at the, 204; judging at the, 185; Sweet Peas at the, 166
Shrubs, forced, exhibition of, at Boskoop, 23
"Silver" leaf disease, 2, 353, 356, 395
Singapore Botanic Garden, 212
Small holdings, 359, 366
Smith, Mr. James, 376
Smudge fires in orchards, 342
Snow scene in a Yokohama nursery, 487
Sobralia macrantha alba at Roby Hall, 182

THE EXPERIMENTS AT RIDGMONT.

ON the 23rd ult. a party of about 40 members of the Council, and the Scientific and Fruit Committees of the Royal Horticultural Society visited the Experimental Fruit Farm at Ridgmont, at the invitation of the Duke of Bedford, K.G., and the Director, Mr. Spencer Pickering, F.R.S.

The party was met at Ridgmont Station by Mr. Pickering, who conducted the members round the farm and explained the experiments. Later on they drove through the beautiful grounds, teeming with foreign animals and birds, which are quite at home there, to Woburn Abbey, where they were entertained at a luncheon over which Mr. Pickering presided.

An opportunity was then given for the members to see the principal rooms of the Abbey and the well-kept and finely timbered grounds which surround it.

The soil of the farm lies on Oxford clay, and a stiff, tenacious clay is present at a short distance below the surface throughout the experimental ground. Under certain circumstances the soil cracks badly, and, when it is dug late in the season, it is liable to remain in hard clods with considerable spaces between them, as could be seen

over much of the ground. It appears to contain little lime, and in places to be actually acid, if one may judge from the copious growth of Sheep Sorrel upon it.

On the whole, it appears to be a good fruit-growing soil, if thoroughly cultivated, though it would be easier to work if lime were added, and it would probably be improved in other ways by the addition of this substance.

The experiments have been most carefully planned, and they are carried out on an adequate scale. Though, before the conclusions could be accepted as of general applicability, they would require to be confirmed by further experiments on other types of soil. Experiments with living things are matters of very great difficulty, and interference with any one factor may often mean interference with others less easily seen, and perhaps not seen at all, resulting in a variety of changes which may or may not affect the final result. But at Ridgmont great care has been taken to plan all the experiments so as to ascertain the value of each known factor in reaching the result. Some of the results obtained have been startling in their apparent contradiction of accepted practice, not less to those who conceived the experiments than to the fruit-grower. In other cases it has been conclusively proved that different results follow similar practice when different varieties, say, of Apples, are concerned. Here it is apparent, as all observant fruit-growers know, that the cultivation of different varieties calls for modifications of general method, and it is quite probable that the question of varietal differences explains many of the apparent contradictions in practice advocated by different fruit-growers.

The first group of plots is intended to demonstrate the manner in which farmers might arrange fruit plots to the best advantage. Since they have reached good growth, they have given an average return of £30 per acre per annum. It may be mentioned in passing that it was found that the cultivation of vegetables and fruit in separate plots gave, over a series of years, better results than when they were intermixed.

The bad effects of Grass in orchards are well demonstrated in these experiments, though the actual reason for such effects is still to seek. It does not appear to be due to drying out, to check of free circulation of air, or to the robbing of the soil of plant food, as numerous interesting experiments have shown. The trees growing in grass, whether they be on the Paradise or Crab stock, are dwarfed, and their stems have a less circumference; the foliage is often yellowish and the fruit very brightly coloured; finally the trees die. Generally speaking, the ill effect is most marked upon quite young trees, but if it has not become too marked, the trees begin to recover when the grass is partly or entirely removed. On the other hand, grassing down after even 12 years' growth in cultivated soil produces a markedly adverse effect in some cases. Where the Grass has been allowed to grow gradually over the planted area, as it was often allowed to do in old times, the result has not been nearly so bad as where the land was sown down immediately.

It is important to note here, however, that some varieties of Apples show the evil results less than others, though all show it at Woburn to some extent.

THE QUESTION OF PRUNING.

The experience at Woburn has been all in favour of pruning in the winter the planting is done. If the pruning is left for a season, the growth in the first year is very weakly, and the trees frequently die. Where pruning was done, at no matter what time of year the planting was done, better results have followed.

Hard pruning carried out every year (no matter at what time) has been found to materially reduce the size of the tree and its yield, and not to increase the size of the fruits. The meaning to be attached to the terms "hard," "moderate," and "light" pruning is perhaps not clear, but, as was very evident, it is better to prune some varieties during the first few years of their growth, such as Stirling Castle, for instance, and other precocious varieties.

It cannot be argued from these experiments that a tree should never be pruned, but it would seem that, other things being equal, a tree left entirely unpruned will be, at the age of 16 years, larger than one that has been hard pruned every year.

There are, of course, as the experimenters realise, many questions to be considered in deciding whether to prune or not to prune, and here the only questions are as to the size of the tree and its yield. Various interpretations may be placed upon the old saying: "Growth follows the knife," and upon the interpretation given depends whether we regard the results as opposed to accepted ideas or in accord with them.

ROOT PRUNING.

Trees root-pruned every year were nearly or quite dead; those root-pruned in alternate years were rather better; those every fourth year better still; but, though for a time perhaps rather more fruitful than those not root-pruned, they were less vigorous. Root-pruning acts as a severe check on growth, it is quite evident, but no tree that could be judged to need root-pruning was observed on the farm.

PLANTING.

All growers know the value of firm planting, but most believe that, if the method is carried to the extreme, the results are sure to be bad. At Woburn the greatest success is obtained when the soil is rammed firm around the trees with an iron rammer, 50 per cent. more growth being made. At least, in the case of young trees, the removal of fibrous roots before planting, or the doubling up of the roots, has a beneficial effect when attention is given to the trees during their subsequent growth.

So convinced are the experimenters at Woburn of the lack of necessity for the care usually taken in planting, and of the good results of ramming, that they will not tolerate upon the place a cultivator who plants in the ordinary way.

The general hope of the party was that all who have the opportunity will try the effect of this method of treating trees, as against the usual one, in other soils and situations.

MANURING.

At Woburn no benefit has been derived from the use of manures on Apples and

other fruit trees, but with Gooseberries farm-yard manure has proved indispensable.

SILVER LEAF IN PLUMS, &C.

A very large number of Plums and other trees have been inoculated with the mycelium of the fungus (*Stereum purpureum*), and in 80 per cent. of the cases the inoculation has been followed by the development of silver leaf, while in no case has the disease appeared in trees grown close by for comparison. As a rule, the death of the branch or tree affected was followed by the development of the fruit of the fungus.

The correctness of Professor Percival's conclusion, published some years ago, would seem, therefore, to be established, and we may regard the fungus *Stereum purpureum* as being the cause of silver-leaf disease.

It is most desirable that many of the experiments should be repeated under other soil—and general climatic conditions. This is being done in some places, the Woburn experiments having done perhaps as much, as Mr. Pickering said at luncheon, in suggesting the manner in which experiments might be carried out, and in awaking a questioning spirit, as in other ways. But there is room for many more, provided every care is taken to record conditions and to avoid interference with the results by careless planning and by conducting the experiments on an inadequate scale. Then possibly fruit-growing, well as it is done in the skilful hands of present-day growers, will be done yet better, and in any case we shall be well on the way to securing a firm basis on which to build a science of fruit-growing. J.

NEW OR NOTEWORTHY PLANTS.

NYMPHŒA BAUMII.*

THIS is the smallest of all typical Nymphæas in cultivation. The flowers are very small—about an inch in diameter. They are white, and remain open for six to eight hours during the day. The peduncle is from 4 inches to 1 foot long, slightly decreasing, rosy when young. The sepals are elliptical, pale yellow at the base and at the sides, green at the apex, white within, rosy in old flowers. The veins of the sepals are fine, pale, transparent, and the sepals are covered all over outside with fine violet stripes. Sepals and petals persist on the maturing fruit, enclosing it closely. The number of petals varies from 7 to 8; they are lanceolate, white: outer petals green with fine violet stripes on their ventral surfaces. The petals are shorter than the sepals, and are inserted near the base of the receptacle. Stamens 14 to 22 inserted near the middle of the receptacle, half as long as the petals; filaments, pale yellow, anthers dark yellow. Carpels 5 to 8, the upper third quite free, as the receptacle does not cover the carpels entirely. Fruit round. This species differs in this respect from all other Nymphæas known to me. The stigma is yellow, papilla conical. The seeds are about a twenty-

fifth of an inch long, oval, violet when young, dark green on ripening, and not covered with longitudinal lines of hairs.

The leaves are leathery, about 1½ inch in diameter, nearly round, dark green above, nerves slightly paler. The underside is green, with a brown shade, covered all over with irregular dark violet blotches; veins dark green; lobes round. The petiole is very long and thread-like.

The plant is a native of South-west Africa, 18° longitude east of Greenwich, rare at Minesera on the Longa, in shallow water 8 inches to 1 foot deep; also as very small flowering bog plants at the margin of a swamp near the Longa. Temperature of water, 31° C. (= 88° F.). It grows together with *Nymphaea sulfurea*, one of the two, yellow African Nymphæas, which, unfortunately, like many other African species, have not yet been introduced. *N. Baumii* was collected in 1902 by H. Baum, curator of the Botanic Garden at Rostock. I have never succeeded in getting this species to cross with any other Nymphæa, and this is not to be wondered at, as it differs largely from all others in cultivation.

It would be of great value if more seeds and plants of Nymphæas of all parts of the world could be introduced, even if they seem to be of

FIG. 1.—NYMPHŒA BAUMII, A SMALL SPECIES WITH WHITE FLOWERS.

common kind, as our knowledge and collections are far from complete. Seeds must be well cleaned before putting them in a small glass with a few drops of water, just enough to keep them moist. Fr. Henkel, Darmstadt, *Landscape Gardener and Botanist*.

IRIS × FULVALA.

THIS Iris, which was shown before the Royal Horticultural Society on June 21, and recommended for an Award of Merit by the Floral Committee, is interesting as being the first recorded hybrid of *Iris fulva*, a species from the swamps of the Southern United States, distinguished by its remarkable terra cotta colour and the drooping habit of its standards and falls. The fact that no other Iris approaches it in colour has led to repeated attempts to increase the size of the flower by hybridisation, but hitherto, apparently, these attempts have been fruitless.

The pollen parent of *fulvala* was the beautiful local species found by Lora La Mance in the mountains of Arkansas and usually known as

hexagona *Lamancei*. This Iris forms, with the true hexagona, one of the several curious pairs of American Irises (of which another instance is *bracteata* and *Purdyi*), the flowers of which can scarcely be distinguished, although the structural details of the botanically important parts of the plant, such as the ovary, the tube and the spathes, show that they belong to two distinct species. The large blue-purple, flattish flowers of *Lamancei* are of considerable substance and great beauty, but the plant produces only a dwarf stem, and, therefore, hides its flowers low down among the leaves.

In the hybrid the tall stem of *fulva* is retained, and three to five flowers are borne in the axis of large leaves, which decrease in size from the base upwards. The flower is of the shape of *Lamancei*, with spreading segments and somewhat pointed falls. The colour of the specimens shown at the meeting was a rich velvety, reddish—almost crimson—purple, becoming yellow towards the centre of the flower, the falls bearing a central, deep yellow slightly-raised ridge, which is distinctly pubescent. This last feature is noticeable in *Lamancei* but not in *fulva*.

As far as I can tell at present, the plant is more floriferous than *fulva*, which, in some years, fails to give me any flowers at all.

Besides the above plant, I have another which is very similar, but which bears flowers of a deep blue-violet. Both come from a pod of seed that ripened in 1907. W. R. Dykes, *Charterhouse, Godalming*.

NATIVE HABITAT OF ASTER FALCONERI.*

WHEN my No. 14,502 was placed in Mr. Hutchinson's hands it had only a field label on it, and I omitted to explain that it was gathered by myself on open, grassy slopes below the Saskalli Pass, near the head waters of the left (eastern) branch of the Liddar River, that is, on the northern side of the Vale of Kashmir. Aitchison found it in abundance on the southern range (which divides the valley of Kashmir from the plains of the Punjab) in grassy meadows above Gulmarg. I have also seen it, but not in flower, on the Kashmir side of the Pir Punjab Pass, where it was found long ago by Falconer's collectors. It is found, I believe, though not usually now in quantity, as grazing has extended of late years enormously, just below the zone of Birch forest throughout the mountains which encircle the plateau (or vale) of Kashmir, and no doubt it extends westwards to Cleamba territory, but I have never seen or received it from the Himalaya eastward of the Ravi. It should be perfectly hardy in parts of these islands, but in its native haunts it has a clear, bright atmosphere for most of the year, while the underground part of the stems with the roots is under heavy snow from December to May. In May or June the snow is swept away or melted by the strong sun, which brings on the flowering shoots very rapidly. J. R. Drummond.

STRAWBERRY "UTILITY."

THIS is one of the newer varieties of Strawberries raised by Messrs. Laxton Bros. from a cross between a late-fruiting variety and Waterloo. The fruits ripen a few days before those of Waterloo; they are wedged-shaped, very firm in texture, and possess a good flavour. Messrs. Laxton describe the plants as possessing free-cropping and vigorous-growing qualities. They consider it superior to Givon's Late Prolific, and recommend the variety as one to succeed the ordinary main crop of Strawberries. Our illustration represents fruits exhibited at the Royal Horticultural Society.

* See *Gard. Chron.*, June 18, 1910.

* *NYMPHŒA BAUMII*, Rehnelt et Henkel, spec. nov.—Folia coriacea, integra, 2-3 cm. diam. cordato-orbicularia, sinu aperto lobis rotundatis, supra nitida viridia subtus pallidiosa violaceo-punctatis, nervis immerstis. Sepala anguste elliptica viridia punctis striisque violaceis maculata, intus albida. Petala 7-8 lanceolato-elliptica, acuta, alba. Filamenta 14-20, petalis dimidio breviora, lutea, appendicibus brevibus albis. Stigma luteum radius 6.

Ex Africa aust. occidentalis introducta.

THE ROSARY.

CULTURAL HINTS FOR JULY.

The hot weather has favoured Roses, and growers who have kept down insect pests by means of spraying should have good results. The buds inserted last season have grown freely, and the shoots will now need staking and tying. The top of these growths should be pinched out so as to cause the lower buds to break and form a bushy head.

Roses that have had their shoots pegged to the soil promise exceptionally well for blooming. Where there is a heavy crop of flowers, the plants should be assisted with a little liquid manure, which should be applied at half strength and when the soil is moist.

BUDDING ROSES.

It is now time to commence the work of budding Roses, selecting the standard and dwarf Briars first. The growth of Roses generally is much later this year than usual, and care must be exercised to see that both the stock and the scion are well ripened before budding is attempted. If the tips of unripened shoots are pinched, this will have the effect of hardening

Amongst the more desirable varieties of this type are *repens alba*, *atropurpurea*, *Blanche de Coubert*, *alba*, and *Mme. Geo. Bruant*. The Ayrshire Roses are also suitable for training as weeping standards; the best of these include *Dumdee Rambler*, *Thoresbyana*, and *Félicité Perpétué*. Examine the general stock of Roses with a view to removing useless shoots, as those that remain will receive the benefit of additional light and air.

Tea and Noisette varieties planted against walls must not be allowed to suffer from drought at the roots; specimens that have finished flowering may be pruned a little and afforded some stimulant. Nothing is better for securing Roses to walls than strands of galvanized wire placed at 15 inches apart. The wire should be stretched through "eyes" placed at a little distance from the wall.

Roses in pots that have been forced and afterwards plunged or stood out-of-doors must be kept dry at the roots (but not allowed to flag) until September.

Roses planted out under glass, having been lightly pruned after flowering, will soon be breaking into new growth. Keep the plants free from green-fly and mildew, and apply doses of weak

being especially well suited for a high, south wall. *Isabella Sprunt* was sent out by Verschaefelt in 1866; it is of vigorous growth, quickly covering a wide wall-space if allowed to extend without much close pruning. A western aspect suits this variety. In the bud it is a beautiful light canary-yellow in colour.

Safrano was sent out as long ago as 1830, and is still one of the best as a button-hole Rose when in the bud. On a low south wall it grows and flowers to perfection. The colour is a bright apricot.

Mme. Alfred Carriere, distributed by Schwartz, has vigorous growth, and is well suited for a pillar or pergola, flowering early in June. Although catalogues describe it as a pure-white, I find it prettily flushed with pink in the bud state.

Among single varieties, none is so early and attractive as *Carmine Pillar*, sent out by G. Paul & Son in 1896. Its large, single blossoms are rosy-carmine, and in no way does it show to greater advantage than when trained loosely to a pillar or over a fence.

Never have I seen the Banksian varieties, yellow and white, flowering in such profusion as this season. They require a high south or east wall, liberal cultivation and very little pruning other than the removal of useless spray. No Rose that I know gives its blossoms in such quantities as the yellow form, and there is much charm in the deep yellow of its closely-formed, button-like flowers. This variety was introduced in 1823 by Damper, but it is seldom seen in private gardens. The white variety is distinctly shy blossoming, except under the most favourable circumstances of site and management.

Mme. Georges Bruant belongs to the *Rugosa* type, and is a pure-white, early-flowering form, especially sweet in its perfume. As a bush, growing in a suitable site—in the front of the shrubbery, for example—its early blossoms are appreciated.

Reve d'Or, sent out by Ducher in 1869, should be given a southern exposure on a high wall. Its deep-yellow blossoms are beautiful at the end of May. It should not be pruned severely.

Gardenia, as a pillar Rose for early-flowering, has few equals; its deep-yellow buds and pure-white blossoms are relieved by the deep-green, glossy foliage. *E. Molyneux*.

FIG. 2.—STRAWBERRY "UTILITY."

the shoots and induce the formation of lateral shoots, thereby causing an increased flow of sap. When the bark parts freely from the wood, budding can be proceeded with. It will be better to select the scions from flowering shoots of plants cut back last year; should these not be available, use only the most prominent bottom eyes from ordinary shoots. Do the work of budding in cool, showery weather. If dry weather continues, the work should be done in the morning and evening, after supplying the roots of the stock, some days in advance, with a drenching of water. Make a clean incision in the stock, and be careful not to damage the bud. Raffia is the best binding material, and should be used when wet, keeping it in the water, in which the ends of the scions are placed. The budding of dwarfier stocks of *Manetti*, *De la Grifferae*, and stocks from Briar cuttings may be left over until the end of July or some time in August. The budding of the seedling Briars should follow the standards. Remove the soil a few inches from the stem and insert the bud just above the roots.

Varieties of *Rosa rugosa* are suitable subjects for the shrubbery, with their dark-green foliage and showy flowers, followed later by the brilliant hips. *R. rugosa* may be budded as standards and made to assume a weeping form.

liquid manure to the roots with an occasional sprinkling of basic slag and bonemeal. Keep the ventilators open both day and night, and remove all flower-buds to conserve the energies of the plant.

Apply mulchings to the roots of newly-budded and other Roses during dry weather, and hoe the beds and borders frequently, so that the soil may be well aerated and moist. *J. D. G.*

ROSE KÖNIGIN CAROLA.

This H.T. variety, sent out by Turke in 1904, is one of the first in my collection to open its blossoms, which it did this year on May 30. The flowers last a long time in good condition and retain their satiny-rose colour well. The blooms, when fully expanded, contain a large number of petals, making huge flowers. The variety deserves the attention of Rose growers for garden decoration.

EARLY-FLOWERING ROSES.

The following varieties may not be new, but none of the newer sorts is more useful for early-flowering, as they all give an abundance of blossom quite early in the season. *Reine Marie Henriette*, sent out by Levet in 1875, is commonly known as the *Red Gloire de Dijon*: in colour it is a deep cherry-red. The plant has a vigorous growth and abundant blooming qualities,

PLANT NOTES.

HELIOTROPES.

For some time past M. Bruant, of Poitiers, France, has devoted much attention to the raising of new varieties of *Heliotrope*, as well as many other classes of soft-wooded plants.

Visitors to the meeting of the Royal Horticultural Society on June 7 had an opportunity of seeing freely-flowering examples of several of these newer forms, one of which, *Favori*, was, under the name of *Favourite*, given an Award of Merit by the Floral Committee. This variety has massive heads of unusually large flowers, the colour being lilac-mauve with a lighter centre. The trusses possess the great merit of being exceptionally fragrant. Of the other varieties represented I was most impressed with *Plume de Paon*, first distributed by M. Bruant in 1908. This is one of the finest of the dark-coloured kinds, and a small, light centre to each flower serves to light up the dense, massive heads of bloom. *Réverie* has almost white flowers, which afford a marked contrast to those of *Plume de Paon*. Many of the more recent forms of *Heliotrope* are remarkable for their large, spreading heads of blossoms, and this may be largely owing to the influence, either directly or indirectly, of *Heliotropium incanum*, a species introduced from Peru by the late Mr. William Bull, of Chelsea, and distributed just 25 years ago. It is altogether a larger and bolder grower than the old *Cherry Pie* (*Heliotropium peruvianum*), while the foliage is particularly hoary. *W.*

MULCHING.

This is a familiar term in gardening, but the practice is not thoroughly understood by all who engage in it. Indeed, in many cases mulching is carried out mainly because it has become a rule. Little or no thought is given as to the conditions of the season and soil at the time of applying a mulch, or to the character of the material used for the purpose. In a general way a suitable mulch given at the proper season is beneficial, but mulching may be carried to excess, and it is then a means of harm rather than good. This applies to vine and Peach borders under glass, fruit trees trained to walls, or fruit trees in the open garden, also to vegetable crops.

Among the mistakes that are made is that of applying the mulch too early in the season. To cover the ground with a thickness of close, heavy manure before the ground has become warmed by the summer's sunshine is against the well-doing of the tree or plant. A warm, moist rooting-medium is necessary to fertility. Some growers think that, by mulching early in the season, moisture is conserved in the land, but they overlook the facts that warmth is quite as important a factor, and that a mulch is apt to exclude it.

In all cases light and porous materials should be used. A covering of suitable material about 2 inches in thickness over the roots does much to maintain the soil in a moist state, the full force of the sun is tempered, but sufficient warm air can penetrate. The ground, under such a covering, remains open and sweet in contrast with that where too great a thickness of solid dung is placed over it. Perhaps one of the best materials for mulching purposes is horse dung from a spent Mushroom bed, since, though still retaining some feeding properties, it is light and porous, and not unsightly. Even such a light covering as this is best withheld in a cool, moist summer like that of 1909. Therefore, it should not be applied until the necessity actually arises. In cases where there is no choice of material for mulching and rotten dung has to be used, it should be employed sparingly. By forking it over lightly as required it may be prevented from settling down into a solid mass. *R. P.*

The Week's Work.

THE FLOWER GARDEN.

By E. BECKETT, Gardener to the Hon. VICARY GIBBS, Aldenham House, Herefordshire

Herbaceous border.—Everything should be done to make the flower border neat and tidy. Remove the old flower-stems and any unsightly shoots. Place stakes where necessary, and secure any shoots that need tying. Plants that are dry at the roots should be given a thorough soaking of water and afterwards a mulch. Keep down weeds and promote a fine tilth on the surface by means of the Dutch hoe; hand weeding must be practised where the hoe cannot be employed. The present offers a suitable time for the dividing of the *Fritillaria* or Crown Imperial. *Fritillarias* continue to grow well for a number of years if undisturbed, but it is advantageous sometimes to thin them, and division is one of the easiest means of increasing the stock. Many plants that flower in the spring may be increased at this season by means of cuttings. Shoots of *Aubrietia*, *Arabis*, *Lithospermum prostratum*, *Alyssum*, and *Iberis* will root readily in a sandy compost. Select a shady position, keeping the cuttings close until rooted, hand-lights placed under a north wall being suitable for the purpose. After Pinks have finished flowering, they may also be increased in this manner.

The water-garden.—The hot, sunny weather has been especially suited to *Nymphaeas*; never before have I seen them in better condition at this season. The foliage, too, seems to be very little affected this year by aphids, although this pest may become prevalent later, in which case some insecticide must be used in the evening, when the flowers are closed. There is a splendid selection of colour in the flowers of *Nymphaeas*,

and where a limited water area is available, only the very finest should be included. When the plants are in full bloom is a favourable opportunity for considering any alteration in the scheme of planting when the proper season arrives. Where large tracts of water are available, the commoner forms, such as *Nymphaea alba* and its variety *candidissima*, *N. Laydekeri*, *N. Marliacea*, *N. carneae*, and *N. chromatella* should be included. The Japanese *Iris* *L. Kämpferi* are beginning to unfold their gorgeous flowers, and these, together with the *Astilbes* (*Spiræas*), are creating a fine effect in the water-garden.

Roses.—Many of the climbing varieties will need a thorough overhauling. All faded flowers should be removed, and, if the flowering of any particular variety is over, cut out the old flowering shoots, so that the young growths may be trained in their places. Be careful not to injure the stout basal growths, as these will form the flowering branches of next season. Other kinds of *Roses* that have passed out of flower will need syringing with an insecticide. A simple and effective wash can be made with soft soap and water, using half an ounce of soap in each gallon of water. In the case of hybrid perpetual *Roses*, should extra fine blooms be required, disbudding must be resorted to, and stimulants applied at the roots. The appearance of the *Rose-garden* will be enhanced if the plants are gone over at least once a week, and the petals of faded blooms removed before they fall. At the same time rake over the surface of the soil.

The wild garden.—It will be necessary now to mow the grass, otherwise the flowering plants may be smothered and their growth checked. Endeavour to have the wild garden as natural and informal in appearance as possible, and for this reason planting should always be done in irregular patches. Weeds must be kept down by means of the hoe. Take care when raking up the mown grass not to injure the stems of any of the shrubs or other plants.

THE KITCHEN GARDEN.

By JOHN DUNN, Kitchen Garden Foreman, Royal Gardens, Windsor.

Leeks.—Those which were planted in trenches in the beginning of May should receive liberal supplies of liquid manure from the farmyard. If this is not available, the trenches may be freely dusted with guano, following this with an application of clear water, which should be exposed to the sun for some time before use. Earthing-up should never take place before the plants have been given sufficient moisture at the root. The soil must be worked carefully round the stems of the plants, and this process continued from time to time until the trench is filled level with the surrounding bed.

Onions.—Plants which are to grow to a large size should now receive liberal supplies of artificial manure, but this should not be continued late in the season, or the bulbs may split. Whenever water is necessary a good soaking should be given in preference to frequent light waterings.

Shallots.—Those planted early in the year will now be ready for lifting and placing under cover where plenty of air can circulate about them. When perfectly dry they may be stored away, selecting the hardest and best matured bulbs for keeping until spring.

French Beans.—Seed should be sown now on some sheltered border, where the plants can be protected from September frosts, to afford supplies late in autumn. Cold frames recently occupied with Potatoes and other early vegetables may be prepared, and the first sowing of French Beans made in them about the middle of July and at weekly intervals until the middle of August, when, if heated pits are available, a good sowing should be made for the latest supplies.

Parsley.—Parsley sown for winter use should now be ready for thinning, leaving the plants at 6 inches apart. In September the whole plantation should be cut close to the ground to encourage short stems which will stand the winter. The young seedlings removed from the rows should be transplanted into a cold frame for use in severe weather. The soil should be trodden tightly before planting, and after planting the whole bed should be carefully watered. The lights may be stored away until the approach of winter weather.

Turnips.—A sowing of Turnips may be made on a north border or some other situation on

which the sun does not shine during the hottest part of the day. Turnips are best when drawn from the bed as required for us, therefore frequent sowings should be made. Thin the plants to 9 inches apart as soon as they are large enough to handle. Sow again at about the middle of July for autumn and winter use. Green-top Stone, Red Globe, and Golden Ball are good varieties for winter use. The Turnip fly, which is so troublesome in dry weather, may be kept in check by frequent dustings of wood ashes applied when the foliage is damp.

Lettuces.—Make a small sowing of Lettuce every 10 days, choosing a rich soil on a shady border. Frequent waterings may be necessary to ensure quick growth. Mammoth White Cos, Iceberg, and Pearl are good summer varieties. Continuity is good for hot seasons.

Radishes.—A sowing should be made in a cool situation, and the plants must be watered frequently. Sow the seeds thinly. The best place to grow Radishes in summer is in box frames behind a north wall. The soil should be light and rich.

THE APIARY.

By CHLORIS.

Queen raising.—Sufficient attention is not given to this important branch of apiculture by amateur beekeepers. To be successful in bee-keeping every colony must be headed by a young and prolific queen. No stock should include a queen that has passed her second season. By raising queens from well-selected colonies a supply of fertile queens may always be at hand to replace those that have passed their most profitable period, or to take the place of those that have been injured or accidentally killed. During the height of the honey season the loss by mortality amongst bees is very great, and the loss of the queen will soon react on the prosperity of a hive. Very much depends upon the queen: her offspring must be numerous, hard-working, and hardy. The hive which is set aside for raising the queens should be fitted up with foundation of worker base, and, to attain excellence, another equally good colony should be fitted up to produce drones. A few combs may be inserted in the middle of the brood chamber, and, if the bees are well fed with syrup, the queen will rapidly fill these with drone eggs. When all is ready, insert a new frame containing foundation with worker base, stimulate, and in three days remove the queen, keeping her for use, where a less valuable queen can be sacrificed. Take care to remove all combs containing unsealed brood; these can be placed in weak colonies. These latter combs are removed in order to prevent the bees from raising queens from larvae more than three days old. The bees will raise queens from the eggs in the new comb, the grubs being well fed from the time of hatching. It may be expected that from 10 to 25 queen cells will be started, and in nine days these will be sealed over. If there are not sufficient cells, another comb of eggs from the same queen may be added, and on removing the queen cells, the bees, being queenless, will at once again set to work to raise queens. Great care must be taken not to shake the frame, as is commonly done in ridding the combs of the bees, for this will kill or injure the queens. The bees are best brushed off with a quill; nothing irritates bees more than the use of a brush. Some beekeepers are at a loss to understand the meaning of a nucleus colony. It is really a colony of bees consisting of three or four combs; sometimes not more than two or three combs are sufficient—the two outer ones containing honey and pollen and the middle one brood. A queen cell is carefully secured in a hole in the centre of the comb with pins. These combs have all been taken from a well-stocked hive, and the adhering bees will raise the brood and maintain the requisite temperature in the hive. Wrap up each nucleus well with quilts and take care to have an entrance which will only permit one bee to pass at a time. This will tend to prevent robbing. In removing the queen cells, cut the comb well away from the actual queen cells, and do not expose the cell more than is necessary to either cold or the sun's heat. To ensure success, the work must be done expeditiously. In about two weeks time, the queens will commence laying, and they will then be ready for transferring to their new hive. The proper method of introducing the queen to a colony will be described in a further note.

THE HARDY FRUIT GARDEN.

By A. R. SEARLE, Gardener to the Marquis of NORTHAMPTON, Castle Ashby, Northamptonshire.

Strawberries.—Where Strawberry plants are required for planting in the open quarters during August or early in September, the runners should be layered as soon as they are procurable. Pots 3 or 3½ inches in diameter are the most suitable, and should be filled with fresh loam made moderately firm. A few rough pieces of loam at the bottom of the pots will afford sufficient drainage. If the loam be considered poor, a sprinkling of bone-meal should be mixed with it. The runners should be pegged in the centre of the pots, and it will be necessary to keep them well supplied with water and to sprinkle the plantlets each afternoon with a rose-can during dry weather, until they are established. If the pots are partly plunged in clumps or rows, this will prevent them drying too quickly, and the plants may be more easily attended to when so placed. In these gardens the Strawberry season will be a short one, and the fruits generally on the small side, owing to the excessively hot and dry weather during the swelling of the "berries."

Perpetual-fruiting varieties.—Those required to furnish a successional supply of fruit after the main crop is over should have all the runners and flower-spikes removed till within six weeks or thereabouts from the time the fruits are required. All recently-planted Strawberries that have been forced (as mentioned in the Calendar for April 16) should have the runners removed and the soil round about them should be frequently stirred with the hoe. These plants will produce some very good autumn fruits if occasional applications of liquid manure water are given them.

Figs.—The trees are now growing freely, and they need the shoots disbudded and the fruits thinned if a heavy crop has formed. The shoots should be thinned gradually in order that the trees may not receive a severe check. Avoid overcrowding the growths or the wood will not mature properly. Remove the extra-strong shoots and retain those of moderate strength that are short-jointed. Trees growing in restricted and properly-prepared borders and carrying good crops of fruits will require liberal waterings of liquid manure while the fruits are swelling, but the manure water must be discontinued immediately the fruits show signs of ripening. No stimulants must be given to trees that are making a quantity of gross shoots or those that have failed to crop. Continue to fasten in the shoots as they develop, but do not stop them. Red spider is sometimes present in the foliage if the roots are allowed to suffer from drought. Where this is the case, the foliage should be syringed vigorously with clear water.

PLANTS UNDER GLASS.

By JOHN DONOGHUE, Gardener to JOSEPH PICKERSGILL, Esq., Bardon Hill, Westwood, Yorkshire.

Selaginella.—The Selaginellas succeed best in a mixture of rich porous loam and lumpy peat. They are easily propagated by portions of the stem. Place from four to six pieces into small, shallow pans and stand the pans in a shady position in the intermediate stove. The plants are of quick growth, and specimens of a useful size may be soon obtained by this means. *S. caesia* does best when exposed to the light and grown near to the glass, as sunlight is needed to develop the tints seen in this variety. The others should be given shade. *S. caesia arborea* has an exceptionally high colour and forms a pretty contrast with green species when used amongst dwarf plants for grouping.

Climbing plants.—These will soon afford a brilliant display of bloom. The plants must receive regular attention with respect to watering and be given a sprinkling of chemical fertiliser. Thin out the weak and undesirable shoots so that the other occupants of the plant-houses may receive the necessary amount of light. Creepers planted out in borders must be supplied at intervals with top-dressings, and be given thorough soakings of water. Camellias form ideal wall-plants in the greenhouse or conservatory. The trees are well furnished with their new season's growth and will need an occasional syringing with an insecticide to keep the plants clear of pests.

Francoa ramosa.—This plant forms a useful object for greenhouse or conservatory decoration.

It does best when cultivated as a specimen plant in pots of from 7 to 8 inches in diameter. Under such treatment I have obtained from 12 to 18 flower-spikes on a single plant. As soon as the flower-spikes are observed, afford liberal doses of liquid manure at alternate waterings, and this stimulant may be continued until the flowers are showing colour. If desired, Francoas may be raised from seed sown during the spring, but this method of propagation is not to be preferred to cuttings. The shoots should be inserted singly, into small pots, as soon as the plants pass out of bloom. Allow the cuttings to remain in a cool frame until the weather becomes cold, when they must be afforded a position in the cool greenhouse.

Acalypha.—Specimen plants of *Acalypha* which have become unsightly through losing the bottom foliage may be notched and mossed around the stems with a view to ringing them. If kept close and moist for a few weeks, the stem at the notched portion will soon form roots, and may then be severed at that part. After they are suitably potted, afford shade until they are well established, and then expose them gradually to the sunlight to become well ripened. The old root-stocks may be reserved for propagating purposes.

THE ORCHID HOUSES.

By W. H. WHITE, Orchid Grower to Sir TREVOR LAWRENCE, Bart., Burford, Surrey.

Cattleya.—*C. Warscewiczii* (gigas) is a free-growing species in suitable conditions. At the present season, when many plants are in bloom, they should be kept in a moderately dry atmosphere, and the flowers will then last a considerable time in perfection. Plants which are still growing should be placed within a few inches of the roof glass, where there is most light, as the action of light will tend to make the plants floriferous. These remarks apply also to plants of *C. Dowiana* and *C. D. aurea* now showing their flower sheaths. The best time to repot plants of *C. Warscewiczii* is about a fortnight after the flowers fade, as, at that time, the new pseudo-bulbs produce from their bases a number of roots that will readily enter the new compost; while, if the operation is left till the roots are present, many of these are likely to get broken. After the flowering stage, stand the plants in a position where they will be exposed to plenty of light and air. Afford only enough water to keep the old roots from perishing; a slight shrivelling of the pseudo-bulbs may be allowed, as they will readily plump again to their normal condition when growth recommences. Plants of *C. Mossie*, *C. Mendelii*, and *Lælia tenebrosa*, many hybrid *Cattleyas* and *Lælio-Cattleyas* which have passed their flowering stage, also plants of *C. Bowringiana*, and its hybrids now starting to grow, may be repotted at this season. *C. Lawrenceana* should be placed in a light position in the Mexican house, with *Lælia anceps*. Fresh material may be afforded to this plant when the growths have fairly started, using the best *Osmunda* and *Polypodium* fibres in equal parts, with plenty of small crocks intermixed. Remove all unnecessary back pseudo-bulbs, so that each plant may be placed in a pot suitable to its requirements for several seasons, and pot firmly. All the plants in the *Cattleya* house will require abundance of ventilation, weather permitting, by means of the lower ventilators; a thorough damping-down should be given in the morning, and again early in the afternoon, so as to produce a good growing temperature several hours before the sun ceases to shine on the roof. The atmosphere may be allowed to become comparatively dry for a few hours during the middle of the day.

Dendrobium albo-sanguineum.—Suspended to the roof, in a light position over the *Cattleyas*, is the best place, we have found, for the rather difficult *Dendrobium albo-sanguineum*. The plants of this species have their new growths well advanced, and, before the roots push out from their base, repotting should be done, using the same potting mixture as advised for the *Cattleyas*. From the present time until growth is completed, copious waterings will be necessary. Red spider being the chief enemy of this plant, the leaves should be sponged over at least once each week.

Odontoglossum pulchellum.—In the rather cooler temperature of the intermediate house

plants of this pretty white species are commencing to grow and may be repotted. Afford plenty of drainage material, and use a compost of *Osmunda* fibre, *Polypodium* fibre, and *Sphagnum*-moss in equal parts. Cut the moss up much smaller than the fibres, so that it will intermix well with them, and add plenty of small crocks. Fix the plant just above the rim of the pot, and work the soil in rather firmly around the base of the pseudo-bulbs. The plant, when repotted into this new kind of compost, generally takes a long time to re-establish itself, but it will, in time, reward the grower for his care and patience. After potting, it is advisable to stand the plant at the warm end of the house. Keep the surface of the compost just moist, and protect it carefully from strong light and all sunshine.

Masdevallia tovarensis.—This pure white *Masdevallia* thrives well along with the *Odontoglossums*. The plants have now recovered from their disturbance by repotting, and are making many new leaves. Afford plenty of water to the roots, but do not let the compost be constantly saturated. Plants that grow in moderate shade thrive better than those which are in more exposed positions.

Palumbina candida grows and blooms freely when suspended in a shallow pan in the intermediate house.

FRUITS UNDER GLASS.

By E. GOODACRE, Gardener to SIR ERNEST CASSELL, G.C.B., Moulton Paddocks, Newmarket.

Strawberries.—Young plants which were put out last year to provide layers should have the flower-spikes pinched out. The runners should be pinched when large enough, leaving one runner to each plant.

Layering Strawberries.—The layering of Strawberry runners to provide plants for forcing may now be taken in hand. The runners may either be layered into small pots or direct into the fruiting pots. There is less work in the latter method, and the results are quite satisfactory. The best runners are produced by young plants grown specially for stock purposes, therefore a few rows should be planted every year for this purpose.

Layering in small pots.—If this method is adopted, the necessary number of pots should be filled in readiness, using good, loamy soil which has been passed through a sieve with a half-inch mesh, to remove stones. Fill the pots rather loosely, so that the runners may be pressed well down, after which the soil may be made firm to prevent the young plant from being blown out of the pot before it has established itself in the soil. Stand the pots close together between the rows until they are ready to be detached from the parent plant, and give daily attention to watering. Keep all runners pinched back as they appear, and also any that spring from the old plants.

Layering in fruiting pots.—For the earliest crops, pots of 5 inches in diameter are quite large enough, and others 6 or 6½ inches may be used for general purposes. These should be washed clean and crocked carefully, so as to ensure thorough drainage. Prepare a compost of roughly-chopped, fibrous loam five parts, well-decayed manure one part, and a 4 inch potful of bone-meal, and another of soot to each barrowload of soil, also a good sprinkling of old mortar rubble. Turn this mixture several times in order to have the manure thoroughly incorporated with the other ingredients. Fill the pots to within 1 inch of the rim, using a rammer. The plants are most successful in a firm rooting medium, but if the compost is inclined to be too moist, or it is stiff loam, severe ramming causes the plants to get water-logged. Make a small hole in the centre of each pot with a trowel, insert the runner, and make it quite firm. The young plants will benefit by spraying with a rose can when the weather is dry, but watering must be done carefully until the pots are well filled with roots. When it is seen that the plants are well established, they may be removed to an open position and placed on a base composed of coal ashes a few inches deep. Give regular attention to watering and syringing, and feed the plants with liquid manure when they are well rooted, remembering that next year's crop of fruit is largely dependent on the autumn treatment. Place the plants further apart as growth advances, so that they are thoroughly exposed to sun and air.

EDITORIAL NOTICE.

ADVERTISEMENTS should be sent to the PUBLISHER, 41, Wellington Street, Covent Garden, W.C.

Newspapers.—Correspondents sending newspapers should be careful to mark the paragraphs they wish the Editors to see.

APPOINTMENTS FOR JULY.

SATURDAY, JULY 2—Windsor, Eton and District Rose Soc. Sh. Soc. Franc. d'Hort. de Londres meet. Sutton Rose Sh.

TUESDAY, JULY 5—Roy. Hort. Soc. Summer Exh. at Holland House, Kensington (2 days). Scottish Hort. Assoc. meet. British Gard. Assoc. Ex. Council meet. Southampton Fl. Sh. (2 days).

WEDNESDAY, JULY 6—Reigate Rose Sh. Croydon Fl. Sh. Bath Rose Sh. (2 days). Hanley Park, Staffordshire (2 days).

THURSDAY, JULY 7—Ipswich and E. of England Hort. Soc. Summer Sh. Woman's Agr. and Hort. Intern. Union.

FRIDAY, JULY 8—Nat. Rose Soc. Sh. at Royal Bot. Gdns., Regent's Park.

MONDAY, JULY 11—United Hort. Ben. & Prov. Soc. Com. meet.

TUESDAY, JULY 12—Nat. Sweet Pea Soc. Exh. at R.H.S. Hall, Westminster (2 days). Wolverhampton Floral Sh. (3 days).

WEDNESDAY, JULY 13—Nat. Rose Soc. Sh. at Salisbury. Teddington Fl. Sh. Uxbridge Fl. Sh. Derby Agr. and Hort. Soc. Sh. (2 days).

THURSDAY, JULY 14—Finchley Hort. Soc. Sh.

TUESDAY, JULY 19—Royal Hort. Soc. Coms. meet. (Lecture at 3 p.m. by Mr. Fred. Enock on "Insects Affecting Crops.") Roy. Scottish Arboricultural Soc. Forestry Exh. at Dumfries (2 days).

WEDNESDAY, JULY 20—Cardiff & County Hort. Soc. Sh. (2 days). Liverpool Sweet Pea and Rose Sh. (2 days).

FRIDAY, JULY 22—Handsworth Fl. Sh. (2 days).

TUESDAY, JULY 26—Nat. Carnation and Picotee Soc. Exh. at R.H.S. Hall, Westminster. Yorkshire Agr. Soc. Intern. Sh. at Roundhay, Leeds (3 days).

WEDNESDAY, JULY 27—Leamington Fl. Sh. (2 days). Southampton Carnation and Sweet Pea Sh. Sweet Pea Exh. Borough of Gillingham, Kent (2 days).

AVERAGE MEAN TEMPERATURE for the ensuing week deduced from observations during the last Fifty Years at Greenwich—62.2°.

ACTUAL TEMPERATURES:—LONDON.—Wednesday, June 29 (6 P.M.): Max. 64°; Min. 50°. *Gardeners' Chronicle* Office, 41, Wellington Street, Covent Garden, London.—Thursday, June 30 (10 A.M.): Bar. 29.4; Temp. 61°, Weather—Showery.

PROVINCES.—Wednesday, June 29; Max. 61° Cambridge; Min. 54° Yorkshire.

SALES FOR THE ENSUING WEEK.

TUESDAY—Orchids at 67 & 68, Cheapside, E.C., by Protheroe & Morris, at 1.

Employers, whether nurserymen, market- or head gardeners, are confronted with the problem of the supply of efficient labour. In America this problem seems to have reached an acute stage, and our contemporary, the *Florists' Exchange*, has dealt with it recently in a leading article. It appears that, in all parts of America, florists, nurserymen and seedsmen are crying out about the shortage of experienced assistants, and our contemporary adds that, "admittedly there is a shortage of practical men, which is yearly becoming of more and more serious import," and summarises the situation thus:—

"Here and there individual employers may be fortunate enough to have so built up their business as to be in a position where they are never bothered by a shortage of this kind (skilled, interested labour). Such men are to be commended because, wise in their generation, they have exercised foresight, and have continued to train new men which they could promote as the business expanded.

"As we see the question, it is largely one of

employer and method. Too many employers think it a bore and a loss of time to teach beginners.

"Yet it is the young blood which you yourself carefully educate in your particular line, interest, and treat generously which is going to be your mainstay as your requirements enlarge.

"Mere labourers can be had at any time; skilled labour is painfully short in almost every trade; ours is not the only sufferer, by any means.

"Those employers who will give boys a liberal training are the best off, and even they will have many a discouragement. This is so self-evident as not to require debate.

"But in the meantime the question is, how to obtain an adequate supply of skilled labour for this and next year's requirements."

Does not this exactly describe the condition of affairs in our own country, so far as the difficulty of securing interested workers is concerned? It is quite the fashion nowadays to blame the men and boys for preferring football and sport to business; but there is another side to the shield, and the American writer expresses it well when he says it is largely a question of employer and method. In few trades are the hours so long as in gardening, and in no trade is the remuneration so low. These two vital matters doubtless tend to deter the best types of boys from becoming gardeners. Sixty hours, which is quite general in the trade, is much too long a week, with Sunday duties in addition. Then as to wages: after serving for four or five years, a young gardener can rarely obtain more than 20s. to 22s. a week, and he has often to remain many years at this wage. In a country place with a bothy, it may be claimed that this is reasonable, but thousands of nursery gardeners living in towns get no more money. Their prospects are poor and the chances of their settling down and getting married are indeed remote.

Let employers recognise the necessity for improvement in the gardener's prospects and they will immediately attract a better class of apprentices, and in this way raise the general standard of efficiency. It would pay in the long run, for, with the promise of a better career and with the powerful spur of ambition, the right men would not be lacking. The problem is, of course, inextricably bound up with the two interests—the employer and the employed; but we feel that, if any marked improvement is to take place, the first step must be made by the employers. Where such a step has been taken—and we know of not a few instances in which it has been done—the difficulty of the labour problem has been greatly reduced. Sooner or later the questions of hours and remuneration must be faced, and we hope that employers who are in a position to give a lead on the lines we have indicated will take this step. Others will follow their lead. No business of any magnitude can be built up without the assistance of first-rate subordinates; therefore, it is to the advantage of those who desire large businesses to exert themselves to the utmost to secure efficient labour. We may be told that the profits of the seed and nursery trades will not admit of more expenditure on wages. In the long run we do not believe that increase of wages would mean reduced profits. Efficient service would more than compensate the employer for his increased outlay, and, in the new conditions, employers would have no reason to tolerate those incapable of rendering such service.

OUR SUPPLEMENTARY ILLUSTRATION shows the remarkable tree of Evergreen Oak (*Quercus ilex*) at Wilton House, referred to in the description of the gardens which appeared in the issue for June 11. The date when this tree was planted is not known, but the specimen must be several centuries old, for it is described in Loudon's *Arboretum et Fruticetum Britannicum* (published in 1838), as having, in 1816, a trunk measuring 10 feet in circumference. Since then the tree has grown considerably, for it now measures 18 feet at a short distance from the ground. The tree covers a remarkably large area, and the more important branches are supported by stout props. It is still in good health, and promises to last for many years. Those parts that have shown decay have been carefully tended, and water is prevented from lodging in them by coverings of sheet zinc, as may be seen in the picture. Some of the larger ramifications of the trunk are secured together by means of stout chains. At the foot of the bole is a paving of stones placed on their ends, and in the summer time seats are arranged on this paving, which is specially suitable because it does not prevent the rain from passing through to the roots. Tradition states that Sir PHILIP SYDNEY composed *Arcadia* under the seclusion of this delightful old tree. The gardener, Mr. THOMAS CHALLIS, is seen standing beneath the tree, which he has had in his care for more than half a century.

ROYAL HORTICULTURAL SOCIETY.—The Council have again accepted from the General Dutch Bulb Growers' Society, at Haarlem, prizes for bulbous Hyacinths, to be competed for on March 14 and 15, 1911. There will be four classes for amateurs and two for trade growers. The amateur classes are for 18 Hyacinths, distinct; 12 Hyacinths, distinct; six Hyacinths, distinct; and four pans containing Hyacinths, 10 roots of one variety in each pan, the blooms of each pan to be of a distinctly different colour to those of the other three pans. The bulbs need not have been actually grown in the pans in which they are shown. For trade growers, the classes are:—Collection of 100 Hyacinths in 25 named varieties, four blooms of each variety, grown in pots or glasses, and a collection of 120 Hyacinths in 12 varieties in pans, 10 roots of one variety in each pan. All bulbs must have been forced entirely in Great Britain or Ireland, and all varieties must be correctly named. In the amateurs' classes money prizes are offered; the traders will be given the Gold Medal of the General Bulb Growers' Society at Haarlem.

THEIR MAJESTIES AND THE ROYAL HORTICULTURAL SOCIETY.—We are glad to receive the following information from the Rev. W. WILKS:—"Your readers, and especially those who are Fellows of the R.H.S., will learn with much pleasure that their Imperial Majesties the KING and QUEEN have consented to become patrons of this Society."

R.H.S. SUMMER SHOW.—We would remind our readers that this show is to be again held at Holland House, Kensington, by the kind invitation of MARY Countess of HECHSTER, on July 5 and 6. The exhibits will include Orchids, Roses and herbaceous flowers, rock, Alpine and foliage plants, fruit and vegetables. Horticultural sundries, which are excluded from most of the shows owing to considerations of space, will be shown in considerable numbers.

THE JAPAN-BRITISH EXHIBITION.—The Council of the Royal Horticultural Society having decided to award silver cups to the value of about £100 to garden exhibits in the Japanese section of the Japan-British Exhibition, the judging took place on Thursday last. There will be a

complimentary luncheon on the second day (July 6) of the Society's summer show in the tent at Holland House, Kensington, to welcome Japanese horticulturists visiting London. About 100 guests are expected, and among those to be present are the Japanese Ambassador, Baron OURA, Lord BLYTH, Lord REDESDALE, Sir WILLIAM THISTLETON-DYER, Sir DANIEL MORRIS, and Mr. Commissioner-General HIKOJIRA WADA.

THE GREAT ROSE SHOW OF THE YEAR.—

Respecting the Metropolitan exhibition of the National Rose Society, to be held on the 8th inst., in the Royal Botanic Society's Gardens, Regent's Park, Mr. EDWARD MAWLEY, the hon. sec., writes us as follows:—"I venture to predict that the coming National Rose Society's Exhibition will be the finest the Society has held for some years, and for the following reasons: In most localities there has been plenty of rain, and, as a rule, moderate temperatures have prevailed, both of which conditions favour the gradual development and, consequently, the increased size and perfection of the blooms. Then, again, the season being an early one, and the date of the show later than usual, all the earliest blooms, which are generally inferior owing to late frosts, &c., will be over, and those which follow—generally the choicest of the year—will be available. These two circumstances will also allow of Roses from all parts of the country being more generally represented than in recent years, when the fixture has been earlier and the season unusually late. Among the new features at the exhibition may be mentioned a class for bedding Roses shown in baskets, which is likely to be an attractive one, and to bring out the suitability of the different varieties exhibited, for massing together in large or small beds far better than when shown in the ordinary way. The new seedling Roses are always the most popular feature of the show. This year, to prevent crowding, and to allow of these new Roses being comfortably inspected, they will be exhibited for the first time in a separate tent. There are now so many good raisers of Roses in the British Isles and elsewhere, and the season, as before stated, has been so favourable, that the display of these novelties is likely this year to be unusually large, and the varieties staged for the Gold Medal of the Society will, it may be predicted, be exhibited in unusually good form."

NATIONAL CHRYSANTHEMUM SOCIETY.—The annual outing will take place on Monday, July 25, when a visit will be paid to Tring Park, Hertfordshire, by kind permission of Lord ROTHSCHILD. Tickets, price 10s. 6d. each (inclusive of railway fares, brakes, lunch and tea), may be obtained from the secretary, Mr. RICHARD A. WITTY, 72, Savernake Road, Gospel Oak, London, N.W. All applications for tickets must reach the secretary by July 20.

ARRANGEMENTS FOR THE INTERNATIONAL SHOW, 1912.—We understand that the International Horticultural Exhibition which is now being promoted will be opened on May 22, 1912, and it will remain open eight days. These days will include a portion of Whitsun week, from Whit-Monday until the following Thursday. An admirable site in the west of London, providing an area of something like 30 acres, has been secured, and it is expected that the lease will be signed at an early date. It is intended to appoint sub-committees to represent various districts in these islands for the purpose of raising subscriptions and guarantees. The question of privileges to be granted to guarantors and subscribers is now under consideration by the executive committee, and particulars will be published later.

WINDSOR ROSE SHOW.—The 19th annual show takes place to-day (Saturday) on the Slopes at Windsor Castle. Eight cups are offered for competition, including the challenge cup that was offered by his late Majesty King EDWARD VII., the Windsor Challenge Cup, the Princess Alexis Dolgorouki's Challenge Cup, and the Mayoress Challenge Cup. Besides these, the prizes include three medals and money to the value of over £100.

NATIONAL AMATEUR GARDENERS' ASSOCIATION.—An exhibition of flowers, fruit, vegetables, &c., will be held at the Royal Botanic Gardens, Regent's Park, N.W., on Saturday, July 9. There will be competitions for Roses, Sweet Peas, Violas, table decorations, &c. A gold medal is offered in the Rose classes. Tickets for the exhibition and full particulars of the monthly meetings and lectures of the Association may be obtained from the hon. sec., Mr. FREDERICK A. POULTON, "Rosemount," Park Road, New Barnet.

FLOWERS IN SEASON.—A few days before the earliest of the summer exhibitions took place, Mr. T. H. BOLTON, of Powderham Gardens, Exeter, sent us some very fine flowers of many of the newer varieties of Sweet Peas, which he said would be certain to be shown in most of the competitive classes this season. He has found that several varieties exhibited last season are insufficiently distinct to be distinguished from existing sorts. Mr. BOLTON, however, states that amongst the striped varieties, Senator, a dark-coloured flower, and Mrs. Wilcox, rose-coloured and white, are distinct. Some of the varieties received are Senator, Evelyn Hemus, Audrey Crier, Paradise Ivory, Mrs. Henry Bell, Othello (Spencer), Helen Lewis, George Stark, The Marquis, Clara Curtis, King Edward (Spencer), Countess Spencer (true), and Elsie Herbert. Mr. BOLTON sent a seedling saved from Audrey Crier, which he considers to be similar to Etta Dyke, and a seedling found amongst plants of Helen Lewis, which he considers to be identical with Nancy Perkins and Earl Spencer.

Mr. J. BOWERMAN has resigned his position of gardener to Lord CRZON, Blackwood Park, Hampshire, which he has held for the past 27 years.

WOMEN'S AGRICULTURAL AND HORTICULTURAL INTERNATIONAL UNION.—The annual show and sale of farm and garden produce, also poultry, will be held at the Royal Botanic Gardens, Regent's Park, on Thursday, July 7. The show will be opened by the Marchioness of SALISBURY at 2.30 p.m. Demonstrations in trussing and boning fowls, and in fruit bottling, will be given during the afternoon. An exhibition of drawings of flowers and gardens will be held in the Fellows' room.

DAVID THOMSON MEMORIAL FUND.—It having been decided to close this fund on July 16 next those who are desirous of subscribing are requested to send their contributions before that date to one of the following:—HARRY J. VEITCH, V.M.H., Treasurer of the Gardeners' Royal Benevolent Institution, Royal Exotic Nursery, Chelsea, S.W.; JAMES WHYTOCK, President of the Scottish Horticultural Association, The Gardens, Dalkeith Palace, N.B.; J. W. McHATTIE, Vice-president of the Royal Caledonian Horticultural Society, Public Parks Office (City Chambers), Edinburgh; GEORGE MONRO, V.M.H., Covent Garden Market, London, W.C.; J. H. GOODACRE, V.M.H., The Gardens, Elvaston Castle, Derby; or W. HENDERSON, The Gardens, Balbirnie, Markinch, N.B.

NURSERY EMPLOYÉS' OUTING.—The members of the Recreation Club of Messrs. JAS. BACKHOUSE & SONS, LTD., York, held their annual excursion on Saturday, June 25, visiting London, including the Japan-British Exhibition. At luncheon in the Holborn Restaurant, Mr. GEO. GRAY, a director of the firm, spoke of the good feeling that prevailed between the management and employés.

FATALITY TO A SCOTTISH GARDENER.—Mr. R. SIMPSON, the gardener at The Pines, Broughty Ferry, met his death by drowning on the 25th ult. Mr. SIMPSON was seen to fall from the pier at Broughty Ferry, and attempts at rescue were ineffective until life was extinct. Mr. SIMPSON was in the prime of life, and was an able gardener. He is survived by a widow and family, for whom much sympathy is felt.

RURAL EDUCATION.—The Rural Education Conference, which has been constituted by the Presidents of the Board of Agriculture and Fisheries and the Board of Education, for the discussion of all questions connected with education in rural districts and for the periodical exchange of views between representative agriculturists and the two departments, will be composed as follows:—Lord Merton (Royal Agricultural Society of England), Lord Barnard (Central Land Association), the Rt. Hon. Lord Belper, the Rt. Hon. Lord Reay, G.C.S.I., G.C.L.E., the Rt. Hon. Arthur H. Dyke Acland, the Rt. Hon. Henry Hobhouse (County Councils Association), Sir Francis A. Channing, Bart., M.P., Sir Albert K. Rollit (Royal Horticultural Society), Major P. G. Craigie, C.B., Mr. Graham Balfour (County Councils Association), Mr. Chas. Bathurst, M.P. (Central Chamber of Agriculture), Mr. G. A. Bellwood (National Farmers' Union), Mr. J. F. Blackshaw (Agricultural Education Association), Mr. W. Fitzherbert Brockholes (Lancashire Farmers' Association), Mr. G. G. Butler (University of Durham), Mr. A. W. Chapman (County Councils Association), Mr. F. J. Chittenden (Royal Horticultural Society), Mr. S. H. Cowper-Coles (Land Agents' Society), Mr. David Davies, M.P. (Welsh National Agricultural Society), Major J. W. Dent (University of Leeds), Mr. H. J. Elwes, F.R.S. (Royal English Arboricultural Society), Professor W. R. Fisher (Royal English Arboricultural Society), Mr. P. Hedworth Foulkes (Agricultural Education Association), Mr. W. J. Grant (British Dairy Farmers' Association), Mr. A. D. Hall, F.R.S. (Agricultural Education Association), Mr. W. A. Haviland (Central Land Association), Professor C. Bryner Jones (University College of Wales, Aberystwyth), Mr. T. Latham (Farmers' Club), Mr. J. L. Luddington (Royal Agricultural Society of England), Mr. Howard Martin (Surveyors' Institution), Mr. Ernest Mathews (Royal Agricultural Society of England), Rev. Rollo Meyer (Agricultural Organisation Society), Mr. Wm. Parlour (North-Eastern Agricultural Federation), Mr. C. N. P. Phipps (Bath and West and Southern Counties Society), Mr. J. H. Sabin (Surveyors' Institution), Mr. A. F. Somerville (Bath and West and Southern Counties Society), Professor Wm. Somerville, M.A., D.Sc. (University of Oxford), Mr. A. E. Bromhead-Soulby (Yorkshire Union of Agricultural Clubs and Chambers of Agriculture), Mr. Chris. Turner (Central Chamber of Agriculture), Mr. F. Verney, M.P., Professor T. Winter, M.A. (University College of North Wales, Bangor), Professor T. B. Wood, M.A. (University of Cambridge). The Rt. Hon. Henry Hobhouse will act as chairman of the Conference, and Mr. E. G. Howarth (of the Board of Education) and Mr. H. L. French (of the Board of Agriculture and Fisheries) will act as joint secretaries.

HEXHAM FRUIT CONGRESS AND SHOW.—As already announced, this show will be held from October 20-22. The opening ceremony will be performed on Thursday at 2.45 p.m. by the joint presidents, and the cups, medals, &c., will be presented on Saturday at 3.30 p.m. Arrangements are being made with the following gentlemen to lecture on Saturday, October 22: Professor E. S. SALMON, on "Fungous Diseases," and Professor S. T. PARKINSON on "Smudge Fires." A luncheon will be provided on the opening day at the Abbey Hotel from 1.15 p.m., tickets 2s. 6d. each. The committee, with a view to preventing the public being misled by a show of all sorts of Apples, many totally unsuited for planting in the north, have decided to place the following restrictions on trade exhibits of fruit from growers outside the four northern counties:—1. Varieties of fruit shown must have been supplied by the firms exhibiting to growers within the four northern counties—varieties introduced since 1900 are exempt from this condition. 2. Any variety of fruit introduced since 1900 may be exhibited, but as regards older varieties these are limited to the 12 varieties of Apples and the two varieties of Pears mentioned in the schedule, viz., Apples, Worcester Pearmain, James Grieve, Alington Pippin, Stirling Castle, Ecklinville Seedling, The Queen, Warner's King, Lord Derby, Bismarck, Lane's Prince Albert, Newton Wonder, and Bramley's Seedling; Pears, Pitmaston Duchess and Williams's Bon Chrétien. 3. These exhibits will form a class by themselves and are eligible for awards of medals and certificates.

THE LARCH SAWFLY.—The Board of Agriculture and Fisheries desire to give publicity to the fact that the first caterpillars of the large Larch Sawfly (*Nematus Erichsoni* Hart) were seen this year on the 19th ult. They are now probably to be found in all places infested with this pest, and owners of Larch plantations should arrange to have their trees examined with a view to the discovery of the pest, which must be notified to the Board in conformity with the Destructive Insects and Pests Order of 1910. A memorandum explaining the means of detecting the caterpillar and of distinguishing it from other pests of the Larch can be obtained free on application to the Secretary, Board of Agriculture and Fisheries, 4, Whitehall Place, London, S.W.

DARLINGTON'S HANDBOOKS.—We are informed that the KING has accepted an advance copy of the new edition of DARLINGTON'S "London and Environs," carefully revised by Mr. E. T. COOK, M.A., with new maps and plans and indexes of 12,000 references.

ANOTHER GARDEN VILLAGE SCHEME.—It is proposed to acquire the Brent Lodge estate, Church Lane, Finchley, which comprises 26 acres of freehold land, a mansion, a farm, and the usual outbuildings, for £10,000, and develop it on garden village lines, while at the same time an endeavour will be made by co-operation to purchase all the latest labour-saving appliances in order to eliminate as much as possible the drudgery hitherto inevitable in most middle-class homes. According to the *Times*, meals will be provided in the central building for all who wish to have them so provided, while flats or small houses will be erected to accommodate bachelors or spinsters who, while following their daily avocations, have hitherto not been able, except at great cost, to have homes of their own. The rest of the estate will be occupied by houses of varying size, according to the requirements of the prospective tenants, but due regard will be had to the provision of open spaces. It is intended at present that all the roads should remain the sole property of the shareholders, and not be vested in the local authority.

HOME CORRESPONDENCE.

(The Editors do not hold themselves responsible for the opinions expressed by correspondents.)

CULTURE OF RHODODENDRONS.—If the "black and retentive peaty soil," described by W. (*Gardeners' Chronicle*, vol. xlvii., p. 429), is well drained, it may be made most congenial for Rhododendrons of the finer kinds by trenching and the addition of plenty of coarse sand, preferably granite sand. *Herbert Maxwell*.

EFFECTS OF LAST WINTER ON VEGETATION.—The following names may be added to the list published in the *Gardeners' Chronicle* for June 25: *Killed outright*: *Ozothamnus rosmarinifolius*, *Verbena venosa*. *Injured*: *Escallonia* × *langleyensis*, *E.* × *exoniensis*, *Hypericum patulum*. *Uninjured*: *Rhododendron* × *kewense*, *Lespedeza cyrtobotrya*, *Hypericum Hookerianum*, *H. triflorum*, *H.* × *Mozerianum*, *Escallonia Philippiana*, *E. macrantha*, *Fatsia japonica*, *Cianthus puniceus* (on wall), *Acanthus mollis*, *Amaryllis Belladonna*, *Lilium auratum platyphyllum*. *Herbert Maxwell, Monreith*.

—Referring to Sir Herbert Maxwell's interesting notes on this subject in the *Gardeners' Chronicle* for June 27, my theory is that in addition to the causes of loss that he mentions, the want of sunshine and of warm weather during last summer had considerable bearing on the unsatisfactory "wintering" of plants. In South Wales, at least (where we had our full share of losses), roots, root-stocks and branches were insufficiently ripened and the soft, sappy growth easily succumbed to the winter weather. In support of this theory, I may mention that several plants that require to be well ripened in the sun have failed to flower freely this spring, including some sorts of *Narcissus*, *Iris stylosa* in variety, and German *Iris* in variety. *Harold Evans, Llanishen, Cardiff*.

PLANTS ON NORTH-EAST COAST.—It is interesting to note the effects of frost on plants in the same parallel of latitude on opposite sides of our island. The effect of the Gulf Stream on the climate of the west and south-west of Scotland is illustrated by the observations of your correspondent, Sir Herbert Maxwell, whose list, in last week's issue, of the plants out-of-doors which were uninjured, partially uninjured, and killed by the frosts of the past winter is particularly interesting. On the east coast, about midway between Newcastle-on-Tyne and Berwick-on-Tweed, therefore a trifle more southerly than Monreith, Wigtownshire, there are but few of the plants that are named as growing out-of-doors at Monreith which can be risked in the open in the winter months without good protection. None of the species of Himalayan *Rhododendron* would survive unless the weather should prove unusually mild. *R. ponticum*, *R. caucasicum*, *R. catawbiense*, and *R. hybridum* varieties stand the climate and flower abundantly. *Buddleia globosa*, when planted in sheltered spots, is not injured and blooms fairly, whilst at Monreith the plant was injured. *Myrtus communis*, *Illicium*, *Eucalyptus* species, *Phormium tenax*, *Libertia grandiflora*, on the east coast, must be kept in the greenhouse. *Aloysia citrodora* and *Fuchsia Riccartonii* must be well thatched and the soil round about the plants deeply coated with fallen leaves, or the roots, as well as the shoots, would be killed. At Monreith they are uninjured. Most of the plants mentioned as being uninjured would stand no chance on the east side of Northumberland, even quite near the ocean. The power of plants to withstand low temperatures in one place and not in another of the same latitude is a matter well worthy of further elucidation. *F. M.*

ROSE WICHURAIANA "EDMONDE PROUST."—I should be interested to hear of the experience of growers of this variety as to its colour. Here, for several seasons, it has thrown flowers of a cream colour suffused with a pale salmon-pink, sometimes with a suggestion of copper. This year it has, for the first time, shown us its true colour of "coppery carmine," and this only in the case of a few flowers, the paler-coloured flowers described above greatly preponderating. Both varieties of the flower occurred on the same bush. *Harold Evans, Llanishen, Cardiff*.

EARLY STRAWBERRIES ON SOUTH BORDER.—I read with interest the note from H., *Frogmore*, in the issue for June 25, regarding early Strawberries. I have grown Royal Sovereign on a south border here the last few years treated as an annual, and have picked fruits, early in June, from plants which received no protection whatever. This year I picked fruits on June 4, and daily since that date. *P. S., Parham Park Gardens, Pulborough*.

PRIMULA SPECIES.—Whilst the discussion in these columns between Messrs. Nicholson and Farrer may have much interest for specialists in *Primula* species, yet it is a subject of little importance to many readers, simply because the species of *Primula* are little known. Is it possible to create a National *Primula* collection, in which the species from various parts of the world would be grouped according to their habitats, and including all the British species, which florists have great love for, in spite of Mr. Nicholson's remarks? Because these philistines have in the past created, for instance, singularly beautiful garden races of *Auriculas* and *Polyanthuses* from original species, it by no means follows that those species have been forgotten or that they are regarded with contempt. Perhaps it may be difficult under any form of garden culture to make *P. vulgaris*, *elatior*, *veris*, and others thrive as they do in their wild habitats, but it should not be difficult to provide semi-garden conditions for them, such as are found to suit the *Primulas* from China and Japan. Probably there is no other group of plants that, whilst hardy or fairly so, has so many members so varied in character and so widely dispersed. Why not, therefore, promote the formation of a great *Primula* garden and collection at Wisley? Were such a collection in existence, and experts fought battles in the *Gardeners' Chronicle* over *Primulas*, how easy it would be for the reader-umpire to settle the subject of dispute in the presence of a growing collection, thus making a decision that would be final. *A. D.*

LAW NOTE.

SALE OF POISONOUS COMPOUNDS BY A LIMITED COMPANY.

THE hearing of a test case of considerable interest to the nursery trade was concluded in the City of London Court on Tuesday last, the Pharmaceutical Society having sued Mr. A. J. Pecover, manager of the branch of Hobbies, Ltd., at Broad Street Place, E.C., to recover, under the Poisons Acts, a penalty of £5, on the ground that he had sold a poisonous substance, namely X.L.-All fumigator, for use in horticulture without being a person holding a licence under the Act of 1908.

Hitherto many local authorities have taken the view that a licence granted to a limited company necessarily authorises such company to sell by the agency of its manager, but the contention of the Pharmaceutical Society was that such a licence in effect could only empower a limited company to "keep open shop" for the sale, and that, in addition, the manager or other person actually selling the goods must also hold a licence "to sell." In the present case the vendor merely handed a sealed package over the counter and obtained the purchaser's signature to the poisons book and did not profess to make up prescriptions or compound medicines as a chemist would have to do.

Mr. Glyn Jones (instructed by Messrs. Flux, Thompson & Quarrell) appeared for the Pharmaceutical Society, and Mr. R. O. B. Lane (instructed by Messrs. Rutter, Veitch & Bond) appeared for the defendant.

The case was argued fully by counsel last week, the arguments being of a technical nature, dealing with the construction of the various Acts of Parliament bearing on the subject. At the conclusion of the arguments his Honour Judge Lumley Smith, having regard to the importance of the case, reserved judgment until Tuesday last.

In the result, the Judge decided that the licence held by Hobbies, Ltd., was not sufficient to enable their manager to sell poisonous compounds, unless he himself held a licence, but his Honour directed execution to be stayed for 14 days, to enable the defendant to take the case to a higher court.

SOCIETIES.

ROYAL HORTICULTURAL

Scientific Committee.

JUNE 21.—*Present:* J. T. Bennett-Poë, Esq., M.A. (in the Chair); and Messrs. W. Hales, G. Gordon, W. Cuthbertson, J. Douglas, J. W. Odell, R. H. Pearson, E. M. Holmes, and F. J. Chittenden (hon. sec.).

Fungus on roof.—It was reported that the fungus shown at the last meeting from the roof of Chelsea Church was *Coprinus radicans*.

Saxifraga umbrosa.—Mr. J. FRASER showed seedlings of a compact form of *Saxifraga umbrosa*, with prettily-spotted flowers differing from the type in stature and in the closeness of the rosettes. The seedlings came true in habit, but showed some variation in the spotting of the flowers.

Cross-bred Pinks.—Mr. DOUGLAS showed a large number of flowers of seedlings the result of crossing the ordinary white form with the pink called "Rubican." The seedlings showed in a marked manner the influence of the latter, and some very beautiful forms were among them; 10 to 12 per cent. of the seedlings bore single flowers, and no fringed flowers were among the singles.

Colouration of Sweet Pea tendrils, &c.—Mr. CUTHBERTSON showed Sweet Pea growths in flower for the purpose of showing that the colouration of the tendrils and axils cannot in every case be accepted as one of the guides to purity of stock. The variety "Mrs. Hugh Dickson" gives both green and coloured tendrils and axils. The old variety "Lady G. Hamilton" behaves in a similar way. Mr. IRELAND, Messrs. DOBBIE'S Sweet Pea grower, says that seed saved from a green-tendrilled plant gives, when grown, both colours in the first generation. It was at one time thought that the presence or absence of colour in the axils and tendrils of Sweet Peas might serve to enable "roguing" to be done at an early stage, but although this is frequently true it is evident that this unit character would have to be selected and bred for like any other, before it would prove a trustworthy guide.

LECTURES ON PANSIES AND VIOLAS.

(Concluded from vol. XLVII., p. 132.)

MR. CUTHBERTSON'S PAPER.

It is now more than 30 years since I joined the firm of Dobbie & Co. Mr. James Dobbie was then in full vigour, and was noted, among other things, for Pansies. I remember several times trying to induce him to grow Violas, but he would have none of them. They are only "bad Pansies," was his oft-repeated remark; "leave them to Grieve and Baxter." In that you see the old florists' condition of mind. To them, form or outline and clear, distinct markings were everything.

From 1860 to 1880 the old English or Show Pansy was gradually being perfected, and the fine varieties then in existence have not since been surpassed. I can remember the best among dark selfs in 1880 were Beacon, Robert Black, The Shah; the finest among yellow selfs, Capt. Hayter, Golden Lion, Yellow King; the finest white selfs, Alpha, Mrs. Dobbie, Janey Anderson; the finest yellow grounds, David Christie, Defoe, Robt. Burns; and the finest white grounds, Blue Gown, Jane Grieve, and Village Maid.

But, even 30 years ago, the Show Pansy was being hard pressed by the Fancy or Belgian Pansy, which is so well known to-day. I do not know whether it is because I have a hankering after old things or not, but I think the Fancy Pansies of the 'eighties—May Tate, Evelyn Bruce, Kenneth Brodie, Miss Bliss, Mrs. Jamieson, Mrs. John Downie, Catherine Agnes, David Rennie, Mrs. E. H. Wood, Wm. Cuthbertson, and others—were as fine and distinct in their markings as any we have to-day. We have certainly increased the size, and I am sure we grow them better, but the quality is not better, or I am much mistaken.

Pansies can be grown in two ways—from cuttings or from seed. Let me speak first about growing named sorts. Speaking generally, they will not give satisfaction in dry, sunny situa-

tions. The wild types love the shelter of a hedge bank, and he who imitates Nature's conditions will succeed best. The morning or late afternoon sun will do good; the full glare of the sun from 11 to 3 o'clock will make named Pansies unhappy. Select, then, a position in the garden where the plants will enjoy themselves, and you will be amply repaid. Prepare the ground in autumn by deep cultivation, enriching liberally with half-decomposed cow dung, if it can be had. Fork over the surface in January or February. Plant the plants from the cold frames in March, with as much soil adhering to the roots as possible, and, with careful tending to watering and other details, splendid flowers will be had during most of the summer. To obtain fine, strong plants for spring planting, cuttings should be inserted in cold frames in a shady position from July onwards to September, and named varieties should certainly be allowed to winter in frames. Now about varieties. I think if I give 12 or 18 names of good doers that will be enough for those who are not exhibitors:—Hugh Mitchell, Archie Milloy, Holroyd Paul, Hall Robertson, Mrs. R. P. Butler, John Picken, Mrs. A. Ireland, Mrs. James Smith, Mrs. H. Stewart, Miss Neil, Miss A. B. Douglas, Margaret Fife, Robt. McCaughie, Mrs. Campbell (yellow), Thos. Stevenon, James McNab, Neil McKay, Rev. D. R. Williamson. These are fine sorts and good growers.

THE RAISING OF PANSIES FROM SEED.

This is perhaps the best way for those who wish for a good display, as seedlings are always hardier than plants from cuttings, and they can be planted out with safety in most places in autumn, thus ensuring a longer period of blooming. From May onwards seed may be sown according to the treatment it is intended to give the seedlings. If sowing is to be done out-of-doors or in a cold frame, I should recommend the end of May; if in boxes in a greenhouse and carefully looked after, a month later will be time enough. The great object to be aimed at is to obtain by the end of September fine, strong, stubby plants with three or four shoots breaking at the base and well rooted. From the seed boxes or seed bed the plants ought to be transplanted once, say in August.

Results will depend much on the quality of the seed sown, and everyone should make sure of obtaining a high grade article. Let me say that cheap Pansy seed cannot be good. It is exceedingly difficult to save Pansy seed in quantity in this country, and we are, therefore, dependent to a large extent on foreign seed. To give an idea of the range in quality, wholesale firms like Benary and Vilmorin quote Pansy seed as low as 1s. oz. and as high as 50s. Genuine home-saved seed from named varieties is always difficult to procure, but the highest grade of foreign seed will give excellent results.

Two years ago I saw several, large beds of Pansies in the garden of Mr. Walsh, the schoolmaster, of Birch, in Essex. I never saw stronger, healthier Pansy plants in my life. They were seedlings, which Mr. Walsh told me he sowed in boxes placed under a north wall on June 27 of the year previous, transplanted into a bed facing west early in August, and finally planted where they were to flower at the end of September. Before planting out, several had thrown flowers, but these were picked off, and I think this is one of the secrets of getting seedling plants like Pansies, Pentstemons, Antirrhinums, &c., to winter outside—to rigidly prevent them blooming. They then make every effort themselves to survive to carry out their life's work. Mr. Walsh had no loss at all during the winter. At Easter they were in full bloom, and such blooms—hundreds and hundreds—well over 3 inches in diameter, capital flowers most of them. One frequently sees large-flowered, most brilliantly-coloured Pansies on sale in London shops and in Covent Garden, and everyone who buys them, takes them home, and plants them is disappointed. I know, because I have tried it several times. The reason is this. The plants are specially grown and specially fed to produce the blooms which make them sell, and this exertion, coupled with the attempt to transplant when in a flush of growth, ends in disaster. Anyone imitating the procedure of the market-grower under his conditions would get similar results, and the results would be continued if the plants were not moved and the old flowers picked off. The strains used are splendid ones and the results of

many years selection. They resemble in many cases a part of the goodwill of the business, and are carefully treasured by the owners.

VIOLAS.

One of the gardening sensations of last century was the spring bedding at Cliveden carried out by Mr. John Fleming. Violas were largely used, and became known as Cliveden Yellow, Cliveden Purple, Cliveden White and Cliveden Blue. They were most effective for the purpose for which they were used. They were, of course, much nearer to the wild types in habit of growth and form of flower than our modern Violas. These latter are the creations of a host of raisers, nearly all of whom I have known personally during the last 30 years. Here, to-day, I shall only name those who were the pioneers in the work—Grieve of Dicksons & Co., Baxter of Daldowie, Dr. Stuart, Dr. Dickson of Hartree, the brothers William and Richard Dean, all of whom, except Mr. Grieve, are now gone. In the popularising of Violas, or, as he persists in calling them, Tufted Pansies, no man has done better work than Mr. William Robinson. In the early days he persistently figured them in colours in *The Garden*, and I have framed in my bedroom now pictures of Jackanapes and Quaker Maid, Duchess of Fife, Hartree and other old varieties. What impresses one in this connection is the persistency of some of the old Violas. I have before me a catalogue issued by Dicksons & Co., of Edinburgh, in 1880, and I find in it Archibald Grant, Canary, Blue King, Countess of Kintore, Holyrood, Grieve, Lilacina, Sovereign and The Tory, all of which are still grown, and one or two of which are not yet superseded. Advancing 16 years, I find another interesting list in the official report of the trial of Violas in Regent's Park, held under the auspices of the Third Viola Conference. In that list we find Marchioness, Countess of Hopetoun, Pencaitland and Snowflake given among the best whites, and any list of the best whites prepared to-day must contain Snowflake and Pencaitland, though I believe the modern Snowflake is an improved form.

Sylvia is given among creams, and it is the best still. Suboluna is among the primroses, and none to-day possesses a better habit. The yellows in 1886 have all been eclipsed except Bullion. Other old names which appear and still survive are True Blue, Archd. Grant, Favourite, Wm. Neil and J. B. Riding.

I do not to-day propose to speak of exhibition Violas. If I was addressing an audience in the industrial centres of the north or in Scotland, they would not thank me unless I told them which Violas produced the biggest blooms and made up into the best exhibition sprays. But I wish to speak of the hardiest, the earliest to bloom and the most floriferous.

Three years ago I started to carry out an experiment in Essex to discover which varieties possessed these merits. I collected from the leading growers all the varieties they recommended for autumn planting, and in October I planted them in an open field in Essex. Time will not allow me to go fully into the details of the trial. These will be found in a book written by me and recently published by Messrs. Jack. It must serve to-day to tell you which have survived satisfactorily over the three intervening winters without the slightest protection of any kind, and have grown into splendid clumps 12 to 18 inches in diameter. I consider the survival satisfactory if 75 per cent. or over have lived. The following varieties have stood that test:—

Whites.—Peace, Seagull, Pencaitland, Christiana, White Beauty (very late).

Cream.—Sylvia.

Yellows.—Klondyke, Grevii, Mrs. E. A. Cade.

Shades of blue.—Royal Scot, Blue Duchess, Lilacina, Florizel, Wm. Neil.

Purple.—Jubilee, Edina (very late).

Fancy.—Blue Cloud, Mrs. Chichester.

Fifty to 75 per cent. of some remarkably fine sorts have survived, and these include favourites such as Snowflake, Redbraes Yellow, Walter Welsh, Wm. Lockwood, Iliffe, Primrose Dame, Archd. Grant, Mauve Queen, Maggie Mott, Blue Rock, Lady Marjorie, Bridal Morn, Councillor Waters.

In Edinburgh Mr. McHattie finds the following most satisfactory:—Blue Bell, Royal Scot,

• *Pansies, Violas, and Violets*, (Present-Day Gardening Series).

Saughton Blue, Maggie Mott, Bullion, Redbraes Yellow, Alexandra (white).

Here I might say a word about a class of *Violas* called *Violetta* or *Miniature*. Its origin was a variety named "*Violetta*," raised by Dr. Stuart, of Chirnside. The habit is remarkably close and compact, and almost truly perennial in character. The blossoms are small and sweetly scented. For edgings and rockwork they are most valuable. Mr. D. B. Crane, of Highgate, is one of the best friends the *Viola* has in the south.

I can testify to the marvellously fine effect Mr. MacLattie obtains with his new blue planted in conjunction with whites and yellows, and allowed to stand for two or three years. Saughton Blue I would not term a *Viola*, because it has, like *Lilacina*, a blotch on the under petal. Varieties which are rayed, rayless or blotched should be so described in all catalogues. For some reason or another the blotched varieties are hardest.

I regret that the Royal Horticultural Society has ceased to hold trials of *Violas*, but I can quite well understand that the soil conditions at Wisley are unsuitable, but they might be made suitable if the ground was cultivated in August and thoroughly enriched with a very heavy dressing of cow manure, and the plants put out in October.

At Chiswick in the old days very fine trials were held, and time has proved that the majority of the awards then made were right.

DIFFERENCE BETWEEN PANSY AND VIOLA.

Pansies being largely bred from *V. tricolor*, an annual, are less perennial in their character than *Violas*, which, as you have heard from Mr. Grieve, were raised from true perennial species on the maternal side. But nowadays the distinction is an arbitrary one of florists. Generally speaking, *Violas* have no solid markings like the blotches of Pansies, and are best fitted, on account of habit and purity of colour, for all kinds of bedding work.

HORTICULTURAL CLUB.

JUNE 21.—After the usual monthly dinner of this club, held at the Hotel Windsor on this date, Mr. C. E. Shea presiding, Mr. Charles T. Drury, V.M.H., F.L.S., opened a discussion by reading three papers, the first on "Clouds, Rain, and Rivers," while the second embraced "Jack Frost and His Work," and, finally, as affording a better opening for discussion, "Variation and what We Owe to It."

The final paper, on "Variation and what We Owe to It," evoked much interest, since it was pointed out that practically our debt is our very existence, since, without the power of variation and adaptation, which was implanted in the primarily simple forms of life, evolution would have been impossible. From the horticultural point of view it is marvellous what man, with his power of definite selection, has been able to do. While unaided nature seemingly takes aeons of time to effect great structural changes, man can do as much or more within the scope of a short lifetime to modify and transform the flowers, vegetables or fruits, to say nothing of animals. A mere weed like the Cabbage is made the progenitor of many hundreds of diverse forms, most of which are, save in the flower, different from the wild plant in every character. Crossing and hybridizing have also come in to combine the different characters of different species, and thus increase the scope of selection.

EALING TENANTS.

JUNE 25.—The first annual Rose show of the Ealing Tenants Horticultural Society was held in the Institute on the estate on this date. The show was opened by Councillor Farr, who, with the other guests, afterwards went down to the recreation ground to open an open-air kindergarten school.

The show was highly successful, and the Tenants are now eagerly looking forward to the August Bank Holiday show.

RICHMOND HORTICULTURAL.

JUNE 29.—The 36th annual flower show was held on this date in the Old Deer Park. The exhibition was one of the finest of recent years, being reminiscent of the grand shows at Richmond in former times. The number of entries, 500, exceeded by 100 those of last year, the most remarkable additions being in the Rose classes. The Roses were superb, and these, with the fine, non-competitive exhibits, were the features of the Show. For such success much is owing to the hard-working Secretary, Mr. W. J. Cook.

The 1st prize for a group of plants in or out of flower was awarded for a splendid exhibit shown by Lady WAECHTER, Terrace House, Richmond Hill (gr. Mr. H. Burfoot). It consisted of greenhouse plants of fine quality staged with skill. Some fine *Hippeastrums* and gorgeously-coloured *Coleus* were noticed.

In the class for a semi-circular group of plants in or out of flower the best of four groups was shown by W. S. BAILEY, Esq., Poulett Lodge, Twickenham (gr. Mr. H. A. Stiles); 2nd, C. M. BARTLETT, Esq., East Sheen (gr. Mr. H. Hicks). The best Palms were also shown by Mr. BAILEY, who won the 1st prize easily; 2nd, Lady WAECHTER.

Specimen plants of *Coleus*, *Fuchsia*, and *Caladiums* were remarkably fine, but *Orchids* showed a falling off from last year. H. LITTLE, Esq., Baronshalt, Twickenham (gr. Mr. A. Howard), being the only exhibitor. He was awarded the 1st prize, *Laelia tenebrosa grandis* and *Cypripedium superciliale ornatum* being the best examples.

There were three exhibits of six *Caladiums*, those shown by Mrs. VAUGHAN-ARBuckle being not only large, but finely coloured; 2nd, Mr. BARTLETT, also with fine plants, well coloured.

Mr. BARTLETT excelled for *Coleus*; 2nd, LIONEL WARDE, Esq., Petersham (gr. Mr. Allum).

The most compact plants of *Fuchsia* were placed 1st, the exhibitor being Mrs. COOPER COLES, Headingham House, Twickenham (gr. Mr. W. H. Keary); 2nd, Mrs. VAUGHAN-ARBuckle, with more graceful examples.

Small baskets of flowering plants were pretty. A delightful arrangement of *Begonias*, *Coleus*, *Ferns*, *White Campanulas*, with other pretty subjects, was placed 1st; it was shown by J. H. MASTER, Esq., Richmond Hill (gr. H. Burfoot).

Gloxinias shown by E. R. W. BENNETT, Esq., Darby Lodge, Sunbury (gr. Mr. W. Chant), could scarcely be finer, the best plant having more than forty expanded blooms; 2nd, G. ATKINS, Esq., Manaton, East Sheen (gr. Mr. W. J. Hill), also a good half-dozen. The prizes in this class were given by Messrs Sutton & Sons.

Mr. G. ATKINS won the 1st prize for *Streptocarpus*.

ROSES.

Nothing could surpass the exhibits of *Roses* shown on this occasion. In the class for 48 triplets there was a good competition. There were six exhibitors, and as each required six boxes it will be understood they made a grand display. The quality was high, especially the blooms shown by Messrs. D. PRIOR & SON, Colchester, who won the 1st prize, which included the Gunnersbury Park Challenge Cup; 2nd, Messrs. FRANK CANT & Co., Colchester; 3rd, Messrs. BEN. CANT & SONS, Colchester.

In the class for 24 distinct varieties shown in triplets, there were eight good collections. Messrs. FRANK CANT & Co. reversing positions with Messrs. PRIOR; 3rd, Mr. GEO. PRINCE, Longworth.

In the class for 12 *Roses*, distinct, in triplets, Mr. CHAS. TURNER, nurseryman, Slough, was awarded the 1st prize.

In the two amateurs' classes for *Roses*, Mr. E. J. HOLLAND, Sutton, won the 1st prize in each case with choice flowers.

No fewer than 15 exhibitors competed in the class for 12 blooms of one variety, the 1st prize being awarded for a magnificent stand of Mrs. J. Laing, shown by Messrs. R. HARKNESS & Co., Hitchin; 2nd, Lady Ashtown, shown by Messrs. D. PRIOR & SON; 3rd, Lyon Rose, shown by Mr. GEO. PRINCE.

Tea *Roses* were also shown strongly in a class for 12 blooms of one variety, the 1st prize being

awarded to Messrs. PRIOR for Mme. Jules Graveaux.

Some choice hardy border flowers were shown in a class for 24 bunches. The 1st prize was won by LIONEL WARDE, Esq., Petersham (gr. Mr. Allum); 2nd, Rev. W. H. OXLEY, Petersham Vicarage (gr. Mr. F. Gower).

In Messrs. Eckford's class for nine distinct varieties of Sweet Peas, the 1st prize was won by G. T. BIDDULPH, Esq., with flowers of excellent quality.

For a similar class of Sweet Peas, the prizes offered by Sir Thomas Skewes-Cox, J.P., the 1st prize was awarded to A. W. PERKINS, Esq., Harrow (gr. Mr. G. Baldwin).

FRUIT AND VEGETABLES.

One tent was largely devoted to these, but they were mainly vegetables shown by amateurs and cottagers.

There was no entry this year in the class for a collection of six dishes of fruit, in which Lady Max Waechter offers a cup.

The best White Grapes were Foster's Seedling, shown by Sir WALPOLE GREENWELL, Bart. (gr. Mr. W. Lintott); the best Black Grapes, fine bunches of Prince of Wales, also shown by Sir WALPOLE GREENWELL. The best Melon was exhibited by Mr. BIDDULPH, Petersham. Messrs. W. & E. WELLS, Hounslow, had the best Peaches and Strawberries.

VEGETABLES.—The Earl of DEVON, Powderham Castle, Exeter (gr. Mr. T. H. Boiton), won the 1st prize in Messrs. Webb's class for a collection of six kinds, having fine Potatoes, Tomatoes, Carrots and Peas. 2nd, Miss LANGWORTHY, Holyport (gr. Mr. T. J. Broom), who was placed 1st in the society's class for 12 kinds, *Cole BIDDULPH*, Ham (gr. Mr. Montague), being 2nd in this latter class.

In Messrs. James Carter & Co.'s class for nine kinds there were five exhibits, the best being shown by E. G. MOCATTA, Esq., Addlestone (gr. Mr. Tho. Stevenson); 2nd, Miss LANGWORTHY.

The numerous displays of vegetables shown by cottagers and allotment-holders reflected credit on the growers.

NON-COMPETITIVE EXHIBITS.

Amongst the more important of these were the following:—

Mr. L. R. RUSSELL, Richmond, made an imposing display with choice stove and greenhouse plants, all of magnificent quality and delightfully arranged. (Large Gold Medal.)

Messrs. JAS. VEITCH & SONS, LTD., Chelsea, put up a floor group of pot *Roses*, interspersed with varieties of *Clematis* and *Lilium*. (Silver Medal.)

Mr. H. E. FORDHAM, Twickenham, showed mauve and white *Gloxinias*, set in a bed of *Adiantum Ferns*, with white *Liliums* as foils—a delightful combination.

Mr. W. J. UNWIN, Histon, Cambridgeshire, put up a pretty group of Sweet Peas, having choice bunches of well-known sorts. (Large Gold Medal.)

Mr. C. F. WATERS, Balcombe, Sussex, exhibited *Carnations* in variety. (Large Gold Medal.)

Mr. HENRY ECKFORD, Wem, staged a notable exhibit of Sweet Peas, having several novelties. (Silver-gilt Medal.)

Mr. W. H. PAGE, Hampton, put up one of his usual fine displays of *Carnations* and *Liliums*, with *Rambler Roses* at the back. (Gold Medal.)

Messrs. H. B. MAY & SONS, Edmononton, showed choice *Ferns*, including their new *Nephrolepis Marshallii*. (Gold Medal.)

Messrs. T. S. WARE, LTD., Feltham, set up one of the largest groups in this section, having a wealth of hardy flowers, with beautiful *Begonias* of the tuberous-rooted type in front. (Silver-gilt Medal.)

Mr. F. M. BRADLEY, Peterborough, showed *Roses* of remarkably fine quality. (Silver Medal.)

Messrs. BAKERS, Wolverhampton, made a notable exhibit of border flowers, including Pansies and *Violas*. (Silver Medal.)

Messrs. KELWAY & SON, Langport, Somerset, showed *Delphiniums* having superb spikes of finely-coloured blooms. (Gold Medal.)

Messrs. WM. CUTRUSH & SON, Highgate, showed *Carnations* and *Polyantha Roses*. (Silver-gilt Medal.)

Messrs. W. & J. BROWN, Stamford and Peterborough, had a delightful display of Roses. (Gold Medal.)

Messrs. GEO. JACKMAN & SON, Woking, made a showy group with hardy flowers and Roses. (Silver Medal.)

Mr. KARL THERKILDSEN, Old Southgate, had a collection of Roses. (Silver Medal.)

Messrs. STUART LOW & Co., Bush Hill Park, Enfield, made an attractive display with Carnations.

Mr. W. THOMPSON, Richmond, showed a group of Hydrangeas, Roses, Palms, Ferns, and decorative foliage subjects. (Silver-gilt Medal.)

Messrs. ED. WEBB & SONS, Stourbridge, made an attractive exhibit of flowers, fruits, and vegetables. They had Gloxinias, Sweet Peas, Melons, Tomatos, Carrots, Peas, and other produce from their strains of seeds. (Gold Medal.)

Messrs. JARMAN & Co., Chard, showed Centaureas and Sweet Peas. (Silver Medal.)

Mr. G. ENGELMANN, Saffron Walden, showed Carnations of the perpetual-blooming type. (Silver Medal.)

Messrs. WM. PAUL & Son, Waltham Cross, exhibited blooms of the beautiful new Rose named Juliet.

THE WEATHER.

THE FOLLOWING SUMMARY RECORD of the weather throughout the British Islands, for the week ending June 25, is furnished from the Meteorological Office:—

GENERAL OBSERVATIONS.

The weather was fine at the commencement of the period, but an unsettled condition soon set in in the west, and in the course of a day or two extended to all parts of the Kingdom. Thunderstorms occurred in some western and north-western localities on Monday, and subsequently they were experienced every day in many parts of the Kingdom, accompanied by heavy local rains.

The temperature was above the average, the excess varying from less than a degree in Scotland E. and about 1° in the south-western districts to 3° in the midland and eastern English districts. The highest of the maxima were recorded generally either on the 19th or 20th when the thermometer rose to 81° or above, in all the English mainland districts, the highest readings being 83° in England E. and the Midland Counties. In Ireland the highest value was 75°, in Scotland E. 71°, and Scotland N. 69°. Late in the week the maxima were low for the time of year. The lowest of the minima were mostly registered between the 23rd and 25th. In Scotland E. and W. the reading was 40°, and in England N.W. 41°, while in the other districts the values ranged from 43° in various districts to 47° in England E., and to 48° in the English Channel. The lowest grass minima reported were 34° at Llanganmarch Wells, 35° at Hereford, 36° at Sheffield and West Linton, and about 40° in several other localities.

The mean temperature of the sea. Except at Wick, where it was much colder, the water was generally warmer than during the corresponding week of last year, the excess being nearly 5° at Margate and Teelin. The actual means ranged from 63° at Margate, 61° at Eastbourne and Teelin, 59° at Newquay and Seahfield, to about 51° at several stations on the north-east coast.

The rainfall was less than the normal in Scotland N. and E. and also in the English Channel, but greater elsewhere. In Ireland and the central and eastern parts of England the excess was large. Many parts of the Kingdom experienced a fall of an inch or more within 24 hours on Monday; the amount of 1.5 inch fell at Armagh, and about 1.3 inch at Cahir and Rotbsay; on Thursday there was 1.1 inch at Great Yarmouth, 1 inch at Bradford, 1.5 inch at Hull and Huddersfield, and 1.3 at Cahir, and on Saturday 1.1 inch at Killarney.

The bright sunshine was rather in excess of the average in nearly all parts of England, but deficient in England N.E. and also in Ireland and Scotland. The percentage of the possible duration ranged from 51 in England S.E. and the English Channel, and 44 in England E. and N.W. to 25 in Ireland, 23 in Scotland N., and 19 in Scotland E.

THE WEATHER IN WEST HERTS.

Week ending June 29.

A cold and sunless week.—All the days of the past week were more or less cold, but on only two nights was the temperature below the average. The ground is now at a seasonable temperature at 2 feet deep, but 2° colder than is usual at the end of June at 4 foot deep. Rain fell on four days, and to the total depth of about half-an-inch. There have been a few drops of rainwater the last three days through the bare-soil gauge, but no percolation at all through that on which short grass is growing for 10 days. The sun shone on an average for 33 hours a day, which is 2 1/2 hours a day short of the average duration for the time of the year. The wind has been rather high the last two days, but during the rest of the week light airs alone prevailed. In the windiest hour the mean velocity amounted to 18 miles—direction W. The average amount of moisture in the air at 3 o'clock in the afternoon exceeded a seasonable quantity for that hour by 7 per cent. E. M., "Rosetank," Berkhamstead, June 29, 1910.

MARKETS.

COVENT GARDEN, June 29.

[We cannot accept any responsibility for the subjoined reports. They are furnished to us regularly every Wednesday, by the kindness of several of the principal salesmen, who are responsible for the quotations. It must be remembered that these quotations do not represent the prices on any particular day, but only the general averages for the week preceding the date of our report. The prices depend upon the quality of the samples, the way in which they are packed, the supply in the market, and the demand, and they may fluctuate, not only from day to day, but occasionally several times in one day.—Eos.]

Cut Flowers, &c.: Average Wholesale Prices.

Table listing various cut flowers and their prices, including Alströméria, Bouvardia, Calla, Carnations, etc.

Cut Foliage, &c.: Average Wholesale Prices.

Table listing various cut foliage and their prices, including Adiantum, Asparagus, Croton, etc.

Plants in Pots, &c.: Average Wholesale Prices.

Table listing various plants in pots and their prices, including Aralia, Euonymus, Ferns, etc.

Plants in Pots, &c.: Average Wholesale Prices (Contd.).

Table listing various plants in pots and their prices, including Lily of the Valley, Marguerites, Mignonette, etc.

Fruit: Average Wholesale Prices.

Table listing various fruits and their prices, including Apples, Bananas, Cherries, Currants, Lemons, etc.

Vegetables: Average Wholesale Prices.

Table listing various vegetables and their prices, including Artichokes, Asparagus, Beans, Broccoli, etc.

REMARKS.—Southampton Strawberries are a glut; also other English varieties. Consequently prices are very low. Both English and French Cherries are a good supply. English Peaches are plentiful. Currants from France are very good, and samples are selling freely. There are plenty of good English Grapes of all varieties, the demand being fairly good. English Tomatos are cheaper, 4s. and 4s. 6d. being the top prices for good fruit. West Indian claret-coloured Bananas arrived this week and met a fair demand. Raspberries from Southampton are a fresh arrival on the market this week, 1s. 6d. per bushel of 4 to 5 lbs. seems to be the market value at present.—E. H. K., Covent Garden, Wednesday, June 29, 1910.

Potatos.

New Potatos.

Teneriffe, per cwt.	6 0-7 6	Jersey, per cwt.	6 6-7 0
St. Malo, per cwt.	6 0-6 6	Cherbourg, per cwt.	5 9-6 3

REMARKS.—Old Potatos have sold out better than was expected. Next week will see about the finish of St. Malo and Jersey Potatos. The market will be well supplied with English tubers from Kent and Bedfordshire. *Edward J. Newborn, Covent Garden and St. Pancras, June 29, 1910.*

COVENT GARDEN FLOWER MARKET.

The enormous supplies of cut flowers of *Lilium longiflorum* are now exhausted, and the prices advanced 50 per cent. this morning. Beyond this, there is very little to add to last week's remarks. *A. H., Covent Garden, June 29, 1910.*

AMERICAN GARDEN PAPERS: *J. H. H. The Garden Magazine* (Doubleday, Page and Co., 133-137, East 16th Street, New York); *The American Florist* (American Florist Company, 1,133, Broadway, New York); *Horticulture* (Boston).

ANTS ON A LAWN: *W. M.* A simple method of destroying ants is to pour boiling water down their burrows. There are several proprietary articles for destroying ants, one of the best being Ballikinrain Ant Killer. You can obtain this from the horticultural sundriesman. Vaporite, apterite and similar ground insecticides may also be recommended.

BETTER: *A. B.* and *J. W. S.* The beetles are of the same species as those sent by *Aria* last week (see p. 436).

BEGONIA AND GLOXINIA LEAVES: *Sunflower.* The injury to the foliage has been caused by Thrips. Dip the plants in a solution of soft soap three times at intervals of three days.

CATERPILLARS ON ROSES: *Love, Gosfield.* The best plan is to spray the trees with an insecticide. It will be safe in the case of Roses to use some strong poisonous material such as Paris Green or London Purple, both of which contain arsenic. Take one ounce of Blundell's Paris Green Paste and mix it with 12 gallons of water. See that the liquid is well stirred during the spraying operation, and use a fine nozzle. Be careful to work on the windward side so that none of the spray falls on the operator. Gloves should be worn, as the arsenic would be liable to set up inflammation if it entered the skin through cuts and bruises. Lead arsenate is another excellent insecticide, and is very effective in destroying caterpillars. You can obtain both these substances from the horticultural sundriesman.

CLEMATIS DYING: *P. W. C.* The plant has been killed by a pith-mining maggot that has entered at the collar. Dust soot around the base of the stem.

EMPLOYMENT AT KEW: *L. H. M.* You do not read your *Chronicle* carefully. Full particulars of the conditions of employment as gardener at Kew were given in the issue for June 18, p. 416. Write to the director for a form of application.

FLOWER BUDS OF SWEET PEAS DROPPING: *Disappointed.* You should have sent specimens for examination; without examples we can only enumerate causes that might be responsible. These are a cold, damp spell of weather, drought, excessive manuring, including the too free use of chemical manures, and insect pests.

GRAPE SPOT: *W. McG.* and *H. J.* The berries are affected with spot (*Gloeosporium ampelophagum*). Those sent by *H. J.* are also rubbed, most probably in the process of thinning. To check the "spot," dust flowers of sulphur on the leaves and shoots at intervals of 10 days, until the disease has ceased to spread. On the second application a small quantity of quicklime can be mixed with the sulphur, and the quantity of lime should be increased on every successive occasion, until

the proportions of lime and sulphur are almost equal. In winter, wash the branches thoroughly with a solution of sulphate of iron, and rich stable manures should be used very sparingly. Remove all leaves, shoots, and fruit showing signs of disease, and burn them. (Thanks to *H. J.* for contribution to R.G.O.F. box.)

GRAPES UNSATISFACTORY: *F. D.* The trouble is not due to disease. The cause must be looked for in some wrong cultural treatment.

LILIES DYING: *G. W.* The Lilies are killed by the Sclerotium disease, which is present in the bulbs; 2 ounces of sulphide of potassium in 3 ounces of water is too strong a solution for spraying any plant.

NAMES OF PLANTS: *A. B.* 1, *Cassandra calyculata*; 2, *Vaccinium stamineum*; 3, *Berberis Wallichiana*; 4, *Vaccinium corymbosum* var.; 5 and 6, forms of *Iris sibirica*. The Abies is attacked by a species of chermes.—*Kentea Court.* *Kalmia latifolia*.—*T. Smith.* 1, *Cornilla emeroides*; 2, *Urospermum Dalechampii*; 3, *Hedysarum coronarium*; 4, *Heuchera Wheeleri*.—*J. W.* *Phacelia tanacetifolia*.—*W. C.* *Gesneria cardinalis*, *Pelargonium "Elegante,"* *Sedum sarmentosum variegatum*.—*A. B.* 1, *Tropaeolum polyphyllum*; 2, *Veronica buxifolia*; 3, *Erigeron philadelphicus*; 4, *Gemista pilosa* var.; 5, *Phlox frutescens*; 6, *Hieracium villosum*; 7, *Lithospermum* sp. (specimen insufficient for determination of species).—*L. G. P.* *Campanula patula*.—*D. Barr.* The specimen was not sufficient for identification.—*H. J. M.* 1, *Lysimachia vulgaris*; 2, *Melilotus officinalis*; 3, *Helxine Soleirolii*.—*E. E.* 1, *Gongora portentosa*; 2, *Eria obesa*; 3, *Dendrobium ciliatum*; 4, *Ceoloyne odoratissima*; 5, *Hartwegia purpurea*; 6, *Vanda parviflora*.—*W. F., Cobham.* *Gongora gratulabunda*.—*Vactis.* *Lygodium scandens*.—*F. A. R., Sussex.* *Asclepias curassavica*.—*J. T., Liphook.* 1, *Metrosideros floribunda*; 2, *Weigela hortensis*; 3, *Trachelospermum (Rhynchospermum) jasminoides*.—*T. H.* 1, *Masdevallia trichete*; 2, *Stelis micrantha*; 3, *Pleurothallis obovata*; 4, *Cochlidium sauguinea*; 5, *Epidendrum virens*.—*A. M.* 1, *Clematis*. Send when in flower; 2, *Ginkgo biloba*. The Begonia is affected with rust. Dip the plants in tobacco water.—*C. M.* Crown or Mummy Pea.—*L. G. P., Dorset.* *Campanula patula*.

ORIGIN OF THE POLYANTHUS: *Correspondent.* There appears to be no definite record as to the origin of the Polyanthus, but the generally-accepted theory that this race of garden plants is the result of a cross between the Cowslip and Primrose is probably the true explanation. Miller, whose name is given as the authority for the name *Primula polyantha*, says in the *Gardeners' Dictionary*, in 1768, "a Primrose or Cowslip, with heart-shaped, crenated leaves, having footstalks and flowers growing in bunches on very long footstalks. It has been much improved in the last 50 years as almost to equal the variety of the Auricula." There seems to be no reason why one should doubt that the Polyanthus is the result of crossing these two species, and we have reason to believe that experiments now in progress will prove the truth of this hypothesis.

PEAR TREES: *J. H.* There may be many causes to account for the Pear tree remaining practically dormant whilst another one next to it has grown freely. The constitution of the tree may be responsible, or it may be due to a weakened root system. Perhaps it is grafted on the wrong stock, or the soil at the particular spot in which it is planted is unsuitable. Similar cases are not infrequently seen in gardens where fruit trees are planted extensively.

PELORIC FOXGLOVE: *E. P. D. & Sons.* The terminal flower of the spike has become regular, a condition termed Peloria, frequently seen in such flowers as Foxgloves and Antirrhinums.

PLANE TREE: *Platanus.* No disease is present on the piece of stem sent. There is probably a fungus present in the root, for which there is no remedy.

PLANTS FOR PEONY BED: *H. P. Powell.* Nothing is more suitable for associating with Peonies, to flower in the latter part of the summer, than a selection of *Liliums*, or even a number of plants of one variety of Lily. *L. tigrinum Fortunei giganteum* and *L. t. splen-*

dens are especially to be recommended for grouping, as the plants take up comparatively little room. The varieties of the *L. speciosum* group are best for the purpose, except that they might be considered too late in flowering. The varieties *cruentum*, *macranthum*, and *Melpomene* have highly-coloured flowers; *album* and *Kratzeri* have white flowers. The species named other than *L. speciosum* flower in August and September, and should be planted 5 inches deep. *L. speciosum* flowers in September and October, and should be planted 8 inches deep; because of the great mass of stem roots, which appear on or near the surface, a mulch of some rich material should be afforded the plants during the summer.

PLANTS OF GREEN CHILI: *R. O. S.* It should be possible to obtain plants from some of the nursery firms who deal in vegetable seeds. Many gardeners would have surplus plants, and they would probably oblige you with some. Insert a small advertisement in some gardening paper.

ROCK GARDENS NEAR LONDON: *F. E. S.* In addition to the fine rockery in Kew Gardens, you should endeavour to visit the remarkable Alpine garden at Friar Park, Henley-on-Thames. Visitors are sometimes allowed to inspect the rockery for a small fee, which is given to local charities. The rock-garden at Leonardlee, Horsham, is also celebrated, whilst rock-plants are extensively planted at Wisley Gardens.

ROSE BUDS: *W. G. W.* See reply to *J. M.* under "Proliferous Roses" in the last issue, p. 436.

ROSES: *Correspondent.* *Empereur du Maroc*, sent out in 1859, is the nearest to a black Rose. *Prince Camille de Rohan* (1862) and *Grand Mogul* (1875) are both blackish-maroon at times, but always with a distinct shade of maroon-scarlet. There is no blue Rose. *Veilchenblau*, a seedling from *Crimson Rambler*, and like it in flowering and growth, has been advertised as a blue Rose. This was sent out last year. It is reddish-lilac while young, but takes a dull, steely-blue as the flower ages, and is the nearest approach to blue we have. One may also find a distinct shade of purplish-blue in a fresh flower of *Bardon Job*.

ROSES: *W. R. G.* The leaves are affected with the Rose-leaf black blotch. Spray the plants with diluted copper sulphate or with *Eau Céleste*, which has been found useful against this pest. Damage to the foliage is also apparent from some leaf-eating insect.

ROSE SPORTING: *W. O.* You did not mention on what variety of Pink Rose the sport appeared. The bloom was too full-blown when received to properly judge of its merits, but it appeared worthy of perpetuation. The season is at hand for budding Roses, and you should insert a few buds from this special shoot on to stocks of the ordinary Briar, or ask some nurseryman to do so for you. Another season, submit flowers to the National Rose Society at their summer show.

SHELTER FOR THE KITCHEN GARDEN: *H. P. P.* As it is impossible to employ bricks on account of the cost and you object to using stone, your only alternatives are wooden fences or live hedges. If the situation is not too exposed some dense-growing Conifer might be planted to form a hedge. Hornbeam planted thickly and cut so as to make a square hedge offers great resistance to wind, and is often employed by the nurserymen as shelter for tender plants out-of-doors. Beech may be similarly employed, whilst Yew, Box, Holly and Quick offer further selection. Your best plan is to see what is used for enclosing other gardens in the locality, and, if a live hedge is employed, select the plant which succeeds best in the district.

BRITISH ALPINE GARDENS.

SINCE my last visit to Britain, some two or three years since, I find that the love of alpine plants has grown so remarkably and their cultivation so much increased, that it is impossible to record the progress within the limits of a single article. Nobody can view this great development without astonishment. When I first visited England in 1885, I was so surprised with what I saw in gardens that I returned to Geneva discouraged with my own efforts, thinking that I had better give up gardening or go and reside in England. I had, however, some encouragement from friends here, who thought I could, in some ways, do even better with alpinism in Geneva than they, and their encouragement decided me to continue. I have found that certain subjects will grow in my dry and sunny climate, if not better, at least quite as well as in England.

The following impressions of some gardens which I have recently inspected are given in the order in which I visited them.

I have on a former occasion written of Friar

Park, Henley-on-Thames. I find on revisiting it, that the rockery has been considerably enlarged. The Matterhorn stands in the middle of this miniature representation of the Pennine Alps, with the Italian valleys lying on the south in natural positions. What a marvellous display of plants are to be found flourishing in this most picturesque rock-garden! *Daphne Blagayana* seems to be quite at home, and I never saw more beautiful patches of *Schizocodon soldanelloides*. The scheme of the rock-garden is so imposing that the small jewels of the high altitudes are almost lost sight of, but they are there, jealously cared for by the owner. There were seen in full flower *Campanula cenisia*, *Alyssum spinosum roseum*, *Linnaea borealis*, a large collection of terrestrial Orchids, and many others.

A remarkable collection of alpinism is to be seen in Sir Dighton Probyn's garden at Windsor Castle. The gardens surround the Big Tower and the Norman Keep, and are interesting especially on account of the number of species which have been planted in the old walls of the fortress. *Saxifragas*, *Campanulas*, *Phyteumas*, and other plants grow well in perpendicular positions, whilst, at the foot of the tower, *Pinguiculas*, *Sarracenias*, *Gentians*, and *Primulas* flourish in a bog garden. In a new rockery, that contrasts greatly with the old stonework of the castle, many fine plants are flourishing.

In the neighbourhood of Windsor Castle is to be found a place full of poetry and charm, away from the noise of town and pervaded by a sense of restful calm. I refer to Bishopsgate in Windsor Forest, where Lady Marcus Beresford is creating a most beautiful garden and forming one of Nature's pictures which surpasses the best of man's paintings on canvas.

Hillbrook Place is not far from Bishopsgate, and there a wood-garden bears the same importance to the place as does the rock-garden at Friar Park. I have seen it three or four times, and always with fresh pleasure. In some respects Hillbrook reminds me of Wisley garden as it was when it was still under the care of Mr. Wilson. The place will be even more delightful in the future.

The gardens at Kew always appear increasingly beautiful. Kew is a museum of new and rare living plants, with most of the gems of the world's flora. What is there to be said about Kew which has not been said already a thousand times?

In the manufacturing and mining districts of England, where the beauty of Nature has been spoiled by man, are to be found some of the cleverest and most attentive of gardeners. I refer to those workmen who possess fine collections of *Auriculas* in their windows. Nothing can be better than these. I went to Yorkshire and Lancashire, and scarcely saw a ray of sunshine. I fear the sun is as seldom to be seen there as a fog in Geneva. But, of course, there must be a sun in Yorkshire, as well as in Surrey or Switzerland—I believe in it, at least.

I could not imagine a better alpine garden than I found in this northern district. It is a very small one, enframing a kitchen garden. I am sorry to say, but containing the best specimens of the alpine flora which I have seen in this country—this before I went to Edinburgh. I refer to Wennington Hall, where an enthusiastic lady grows choice species from the high Alps, tending to their wants herself. When I say that I saw there the following plants in full flower and perfect growth, some small idea of her success may be formed:—

Aquilegia alpina, *Erithrichium nanum* (grown from seeds), *Androsace glacialis*, *A. helvetica*, *A. pubescens*, *A. villosa*, *Phyteuma hemisphericum*, *Azalea procumbens*, *Ranunculus alpestris*, *R. parnassifolius*, *Anemone alpina*, *A. sulphurea*, *A. narcissiflora*, *Arnica montana*, *Trifolium alpinum*,

all kinds of *Gentians*, *Primulas*, *Soldanellas*, *Drabas* and *Alyssums*.

Near to Lancaster, close by the sea, but higher, of course, than the town, at Bailrigg, I saw a very large place, where Ferns attain such dimensions that they suggest the period when Ferns formed the most imposing vegetation. And there, in ordinary brick walls, was the most exquisite bit of wall gardening I have ever seen in England. These walls, facing south and west, are supporting soil at the back, and, consequently, are always moist. They are covered with flowers, and everything seems to succeed in them. I have always maintained that wall-gardening is the best means of growing rare and delicate alpine plants in England. But the walls must be perfectly perpendicular; if not, the plants will fail. I did not know before that it was possible to grow such a big collection of Alpinism in a brick wall, for I was of the opinion that baked earth (bricks) would be adverse to plant life. The gardens of Bailrigg quite alter my opinion.

Mr. Farrer's garden at Ingleborough offered another surprise to me. I visited this place some years ago, but it has been largely increased, and especially in two interesting directions; I mean the moraine- and the false-garden. In two moraines (of course, not those big moraines which surround the glaciers) Mr. Farrer grows the most delicate of alpine plants—*Gentiana bavarica*, the more beautiful *G. Rostanii*, *G. verna*, *G. brachiphylla*, *Ranunculus alpestris*, *R. glacialis*, *R. bilobus*, some rare *Androsaces*, and a good collection of alpinism from high altitudes. Of course, this method of growing alpinism has not yet been proved, and we have to await the results before approving of it. The false is a natural wall, rising perpendicularly above a little lake, and the path to it is what a Parisian would call "vertigineux." In that wall, Mr. Farrer has been sanguine enough to plant alpinism that are most difficult to cultivate, including *Androsace argentea* (imbricata), *A. helvetica*, *A. pyrenaica*, *A. pubescens*, *A. ciliata*, numerous kinds of *Saxifraga* of the *Kabschya* group (*S. diapiensoides* and *S. Vandellii*, for instance), and even many peat and bog-loving plants, which seemed to me a paradoxical arrangement. I hope that Mr. Farrer's sanguine anticipations will be fulfilled.

Underley Hall gardens are well known for their beauty, and years ago I was enthusiastic about them, my visit then being in autumn. This year I saw them in the spring time, and I dare not say at which season of the year they appeared the better. It is for me a "Paradis Terrestre," its wild-garden being an intermediate form of gardening between the rock and the wood-garden.

But, after seeing all these places, I went to Edinburgh, and I saw there, in the Botanical Garden, alpinism which I knew only by reputation. I went there as a pilgrim to a shrine, and I should never have imagined that such rare and choice plants could be made to flourish together. Words fail me to express my enthusiasm. Everything is flourishing to an extent that I have never found elsewhere. Professor Balfour is an enthusiast, pur sang, and loves plants in a way that I have seldom known.

In this garden *Omphalodes Luciliae* looks as happy as it does at Floraire, and a wall is quite covered with the exquisite *Armeria caespitosa*. A number of rare Spanish plants have been raised from seeds taken out of dried specimens in the herbarium, and many of them were new to me. *Pentstemon Menziesii Douglasii*, which created such a sensation at the last Temple Show, looked very happy, and many new Himalayan, Tibetan, and Chinese *Primulas* were growing with freedom. None of the rare plants I enquired for were absent. Professor Balfour showed me *Diapensia lapponica*, *Saxifraga arachnoides*, and *Rubus chamaemorus*, which nobody else, I believe, can grow successfully.

I once went to Yena, in the centre of Germany, to see a plant of *Rubus chamemorus* growing there in a garden, and it seemed anything but happy. Not far from the Botanic Garden is the nursery of Mr. Fraser, where I saw *Primula suffrut-scens* in full bloom. I must confess that I came back from Edinburgh rather discouraged. Although I do not cultivate the sin of jealousy I envied the success which had attended English and Scotch gardeners in their cultivation of choice alpine. *H. Correvon, Floaire, Geneva.*

(To be continued.)

ORCHID NOTES AND GLEANINGS.

DENDROBIUM WILLIAMSIANUM.

A good specimen of this beautiful *Dendrobium*, exhibited by H. S. Goodson, Esq., Fairlawn, Putney (gr. Mr. G. E. Day), at the Royal Horticultural Society, on June 21, serves to revive the interest in this always rare species, which was first introduced from New Guinea by Mr. B. S. Williams, and illustrated in the *Gardeners' Chronicle*, 1886, p. 175. It is certainly a species to which importers might well turn their attention, for it should be better represented in gardens. In growth it resembles a slender *D. Phalenopsis*. Its showy flowers, each between 2 and 3 inches across, have the blush-white sepals and petals arranged on one plane, the scoop-shaped, violet-coloured lip being sheltered by the sepals and petals. It is a most elegant and distinct species, requiring warm-house treatment similar to *D. Phalenopsis*, and, according to the experience of Mr. Goodson's Orchid grower, it is not more difficult to grow than that popular species, a warm, moist house, however, being essential. At Fairlawn it flowers regularly.

DENDROBIUM OCHREATUM LUTEUM.

DENDROBIUM OCHREATUM was discovered by Wallich in the Chittagong district, India, and described by Lindley in *Bot. Rep.*, 1835. In 1837 Gibson brought the first living plant to Chatsworth, where it flowered early in 1838, and was figured in *Parson's Magazine of Botany*, vi., t. 265, as *Dendrobium Cambridgeanum*, under which name it is generally found in gardens. The stoutish, cylindrical stems are swollen at the joints and curved. It has the peculiarity of flowering on the leafy, new shoots, before their growth is finished. The flowers, generally in pairs, are each over 2 inches across and of a rich, golden yellow, with a deep maroon-purple blotch on the lip.

It has been imported frequently in moderate quantities, but no variation in colour worthy of note seems to have been observed.

At present, however, a plant is flowering in the Orchid-nursery of Mr. H. A. Tracy at Twickenham, in which the flowers are of a lemon-yellow colour, the purple blotch on the labellum being also much lighter in tint than in the ordinary form.

HARDY FLOWER BORDER.

CAMPANULA BARBATA.

THIS charming Alpine has behaved this year in a remarkable manner. Although I brought it home from the Abula Pass more than 30 years ago, it has always shown with me uncomfortable biennial tendencies, and I have had to replenish the stock several times by purchase. Only one out of a dozen old plants survived last winter, but this year there have sprung up dozens of vigorous seedlings, which are now flowering with a profusion I never saw before in this species. On one plant which I measured this morning (June 26) the main spike is 18 inches high, with 17 bells simultaneously expanded, and with half-a-dozen other spikes coming on. These seedlings have come up in a peat border at the foot of a retaining wall, on which the defunct parent plants were growing. *Herbert Maxwell.*

SOME HANDSOME SENECIOS.

SENECIO MACROPHYLLUS, shown in the accompanying illustration, is a hardy perennial from the Orient. It is of coarse growth, and hence unsuited for borders of choice plants or for small gardens. It is, however, valuable for the wild garden, where its massive character is seen to advantage and furnishes a picture of bold beauty. The glaucous leaves are nearly 3 feet in length. The flower-stalk attains a height of 6 feet, and the yellow flowers are borne in a loose, broad panicle.

is highly effective when grown in bold groups. It is not suited for the herbaceous border, as it is a terrible land-grabber and will quickly overwhelm less vigorous neighbours. The growth is most luxuriant when the roots have access to liberal supplies of plant food and an abundance of moisture, and the noble masses of foliage and large, brightly-coloured flowers are especially attractive when reflected in still water. The positions prepared for this plant should always have a liberal dressing of partly-rotted manure worked into the soil, which should be broken up to a depth of at least 2 feet. When growth is

FIG. 3.—*SENECIO MACROPHYLLUS*: FLOWERS YELLOW.

S. clivorum was introduced about eight years ago from Western China, and is also found in Japan. It is of the greatest value for planting in positions where bold vegetation is appropriate. The plant has large and handsome foliage, the roundly peltate leaves being about 20 inches in diameter, whilst the forked flower-spike often attains a height of 5 feet. The blossoms are rich orange-yellow, with dark centres. It is best suited to a position on the margin of a lake or by the side of a stream, while it will succeed in a moist spot in the wild garden, and

made under favourable conditions, strong plants soon form specimens 5 feet across.

S. tanguticus is a native of Central China, whence it was imported in 1902. It is one of the finest plants yet introduced for the wild garden, large groups having a splendid effect among natural surroundings. The elegantly-cut foliage is exceedingly graceful and the great, erect, pyramidal-shaped panicles of flower, often nearly a foot in height and 8 inches in breadth, are particularly ornamental when seen from a little distance. The individual blossoms are very small.

Each flower consists of three narrow, yellow petals, but the great panicles with their little blooms lightly poised have a pretty, plume-like effect. Like *S. clivorum*, it enjoys moisture and is seen at its best when growing by the waterside. Its flower-spikes attain a height of from 5 to 6 feet, and where the conditions are to its liking it soon forms huge clumps. It blooms in September, the flowers being followed by silky seed-vessels that form a silvery-grey cloud of great beauty. It is quite unsuited for the border owing to its rampant growth, and is a nuisance where space is limited. Its vigorous aggressiveness is, however, an excellent feature in the wild garden, as it proves beyond a doubt that it can take good care of itself, and in such a site the plant possesses a measure of attractiveness that well accords with its environment.

S. Veitchianus is a recent introduction from China. It is a very free grower and is seen to the best advantage when backed by dark-leaved trees. It flowers during August and September, throwing up columnar flower-spikes 5 feet high which carry an abundance of deep, golden-yellow blossoms well above the handsome, cordate foliage. It is a splendid species for massing by the lakeside or in moist places in the wild garden, where it is vigorous enough to hold its own with the native vegetation.

S. Wilsonianus is another newly-introduced plant from Western China. It has large, heart-shaped leaves and very erect flower-spikes that rise to a height of 5 feet. In this species the spikes are columnar and thickly studded with flowers somewhat resembling those of *Eremurus*. From the point where they emerge from the clustered foliage the spikes are closely set with bright, golden-yellow flowers to their very summit. It is a fine plant for the moister spots in the garden, but needs considerable space, and is out of place where room is limited. The foregoing are some of the best of this large genus. *Wynndham Fitzherbert*.

SCOTLAND.

THE BEGINNING OF THE ROSE SEASON.

ATMOSPHERIC influences have of late been extremely favourable to the culture of the Rose in Southern Scotland. Owing to the alternation of strong sunlight and congenial rains, the blooms of the earliest varieties have been much larger and fuller than in many previous years. The first Rose to bloom in my own garden this season has been the beautiful, salmon-pink hued Viscountess Folkestone, one of the most richly-fragrant of all Hybrid Teas, and perhaps the most valuable and enduring in its popularity of Mr. Henry Bennet's raising. It was closely followed by the famous Lyon Rose, whose glorious colour, shrimp-pink, deepening like a sunset towards the centre, and most delicately suffused with chrome-yellow, is marvelously effective. Another new Rose of great attractiveness is Margaret, raised by Messrs. Wm. Paul & Son, of Waltham Cross. Albatross, also one of their most recent introductions, has a complexion almost peculiarly its own. Their brilliant Juliet I recently had the gratification of seeing at their nurseries. I admire it greatly and regard it as a most distinct acquisition.

Of the Newtownards Roses, those that succeed best in South-western Scotland are Margaret Dickson, which is always reliable and often flowers here at an abnormal height, Lady Helen Stewart, an odorous and exquisite Rose, Ard Rover, Mrs. Sharman Crawford, Helen Keller, and Florence Pemberton. Mary Countess of Ilchester, which is said to be a very handsome and lustrous variety, has not yet flowered here; but I am hoping for some floral activity on its part early in autumn. A veritable gem is Molly Sharman Crawford. It was by far the sweetest Tea Rose in my garden last year, and it requires a sunny, open position. The only dark crimson Hybrid Perpetual I have at present (June 25) in bloom is Salamander, a variety of the most

velvety texture; but Duke of Edinburgh, Duke of Teck, Lady Helen Stewart, Hugh Dickson (an invaluable variety), Horace Vernet, Captain Hayward, and Charles Lefebvre are almost contemporaneous.

The Wichurianas and their American derivatives have an affluence of embryonic flowers, especially Lady Gay, Hiawatha, Christian Curle, and the white Dorothy, of which the last mentioned Rose, though sufficiently fascinating, is not more beautiful than the Waltham Bride; while Paul Transon, a charming hybrid between this fine-foliaged race of Roses and *L'Idéal*, is already, with characteristic precociousness, preparing to bloom. *David R. Williamson*.

THE ROSARY.

WEeping ROSES AS POT PLANTS.

ONE of the most striking of modern introductions in the Rose world is the Weeping Standard Rose. With its magnificent trusses of bloom, and its beautiful shiny-green foliage, there is nothing which looks so graceful in the conservatory when used as a pot plant. Its tall stem and drooping heads have an effect quite lacking in upright-growing plants. The Weeping Standard Rose is looked upon by some as a shy plant to cultivate, but I have found from experience that there is nothing easier to bring to perfection. A mistake is frequently made in trying to flower the plant before it is established, and I have heard complaints from gardeners who have purchased plants, potted them and put them straight away into heat, expecting them to flower well in the first season. Freshly-potted plants should be left one season in the pots to become firmly established before starting them in heat. When newly-potted plants are placed directly into heat they are forced to break into growth, but the roots, being less active than the top, they soon suffer a check.

There are so many varieties that it is difficult for the general purchaser to select those pleasing in colour and of a perfect habit. I have therefore taken much trouble to select a number of varieties which combine all the qualities needed for the perfect weeper, which is a plant having a stem not less than 5 feet 6 inches in height. My selection is Hiawatha (deep crimson with yellow stamens), Dorothy Perkins (shell-pink), Tausendschon, Peach Blossom, Minnehaha (dark rose colour), Paul Transon (rose colour), and White Dorothy Perkins. A good yellow variety is needed with the qualities of Minnehaha. I have seen Alberic Barbier used, but I cannot say that it is perfect for such purposes. There is a new variety in which I have much faith at present, for it possesses free-blooming qualities, large trusses, and a better yellow it will be hard to find. In Alberic Barbier the blooms are mostly single, which is not desirable in a weeping plant. The new yellow has the name of Aviateur Blériot, and I think, when this variety is introduced as a weeper, we shall have a complete collection.

SORTS TO BE AVOIDED.

Those who think of purchasing novelties should purchase them from a good nursery, and avoid such sorts as I shall mention, because they do not weep well, it being against their habit to do so. At the same time, they are to be recommended, and used, when the more suitable varieties cannot be obtained. They are: Blush Rambler, Thalia, Goldfinch, Stella, Waltham Bride, Philadelphia Rambler, Seagull and Bordeaux. The average gardener who selects with judgment, avoiding such sorts as I have mentioned, will be able to bring his Weeping Roses to perfection as pot plants.

HOW TO GROW THEM.

In the first place, time is of importance. Let early plants, such, for instance, as are wanted in April or early in May, have about 18 weeks for growth.

When the plants are taken into their new

quarters, after standing outside all the previous autumn, a good "dry-out" is most important, so as to make the soil porous. Whilst the plants are drying-out, prune them, but take care to remove all the upright-growing shoots, and leave the drooping shoots about 12 inches in length, so as to give the appearance of an umbrella. Cut the small shoots back to three eyes, which grow from the strong, weeping shoots. When the plants have had a good dry-out, give them a watering, and take care afterwards not to let them get too dry or too wet. Syringe them well night and morning, let them have plenty of air when first started, and bring them gradually to the heat by closing the house at night. Do not force them too fast before the bloom-buds are set or the eyes will be blind. When bloom-buds are set, you can apply more heat if desirable, but those grown on the cool side, with plenty of air when occasion permits, become stronger plants and the flowers a better colour. The atmospheric temperature at night should be 55° to 60°. When the flowers are showing colour, liquid manure may be afforded the roots at intervals of some two or three days. *A. B.*

NOTES ON IRISES.

IRIS LÆVIGATA AND I. KÆMPFERI.

MAY I once more revert to this subject, the interest in which is renewed by the recent exhibition of a variety of the so-called albo-purpurea?

As far as I have been able to discover, the truth of the matter seems to be that in the marshy ground on the banks of the River Amur there grow two Irises, one with somewhat narrow leaves, with a distinct mid-rib—to use a convenient but inaccurate term—and the other with much broader, yellow-green leaves, which have a very slight, if any, trace of thickening along the centre. Of these, the former is apparently the *I. Kæmpferi*, of Siebold, and the latter the *I. lævigata*, of Fischer and Meyer, but not of Regel. (The latter is a synonym of *Iris Kæmpferi*.) *I. Kæmpferi* has deep red-purple flowers, relieved by a golden central ridge on the falls, whilst *I. lævigata* is the best blue Iris that I have ever seen. I incline to think that these two Irises are the parents of the *Kæmpferi* hybrids so extensively grown in Japan.

Of *I. lævigata* there are certain garden forms, apparently from Japan, of which the first to be noticed in England was Mr. Baker's albo-purpurea, a plant with white falls dotted with pale blue. The plant which Messrs. R. Wallace & Co. exhibited on June 21 (see *Gardeners' Chronicle*, vol. xlvii., p. 231) was a deep-blue form of this, and I am sorry to say that at least two double monstrosities are also to be obtained from Japan, one with six fall-like petals of a deep indigo-blue colour and the other of a dingy grey colour of similar shape. All of these are, however, vastly inferior, to my mind, to the type, with its large flowers of a glorious deep-blue colour. Both this and *Kæmpferi* are now in flower together here, and I am inclined to wonder whether the Japanese really prefer their double monstrosities, or whether they simply palm off such freaks on us and keep the type to themselves. At any rate, the type seems extremely difficult to obtain, although I hope, in a year or two, to be in a position to distribute some of the many seedlings, both of the type and of the beautiful form albo-purpurea that are growing here.

If this view is adopted, the proper nomenclature will be:—*I. lævigata* Regel, a deep-blue single flower; *I. lævigata* Rgl. var. albo-purpurea Baker, for the original Kew plant, which is still growing by the side of the new Water Lily tank there; and *I. lævigata* Rgl., var. albo-purpurea colchesterensis, for the plant that Messrs. R. Wallace & Co. showed. In view of the length of this latter title, it would surely be better to give some English name to this garden form, especially as it seems more convenient to reserve Latin names for wild species. *W. R. Dykes, Charterhouse, Godalming.*

IRIS TINGITANA.

This Iris, which is a native of Tangiers whence it was introduced into this country in 1572, resembles a glorified Spanish Iris. The blossoms are very lovely, the standards being violet-blue and the falls a delicate French-grey, which colour is set off by the gleaming yellow of the central blotch. The flowers measure 5 inches across, and, with the falls, spread out 10 inches. The width of the falls is about 2 inches, and the height of the standards is 4 inches. Although this Iris has been known in England for nearly 40 years, it is but little grown, and apparently but few are able to flower it satisfactorily. Numerous letters have appeared from time to time in the horticultural press commenting on this species' persistent refusal to bloom. These failures have not been confined to amateurs who have just taken up the pursuit of gardening, but some of our most eminent horticultural experts have had to admit ill-success. The late Sir Michael Foster wrote that he had never bloomed it in the open; Mr.

versation, and having heard that the Tangiers Iris grew in sand, determined to apply Mr. Elwes's suggestion to it. I had grown *Iris tingitana* for some years with complete lack of success as long as it was left in the ground through the winter, but with an occasional flower when it was lifted as soon as the foliage had died down and replanted in October. I had always, however, grown it in sandy soil. In making the new bed I placed a deep layer of manure 8 inches below the surface, and mixed with the upper soil an equal proportion of old Mushroom-bed manure, so that it was very rich. The bulbs were planted 3 inches deep and entirely surrounded with silver sand. The next year I had 29 flower-spikes from 30 bulbs, another year 11 out of 12 bloomed, and for the last six years this Iris has flowered splendidly. My success I attribute entirely to Mr. Elwes, and am convinced that what *Iris tingitana* requires is a very rich soil. This year I feared that, for the first time for six seasons, I should have no flowers. Groups of my largest bulbs are planted near the house so that there may be a good show from the windows.

in January, and from that date they bloom until the end of April. This year they blossomed simultaneously, and were at their best in the third week of April. Two years ago I had an inquiry from a correspondent asking me if I would tell him how I managed to flower this Iris. I sent him the fullest particulars of my method of culture, and the next year was pleased to receive a letter from him telling me that he had followed my instructions to the letter and had succeeded beyond his expectations. In this note I have given full cultural details in order that any readers who wish to do so may be able to follow the system, which, with me, has led to such pleasing results; for certainly anything that will induce this lovely Iris to relinquish its shy-blooming habit and become a free flowerer is worthy of note. *Wyndham Fitzherbert.*

THE MYSTERY OF FRUIT FAILURE.

IN making remarks upon this subject, it is desirable in the first instance to explain that by "failure" is meant more or less serious partial failure, and not absolute failure—a catastrophe, indeed, which rarely, if ever, happens. This partial failure appears to be general throughout the country in the cases of all fruits except Strawberries, Red and White Currants and, possibly, Raspberries. There have been years in which any one of the fruits other than those named has been more nearly a complete failure than it is this season, excepting Black Currants and Pears: the crops of these are the smallest that I have ever seen, but I cannot recall any year in which Apples, Pears, Plums, Damsons, Gooseberries, Black Currants, Cobnuts and out-door wall-fruit were so deficient, taking them all round, as they are this season. Still more striking is the consideration of the disappointing results of prospects which at one time were fair in some cases and uncommonly good in others; and it is in this connection that the "mystery" of fruit failure comes into play.

There is no mystery as to the cause of the dropping of Gooseberries and Black Currants. That this was due to frost seems to me to be clearly proved by the almost complete denudation of bushes in low and sheltered parts of fields, where frost is always most severe, while a passable show of fruit was left on high ground in the same plantations. All that is puzzling in relation to the partial failure of these fruits is that it is much worse than it has been in seasons in which more severe frost than occurred last spring has been experienced, and that Red and White Currants passed safely through an ordeal which damaged Black Currants very badly. On my own farm near the south coast, no more than 5° of frost were registered 4 feet from the ground after Gooseberries and Currants were in blossom, and so much only once, whereas in previous years 5° or 6° have done no harm to these crops. Whether or not the comparison of frosts close to the ground-level would be proportionate to those of 4 feet about it, I am not able to say. But the damage appears to have been done by one of the frosts which occurred after the fruit was set early on the three mornings which ended with May 11, the most severe of which on my farm was only 2°. As to out-door wall-fruit, the vitality of the blossom seems to have been destroyed by the frost of 5°, which was registered by me on the morning of April 5. In this case, again, the fruit has often passed through a more severe ordeal with impunity. Apparently, the particular stage in the development of fruit blossom or embryo fruit is as much accountable for damage done by frost as the severity of the latter, within moderate limits. This is a point much needing investigation.

The almost complete failure of Pears in my orchard is more difficult to account for than the less serious damage to Gooseberries and Black Currants. The Pears were not in blossom when the frost of 5° took place, and, therefore, they had no more than 2° degrees to encounter. Is

FIG. 4.—IRIS TINGITANA FLOWERING IN DEVONSHIRE.

Archer-Hind told me that he had only flowered it once in 30 years; the late Rev. Henry Ewhank, of Ryde, admitted that for 15 years it had not flowered with him; the late Mr. Wolley Dod stated that he had grown it for 20 years without having flowered it, and wrote "I must confess myself quite at a loss to know what its requirements are," whilst Mr. Irwin Lynch, in his *Book of the Iris*, says that it is not worth cultivation, presumably on account of its disinclination to bloom. It, however, Mr. Lynch had seen the bed here illustrated he would probably have altered his opinion. In the face of all these records of defeat in the culture of this Iris it is pleasant to be able to record a story of success. A few years ago, when Mr. Elwes was with me, we had a talk about tender plants, and he said that it was useless in this country to employ the same soil as that in which they grew in their native land. That a plant which in its home grew in sand would not succeed in that staple in England, but required richer food to make up for the change of climate. I thought over this con-

After the foliage had come up I saw that the stems were rotting off below the ground. On examining the spot I found that without my knowledge the bulbs had been covered deeply with earth and had more than a foot of soil over them, which accounted for their failure to bloom. In a reserve garden I had a colony of smaller bulbs planted, but expected no flowers from them. However, to my surprise and delight, I saw that many of them were throwing up flower-spikes, and in all 35 were perfected. The plants were very strong, all of them averaging well over 2 feet, while the tallest was only 2 inches short of 3 feet. The garden hangs over the river at the mouth of the Dart, and is about 35 feet above the water level. I invariably lift the bulbs when the foliage has died down and keep them in a dry drawer until the end of October, when I replant. If they are left until well on in November the tops will have begun to grow, but this does not affect their flowering. The blooming season of *Iris tingitana* is very irregular. I have had perfect blossoms in the open

it possible that so slight a frost could kill the blossom almost completely? I cannot believe that it is so. Moreover, the profuse blossom on some tall trees on a high level, where only 1° was registered 4 ft. from the ground, failed as completely to set fruit as that of trees on a low level. Much of the blossom in the former case was 10 feet above the ground level, at which altitude the temperature was probably not below the freezing point. The only suggestion which I can make to explain the mystery of Pear failure is the persistence of wet weather and the frequency of cold wind throughout the blossoming period.

Turning to the case of Plums, the mystery of failure deepens. Like Pears, they were subjected

there was the extensive dropping of Plums after they had been formed. No explanation suggests itself as to the reason why some varieties bore hardly any blossom and others a full or fair quantity. The scarcity was noticeable alike on very vigorously-growing Early Prolifics and feebly growing Monarchs, while the abundance occurred on strong Victorias and weak Pond's Seedling. Seeing that all alike were subjected to the disadvantageous conditions of last summer, the vast difference in blossoming is mysterious. The dropping took place only from the varieties which blossomed fully or fairly.

In the case of Apples, the difference in quantities of blossom did not altogether follow the lines of varieties, as it did with Plums. Most

in making a great deal of wood last season, and those of their fruit-buds which had not been nearly matured in 1908 apparently failed to open completely in 1909.

There would have been a good crop of Apples on the whole on mature trees if a fair proportion of the blossom had set and remained on the trees. But, in the first place, nearly all the blossom failed to set fruit on some varieties; and, secondly, a very large proportion of the fruit which was set dropped off most kinds. There was no frost after Apple blossom opened, and the failure of it to set is the first mystery. It is true that there was an attack of the Apple sucker, but the pest was almost annihilated where it was at all numerous by spraying when the blossom-buds were unopened, and I have the best crop of Apples on two or three varieties which were worst infested, while others of the infested varieties set an abundance of small Apples, which nearly all dropped off. It is this unusual extent of fruit-dropping, which reports show to be common throughout the country, that is most disappointing and inexplicable. Three rows of mature Duchess of Oldenberg were so thickly covered with small Apples, that four women were occupied over two days in thinning them, leaving, of course, the largest. Ten days later, nine-tenths of the Apples they had left on the trees had dropped off, so that their labour was entirely wasted. Other varieties thinned themselves without any attention. Some young and vigorous Golden Spires, which set a good crop of Apples, now have the ground under them strewn with fruit, some of which is as large as a Walnut; and Worcester Pearmain, which set a good crop of Apples in clusters, has thinned its fruit to about half a crop, nearly all singles. Of course, the forcing off of weak by strong fruit in a cluster is a common occurrence in any season; but the extent of the operations this year is phenomenal. If this were all, there would not be much cause to complain, as a crop of single Apples is pretty certain to be one of fine fruit. The great cause for regret is the extensive dropping of whole clusters.

An additional cause of the shortness of the Apple crop that will be saleable is not mysterious. This is the extraordinary proportion of fruit spoiled partly by the sawfly maggot and partly by caterpillars which have gnawed surface holes in the Apples. *A Southern Grower.*

PLANT NOTES.

EXACUM MACRANTHUM.

This *Exacum* was at one time regarded as a difficult plant to cultivate, but Messrs. James Veitch & Sons have contributed several excellent batches of it at recent meetings of the Royal Horticultural Society. A group of *Exacum macranthum* in the greenhouse at once arrests attention by reason of the showy flowers, which are of a rich bluish-purple tone. The flowers of *Ploroma elegans*, a shrubby Melastomal from the Andean region of South America, are of this shade. This plant is another test of the cultivator's skill.

Many of the early failures with *Exacum macranthum* arose from an excess of warmth, the temperature of a stove being considered necessary for its well-doing, but coming as it does from the more elevated regions of Ceylon it must be regarded rather as an intermediate-house subject.

The members of the Gentianaceæ generally are remarkable for the rich shades of blue and purple in the flowers. A member of the same order was, in my younger days, largely grown in gardens, but I have not met with it for some time, this is *Eustoma Russellianum*, formerly known as *Lisianthus Russellianus*. It is a native of Texas, whence it was introduced about a century ago and named in honour of the Duke of Bedford. W.

FIG. 5.—IRIS TINGITANA: COLOUR OF STANDARDS, VIOLET-BLUE; FALLS, GREY, WITH YELLOW BLOTCH.

in my plantations to no more than 2° of frost after the blossom opened; but, unlike Pears, their blossom set well in the first instance, and the evil was that more than half the fruits turned yellow and dropped off when about as large as Peas. There was no frost at all after the fruit had set. It is quite certain, therefore, that frost is not accountable for the serious partial failure of Plums in my plantations. In the first place, there was the lack of any considerable quantity of blossom on some varieties, due probably to the non-maturing of fruit buds in the cold and wet summer of 1909; and, secondly,

kinds of mature trees blossomed profusely as a rule, while other trees of the same varieties had little or no bloom, and a few varieties had hardly any. The possible explanation is that varieties and individual trees which bore great crops last year failed to complete the ripening of immature fruit-buds last summer, while varieties and individual trees which had very little fruit last year finished the ripening of fruit-buds which were just short of the maturity necessary for blossoming in that season. Young trees, four and five years from the planting, for the most part failed to blossom fairly. They were engaged

NOTES FROM A "FRENCH" GARDEN.

WE have just planted the last batch of Cauliflowers for the autumn market, where Turnips or Cos Lettuces have been grown in the open, and among the Melon frames, putting four plants under each light. Previous to the planting, the Cauliflowers were carefully examined, and every plant attacked by maggot was discarded. Maggots have been unusually numerous in the seed-beds this season.

The Cauliflowers planted in the open ground late in March are now ready for the market. Those grown in the cloche-beds will be ready in 10 or 12 days.

The Carrots (Chantenay) sown in the open early in March are now marketed, and their place will be occupied by the Celery known as Red of Aylesbury. The red varieties do not do well on the old manure beds, and produce very slim plants.

The winter batch of Endive (La Ruffec) for heavy ground, La Meaux for sandy soil, and also the Batavian Green will be sown in a few days in order that they may be ready for planting out in the middle of August. These crops sell at remunerative prices, especially when sent to the market in small quantities at a time. They can be bleached as required till Christmas without any more protection than the litter or mats used for the bleaching.

The first Melons were marketed on June 21, and Cucumber Telegraph has been planted in their place. All the Melon plants have grown a great quantity of wood, as the fruits are nearly fully grown, and the weather has been favourable. These extra growths must be thinned out not to weaken the plants unnecessarily, because another batch of fruits may be obtained if the plants are still strong and healthy. Where Melons are grown under cloches it is advisable to put frames and lights in their stead as soon as these are available from the first batch. It is also necessary to choose the first fruit when grown under cloches to obtain a fruit of good size and flavour early in September. The Melons, when in the ripening stage, must be examined frequently, especially on a very hot day. They should be cut as soon as the stalk begins to crack, and placed in a cool cellar for a few hours before being dispatched to market. *P. Aquatias.*

HOME CORRESPONDENCE.

(The Editors do not hold themselves responsible for the opinions expressed by correspondents.)

EFFECTS OF LAST WINTER ON VEGETATION.—Referring to this subject, I may say that *Ozothamnus ros-mariniifolius*, which has been killed outright with Sir Herbert Maxwell in a considerably milder district than mine, is now coming into flower in my own garden. The plant is against a south-west wall, and was injured severely. *Lilium Hansonii* was injured by late frosts, and did not open its flowers, although not suffering much otherwise. Roses have suffered a good deal, but the most injured has been Tea Rambler, which was hardly any the worse for the winter of 1908-1909. Last winter it was cut almost to the ground. Dorothy Perkins growing on a short pergola has again been injured, but the position is a rather draughty one. Jersey Beauty has suffered more than some others of this class, but, on a pillar, it has been less injured than on the pergola. The *Hypericum* have been little injured, and, with the exception of *Arbutus Unedo Croomei* and *Phlox fruticosa*, there is little to report in the way of losses. *Veronicas* have suffered considerably, however, but, trying as the winter was, the losses here do not seem to have been any greater than usual. *S. Arnott, Sunnyvale, Dumfries.*

The following notice of the behaviour of certain shrubs and plants in the south-eastern corner of England since their ordeal of last winter may perhaps prove of interest as a sequel to what has already been reported in your columns by Sir Herbert Maxwell and others:—*Uninjured*: *Tricuspidaria lanceolata*, *Eucryphia pinnatifida*, *Carpenteria californica*, *Buddleia Colvilei*, *B. auriculata*, *Solanum crispum*, *Davidia involuerata*, *Sophora flavescens*, *S. platycarpa*, *S. Mooreana*, *Enothera coccineum*, *Rhododendron cinnabarinum*, *R. Falconeri*, *Philosia*

buxifolia, *Eriobotrya japonica*, *Sollya heterophylla*, *Pentstemon cordifolius*, *Perovskia atriplicifolia*, *Clerodendron Fargesii*, *C. trichotomum*, *C. Bungei*, *Senecio elegnifolius*, *Olearia stellata*, *O. macrodonta*, *O. nitida*, *Stuartia pseudocamellia*, *Tenorium fruticosum*, *Rhycospermum jasmimoides*, *Clianthus puniceus albus*, *Mitrasia coccinea*, *Magnolia Campbellii*, *Notospartium Carmichaeliae*, *Sphacele Lindleyi*, *Plagianthus Lyallii*, *P. betulinus*, *Corokia coton-easter*, *Pittosporum crassifolium*, *Desfontainea spinosa*, *Drimys Winteri*, *Lomatia ferruginea*, *Hoheria populnea*. The following shed their leaves, but are quite vigorous: *Gordonia pubescens*, *Feijoa Sellowiana*, *Schinus patagonica*, *Illicium floridanum*. *Injured*: *Eleodendron sphaerophyllum pubescens*, cut down to the ground; *Tricuspidaria dependens* (true), upper shoots nearly a foot long killed, otherwise growing strongly; *Poincinia Gilliesii*, *Anona triloba*. *Slightly injured*: *Rhaphitamnus cyanocarpus*, *Fallugia paradoxa*, *Eugenia apiculata*. These are the "mimms" of the garden; *Pueraria Thunbergiana*, *Mutisia clematidea*, *Myosotidium nobile*, *Cantua buxifolia*. *Killed*: *Bowkeria triphylla*, *Crossosoma californicum*, *Agapetes buxifolia*, *Sollya Drummondii*. Such plants as *Salvia patens* and *Dahlias* remain here in the ground permanently. The garden is on an exposed site, 200 feet above the sea, and distant from it about three-quarters of a mile. *T. A. Hyde, Ringinglowe, Hythe, Kent.*

—In reference to Sir Herbert Maxwell's remarks on plants of doubtful hardiness, I may state that the following species are growing here in an exposed position at an altitude of about 610 feet and 45 miles from the Gulf Stream:—*Abutilon* var. *ilacina*, *Rhododendron Falconeri*, *Elaeagnus macrophylla*, *Buddleia globosa*, *Berberis nepalense*, and *Rhus cotonoides*, which are here uninjured. Of the plants which he lists as uninjured we grow 16, which are here uninjured, namely, *Buddleia Colvilei*, *B. variabilis*, *Carpenteria californica*, *Azara microphylla*, *Erica arborea*, *Indigofera Gerardiana*, *Romneya Coulteri*, *Fuchsia Riccartonii*, *Lilium auratum*, *Crinum Moorei*, and *C. Powellii*. *Sparaxis* or *Dierama pulcherrima*, and the white variety, *Invarvillea Delavayi*, *Campanula fragilis*, *Kniphofia caulescens* and *Omphalodes Luciliae*, *Escalonia macrantha*, *E. Langleyensis*, and *E. Philippiana* are now in full flower. Of *Cistus* we have a good collection, all uninjured. The same applies to *Veronicas*. The semi-shrubby variety *rupestris* is now very fine, a sheet of blue as a carpet to other flowering shrubs. *Coronilla hypnoides*, which has survived with a little injury the previous four winters has succumbed. *Opuntia Rafinesquii* has weathered the last four winters in good condition. Special mention may be made of the profuse flowering of *Cytisus* in several varieties, *Choisya ternata*, and *Prunus cerasifera atropurpurea*, which is now carrying fruit. Of bulbous plants: *Narcissus*, *Anemones* in several varieties, and *Iris*es have flowered quite equal to usual. *John Edwards, Sylfaen Gardens, Welshpool.*

EXHIBITION VEGETABLE CULTURE.—*Practical* states that I should know better than to say "exhibition Cauliflowers, Potatos, and Beans need only ordinary culture." He asks, do I mean Cauliflowers planted 4 feet apart, mounted about the stems with manure, and daily supplied with water, or Potatos planted 4 feet apart, Tomatos thinned from 12 fruits on a bunch to five, and Beans planted 15 inches apart in the rows? All this is the wildest imagination. Were this form of cultivation adopted it would destroy all hopes of success. Cauliflowers treated as stated would produce heads 10 inches to 12 inches over. What chance would they have of winning prizes? Potatos 4 feet apart would produce huge, ungainly tubers. Tomatos so severely thinned would be two to the pound, and so on. Can anything be more absurd? The very best Cauliflowers possible for show are those of quite medium size, solid and white, easily obtained under ordinary culture. Whoever saw the leading vegetable exhibitors put up larger heads? Those who remember the perfect and beautiful Broccoli heads shown by Messrs. Sutton & Sons not long since, know they came from an open field. I see in our markets here myriads of Cauliflowers so grown which would be prized by any exhibitor of vegetables. I beg readers of the *Gardeners' Chronicle* not to be led away by *Practical's* remarks. All the tendency of vege-

table judging is against undue size. Quality, not excessive size, is now the universal requirement with all kinds or classes. Runner Beans are commonly sown 10 to 12 inches apart, in the row, and to the benefit of the plants and crops; I have seen rows of Runner Beans when in full fruit at Hackwood Park, Sydmonton Court, Highclere Castle, Aldenham House, Welbeck, and other good vegetable gardens, and the grand growth and crops has astonished even so old an observer as myself. Large size in Onions does not represent lack of quality. In a well-ripened bulb of Ailsa Craig there is exactly the same quality of flesh found in a bulb of any other variety, but the taste is milder and that is by no means a defect. For stewing or baking alone these bulbs are splendid, and as to profitable production, let *Practical* ask any cottager or allotment-holder whether he prefers large bulbs to small ones, and he will soon get his answer. Long Runner Beans are always tested for tenderness and edible value. Peas are opened and tested for colour and tenderness and flavour, also for fullness, and not for mere size of pods, as is so foolishly assumed. Celery is tested for its solidity, freshness, blanched condition, and its bolting or non-bolting properties; Leeks for their colour, purity, and fitness for cooking, and not for length of blanched stem, which, as a rule, rarely exceeds 14 inches and never runs to 20 inches. This is, I think, sufficient criticism on my part. Growers who are poor cultivators are fond of flinging stones at those who are first-class vegetable culturists. The man who can do great things under glass may not always be so successful in the kitchen garden. *A. D., Kingston-on-Thames.*

SPRING CABBAGES.—I notice from the report of the trials of Spring Cabbages conducted by the National Vegetable Society (see *Gard. Chron.*, vol. xlvii., p. 423), there are no fewer than 36 names. I would ask what are we to learn from this report? Is not such a publication of varieties most bewildering to the inexperienced, who needs at the most two varieties of Cabbage to meet all the requirements of a moderate-sized establishment? Even the largest garden does not require more than three distinct sorts. A good variety of Cabbage, even if raised 20 or more years ago, is at the present as desirable as any of the so-called modern sorts. For example, Ellam's and Wheeler's Imperial were excellent sorts long ago, and apparently retain their food properties at the present time, as I note that they receive three marks. Surely the National Vegetable Society could find much more important work than the mere publication of a list of three dozen sorts of Cabbages. I think it is beyond doubt that a Cabbage is still a Cabbage, and a vegetable appreciated much during two or three months of the year, and, as there is so little difference between varieties when cooked why confuse the public with such a plethora of varieties? It is a well-known fact that the cottager of even a little experience is alive to the best variety for his purpose and understands methods of culture without the aid of a national society. *E. M.*

SOUVENIR DE LA MALMAISON CARNATIONS AT ENVILLE.—The cultivation of "Malmaison" and other Carnations has made great strides during the last few years, but nowhere have I ever seen such a grand collection, or such well-grown specimen plants as those in the collection at Enville Hall, Staffordshire, the seat of Sir Henry Foley Grey. There are hundreds of plants in successional stages, from those in 5-inch pots to others growing in 16-inch pots. Some of the larger specimens have upwards of 50 flowers, open and opening, and every plant is in robust health, whilst some of the leaves measured fully $\frac{3}{4}$ inch in breadth. Maggie Hodgson, Duchess of Westminster, Nautilus, Princess of Wales, King Oscar, and many other varieties grown on as specimens, 3 feet 6 inches through, and properly staked out, fill one with admiration. They have found the right sort of loam at Enville for the purpose, and it appears to contain a goodly proportion of soluble lime. Mr. Green, Junr., who has entire charge of these beautiful gardens, is to be congratulated upon his successful cultivation, thereby proving himself a worthy son of a worthy sire, seeing that his father, Mr. Green, Senr., was head gardener for upwards of 35 years at Enville until the death of the Dowager Lady Stamford. *W. Crump, Madresfield Court Gardens.*

WILTON HOUSE GARDENS.—The interesting notes that have recently appeared in these columns pertaining to Wilton House Gardens induce me to record a few personal reminiscences of the place. My association with Wilton was upwards of half a century ago, when I acted as flower gardener under Mr. John Brown. In those days, *Plumbago capensis* was considered to be the gem of the parterre in the Italian garden, and as a dwarf bedder it was assigned two of the large, angular beds in proximity to the fountain. In summer it presented unique masses of incomparable, dainty, corulean-blue flowers, the only edging being that afforded by the formal grey-stone bordering. I may here remark that after Wilton, on my appointment as head gardener at Ethington Park, Stratford-on-Avon, I found the climatical conditions so favourable that I cultivated *Plumbago capensis* in the new architectural flower-garden there, with favourable results, and as an edging next to either the grass or Box bordering an excellent combination was found in Mangle's variegated *Pelargonium*, or, by way of a change, the intermixture of the twain afforded a most pleasing "shot-silk"-like effect. Another effective picture was that produced by associating *Calceolaria amplexicaulis* with the *Plumbago*. The historic evergreen Oak

less seed is produced than is the case with the ordinary border *Polyanthus*. All seed-pods are practically bald when formed, whilst in all common *Polyanthus* flowers the pods are wrapped in a green calyx. Hose in Hose *Polyanthuses* were once plentiful, and the late Richard Dean had so many of such a fine strain that he was enabled to offer true and distinct seeds of them. At Long Ditton there were also very large breadths of *Polyanthuses* in colours. Specially plentiful were the rich crimsons, and a strain of an almost rosy-scarlet was singularly bright and almost fiery in the sunlight. Dull shades, such as purple, mauve, buffs, and browns, are not appreciated at Long Ditton, although many are particularly fond of these hues. Whites and yellows were plentiful and good. The old gold-laced section is extensively grown, and Mr. W. Barr hopes to be able to resuscitate that fine quality and beauty of markings which formerly characterised George IV., Lancer, Exile, Cheshire Favourite, and others of the best exhibition varieties. These latter, like the show *Auriculas*, are essentially florists' flowers. A. D.

SWEET WILLIAM PINK.—I am sending you by post a few blooms of an old floriferous mule Pink. The double flowers are a deep rosy-crimson, and the spikes were cut from large clumps

John, then what is Fairchild's Pink, or is the latter lost to gardens? J. Murison.

GERMINATION OF UNRIPE SEEDS.—In my fernery I have a plant of *Lapageria alba* which last season bore a number of flowers. In the late autumn, on entering the fernery, I trod upon what I at first took to be an unripe Plum on the tiled path, but on inspecting it I found that it must have been an hitherto unnoticed seed vessel of the *Lapageria*, within which I found about 20 seeds, white and quite soft, oval and about the size of Sweet Pea seeds. Happening at the time to have pricked out a number of Fern prothalli an inch apart into a 9-inch pan, it occurred to me to place these seeds in the spaces between the prothalli, just inserting them on the surface. This I did, covering them with a sheet of glass, but not with soil, so that they were still visible. To my great surprise, each one shortly produced a shiny root, which penetrated the soil, and in some cases lifted the seed a short distance from it. Eventually, after a period of some months of apparent dormancy, a bud appeared at the points whence the roots issued, and the end result is that although most of the seeds have disappeared, three have survived, of which one has developed a shiny leathery leaf with a healthy bud at its base; another promises to do the same, the leaf being in embryo and the bud visible, while the third seed is still intact, with its root in the soil, but the leaf has failed to develop. I am, therefore, practically certain of two plants, although the seeds were soft and pulpy and evidently very far from being ripe, or ready for sowing. This has resulted in the absence of any artificial heat in a room where several degrees of frost were experienced during the winter, and I attribute the loss of the majority of seeds to sourness of soil, since the Fern prothalli failed in many cases, and the sowing was far from satisfactory. All the seeds germinated quickly and vigorously. Chas. T. Drury, V.M.H., F.L.S.

FIG. 6.—THE WARREN HOUSE, STAMFORD.

(See p. 22.)

(*Quercus Ilex*), which was so excellently reproduced in the *Gardeners' Chronicle* last week, used to serve as a protection for bedding plants before they were sufficiently hardened for planting in the beds. The specimens of Cedar of Lebanon were also objects of veneration. William Gardiner.

SOME OLD-FASHIONED FLOWERS.—In their nurseries at Long Ditton, Messrs. Barr & Sons are growing those old favourites, Hose in Hose, Jack in the Green, Galligaskin, and some other quaint forms of *Polyanthuses*. It was a surprise and pleasure to see these old garden flowers in bloom in May. The Jack in the Green section is represented by flowers of white, yellow, red, crimson, and other shades, and the true form has its pips backed by a broad, green, abnormal calyx. The Galligaskin, or Jack on Ape, as it is sometimes called, has the calyx split up or divided into a somewhat leafy form. Then some varieties have the calyx parti-coloured, it having become partially petaloid and partially green. Though curiosities, they are none the less pretty. The Hose in Hose, or duplex section, has the normal green calyx converted into an ordinary floral pip, from out of the throat of which projects the normal pip. It is only in the throat of the latter that the reproductive organs are found, but because of the unusual length of the throat tube,

now in full blossom that continue to flower until late in the autumn. It is a very uncommon plant, and is known as the Sweet William Pink. The leaves are broader, the stems stronger and stiffer than the ordinary mule Pinks of Napoleon III. type, and the flowers possess a fairly strong clove scent. Wm. Masters, when in business in Canterbury, recorded it in 1831 in his interesting plant- and seed-catalogue, *Hortus Davernii*. More than 20 years ago an old lady, then over 70 years of age, showed it to me in her garden near Andover. She was the only person I ever heard call it "Sweet John," and that induced me to look up Philip Miller's gardening dictionary and others, and as a result of my enquiries I have come to the conclusion that the Sweet William Pink and the "Sweet John" or Fairchild's Pink are identical. Miller describes it accurately under *Caryophyllus* as a narrow-leaved, hybrid Sweet William known as Fairchild's Pink, and in all probability it is the first recorded hybrid plant in British horticulture. It is scarcely known in the modern trade. I have submitted plants to the R.H.S. Mr. Douglas, Mr. Chas. Dixon, &c., and all of these authorities have not been clear about the plant, although known to them. In another quarter it was named "Lady Dixon," "Napoleon III.," but this plant had been in existence long before these names could be applicable. If this is not Miller's Sweet

The Week's Work.

THE KITCHEN GARDEN.

By JOHN DUNN, Kitchen Garden Foreman
Royal Gardens, Windsor.

Cabbages.—A sowing of Cabbage seed may be made now and another after the lapse of a fortnight: this latter date will be more suitable for the southern counties. For Cabbage seeds, borders are frequently selected which have yielded some early crop, but the results would be better if the seeds were sown in a more open situation, selecting soil that is only moderately rich, and a position where the young plants are not likely to be drawn. After the ground has been dug, it should be trodden firmly as soon as the state of the soil will permit. The drills should be drawn at 1 foot apart, and the seeds sown thinly. It is better to make the seed-bed large than to crowd the plants together, causing them to become thin and weakly. In cases where only small plantations are necessary, the young plants should be pricked off as soon as they are large enough to handle, placing them at distances of 4 inches apart each way. Suitable varieties for autumn planting are Flower of Spring, Ellam's Early, and Offenham. A small sowing of Red Cabbage may be made at the same time, for planting out in autumn. Cabbage plantations, where the heads have already been cut, should have the stumps cleared off, in order that the ground may be prepared for a crop of late Turnips.

Carrots.—A sowing of stump-rooted Carrots should be made on a south border, for supplying roots in November and December. It will be appropriate if these Carrots are made to succeed early Potatoes. Last year our best and cleanest roots, available for use in the winter, were obtained from a sowing made on July 7. The drills should be drawn at 9 inches apart, and should be 1 inch deep. Thin the plants as soon as they are large enough, leaving a space of 4 inches between each plant. Hoe the surface soil frequently between the rows.

Endive.—In order to obtain autumn and early winter supplies, seeds of the Endive known as Round Leaved Batavian should be sown in drills drawn at 18 inches apart. Transplant the seedlings to a sloping border as soon as the plants

are large enough to handle. Make another sowing a fortnight later in a position where protection can be given during winter. If unheated frames are available for them, the plants may be transplanted into the frames, where they can be grown without the frame-lights until the autumn frosts. If the plants are grown in this manner, they will not be so liable to damp off during the winter months as those removed to the pits after they have attained their full size.

Broccoli.—Plants intended for furnishing a supply in late spring should be put out as soon as the ground is available for them, choosing an open situation where the soil is not excessively rich. The ground must be made very firm before the plants are put out, as more failures are due to planting late Broccoli on loose, rich soil than from any other cause. A space of 30 inches is not too much to leave between the plants.

Winter Tomatos.—Sow seeds of Tomatos in a slightly heated pit. During germination and until the plants are large enough for planting into 4-inch pots, they should be kept near to the glass. Later they should be potted into 10-inch pots and placed in a house where they can be given an abundance of air by day and night until they have set full crops of fruit. Following this stage the plants may be removed into warmer quarters in quantities sufficient to maintain a supply of fruits. By this method of culture, Tomatos may be had during the greater part of the winter without much trouble or expense. Place a stake to each plant as soon as it is potted and continue to remove all side shoots. The soil for this crop should consist of turfy loam three parts and leaf-mould one part. Suitable varieties are Kershaw's Premier and Winter Beauty.

THE ORCHID HOUSES.

By W. H. WHITE, Orchid Grower to Sir Trevor Lawrence, Bart., Bouf rd, Surrey.

The East Indian house.—When suspended close up to the roof glass on the south side of this house, the *Catasetums* and *Cycnoches* thoroughly enjoy the warmth of the sun and as much light as it is possible to afford them without scorching the young foliage. Both species are now rooting freely and making considerable progress with their new growth. They require to be examined almost every day, so that the best rooted plants and those which are pushing up flower-spikes may be supplied abundantly with water. Prevent water from lodging in the young growths and carefully examine the bases of the pseudobulbs for mealy bug, for if these insects once obtain a footing below the compost it is almost impossible to eradicate them until the potting season again comes round. As the *Thunias* pass out of flower, the plants should be placed in a cool house, such as a light viney or Peach house, where they will be exposed to the sunlight. Any plants which have failed to bloom, and are still growing, should have the apical part of each growth pulled out so as to stop all further progress in this direction; the plants may then be treated similarly to those that have bloomed. After being placed in the drier atmosphere, the leaves are liable to become infested with red spider, but that pest is easily kept in check by laying the plants down on their sides about once a fortnight, and well syringing them with warm, strong, soft-soap and water. These plants will require to be watered as long as the leaves remain fresh and green, but, when they commence to change colour, water should be withheld gradually and the plants placed on a dry shelf where the night temperature is about 55°. The *Dendrobiums* are now growing vigorously. The best rooted plants should be afforded abundance of water at the root and a gentle spraying with tepid soft water, well up under the leaves several times a day when the weather is warm and bright. The shading immediately over them should be removed a trifle earlier each afternoon, so as to gradually prepare them for the ripening process. Continue to tie up the young growths and cut off all badly spotted and decayed leaves. Such *Habenarias* as *H. pusilla* (militaris), *H. canna*, *H. Susanne*, *H. intermedia*, *H. goniculata*, *H. longibracteata*, *H. zambesina*, and *H. uzumbala*, which are now in full growth, should be placed well up to the roof glass in this house. Afford a moderate amount of shade, preserve a moist atmosphere around them, and keep them well supplied with water at the root till growth

is finished and the flowers commence to open. *Habenaria rhodocheila*, being now at rest, should be placed in a rather more cool and drier atmosphere, where they may obtain moderate sunshine to ripen the tubers. Examine them about once a week and water lightly those that are quite dry on the surface. Such deciduous Orchids as *Lissochilus giganteus*, *L. purpurescens*, *L. arenarius*, *L. stylites*, *Eulophia nudans*, *E. Guineensis*, *Geodorum purpurescens*, *G. angustum*, *G. dilatatum*, *Habenaria goodyerioides*, &c., that are in full growth, and some already showing their flower-spikes, should be kept thoroughly moist at the root till the flowers are past and the growths commence to die down naturally. Place these plants in a light corner of the house and keep their immediate surroundings constantly saturated.

THE FLOWER GARDEN.

By E. BECKETT, Gardener to the Hon. VICARY GIBBS, Aldenham House, Hertfordshire.

Dahlia.—The recent showery weather has caused the Dahlias to grow exceptionally freely, therefore tying must be attended to promptly and the growths thinned out where necessary. In the case of Show varieties, the more prominent flowers must also be supported, or many of them will become broken down. Traps must be placed for earwigs. One of the best consists of lengths of broad Bean stalks dried in the sun, some being secured to the stake of the plant with a piece of raffia, and others placed in the foliage. The contents should be blown each morning into a bottle of water. Apply dressings of artificial manure during wet weather, and fork or hoe in lightly.

Gladiolus.—Spikes of Gladiolus provide excellent material for the embellishment of the house when placed in vases sufficiently large for the proper display of the large inflorescences. Where a large quantity is required, and the space necessary is available, it is desirable to devote a border to Gladioli entirely, planting them in rows, though, at the same time, nothing is more effective for the mixed border, or when massed for a bright display. Keep the surface soil aerated by the free use of the Dutch hoe, at the same time stirring in a sprinkling of manure. The plants are gross feeders, and during hot weather they require copious supplies of moisture and stimulants. Staking will be necessary, but the ties must be made loosely, employing just sufficient to prevent the spikes from falling and the flowers from becoming damaged.

Campanula.—Especially suited for massing in beds is *C. persicifolia* and its beautiful forms; also *C. macrantha* and the variety *alba*; *C. latifolia*, *C. van Houttei*, a fine hybrid, with long, blue flowers, and *C. Burghatii*. These require the spikes each secured to neat stakes.

Clematis.—The herbaceous varieties of the Clematis are now flowering freely. They attain a height of from 4 feet to 5 feet. *C. erecta* and its double variety make dense growth, and are now covered with a multitude of white flowers. *C. Pallasii* is similar in habit, and has white flowers of a finer colour and much larger. *C. Algeri* has large, blue flowers, as also has *C. integrifolia Durandii*, but of smaller size; *C. Davidiana*, a Chinese species, produces pale blue flowers of a beautiful form and sweetly scented.

General work. The recent rains have afforded a good opportunity for rolling the drives and walks. Lawns also will derive much benefit if rolled lightly. Hedges of various description and any other shrubs formally trained may now be clipped. Low growing plants used for carpeting in the bedding arrangements must be pegged down evenly, and the beds kept free from weeds by hand pulling. Late-sown annuals will require thinning, and a further sowing of Mignonette may be made on a shady border. Remove all decayed flowers on Sweet Peas, to encourage growth and prolong their flowering period. The majority of the Rhododendrons have now passed out of flower, and these should have the seed-vessels removed. Quarters containing such plants as Phlox, Asters, Carnations, Pentstemons, &c., growing freely must be kept neatly tidied, and the soil constantly stirred and freed from weeds. Stocks of plants, such as Alpines, &c., especially if in small pots, will need less attention as to watering if plunged to the rims of the pots in ashes contained in frames.

Frames containing unrooted cuttings should be kept close and shaded, and the cuttings may be syringed until they have made roots.

THE HARDY FRUIT GARDEN.

By A. R. SEARLE, Gardener to the Marquis of NORTHAMPTON, Castle Ashby, Northamptonshire.

Summer pruning.—Continue to train-in the shoots upon Plum, Peach, and Pear trees, taking the opportunity at the same time to finally thin the fruits. Where Apples and Pears have set heavy crops, and it is desired to obtain specially fine fruits for exhibition or other purposes, the fruits should be thinned freely. Early varieties of Apples, such as Lady Sudeley, Worcester Pearmain, Irish Peach, Beauty of Bath, etc., frequently set heavy crops, but they fail to ripen fruits of sufficient size and quality for dessert purposes unless thinning is carried out.

Protection of ripening fruits.—Means must be taken to protect all ripening fruits from birds, especially Currants, Cherries, or Gooseberries. Strawberry plants which have fruited and are not required for another season should be dug up and the ground cleaned immediately the crop has been removed. Make sure that all fruits required for preserving are quite dry at the time of gathering, otherwise they will be deficient in flavour and the jam will not keep well.

Sweet Cherries.—As soon as the early varieties are cleared of their crops, the trees should be syringed vigorously with some approved insecticide to thoroughly cleanse the foliage, making sure that all parts of the wood and foliage are well wetted with the mixture.

Insect pests.—These have been unusually prevalent this season, and have caused the expenditure of a large amount of labour. The worst have been the different species of caterpillars. We have employed arsenate of lead freely on fruit trees and Roses, and it has destroyed a large number. Where trees are unusually badly infested with caterpillars, it is almost impossible to save the crop this season, but by persevering in the cleansing operations, a better state of things may be obtained next year.

American blight.—Examine all trees likely to be attacked by the woolly aphis or American blight, and if any be found, rub the affected parts thoroughly with the mixture recommended in a previous Calendar.

Fruit room.—Keep this room well ventilated and as cool as possible so long as it contains any fruit. Later on, when there is little need for the fruit room, the opportunity should be taken to cleanse the whole structure thoroughly. If the building is of the old type, the walls should be lime-washed and the wood-work washed with hot, soapy water. After such treatment, the room will be ready for housing the fruit in autumn.

Grafts.—Examine all the newly-made growths, and if the scions are found to be growing freely, the ties must be loosened. See that the shoots are fastened securely to the stakes, or they will be damaged by winds. Remove any shoots or suckers that form below the point of union.

PLANTS UNDER GLASS.

By JOHN DONOGHUE, Gardener to JOSEPH PICKERSGILL, Esq., Bardon Hill, Westwood, Yorkshire.

Perpetual-flowering Carnations.—The latest plants intended for flowering in the winter and spring should now be repotted for the last time. The earliest batch, which was potted some time ago, have become well rooted; they may be given a top-dressing of some approved chemical fertilizer and alternate waterings of clear soot-water. It is not desirable to pinch any of the flowering spikes later than the end of June, unless the district is favoured with unusually good climatic conditions. Each shoot may now be looped to the centre stake, and further tieings must be attended to at regular intervals as the flowering spikes develop. Take every means to keep the plants free from aphides, which are frequently a great trouble at this season. Old stock plants that were treated according to previous directions, and are now growing in a border out-of-doors, should now be furnishing flowers.

Souvenir de la Malmaison Carnations.—The varieties of this type are now at their best, and the flowers are particularly grateful in their

beauty and perfume. As the plants pass out of flower, the best of the one-year-old specimens may be reserved for repotting into larger pots for cultivation another season. For this potting, a suitable compost is one consisting of yellow, fibrous loam of a rather sandy nature, and used in a rough or lumpy state with a small quantity of peat, and sufficient lime rubble and coarse Bedfordshire sand to keep it porous. A quantity of broken charcoal may also be used for this purpose if it is thought desirable. Select clean pots, 8 to 10 inches in diameter, these being generally large enough for specimen plants, but the cultivator, in determining the size of the pot must be guided by the size and strength of the individual plant. It is necessary to make quite sure that a plant is moderately dry before affording fresh water to the roots. Attention must be given to the layering of stock for raising plants in sufficient time to become estab-

lished before winter. The layering process is best carried out in cool frames or pits. The most unsightly specimens are quite suitable for layering, provided that they have healthy growths. They should be plunged in a bed formed of half-decayed leaves, arranging the plants so that they are placed in a slanting position, in order that the growths may be the more easily layered into the soil. Pick off the leaves from the base, leaving from four to six pairs on each shoot. Make a clean, sharp cut upwards in the centre of the stem, long enough to allow the plant to be layered with the tongue open. The layers should be carefully pegged down into a sandy compost, and in about a month or six weeks they may be expected to be ready for potting into small pots. Replace the lights upon the frames after the completion of the layering process, and keep the atmosphere rather close for a few days, providing shade during bright

sunshine; but at other times as much light should be admitted as possible, and to this end the glass should be kept perfectly clean.

Chrysanthemums.—Cuttings intended for cultivation for decorative purposes must now be repotted into their flowering pots. When this has been done, they should be placed at proper distance from each other on an ash base in a sunny position out-of-doors. Frequent attention must be given to staking and tying. The shoots should not be pinched after the middle of July, unless a contrary practice has proved satisfactory in the particular district.

Winter-flowering plants.—Plants of various species which are being grown expressly for decorative purposes in winter need constant attention to watering, and, in some cases, repotting will be necessary. Every means should be taken to induce the plants to make perfect specimens before autumn.

in the case of rank growths, which would disturb the balance of the trees. A little fresh growth will tend to keep the roots active.

Later trees.—The later trees will require considerable attention as regards tying and regulating the growths. Avoid overcrowding of the branches, removing any badly placed or useless growths. Ventilate the house freely in hot weather, admitting air sufficiently early on bright days to prevent scorching of the foliage.

Fig trees in pots.—Any pot-trees which have been reserved for late cropping have been out-of-doors up to the present, but they should now be placed in a light, airy house; affix rims to the pots and apply a top-dressing. Maintain a moist, genial atmosphere without excessive heat, syringing the trees once or twice daily with a view to securing healthy young growth. These pot trees, with careful attention to cultural details, will maintain the supply of ripe fruit well

FIG. 7.—HERBACEOUS PLANTS AT THE WARREN HOUSE, STANMORE.

(See p. 22.)

FRUITS UNDER GLASS.

By B. GOODACRE, Gardener to SIR ERNEST CASSEL, G.C.B., Moulton Paddocks, Newmarket.

Figs.—Trees that were forced early will now be swelling their second crops. Very little fire-heat is necessary to maintain the requisite temperature at this season, consequently less damping need be done to preserve a moist atmosphere. Large, established trees absorb great quantities of moisture during hot weather, and, in some cases, it may be necessary to soak the borders several times weekly; manure-water and soot-water should be applied to the roots occasionally. Syringing should be stopped when the "eye" of the fruit opens, as advised in previous *Calendars*. At this stage, a little air may be left on at the top of the house during the night. As the trees will be allowed to rest after ripening this second crop, it will be unnecessary to stop the young shoots after the fruit is cleared except

into the winter. Allow each tree ample space and light so that it will make sturdy and well-developed growth; give frequent applications of liquid manure, varied by sprinklings of some approved fertilizer mixed with a little fresh soil.

Melons.—Plant successional plants as required to meet the needs of the establishment. About 12 weeks may generally be reckoned from the time of sowing the seed until the fruit is ripe, allowing a week or two more or less according to the season of the year. Ripe fruits may be kept in good condition for some time if cut and suspended in a cool and airy fruit-room. Avoid over-watering, especially during dull, cold weather. Less stimulants will be necessary than for plants growing in houses, since, owing to the atmospheric conditions not being so well under control, there is often a tendency for the plants to make much useless growth at the expense of their fruit-bearing qualities.

ished before winter. The layering process is best carried out in cool frames or pits. The most unsightly specimens are quite suitable for layering, provided that they have healthy growths. They should be plunged in a bed formed of half-decayed leaves, arranging the plants so that they are placed in a slanting position, in order that the growths may be the more easily layered into the soil. Pick off the leaves from the base, leaving from four to six pairs on each shoot. Make a clean, sharp cut upwards in the centre of the stem, long enough to allow the plant to be layered with the tongue open. The layers should be carefully pegged down into a sandy compost, and in about a month or six weeks they may be expected to be ready for potting into small pots. Replace the lights upon the frames after the completion of the layering process, and keep the atmosphere rather close for a few days, providing shade during bright

EDITORIAL NOTICE.

ADVERTISEMENTS should be sent to the PUBLISHER, 41, Wellington Street, Covent Garden, W.C.

Special Notice to Correspondents.—The Editors do not undertake to pay for any contributions or illustrations, or to return unused communications or illustrations, unless by special arrangement. The Editors do not hold themselves responsible for any opinions expressed by their correspondents.

Letters for Publication.—As well as specimens of plants for naming, should be addressed to the EDITORS, 41, Wellington Street, Covent Garden, London. Communications should be written on one side only of the paper, sent as early in the week as possible and duly signed by the writer. If desired, the signature will not be printed, but kept as a guarantee of good faith.

Local News.—Correspondents will greatly oblige by sending to the Editors early intelligence of local events likely to be of interest to our readers, or of any matters which it is desirable to bring under the notice of horticulturists.

Illustrations.—The Editors will be glad to receive and to select photographs or drawings, suitable for reproduction, of gardens, or of remarkable plants, flowers, trees, &c., but they cannot be responsible for loss or injury.

APPOINTMENTS FOR THE ENSUING WEEK.

MONDAY, JULY 11—

United Hort. Ben. & Prov. Soc. Com. meet.

TUESDAY, JULY 12—

Nat. Sweet Pea Soc. Exh. at R.H.S. Hall, Westminster (2 days). Wolverhampton Floral Sh. (3 days).

WEDNESDAY, JULY 13—

Nat. Rose Soc. Sh. at Salisbury. Teddington Fl. Sh. Uxbridge Fl. Sh. Derby Agr. and Hort. Soc. Sh. (2 days). Portsmouth Fl. Sh. (2 days). Hereford and West of England Rose Sh.

THURSDAY, JULY 14—

Nat. Sweet Pea Soc. Inspection of Trials at Sutton Green. Finchley Hort. Soc. Sh.

FRIDAY, JULY 15—

Nat. Sweet Pea Soc. Inspection of Trials at Kelvedon and Mark's Tey.

AVERAGE MEAN TEMPERATURE for the ensuing week deduced from observations during the last Fifty Years at Greenwich—63°.

ACTUAL TEMPERATURES:—

LONDON.—Wednesday, July 6 (6 P.M.): Max. 59°; Min. 57°.

Gardener's Chronicle Office, 41, Wellington Street, Covent Garden, London—Thursday, July 7 (10 A.M.): Bar. 30; Temp. 53°; Weather—Overcast.

PROVINCES.—Wednesday, July 6; Max. 59° Mid. Essex; Min. 50° Scotland N.E. Coast.

SALES FOR THE ENSUING WEEK.

FRIDAY—

Imported Cattleya Mossiae, also established Orchids in variety, at 67 & 68, Cheapside, E.C., by Protheroe & Morris, at 12.45.

Lime-Sulphur Sprays.

In our issue of June 11 last we referred to the injurious effects of Bordeaux mixture on the young foliage of some Apple trees in Kent, and suggested that in treating the more tender varieties, especially where spotting of the fruit by spraying is to be feared, it may be found advantageous to use lime-sulphur washes.

It may be useful, therefore, to point out that Mr. W. M. Scott, the officer in charge of orchard-spraying experiments in America, has carried out a series of trials on the value of lime-sulphur sprays as substitutes for Bordeaux mixture. The results of Mr. Scott's experiments, published in Circular No. 54 of the U.S.A. Bureau of Plant Industry, indicate that lime-sulphur sprays are efficient substitutes for Bordeaux mixture in controlling leaf-spot and Apple scab; but that they are less efficacious than the latter with respect to Apple blotch (*Phyllosticta solitaria*) and bitter rot. The solution recommended, as the result of extended trials, is one containing 4 lb. of sulphur to 50 gallons of water, which strength may, of course, be prepared from commercial lime-sulphur by the addition of water. It may be as well to repeat what has been mentioned in previous references to lime-sulphur washes, that they may be prepared by boiling lime and sulphur (2½ lb. lime and 5 lb. sulphur) in

a small quantity of water for about three-quarters of an hour, and making up to 50 gallons by adding water to the boiled preparation. A further point established by Mr. Scott's experiments is the fact that the spray is rendered more useful by the addition of arsenate of lead at the rate of 2 lb. to 50 gallons of lime-sulphur solution. No damage to foliage or fruit results from the addition of this form of arsenical insecticide, whereas the addition of Paris green may cause damage to foliage and fruit. Though no formula can be guaranteed to be universally successful, Mr. Scott recommends, in places where scab is prevalent, spraying with lime-sulphur-arsenate of lead four times—(1) just before the flowers open, (2) as soon as the petals fall, (3) three to four weeks later, (4) six to seven weeks after the third spraying. By this spray-system, Apple scab, leaf-spot, and Colling moth are controlled. Where bitter rot (*Glomerella rufomaculans*) is prevalent, the spray-system should be modified, the lime-sulphur-arsenate-of-lead spray being used for the first two (or three) sprayings, and Bordeaux mixture plus arsenate of lead being substituted for the fourth spraying, and, if necessary, used for further spraying at intervals of two to three weeks.

Mr. Scott has demonstrated that lime-sulphur sprays provide admirable means of protecting the Peach from Peach brown rot (*Sclerotinia fructigena*) and scab (*Cladosporium carpophilum*), which fungi are responsible for an enormous amount of damage to the fruit in America. He finds that both diseases are controlled by three sprayings with lime-sulphur solution, the first given three to four weeks after the petals fall, the second three weeks later, and the third about a month before the fruits ripen. The solution should be 8—8—50 self-boiled; that is, 8 lb. of lime, 8 of sulphur, and 50 of water. If insect pests are feared, 2 lb. of arsenate of lead should be added. As our readers will remember, a self-boiled lime-sulphur solution is one in which the heat generated by the mixing of lime and water is used instead of fire-heat in the preparation of the spray-fluid. It is best prepared in large quantities, say, enough for 200 gallons. For this, 32 lb. lime and 32 lb. sulphur are required. The quicklime is placed in a barrel and water added to cover it. As the lime begins to slake, add the sulphur, passing it through a sieve. Stir constantly, and add water enough to form, first a thick, then a thin paste. After the heat generated by the slaking lime has boiled the liquid for a few minutes, add water to cool. The concentrated solution thus obtained is strained into the spray tank, and diluted to the proper strength by the addition of water.

Though it is too soon yet to dogmatise, we are of opinion that lime-sulphur sprays will prove of great value to the fruit-grower. Those growers who are experimenting with this mixture will be doing a good service if they will keep horticulturists informed, through the medium of these columns, of the results which they obtain.

Stinking Smut.

It is held generally that, of the smuts which affect cereals, some gain access to the plant in the seedling stage, and some actually infect the developing embryos whilst they are still in the ear of the parent plant. In

the former case the smut-spores, finding their way to the surface of the grains used for seed, are sown with that seed, germinate as the seed germinates and produce secondary spores, the germ tubes of which obtain access to the young plant. The preventive measures adopted in such cases consist in steeping the seed in fungicides, which destroy, more or less thoroughly, the smut-spores adhering to the coats of the grains. Inasmuch as this method, to be successful, requires that the fungicide used shall not only destroy the smut-spores but shall leave the seed uninjured, there is evidently plenty of room for experiment as to the relative values of different kinds of fungicides.

Such a series of experiments has been conducted recently by Messrs. G. L. Sutton and R. G. Downing at the Cowra Experiment Station (Australia). The results, published in a recent issue of the *Agricultural Gazette* of New South Wales, should, if confirmed, prove of considerable value to the agriculturist whose Wheat crop is liable to attack by stinking smut (bunt). The conclusion to which the experiments of Messrs. Sutton and Downing point is that a steep of 2 per cent. blue stone (copper sulphate), to which enough salt is added to make a concentrated solution (about 33 per cent.), is more effective than any other in destroying the spores of the fungus, and is also less harmful to the seed.

Thus, seed steeped in 2 per cent. copper sulphate and salt yielded .8 per cent. of bunt plants as against 2.5 per cent. yielded by seed steeped in the copper sulphate alone. Moreover, the amount of seed destroyed by the copper sulphate and salt steep was only 8.7 per cent., whereas, after being steeped in copper sulphate only, the mortality among the Wheat seed was 30 per cent.

We hope that further experiments with this mixture will be made, and that, not only as a steep, but also as a spray-fluid.

OUR SUPPLEMENTARY ILLUSTRATION gives a view of the formal Dutch garden at the Warren House, Stannore, the residence of Mrs. BISCHOFFSHEIM. The development of the estate has been carried out with a view to introducing as much variety as possible, consistent with the preservation of the old-time, sylvan beauties of the place. With the exception of the topiary garden, there are no strictly formal arrangements. The borders of hardy flowers (see fig. 7), Alpine garden, and the long stretches of flower beds around the golf links are delightful features, whilst the Rose garden, with its beautiful arrangement of Rambler Roses, in addition to those of other types, has been formed in the most natural manner possible, and, with a view to obtaining a variety of design. No greater contrast in garden scenery is possible than to pass through the Dutch garden, along the Pine walk, with its stately Pines towering over the clumps of Rhododendrons, to the woody glades which enclose the estate and are still in their pristine condition. Mr. MCINTYRE, the gardener at the Warren House, is an adept at topiary gardening, taking special interest in the work, but the many improvements which he has carried out in the grounds generally demonstrate that his interest in this form of gardening does not encroach on the many other duties connected with the management of this extensive garden. A view of the dwelling-house is given in fig. 6.

JAPAN-BRITISH EXHIBITION.—As was stated last week, the Royal Horticultural Society sent a deputation, on the 30th ult., to award certain silver cups to garden exhibits shown by Japanese exhibitors at the Japan-British Exhibition. The cups were awarded to the following exhibitors: Mr. KEIJIRO OZAWA, Tokyo, for the design of the "Garden of Peace" and the "Garden of the Floating Islands"; Mr. HANNOSUKE IZAWA, Tokyo, for the construction of the "Garden of Peace" and the "Garden of the Floating Islands"; the TOKIO YEN, Sheiba Park, Tokyo, for the design and construction of two miniature gardens; the YOKOHAMA NURSERY CO., Yokohama, for a collection of dwarf trees in pots; the YOKOHAMA NURSERY CO., Yokohama, for a specimen dwarf tree (*Thuja obtusa*, golden variety, 125 years old); Mr. S. HAYASHI, Kioto, for a pair of bronze garden lamps; Mr. SENKER AGAWA, Kioto, for an imitation dwarf Pine, used in ceremonies; NIPPON YUSEN, Kaisha, for a garden of artificial flowers; the GIRLS' TECHNICAL SCHOOL, Tokyo, for an arrangement of artificial flowers.

JAPANESE VISITORS AT THE HOLLAND HOUSE SHOW.—On Wednesday last the president and Council of the Royal Horticultural Society entertained at luncheon a number of Japanese horticulturists, together with other Japanese gentlemen holding official positions in this country. In proposing the toast of "Our Japanese Guests," Sir TREVOR LAWRENCE referred to the cordial relations which exist between the Japanese and the people of this country. He stated that, although it had never been his good fortune to visit Japan, several of his intimate friends had done so, and it was with pleasure he had heard them speak of the most cordial welcome they had received in that country. The Japanese were a people of a sunny and happy nature, possessing a spontaneous gaiety of which we ourselves were scarcely capable. They possess an intense love for their own country, a special attraction of those eastern islands being the beautiful scenery. The Japanese flora had contributed some of our most valued garden plants, including the beautiful *Iris Kämpferi*, which, he was informed, was cultivated as well in this country as in Japan. The beautiful *Wistaria* adorned the walls of cottages in Britain, and, he thought nothing was more beautiful in art than a view of a Japanese teahouse enveloped in a gorgeous covering of *Wistaria*. Beside the *Wistaria* and *Irises*, Japan had given us many beautiful *Azaleas*, *Maples*, *Styrax japonicum*, *Cryptomerias* and other beautiful plants. Dr. MANO, who responded, referred again to the good feeling which existed between British horticulturists and those in Japan, instancing the Japanese gardens at Shepherd's Bush as an alliance between Japan and this country. His own land supplied the idea and the plants, whilst Britain contributed the site and the materials for the building of the rockery. The toast of the "Royal Horticultural Society" was proposed by his Excellency the Japanese Ambassador, Mr. TAKAOKI KATO, who gave a résumé of the work of the Society. Sir DANIEL MORRIS replied to the toast with a capital speech. He was certain that when the future history of the R.H.S. was written no name would be more prominent than that of the present secretary, Rev. W. WILKS, whom all regretted was absent on this occasion through ill-health. Several of the most notable men in the scientific world, and especially botanists, had been associated with their Society. Sir JOSEPH HOOKER was still chairman of the Scientific Committee, and he was pleased to see with them Colonel PRAIN, Dr. RENDLE, and Professor BATESON. The Society had instituted a laboratory at Wisley for training their students in scientific horticulture, and their

young men would no doubt be afforded an opportunity to complete their studies at the Innes Horticultural Institution under the tuition of Professor BATESON. Sir ALBERT ROLLIT proposed the toast of the president, which was accepted with acclamation.

FLOWERS IN SEASON.—Messrs WM. PAUL & SONS have sent us blooms of some new Roses, including seedlings raised by them at Waltham Cross. The first place must be given to the variety named Juliet, a hybrid Briar of most attractive colouring. The distinctive character of the variety is found in the two distinct shades on the inner and outer sides of the petals. The interior is coloured reddish-orange, the exterior being old gold. In addition, the flower possesses a beautiful form, and a charming fragrance. It is one of the most pleasing novelties amongst Roses, and is sure to become a popular variety. The others include the Hybrid Tea variety named Alice Cory-Wright, with large, pink blooms, very broad at the base, the tips of the petals in the unopened flowers narrowing to almost a point. As a bold, showy Rose, it will be valuable alike for the garden and the show bench, its robust growth providing an additional claim. Bianca is a Hybrid Tea variety with creamy-yellow base and rose-flushed tips, this colour appearing very pretty in the centres of the buds. The blooms are somewhat narrow and long. Another beautiful, Hybrid Tea variety was seen in an unnamed seedling of purplish-rose colour. This has all the attributes of a good Rose, and will no doubt become a favourite in gardens. An unnamed H.T. seedling of purplish-rose colour was also very attractive.

SWEET PEA OUTINGS.—We are asked to remind our readers that on Thursday, the 14th inst., the members of the National Sweet Pea Society will inspect the trials of Sweet Peas at The Times Experimental Station, Sutton Green, near Guildford. The inspection will be followed by a visit to the gardens of Sutton Place, the residence of Lord and Lady NORTHCLIFFE. On the following Friday, there will be an outing to Messrs. HURST & SON'S trial grounds at Fering, Kelvedon, Essex, on the invitation of the president, N. N. SHERWOOD, Esq., V.M.H.; and to Messrs. DOBBIE & Co.'s nurseries at Mark's Tey.

EXHIBITION OF FORCED SHRUBS AT BOSKOOP.—An exhibition of forced shrubs will be held at Boskoop in 1911, on the occasion of the 50th anniversary of the Pomological Society of Boskoop (Holland), the members of which formerly occupied themselves principally with the cultivation of fruit trees, but have now for years past applied themselves almost exclusively to the growing of shrubs and Conifers. The principal firms of Boskoop and its environs will collaborate to make the exhibition thoroughly representative of the great industry of the district, that of the cultivation of shrubs for forcing. The exhibition-building will occupy a surface of 2,600 square metres, and the show will take place in the first half of the month of April.

THE POTATO BLIGHT.—It is reported that the Potato blight has made its appearance in some districts in the west and south-west of Ireland, especially in the Charlestown district of county Mayo.

MR. ROBERT NEWSTEAD, Lecturer in Economic Entomology and Parasitology at the Liverpool School of Tropical Medicine, and a member of the Entomological Research Committee of the Colonial Office, has gone to Malta to investigate the problem existing there of the menace to health by the sand fly.

NURSERY EMPLOYÉS OUTING.—The members of the newly-formed recreation club of Messrs. BARR & SONS held their first annual outing on Saturday, July 2, at Arundel. On their arrival, the members indulged in cricket and other amusements. Testimony was given at the luncheon to the good feeling which exists between the heads of the firm and the employés.

THE CAMBRIDGE BOTANIC GARDEN.—We doubt whether any English botanic garden—Kew, of course, always excepted—contrives to render such valuable services to science as the Cambridge Botanic Garden. That this is the case is due in large measure to the energy and breadth of view of the Curator, Mr. IRWIN LYNCH. We learn from the brief annual report that the gardens have not only continued to supply enormous numbers of specimens—no fewer than 108,000—for botanical purposes, but that they have rendered important aid also to the Reader in Forestry (Dr. HENRY) and to the plant-breeding experiments which are being carried on by various members of the University. Nor, in rendering material assistance to the cause of science, does the Curator lose sight of the main functions of a botanic garden. Thus the list of "Plants of Special Interest" contained in the report demonstrates that the Cambridge Botanic Garden well maintains the interest of horticulture.

WORMS IN POTS.—The Rev. HILDERIC FRIEND, St. Asaph, Great Malvern, is preparing for the Ray Society a "Monograph of British Earth and Water Worms." Inasmuch as it is very desirable that accurate information should be supplied therein respecting the species which are harmful, Mr. FRIEND will be greatly obliged if gardeners and others will send him specimens of living worms for identification.

THE GERMAN DENDROLOGICAL ASSOCIATION.—The programme of the 19th annual meeting of the German Dendrological Association has been completed, and includes items of considerable interest. The association will meet in Metz on August 6, and, after visiting Colombey, Lorry and Tignomont, they will proceed to Plantières in order to inspect the arboretum of SIMON LOUIS FRERES. Thence the association travels to Nancy, paying a visit to Messrs. LEMOINE & SONS' nursery, and so on to Maxéville, Malzéville. On August 9 there will be an excursion to Montigny, and on the 10th the members of the association travel to Brussels and bring their excursions to a close on Friday, August 12, by a visit to the Royal Gardens at Laeken. Among the papers which will be read in the course of the meeting are the following:—"The Umaceae in the Service of the Landscape Gardener," by Herr SCHINABECK; "The Germination-capacity of Seeds of Exotics Planted in Japan," by Herr HERRE; and "Japanese Dendrology," by Herr UNGER.

WORSHIPFUL COMPANY OF GARDENERS.—The members of this ancient livery celebrated, at a banquet on Friday, July 1, at the Savoy Hotel, Strand, the installation of the Master, Mr. CHARLES BAYER, who holds office for the second year in succession. The guests were seated at 15 separate tables, each of which was lavishly decorated with a distinctive flower by Messrs. PIPER, of Bayswater. Speeches were made by Mr. BAYER, Mr. SHERWOOD, Mr. W. F. HAMILTON, K.C., and Sir THOMAS R. DEWAR. In replying to the toast of "The Gardeners' Company and the Master," Mr. BAYER said his election to the office of Master of this ancient guild was one of the proudest events of his life.

ROYAL HORTICULTURAL SOCIETY.

Summer Exhibition at Holland House.

JULY 5, 6.—The exhibition of the Royal Horticultural Society, held on these dates in the Park at Holland House, Kensington, was the finest ever held in these grounds. It formed the 9th summer show of the Society, eight of which have been held at Holland Park and one in the grounds of the Royal Hospital, Chelsea. With regard to the exhibits, it may be admitted that there were few outstanding novelties, but the general displays were of a very high standard of excellence. We may select for special mention Messrs. Wallace's Iris garden and rockery, Mr. Amos Perry's show of Delphiniums, Messrs. Sander & Sons' Orchids, Lord Aldenham's collection of vegetables, Messrs. Jas. Veitch & Sons' collection of choice greenhouse and stove plants, and the Duke of Portland's exhibit of fruits. The Iris garden and rockwork designed by Messrs. Wallace displayed characteristics that are very seldom indeed associated with temporary exhibitions of this character, whilst the quality of the flowers borne by the Japanese Irises was remarkable. There were also many good displays of Orchids, Roses, Sweet Peas, Carnations, and fruit trees in pots.

The Council awarded no fewer than 16 Gold Medals, and this fact alone affords some idea of the high quality of the exhibition. In addition to the plants, fruits, and vegetables, there was a very considerable display of implements and sundries employed in gardening operations.

The FLORAL COMMITTEE granted one First-class Certificate and six Awards of Merit, and the ORCHID COMMITTEE two First-class Certificates and three Awards of Merit.

The FRUIT AND VEGETABLE COMMITTEE made no award to a novelty. At the luncheon offered to the Committees and judges on Tuesday, the President, Sir Trevor Lawrence, Bart., expressed the indebtedness the Society owed to Mary Countess of Hechester for her exceeding kindness in lending her beautiful grounds for the exhibition, and he expressed regret that the favour could not be expected in the future.

The attendance on the first day was more satisfactory than on any previous occasion at Holland House, and, notwithstanding the threatening skies, there was no rain until 7 p.m. On the second day rain fell at intervals. Thanks are due to the spectators, the superintendent, Mr. S. T. Wright, and the Vincent Hall staff, including Mr. Frank Reader and Mr. Plowman, for their efforts to make the arrangements as complete as possible. A matter over which they may have had no control, namely, the light-excluding character of the canvas employed for the tents, called forth a great amount of criticism, which, we are bound to add, was perfectly justifiable. On the second day of the exhibition a luncheon was given in honour of the Japanese horticulturists now visiting this country in connection with the Japan-British exhibition. The proceedings are referred to on another page.

Floral Committee.

Present: W. Marshall, Esq. (Chairman), and Messrs. W. Barr, J. F. McLeod, Jas. Hudson, F. Page Roberts (Rev.), Chas. Dixon, T. W. Turner, H. J. Jones, Herbert J. Cutbush, W. P. Thomson, E. H. Jenkins, W. J. James, G. Reuthe, John Green, Chas. T. Druery, W. G. Baker, James Walker, R. C. Reginald Nevill, W. Howe, and R. Hooper Pearson.

GROUPS OF PLANTS.

MESSRS. JAMES VEITCH & SONS, King's Road, Chelsea, made a magnificent display with stove and greenhouse plants, the exhibit having a frontage of nearly 40 feet and a depth of 15 feet. This space was filled with choice ornamental-leaved species, set off by banks of Orchids, Kalanchoe flammula, Anthurium Scherzerianum, and Camas. The beautiful colouring in the leaves of Anthuriums, Caladiums, Codiums, Dracena Bibranti, Marantas (M. Sanderiana being especially fine), Begonia Rex, Heliconia illustris, Tillandsia Massangeana, Alocasia montefontaineensis, and similar species was the subject

of frequent remark. The group was broken by tall plants of Aralia Veitchii, and A. elegantissima, with superb examples of Nepenthes, the varieties Dr. John McFarlane, Diadem, and Curtisii superba being the best of these. Grouped about the base of the stands were plants of Solanum Wendlandii. It was a noteworthy display in a tent of superb exhibits, the arrangements denoting a "master hand" in staging.

Mr. L. R. RUSSELL, Richmond, showed a batch of stove and greenhouse foliage plants. It was a beautiful display, there being choice specimens of Caladiums, Marantas, Dracenas, Anthuriums, Acalyphas, Nephthytis pecturata, Clerodendron fallax in bloom, Gloriosa Rothschildiana, and others of equal beauty, with edging of Nertera depressa and Bertolonias in variety.

MESSRS. R. & C. CUTBERT, Southgate, presented a large group of greenhouse flowering plants and Roses. There were Liliiums, including fine examples of L. lanciflorum album, Crasula coccinea, Verbena Miss Willmott, Hydrangeas, Humea elegans, and Spiraea Queen Alexandra, blended in a fine arrangement, with a border of Marguerite Southgate, a compact, dwarf-habited variety.

FERNS.

MESSRS. H. B. MAY & SONS, The Nurseries, Upper Edmonton, made the largest exhibit of Ferns, having a grand display of the most ornamental stove and greenhouse varieties, all alike remarkable for the high culture they displayed. Notable plants were Gymnogramme flavescens var. Confreyi, Platycerium Cordreyi, Polypodium Vidgonii (elegantly divided in the long pinnae), Nephrolepis Marshallii (the best of the plumose varieties of N. exaltata), Lomaria attenuata (showing tinting in the young fronds), Adiantum cardiophyllum, and Nephrolepis elegantissima compacta. In another tent, Messrs. MAY showed hardy Ferns in variety.

Mr. H. N. ELIOTSON, West Bromwich, showed varieties of Ferns, having a good selection of decorative sorts.

ROSES

MESSRS. WM. PAUL & SON, Waltham Cross, Hertfordshire, had a magnificent display. It was arranged in the largest tent, and was a veritable bed of Roses, all of magnificent quality, with sufficient Weeping and Rambler plants to afford relief. The blooms were arranged in baskets, each with one variety only, so that the merits of the flowers could be well observed. In the centre was a stand of the inimitable Juliet (see fig. 9) that received a First-class Certificate. Others of great beauty were Warrior, Mme. Ravary, Liberty, Lady Ashdown, Belle Siebrecht, Joseph Low, Lyon Rose and Laurent Carle.

MESSRS. PAUL & SON, the Old Nurseries, Chestnut, showed a large and glorious display of Roses, having a back row of Rambler kinds, which encroached towards the front in the centre. The main display was of beautiful bunches of large H.T., T., and H.P. kinds. Shower of Gold is a pretty variety suitable for massing, apparently of the Wichuraiana type. The H.T. Marquise de Sinety is charming in both shape and colouring, which is gold flushed with rose.

Mr. CHAS. TURNER, Slough, staged standard Roses of Polyantha varieties, having a number of vases beneath containing large-flowered sorts. Some Ramblers were trained umbrella-fashion, those of Dorothy Perkins being especially pretty. The vases contained a good selection of popular kinds and a few novelties, including a velvety-red variety named Mrs. G. Henslow. Mr. TURNER had also a bank of Carnations, the variety Mrs. Trelawny, a "Malmaison" approaching a scarlet shade, being shown in large numbers as a centrepiece, with Maggie Hodgson, Old Blush, Thora (white), and Princess of Wales. Lady Middleton is a pretty pink variety striped with darker pink.

MESSRS. STUART LOW & CO., Bush Hill Park, Enfield, staged Gerberas, Hydrangeas, Meteoroides floribunda, and an exquisite exhibit of

Roses. The Roses were beautifully displayed, not so thickly as to cause confusion, and with relief of Adiantum Ferns between. Such beautiful sorts as Richmond, Mme. Abel Chatenay, Lyon Rose, Frau Karl Druschki, Harry Kirk (creamy-yellow), Betty, Mme. Segond Webber, and Countess of Gosford were prominent in the display. Adjoining the Roses, the same firm showed an equally fine display of Carnations, set up with much taste. The new coppery-red "Malmaison" Lady Mary Hope was conspicuous. Others shown finely were Princess of Wales, The Colonel (cherry-red), Maggie Hodgson, Irene (a fine pink Malmaison), and Sir Evelyn Wood (of a deeper pink than the last-named).

MESSRS. HOBBIES, LTD., Dereham Nurseries, Norfolk, showed an imposing group of pillar Roses as standard, weeping, bush and balloon-trained plants. They had also blooms of Tea, Hybrid Tea, and other large varieties along the front of the exhibit, the whole being relieved with Adiantum Ferns.

Roses were well shown by Messrs. B. R. CANT & SONS, Colchester, the season being exceptionally favourable for Roses out-of-doors. Such beautiful sorts as Capt. Hayward, Lyon Rose, Mrs. T. Roosevelt, Avoca, Suzanne Marie Rodocanachi, Mrs. John Laing and Hugh Dickson were displayed in large batches with numerous other sorts. In the centre was a noteworthy stand of the beautiful semi-double Rose du Barri, of the shade indicated by the name. Lady de Bathe, cream, flesh-tinted, is a new variety.

THE KING'S ACRE NURSERY CO., Hereford, made a bold display with Roses, having tall epergues filled with choice blooms. Two of the finest noticed were Liberty and General McArthur.

MESSRS. R. HARKNESS & CO., Hitchin, displayed a selection of Roses, having epergues filled with choice sorts, from which, at the back, were arranged arches of trailing kinds.

MESSRS. GEO. JACKMAN & SON, Woking, showed a big batch of Roses, amongst which we noticed beautiful examples of Marquise de Sinety, Irish Elegance, Lady Ashdown, Countess of Gosford, Harry Kirk, Mme. Melanie Soupert, and others of equal beauty.

MESSRS. ALEX. DICKSON & SONS, Newtownards, showed Roses of superb quality, having bold vases of such elegant sorts as Mrs. Arthur Munt, Dorothy Page-Roberts, Theresa, Mrs. Leonard Petree, Mrs. Foley Hobbs, Mrs. Fred. Straker, and Viscount Carlow.

MESSRS. HUGH DICKSON & SON, Belfast, also showed some admirable Roses, in which the beautiful white single kind named Elegans was a prominent feature. They had an epergne filled with a fine dark-coloured Rose named Leslie Holland, also stands containing good blooms of Mrs. P. H. Coats, Frank Thorpe, Miss Cynthia Forde, Lady Pirrie, and several others of merit of their own raising.

MESSRS. FRANK CANT & CO., Colchester, also showed Roses finely, having many boxes filled with blooms of one variety, none being more beautiful than the popular Lyon Rose.

CARNATIONS.

MESSRS. W. CUTBUSH & SON, Highgate, London, N., filled one corner of the large marquee with a charming exhibit of Carnations set in a ground of Polyantha Roses, backed with Codiums, Palms, Cordyline, Bamboos, and green foliage plants. They showed their large-flowered Carnation named after Lady Coventry, also the beautiful Mercia (salmon), Lady Numburnholme (orange-red), Marmion, Enchantress, Lady C. Waring (a yellow ground fancy), King Arthur (scarlet variety, exceptionally fine), Countess of Onslow (mauve and pink, with a beautiful scent), The Queen (terra cotta, a choice display of this charming sort), Dragut (scarlet), Maggie Hodgson (the darkest of the Malmaison section), and many more. Amongst the Roses we noticed Jessie, a Polyantha variety, with

scarlet flowers. The disposition of the subjects in the group was very cleverly achieved.

Mr. CHAS. BLICK, The Warren Nurseries, Hayes, Kent, showed border, tree, and Souvenir de la Malmaison Carnations. Amongst the border kinds we noticed John Knox (crimson-maroon), Oriel (a fancy, with orange-red suffusion), John Ruskin (a rose-edged yellow-ground Picotee), Micawber (a mauve and yellow fancy), Mrs. E. Martin Smith (white, very fine), Pathfinder (a crimson fancy), and David Abercrombie (a large bloom with rose and yellow ground). There was also a vase of seedling varieties, amongst which were many good things as yet unnamed.

Mr. C. ENGELMANN, Saffron Walden, staged vases of Carnations, in which the dark-crimson Carola figured prominently. There were, besides, excellent blooms of Enchantress, Aristocrat, Mrs. T. W. Lawson, Victory, Winona, Pink Delight, and many more.

A splendid group of Carnations, mainly comprised of Souvenir de la Malmaison varieties, was shown by C. F. RAPHAEL, Esq., Porter's Park, Shenley (gr. Mr. A. Grubb). In the middle of the group, was a bank of plants of King Oscar variety, and in rows outside this were Lady Mary Hope, Britannia, Princess of Wales, Lady Coventry, and other popular kinds. The plants had as many as ten or a dozen good blooms on each; one-year-old specimens of Britannia had almost as many blooms.

Mr. H. BURNETT, Guernsey, showed Carnations, having an imposing display of these beautiful flowers in nearly all the popular sorts.

Displays of Carnations were also shown by Mr. BERTIE E. BELL, Guernsey; Mr. H. LAKEMAN, Thornton Heath, Surrey; Mr. A. F. DUTTON, Iver, Buckinghamshire; E. J. JOHNSTONE, Esq., Groombridge, Kent (gr. Mr. A. T. Paskett); Messrs. R. H. BATH, LTD., Bath; varieties of Roses and Delphiniums were associated in this exhibit.

BEGONIAS AND GLOXINIAS.

Messrs. BLACKMORE & LANGDON, Twerton Hill, Bath, seemed to eclipse all their former efforts in displaying Begonias. They had a most magnificent exhibit of these plants, the large specimens having many fine blooms on each. In front were suspended baskets of trailing kinds, such as Mrs. Bilkey, Carminia, Alice Manning, Gladys, and Fleur de Chrysanthème; which was the most beautiful of these it would be difficult to estimate. In the main group were many lovely filled flowers in most charming shades.

A selection of tuberous-rooted Begonias was also displayed by Mr. A. LL. GWILLIM, Cambria Nursery, New Eltham, Kent, Avalanche (white), Evening Glow (rosy red), Sultan (reddish-orange), Mrs. H. Harris (salmon), and Margaret Gwillim are a selection.

Messrs. THOS. S. WARE, LTD., Feltham, showed Begonias of excellent quality. They also suspended baskets of trailing sorts in front depended from tall, iron standards. The quality of these tuberous-rooted Begonias was of a high standard, and it was regrettable the heavy canvas of the tent did not allow the tints to be seen to the best advantage. Nothing could surpass the exquisite variety of soft-pink tint named after Lady Cromer; cristata flora plena is a crested kind of salmon-rose tint, Mary Pope (white), Lady Fandel Philips, Sonning Joy, Carmine, Mrs. A. P. Brandt (flesh-tinted), and Miss Beatrice Pardy (white) are a few of the more notable sorts displayed.

Messrs. JOHN PEED & SON, West Norwood, showed a bank of Carnations and a fine group of Caladiums. Of these latter plants, there were large, well coloured examples of W. E. Gladstone (reddish, with lighter veins), Candidum (silver, with green veins), Mrs. Harry Veitch (rose, green and silver), Henry Dixon (pale greenish, spotted with red), and other well-known sorts. Messrs. JOHN PEED also exhibited a batch of Gloxinias set in a bank of Ferns and Asparagus foliage.

MISCELLANEOUS PLANTS.

Messrs. JAMES VEITCH & SONS had a varied and imposing display of greenhouse flowering plants. It formed a showy and attractive exhibit, the high quality of the plants, many of which were new, being a notable feature. The flowers of the various subjects provided a wide range of colours that gave opportunity for skilful staging. Thus a bank of yellow Calceolaria

Clibranii was faced with the blue-flowered Sollya Drummondii, in front being a free-flowered Hibiscus named subvirescens. The Streptocarpus were magnificent; there were also Kalanchoe flammea, Solanum Wendlandii, a bank of Cannas with beautiful Exacum macranthum most profusely bloomed; also Gloxinias, a large group of Carnations, and splendidly-grown Fuchsias, some of these being standard plants.

Hon. VICARY GIBBS, Aldenham House, Elstree (gr. Mr. Ed. Beckett), showed a comprehensive collection of Cape Pelargoniums.

Messrs. SANDER & SON, St. Albans, exhibited a group of their new Marguerite Mrs. F. Sander, that well sustained the high reputation this novelty gained at the Temple Show.

Mr. VINCENT SLADE, Taunton, showed Zonal Pelargoniums in variety.

M. EMILE VERCAUTEREN, Melle Ghent, Belgium, showed a variegated Dracena named Souvenir de François Buysse.

especially those of the varieties Blush Rambler and Dorothy Perkins. Amongst the Carnations we noticed a new variety of the Souvenir de la Malmaison type named Charles Darwin. Mr. PAGE also displayed large plants of his new scarlet Zonal Pelargonium named His Majesty.

Mr. FRANK LILLEY, Guernsey, displayed a large group of Gladioli, including the new variety King Edward VII. He also showed Brodiaeas and Ismeme calanthina grandiflora.

Colonel LOCKWOOD, Romford, Essex (gr. Mr. G. Craddock), exhibited a group of Trachelium curuleum.

VIVIAN PHILLIPS, Esq., Orpington (gr. Mr. T. Hobbs), staged a group of Petunias.

Messrs. CARTER PAGE & Co., 53, London Wall, London, showed a big collection of Dahlias, principally of Cactus-flowered varieties, also bunches of Zonal Pelargoniums, and an assortment of Violas and Pansies.

SWEET PEAS.

These flowers were very numerous, some of the leading growers having extensive collections. One of the most noteworthy exhibits was made by Messrs. SUTTON & SONS, Reading, who displayed nearly 200 varieties, all in first-class condition. These occupied a table opposite to their exhibit of culinary Peas, between them being a pergola entwined with Smilax, and having dainty bunches of Sweet Peas hanging from the middle in baskets. Besides a selection embracing most of the standard varieties, they had numerous seedlings. One of these, shown under No. 325, was of great promise. The flowers are a shade of rose on a white ground.

Another large exhibit of these flowers was made by Miss HEMUS, Upton-on-Severn. The varieties in this exhibit were mainly of Miss HEMUS's raising, several of which are exceedingly popular. There were also several novelties, some of which we have already noted in our accounts of previous exhibitions this year.

Messrs. S. BIDE & SONS, Farnham, showed a representative collection of Sweet Peas, having excellent vases of well known varieties.

Messrs. JAMES CARTER & Co., Holborn, made an attractive display of Sweet Peas in their special tent, where they had also some fine Begonias, well-flowered Gloxinias, big blooms of Streptocarpus, coloured Spireas, with Humera elegant, Palms, Ferns, and other greenery to relief, the whole constituting a pretty display.

Messrs. DOBBIE & Co., Edinburgh, and Mark's Tey, Essex, showed a comprehensive collection, including their novelties Sunproof Crimson, Edron Beauty, and Isabel Malcolm. Besides these they showed a great number of new and standard sorts, amongst which were large, finely-coloured flowers of Etta Dyke, Masterpiece (rosy-lavender), Mrs. Chas. Foster, John Ingman (shown superbly), James Grieve, Evelyn Hemus, Nora Unwin, Mrs. A. Ireland and Rosie Adams.

Messrs. G. STARK & SON, Great Ryburgh, Norfolk, showed a bold group of their rose-red variety named Maggie Stark, also a fine white kind named Florence Wright, as well as a general collection.

Messrs. JARMAN & Co., Chard, exhibited a big batch of their new variety of Sweet Pea named Mrs. Townsend, in conjunction with their display of Centaureas and Carnations. The Sweet Pea is tinted mauve on a white ground.

Messrs. E. W. KING & Co., Coggeshall, had an extensive display of Sweet Peas, such choice sorts as Evelyn Hemus, Ellen Lewis, Cerise Paradise, and Sunproof Crimson being conspicuous.

Messrs. JOHN KING & SONS, Coggeshall, displayed a very large assortment of Sweet Peas in excellent condition.

Mr. ROBERT SYDENHAM & Co., Birmingham, showed a particularly fine collection of Sweet Peas, Sunproof Crimson, Cerise Paradise, and Evelyn Hemus being the more notable varieties.

Messrs. G. STARK & SON, Norfolk, and W. J. UNWIN, Cambridgeshire, also had extensive displays of these flowers.

Messrs. WHITEHEAD & PAGE, Chislehurst, showed a small collection of high-class varieties.

Other exhibitors of Sweet Peas included Sir RANOLD BAKER, Bart., Blandford; Mr. C. W. BREADMOBE, Winchester; Messrs. GODFREY & SONS, Exmouth; E. J. JOHNSTONE, Esq., Groombridge (gr. Mr. A. T. Paskett); and Messrs. KELWAY & SONS, Langport.

FIG. 8.—DELPHINIUM "LAMARTINI."
(Award of Merit at Holland House Show.)

Messrs. GODFREY & SONS, Exmouth, showed a new Amaranthus named tricolor, show and Regal Pelargoniums, Solanum Wendlandii, and a selection of Sweet Peas.

Messrs. GEO. JACKMAN & SON, Woking, exhibited a group of Clematis of large-flowered varieties of the Jackmanii type, and a few species. Amongst the more showy varieties were La France, lavender-blue; Jean d'Arc, white; Ville de Lyon, a rich shade of claret-red; Lady C. Neville, lavender; C. montana rubens and C. flammula rosea purpurea.

Messrs. H. J. JONES, LTD., Lewisham, displayed Zonal Pelargoniums and their new white Sweet Pea named Beatrice Stevens.

Mr. W. H. PAGE, Tanglely Nursery, Hampton, displayed an imposing group of Carnations interspersed with bold bunches of Lilium longifolium and having a row of Rambler Roses at the back. The Roses were magnificently flowered.

HARDY PLANTS.

Hardy plants were, as usual, exhibited in great numbers, and two displays in this section, namely, those of Messrs. R. WALLACE & Co., Colchester, and Mr. AMOS PERRY, Enfield, were of unusual interest. Messrs. WALLACE'S group comprised an Iris garden, with a stream of water, and, on one side, a broad terrace of flagstones, backed by a wall garden decorated with choice, hardy flowers. The most-pleasing portion of the display was the Iris garden. It consisted of a gorgeous display of *I. Kämpferi*, with a stream of water cleverly disposed through the centre, and spanned in parts with weather-worn stones. At the back, were banks of *Spiræa palmata*, Bamboos, Ferns, and Palms. In the water floated gorgeous-coloured Nymphæas, the banks being turfed in a natural manner. Where the water terminated overhung a tall plant of *Wistaria multijuga alba*, in a comparatively small pan, as imported from Japan. Here commenced a broad, flagged terrace, and, at the back of this, about the middle, was a stone seat, with sweet-scented plants all around it. Overhanging the seat were tall spikes of *Eremuri*, principally Shelford hybrids, Lilliums, and other tall-growing subjects. So cunningly had the whole been conceived and executed that it gave the impression of a portion transported bodily from some old-time garden, and even the stones themselves had the appearance of age.

Mr. AMOS PERRY, Hardy Plant Farm, Enfield, filled a large tent entirely with Delphiniums, staging from 25,000 to 30,000 spikes of these handsome flowers. The arrangement was that of irregular grouping throughout, and, although under canvas, was attended with very considerable success. Among the more conspicuous varieties we noted Lizzie, Sir George Newnes, King of Delphiniums, Duke of Connaught, Amos Perry, Lamartine, Blue Fendre, La France and Mme. Violet Geslin.

Messrs. WM. CUTBUSH & SON, Highgate, displayed an extensive exhibit of hardy things, prominence being given to a group of hybrid *Eremuri*, the result of crosses between *E. Shelford*, *E. Bungei* and others. *Iris levigata*, *I. aurea*, English Irises in variety with Lilies of many kinds, *Achillea Cerise Queen* (the showiest of the Millfoil group), *Senecio macrophylla*, *Potentillas* and *Campanulas* were shown in large numbers, a few hardy *Sarracénias* appearing at the margin of the water. *Richardia Solfaterre*, having yellow flowers with a dark-coloured base, was also very fine.

Messrs. G. & A. CLARK, LTD., Dover, showed a fine group of hardy flowering plants, of which *Delphinium Alake*, *D. King of Delphiniums*, and the new *Geum Mrs. J. Bradshaw* were prominent features. Very striking, too, was a big, central group of the scarlet *Gilea coronopifolia*, which afforded a blaze of colour. Many other choice Alpine plants and shrubs were noticed in the exhibit.

Messrs. BARR & SONS, Covent Garden, London, arranged a large bank of early *Gladioli*, *Delphiniums*, English Irises, *Iris aurea*, Lilies, *Antirrhinums*, and other seasonable plants, making a showy group.

Messrs. G. BUNYARD & Co., Maidstone, displayed a particularly fine array of hardy flowers, of which *Delphiniums* constituted a leading feature. Of these the most conspicuous was the new variety *Rev. E. Lascelles*, a flower of intense blue colouring with a pure white centre. *Shylock* and *Media* are others possessing desirable characteristics, the first-named variety, with its dark stems, affording a distinct effect. *Alake* and *Pasania* were also prominent in a large collection of these flowers. *Astilbes*, *Campanula lactiflora*, *Iris Mouspur*, and other seasonable things were also remarked.

Mr. CLARENCE ELLIOTT, Stevenage, Hertfordshire, had a particularly interesting and showy rockery, arranged with choice Alpines, including *Campanula pallida*, *C. Stansfieldii*, *C. pumila pallida* (very fine), *C. pulloides*, *Epilobium obcordatum* (a mass of rosy blossoms 4 inches high), *Oxalis enneaphylla*, *Dianthus Atkinsonii*, and several *Androsaces*.

Mr. A. URTON, the Guildford Hardy Plant Nursery, staged many good and interesting plants, of which the *Veronias* were a feature. *Thalictrum Delavayi*, *Scabiosa ochroleuca*, *Crimms*, and other things were also noted.

Mr. R. C. NOTCUTT, Woodbridge, Suffolk, had a large exhibit of herbaceous plants, Irises, and

flowering shrubs, the first-named embracing a large variety of seasonable flowers.

Mr. B. LADHAMS, Shirley, Southampton, had a group of *Campanula persicifolia alba coronata*, together with perpetual-flowering Pinks, *Scabiosa caucasica*, and other good species.

Messrs. R. H. BATH & Co., LTD., Wisbech, showed *Delphiniums* and other herbaceous plants in variety, the first-named in a choice assortment.

Mr. G. REUTHE, Keston, Kent, had one of his notable displays of Alpines, choice shrubs, and herbaceous plants, the whole constituting an exhibit of much interest. Of *Campanulas* alone there was quite a number. *C. Raddeana*, *C. cenisia*, *C. Stansfieldii*, *C. barbata alba*, *C. garganica* in several varieties; *C. pulloides*, *C. G. F. Wilson*, and others being remarked. *Rhododendrons hirsutum* and *saphnoides*, *Mitraria coccinea*, *Philesia buxifolia*, *Abelia floribunda*, with

being a towering example of *Lilium giganteum*, the pendent white, crimson-stained trumpet flowers attracting much notice. Rarely indeed have we seen this plant exhibited better. *Orchis foliosa* was also good.

Messrs. W. & J. BROWN, Peterborough, displayed *Gaillardias* and *Scabiosa caucasica* among many other garden plants.

Mr. H. HEMSLEY, Crawley, Sussex, set up a rocky exhibit of large size, planting it freely with Alpines, dwarf shrubs, and hardy Ferns.

Messrs. G. MALLETT & Co., Cheddar, arranged a bank of Alpine and herbaceous plants. *Lilium caudatum* was very good in the centre of the group; while *Campanula Burghaltii*, *C. Hendersonii*, *C. pusilla*, *Dianthus graniticus* (a mass of rosy blossoms and apparently nearly allied to *D. deltoides*) were other choice plants noticed in this group.

Messrs. PULHAM & SONS, Elsenham, Essex,

FIG. 9.—ROSE "JULIET," AS SHOWN AT HOLLAND HOUSE.
(Awarded a First-Class Certificate.)

Irises, hardy Heaths, and *Wulfenia Amherstii* made up a most interesting collection.

Messrs. WHITELEGG & PAGE, Chislehurst, had an imposing group of *Campanulas* and *Larkspurs*.

Messrs. J. GODFREY & Co., Exmouth, showed a fine strain of *Canterbury Bells* in many shades of colour.

Messrs. GEO. JACKMAN & SON, Woking, had an extensive group of choice Lilies. *Alstromerias*, *Scabiosa caucasica*, white and coloured *Delphiniums*, *Iris Kämpferi*, and other plants.

Messrs. BEES, LTD., Liverpool, showed some of their new *Primulas*, introduced by the firm from China, of which the curious *P. bittoniana* and the golden orange-coloured *P. Bulleyana* constituted the most noteworthy.

Messrs. GEO. PAUL & SON, Chesham, had a large group of seasonable herbaceous subjects chiefly shown as cut flowers, an exception

arranged a small rock-garden exhibit planted with choice Alpines.

Misses HOPKINS, Shepperton-on-Thames, arranged an extensive rockery or Alpine bank, on which was planted a choice assortment of *Saxifragas*, *Sedums*, *Dianthi*, *Campanulas*, *Edelweiss*, and many more.

Messrs. KELWAY & SON, Langport, showed an extensive display of *Delphiniums*. *Lord Lytton*, very dark in colour, *The Shah*, with double flowers of an intense Royal purple colour, and *Sir John Forrest*, dark blue with a white centre, were the more conspicuous varieties.

Messrs. WM. ARINDALE & SON, Sheffield, staged an extensive collection of *Violas* and *Pansies*, having a long table filled with an assortment of the best varieties.

Mr. M. PRICHARD, Christchurch, Hants., arranged a water-garden in conjunction with a

general display of herbaceous plants. A pool was planted with Nymphæas, whilst around were planted Astilbes, Spiræas, Gunneras, and Iris levigata in variety. Alströmérias, many species and varieties of Liliium, Isatis glauca (a cloud of golden blossoms), a lovely patch of Dianthus Atkinsonii, with Eremuri, and much more afforded bright banks of colour.

Messrs. ALFRED WATERS & Co., Bath, had a lovely display of Delphinium Rev. E. Lascelles, with flowers of the deepest blue and white.

Mr. HOWARD CRANE, Highgate, N., had a most charming display of Violettas. The varieties Chloris, Diana, Claribel, Sweetness, Queenie, all raised by Mr. CRANE, were among the more distinct sorts.

AWARDS.

FIRST-CLASS CERTIFICATE.

Rose Juliet (see fig. 9).—This extraordinary variety was given an Award of Merit on July 20, 1909, when shown by Messrs. W. PAUL & SON. The Committee now recommended that the award should be raised to a First-class Certificate on account of the distinctness and attractiveness the flowers exhibit. The petals are bright red on the inner surface and buff on the reverse, the effect being unique. The fine colour, however, is not the only good quality this Rose possesses, for its fragrance is sufficient to distinguish it from most of the newer varieties. (Shown by Messrs. W. PAUL & SON.)

AWARDS OF MERIT.

Begonia Mrs. W. L. Ainslie.—This tuberous-rooted Begonia is remarkable for its exceedingly rich, buttercup-yellow-coloured flowers, which in size are almost equal to the largest in modern collections. (Shown by Messrs. BLACKMORE & LANGDON.)

Delphinium Belladonna semiplena.—In the section of dwarf-growing Delphiniums suitable for bedding purposes, this variety is one of the most pleasing in tint. The flowers are nearly double, and in colour pale, azure blue, with mauve in the centre. Shown by Mr. AMOS PERRY.)

Delphinium Lamartini (see fig. 8).—This dwarf-growing variety has deep-purple flowers, and its effect when massed is described as excellent. (Shown by Mr. A. PERRY.)

Gladiolus Edward VII.—This variety belongs to the early-flowering section, being the result of a cross between Crimson Queen and Ardeus. The flowers are very large and spreading, and the colour is brilliant red with a shade of orange in it, the three lower segments being marked with purple and silver. (Shown by Mr. FRANK LILLEY, Guernsey.)

Rose Mrs. Foley Hobbs.—This new H.T. variety from Messrs. ALEX. DICKSON & SONS, was much admired. The flowers are large, and in their form exhibit much refinement. They are white, with just a suspicion of sulphur shade in all the petals, also of flesh tint in the centre, as the young petals open. The older petals are very large and shell-like.

Rose Mary Countess of Ilchester.—A first-class variety of the H.T. type in a colour section that needs strengthening with new sorts. The flowers are large, possess fine, prominent centres, and the colour is deep rose with slight violet shade. It is one of the very best Roses distributed last season by Messrs. ALEX. DICKSON & SON.

Orchid Committee.

Present: Harry J. Veitch, Esq. (in the Chair); and Messrs. Jas. O'Brien (hon. sec.), J. Gurney Fowler, E. Ashworth, H. Ballantine, F. Sander, H. J. Chapman, J. Charlesworth, Gurney Wilson, H. Little, H. G. Alexander, de B. Crawshaw, W. P. Bound, A. Dye, F. M. Ogilvie, W. Thompson, W. Cobb, W. H. Hatcher, R. G. Thwaites, W. Waters Butler, W. Bolton, H. A. Tracy, C. J. Lucas, and W. H. White.

At the entrance of the large tent on one side, Messrs. SANDER & SONS, St. Albans, staged a magnificent group, which contained a large proportion of exceptionally fine novelties, one of which, *Miltonia vexillaria Lambeauiana*, secured a First-class Certificate, and three other plants gained Awards of Merit. The elevated centre of the group was of white *Phalenopsis amabilis Rimsteadiana*, with the rosy-tinted spikes of *Dendrobium Phalenopsis* mingling with them; the front being of a general selection of good species, including Angu-

loa Ruckeri and other Anguloas; some interesting *Bulbophyllums*, of which *B. virescens* was the largest; and on each side exceptionally fine varieties of *Cattleya Mendelii*, the floriferous and richly-coloured *C. Warscewiczii Sanderiana*, several *Odontiodas*, including the new *O. St. Fuscien*. One of the most beautiful in the group, was *Vanda cœrulea* var. *Princess Juliana*, a model flower of perfect shape and fine substance, the segments veined with violet-blue, the lip wholly violet. Near it, was a good example of the natural hybrid *V. Mooreana* and various other *Vandas* and *Aërides* were included. At the ends, were

were distinct in their classes. Other fine plants were, *Miltonia St. André superba*, *Sophro-Cattleya Danae*, *Phalenopsis Sanderiana*, *Cypripedium A. Dimmock*, &c. Of pretty little species, *Cirrhopetalum Roxburghii*, *Epidendrum Medusæ* and other *Epidendrums*; the rare little *Orchis monophylla*, with fleshy leaf blotched with purple, and a large number of curious plants.

H. S. GOODSON, Esq., Fairlawn, Putney, arranged a small group made up of hybrid *Odontoglossums*, *O. Lambeauianum St. David* being a very fine flower; two very handsome *Cattleya F. W. Wigan*; *C. Gaskelliana Mrs.*

FIG. 10.—GLADIOLUS "KING EDWARD VII.": COLOUR, BRILLIANT RED WITH SILVERY MARKINGS ON LOWER SEGMENTS.

(Award of Merit at Holland House Show.)

a fine selection of *Lælio-Cattleyas*, the forms of *L.-C. blechleyensis* being specially good and varied in tint from rose and purple to bronzy-orange with claret-coloured lip. Hybrid *Odontoglossums* were well displayed. Of new plants, *Lælio-Cattleya lucida* (*L.-C. Phœbe* × *C. Warscewiczii*); *Miltonia vexillaria King George V.*, with a large, blush-tinted flower, having purple markings at the base of the lip; *Cattleya Mossie Wageneri Purity*, a good pure-white flower; and *C. Dupreana* (*Warneri* × *Warscewiczii*)

Goodson, white, with a small purple spot on the lip; several *Odontiodas*, &c.

Mr. E. V. Low, Vale Bridge, Haywards Heath, staged a small group having in the centre a number of well-flowered specimens of *Cypripedium callosum Sanderi*. With them were *C. H. Ballantine*, *C. Gaskelliana alba*, *C. Mossie alba*, some good *C. Mendelii*, *C. Eldorado alba*, *Cypripedium Godetroye leucohilum*, &c.

Messrs. MANSSELL & HATCHER, Rawdon, Leeds, came next with a beautifully-arranged group, in

which the Cattleyas of the season were well represented. The centre was of fine forms of *C. Warscewiczii*, mingled with showy *Odontoglossums*, fine examples of *Miltonia vexillaria*, including the distinct variety *chelseensis*, and a fine, white-lipped variety, *M. Bleiana*, and some bright-scarlet *Odontiodas*. On each side, were a number of plants of the reddish-scarlet *Renanthera imschootiana*, with *Odontoglossums* and fine Cattleyas, the ends being of *Laelio-Cattleyas*, hybrid Cattleyas, *Odontoglossums*, &c. Prominent in the group were two examples of the new *Dendrobium Sanderae*, with sprays of fine, white flowers, having some purple lines in front of the emerald-green base of the lip. A batch of the handsome and fragrant *Oncidium lanceanum*; a fine form of *O. macranthum*, with some purplish markings on the petals; the dark-coloured *Maxillaria nigrescens*; two clear-white Cattleya Mossie *Wagneri*, with several scarlet *Odontioda Bradshawia*; some showy hybrid Cattleyas, and *Laelio-Cattleyas*, *Cypripedium Parishii*, and other *Cypripediums*; *Brasso-Cattleya Digbyana-Warscewiczii*, *Promemna xanthina*, *Angraecum Scottianum*, *Bulbophyllum barbigerum*, and a number of other interesting species were noted in this group.

Sir JEREMIAH COLEMAN, Bart., V.M.H., Gattopark, Reigate (gr. Mr. Collier), staged a very fine group, rich in rare species and good varieties. The centre was of Cattleyas and *Laelio-Cattleyas*, the Cattleya *Warscewiczii* King Edward VII. being a superb form, with the lip almost entirely of a deep, ruby-claret colour, and having only two small white spots in the tube. Overhead were the long spikes of *Oncidium macranthum*, with a good specimen of *O. superbiens*, and some other *Oncidium*s. At the sides, was arranged a selection of *Dendrobium*s, among which was the singular hybrid *D. Arthur Ashworth* (*Brymerianum* × *Dalhousianum*), with a good spike of pale yellow flowers, with some purple markings on the fringed lip. *Miltonia vexillaria* Queen Alexander had large, white flowers; *Zygopetalum Roeblingianum* was finely shown; Cattleya Rex and other Cattleyas, and *Laelio-Cattleyas* were well displayed; and among rare plants noted were *Eriopsis rutidulbulbon*, with a fine spike of golden-yellow flowers, margined with purple; *Cirrhopetalum pulchrum*; *Bulbophyllum lemniscoides*, with a singular tassel-like head of bloom; *B. biflorum*; *B. grandiflorum*; *B. barbigerum*; *Gongora quinquenervis*; some very pretty *Masdevallias*, including *M. calura*, *M. melanoantha* and some of the smaller species, with insect-like flowers; *Zygopetalum rostratum*; *Eria pauciflora*; *Cyclogyne Schilleriana*; and a large number of rare species. Among the *Odontoglossums*, *O. Lady Roxburgh* (*erichsonii* × *periclitum*) was an elegant flower, clear white, and effectively spotted.

On the other side, Messrs. CHARLESWORTH & Co., Haywards Heath, staged a very fine group, the centre of which was of fine plants of *Phalenopsis Rimstadiana*, with an undersetting of *Epidendrum vitellinum*. The plant of the day was *Odontoglossum Smithii*, a noble hybrid, often alluded to in these pages, and which, so far, continues unique. All the plants in cultivation, including this specimen, pass into the collection of J. Gurney Fowler, Esq., the Treasurer of the Royal Horticultural Society. The sides of the group were made up of good *Phalaenopsis*, and Cattleya Mossie, including some very fine white varieties. In the body of the group, *Odontioda Charlesworthii* *superba*, with its bright red flowers; a very fine series of yet unproved *Odontiodas*; some good varieties of *Dendrobium Phalaenopsis*; some new *Laelio-Cattleyas*, including the new *L. C. Ceres* (*L. Phoebe* × *C. Mossie Reineckiana*), a charming flower, and one of the few of these yellowish *Laelio-Cattleyas* which are of good shape. The hybrid *Odontoglossum*, *Laelio-Cattleyas*, and Cattleyas in Messrs. CHARLESWORTH'S group were excellent, and special plants were *Dendrobium Sanderae*, *Odontoglossum ardentissimum* *xanthotes*, *Odontioda Goodsonae*, and *Ludemannia biloba*, a very remarkable and rare species, with long racemes of golden-yellow flowers tinged with purple.

At the other end, Messrs. STUART LOW & Co., Bush Hill Park, Enfield, staged a very interesting and effective group, in which *Dendrobium nobile virginale*, with its pure white flowers, was a telling feature. *Laelio-Cattleyas*, hybrid Cattleyas and species were well shown. In one

little batch, the blue *Dendrobium Victoria* Regina, *D. rhodostoma*, *D. glomeratum*, *Angraecum Scottianum*, *Bulbophyllum Claptonense*, and other *Bulbophyllum*s were noted; also *Pleurothallis stenophylla*, *Epidendrum Brassayola*, *E. calochilum*, and other *Epidendrum*s, *Maxillaria pubigera*, a pretty selection of *Masdevallias*, &c., were noted.

FERGUS MENEITH OGILVIE, Esq., The Shrubbery, Oxford (gr. Mr. Balmforth), showed the delicately-tinted Cattleya *Warscewiczii* Mrs. E. Ashworth, a charming bluish-white variety, which ought to get the higher award of F.C.C., beyond the A.M. already awarded.

J. GURNEY FOWLER, Esq., Glebelands, South Woodford (gr. Mr. Davis), showed *Odontoglossum Pescatorei* alba Fowler's variety, a very charming flower, with pure-white flowers, the only colour being the pale-yellow crest to the lip. Also the rare, pretty, and fragrant *Catasetum Russellianum*.

Messrs. JAS. VEITCH & SONS showed a group of their beautiful *Disa* × *Luna*, *Laelio-Cattleyas*, &c.

AWARDS.

FIRST-CLASS CERTIFICATES.

Miltonia vexillaria Lambouiana, from Messrs. SANDER & SONS, St. Albans.—A most beautiful, pure-white variety of the large-flowered form; the lip is lemon-yellow with a few darker lines on the disc.

Cattleya Mendelii "Stuart Low," from Messrs. STUART LOW & Co., Bush Hill Park.—The finest white *C. Mendelii* yet shown. The flowers are large and of fine form; snow-white with chrome disc to the lip.

AWARDS OF MERIT.

Cattleya Dietrichiana (*superba* × *Hardyana*), from Messrs. SANDER & Co.—A very fine hybrid with large, rosy-lilac flowers of fine form and substance, the broad front of the lip glowing ruby-purple.

Cypripedium Curtisii Sander's variety, from Messrs. SANDER & SONS, St. Albans.—A grand form, and said to be merely an example of a small batch recently imported by Messrs. SANDER & SONS. The difference may be said to be that this variety is much larger and finer in colour and in form than any yet imported.

Cattleya Mendelii King George V., from Messrs. SANDER & SONS.—An extraordinary variation, in which the petals and lip are most beautifully crimped. The sepals and petals are bluish-white, and the front of the finely-fimbriated lip is magenta.

Fruit and Vegetable Committee.

Present, G. Bunyard, Esq. (in the Chair); also Messrs. J. Chal. O. Thomas, G. Wythes, P. G. M. Veitch, J. W. Ward, H. Parr, C. O. Walter, G. Woodward, J. Jaques, A. R. Allen, J. Harrison, F. Perkins, A. Dean, J. Basham, F. Fred. Tresler, W. Pope, H. S. Rivers, G. Reynolds, G. Koff, and T. Coomber.

The only exhibits for the inspection of the Committee included a Tomato from Mr. PAUL, Botley, Hants (unripe), and Strawberries Hibberd's Superlative and George V., from Mr. HIBBERD, Botley Grange, Hants; a large collection of Radishes, Peas, and a Lettuce, grown at Wisley.

FRUIT TREES IN POTS.

Of these there were three collections, one from a private garden, that of S. HEILBT, Esq., Holyport, Maidenhead (gr. Mr. G. Camp), who had, specially prominent, 12 noble and tall Cherries in 14 inch pots, laden with superb fruit. These included Black Bigarreau, Bigarreau Noir de Schmidt, Emperor Francis, Bigarreau Montreuse de Mezel, also Peaches, Nectarines, and Figs.

In the same tent was a very large collection from Messrs. RIVERS & SON, Sawbridgeworth, including some 70 trees of various sizes. Of Peaches, there were Thomas Rivers, Sea Eagle, Peregrine, Nectarine, Albatross, and Crimson Galande; of Nectarines, Early Rivers and Lord Napier; Cherries, Black Tartarian, Governor Wood, May Duke, Black Hawk, Black Heart, and Frogmore Bigarreau; of Grapes, there were Foster's Seedling and Gradishua; of Plums, Curley, Czar, and Tall Orange; of Apples, Lady Sudeley, Peasgood's Nonesuch, Jas. Grieve, and Worcester Pearmain; Pears, Conference and Pitunston Duchess; and Oranges, Maltese Oval and the large Egg. On this last named variety

good-sized, green fruits were hanging with the ripe fruits. There were, fronting the trees, in boxes, fine fruits of Peregrine Peach, Blue Rock and Yellow Egg Plums, Reine Hortense, Emperor Francis, Early Rivers, and Bigarreau Noir de Schmidt Cherries.

From the KING'S ACRE NURSERY Co., Hereford, came a large collection, including many single cordon and standard Gooseberries, these being all well fruited. The collection was faced by a large number of Strawberry plants in pots, all heavily fruited. These included Sir Joseph Paxton, Reliance, President, and Leader. The back trees were Peaches, Plums, and Cherries, but the naming was too indistinct to be seen from the front. One flat-trained tree of Peach Duke of York was well fruited. There were also a few vines and Figs.

GATHERED FRUIT.

A notable feature of the show was the picked fruit, a section not usually well represented. A prominent place was occupied by the superb collection from Welbeck Abbey, sent by the Duke of PORTLAND (gr. Mr. J. Gibson). This included about 50 dishes, the whole being elegantly arranged and prettily dressed with small plants and foliage. The Grapes were Alnwick Seedling (very fine), Black Hamburg, Madresfield Court, Muscat of Alexandria, and Foster's Seedling, three bunches of each; Peaches were Grosse Mignonne, Dymond, Crimson Galande, and Bellegarde, in dozens; also Nectarine Cardinal, Lord Napier, Early Rivers, and Pine Apple; Plums, Jefferson's, Kirke's and Transparent Gage; Cherries, Bigarreau de Mezel and Emperor Francis; Figs, White Marseilles, Negro Largo, and Brown Turkey; Melons, Sutton's Seedling and Scarlet, Emerald Gem, Gunton's Scarlet, Royal Jubilee, and others; Apples, Alington Pippin and Jas. Grieve; and Strawberries, British Queen and Royal Sovereign.

Lord LLANGATTOCK, The Hendre, Monmouth (gr. Mr. T. Coomber), had 20 very clean and well-finished Queen Pines, and 14 boxes of Strawberries, the fruit in each case being exceptionally fine and richly coloured. Scarlets were Fullbasket, The Cropper, Trafalgar, Royal Sovereign, and The Alake. Dark-coloured Strawberries were The Bedford, Reward, Progress, Bedford Champion, Givon's Late Prolific, Gunton Park, President Loubet and Waterloo, with Louis Gauthier white.

LEOPOLD DE ROTHSCHILD, Esq., Gunnersbury House, Acton (gr. Mr. Jas. Hudson), staged a collection inclusive of fine (Crimson Galande Peaches; Stanwick Elruge Nectarine; Kirke's, Jefferson's, and Transparent Gage Plums; and Bigarreau Napoleon, Governor Wood, Emperor Francis (white), Late Duke (red), and Bigarreau de Schrecken, Tradescant's Late Heart, Black Circassian, and Early Rivers (black) Cherries.

From Hatheld House, Herts., the Marquis of SALISBURY (gr. Mr. H. Prime) sent a very nice collection of 40 dishes, including Black Hamburg Grapes; Royal George, Bellegarde, and Crimson Galande Peaches; Lord Napier Nectarines; Brown Turkey Figs; Monarch, British Queen, Mentmore, Givon's Late Prolific, and Royal Sovereign Strawberries; Cherries, Governor Wood and Early Rivers; and other fruits, all excellent.

The Misses LE LACHEUR and SHERRES, Henfield, Sussex, had 20 superbly-finished and coloured fruits of the Swanley College Melon, very round, golden, and handsomely netted, all first-class in excellence.

E. S. HANBURY, Esq., Ware, Herts. (gr. Mr. F. W. Church), staged, rather too crowded, a collection, including Foster's Seedling and Black Hamburg Grapes; fine Crimson Galande, and Dr. Hogg Peaches; Dryden Nectarines; and other fruits, which badly needed more space.

Messrs. LAXTON BROTHERS, Bedford, had 50 feet run of tabling for staging 41 baskets of Strawberries. New varieties were Sir Joseph Paxton, Progress, Laxton's Latest, The Laxton, The Bedford, Utility, Bedford Champion, Reval, Leader, Gunton Park, Waterloo, and Reward. The fruits were well coloured, of fair size, and presented most of the best known varieties.

Mr. S. MORTIMER, Swiss Nursery, Farnham, had a big collection of some 80 magnificent fruits of various Melons, including Sutton's Superlative, Ringleader, Blenheim Orange, Royal Sovereign, Royal Favourite, and Scarlet Gem; also of nearly ripe seedling fruit

Cucumbers Aviator (new), King George, Telegraph, Bounteous, and a fine new seedling, very long and handsome.

Mr. A. POUPART, JUN., Twickenham, staged a collection of over 100 bottles of preserved whole fruits, all in fine condition. These included Apricots, Plums in variety, Raspberries, Cherries, Strawberries, Currants, and Gooseberries.

VEGETABLES.

The Hon. VICARY GIBBS, Aldenham House, Herts. (gr. Mr. E. Beckett), had one of those splendid collections of vegetables for which those gardens are famous. The collection included 80 dishes, staged with an erect back, on which were mounds of Cauliflowers Early London, Walcheren and Kaiser; Peas, Talisman, New Kaiser, Stourbridge Marrow and Gradus; French Beans Canadian Wonder and Ne Plus Ultra; Long Pod Giant Bean; Tomatos, Sunrise, Greengage, Golden Queen, New Jewel, and Sensation; Carrots Intermediate, Early Nantes, Prizewinner and French Forcing; Cucumbers Universal, Bountiful, Royal Favourite, and Telegraph; Celery Prize Pink and Grove White; Cabbages First of All; Potatos Express, Duke of York, King Edward and Queen of the Veldt; Lettuces, Beets, Turnips, Marrow and other vegetables.

C. F. RAPHAËL, Esq., Shenley, Herts. (gr. Mr. A. Grubb), had a meritorious collection of vegetables, which included 50 dishes, most pleasingly staged. Cauliflowers Magnum Bonum and Walcheren; Dwarf Beans Canadian Wonder and Ne Plus Ultra; Peas Duke of Albany, Alderman and Quite Content; Long Pod Beans Leviathan and Green Giant; Potatos May Queen, Windsor Castle, Duchess of Cornwall and Express; Tomatos, Marrows, Celery, Lettuces, Turnips, Cabbages and other kinds.

Messrs. SUTTON & SONS, Reading, staged a very fine representative collection of edible Peas, in all, 85 dishes, of which 56 were distinct varieties. These pods were arranged in baskets, and amongst them were Superlative, Duke of Albany, Early Giant, Bountiful, Discovery, Telephone, Prizewinner, Duchess of York, Matchless Marrow, Exhibition Marrow, Peerless, Centenary and Best of All. Many were quite early varieties, the pods being almost ripe. Some Sugar Peas were included.

OUTDOOR EXHIBITS.

The exhibits of hardy plants were arranged, as in former years, parallel with the two large marquees containing the chief collections of Orchids, warm-house, and greenhouse plants, the backs of the groups being towards the marquees.

Messrs. J. VEITCH & SONS, LTD., King's Road, Chelsea, exhibited a large group consisting of Hydrangeas, including *H. hortensis*, with blue flowers, *H. h. flore alba*, *H. Lindleyana* (a Chinese species, having white flowers), *H. arborescens alba grandiflora* (the plants carrying many trusses of pure white flowers), *H. japonica tricolor*, a few plants of *Veronica angustifolia*, several varieties of Tree Ivies, conspicuous being *Hedera arborea chrysophylla*, *H. a. Golden Cloud*, also *H. Helix canariensis latifolia maculata*; a quantity of plants of *Clematis*, including several of *C. velutina purpurea*, *C. Star of India*, *C. Perle d'Azur* (having flowers of cerulean blue), *C. Mme. Grauge* (purple), *C. modesta*; several *Arundinarias*, and a plant of *Actinidia chinensis*—a recent introduction.

Messrs. D. RUSSELL & SON, Essex Nursery, Brentwood, showed a group having a pool of water in the centre containing Water Lilies, and bordered with flowering land plants, such as *Iris Kämpferi*, *Agapanthus*, *Monarda*, *Buphthalmia speciosa*, *Spiræas* in variety, *Campanula media*, *Veronicas*, *Phorinium tenax*, *Arundo*, &c. Surrounding the pool was a group of Tree Ivies, ranging from 2 feet to 6 feet in height, of variegated kinds, these being backed by taller plants having variously coloured leaves. A few Rambler Roses, with *Hydrangeas*, gave a desirable touch of colouring to the whole. Two rustic arches seemed to afford entrance and egress to the arrangement. In the pool there were floating *Nymphaeas* of the varieties *Gladstoniana*, *gloriosa*, *colossea*, and *Mariacea albida*.

Messrs. J. CHEAL & SONS, Lowfield Nursery, Crawley, erected a three-sided pergola, and decorated it with *Vitis Henryi*, yellow-leaved Hop, *Clematis*, *Actinidia*, variegated Ivies, Doro-

thy Perkins Roses, &c. In the enclosure formed by the pergola were four beds of Pansies, with a grass plot, and round about the latter was a border filled with *Spiræa Anthony Waterer*, *Hydrangeas*, Japanese *Acers*, Rambler Roses, and various small shrubs.

Mr. L. R. RUSSELL, Richmond, had an exhibit of *Bambusas* growing in pots and an oblong pool with Water Lilies in bloom. Other plants than the foregoing included Japanese Maples, and a miscellaneous collection of trees and shrubs.

Messrs. J. CARTER & CO., Holborn, exhibited a rockery that was planted in a pleasing manner, but not precisely with Alpine species. It was an effective piece of work. A long, narrow piece of water, spanned with a Japanese bridge at about the middle of it, and a stone lantern at one end, gave the desired character to the whole. *Iris Kämpferi* and Water Lilies were employed freely. Round about the margin of the lake were pigmy trees, growing in what appeared to be pieces of lava, but which might have been clinkers from the garden furnace. Colour was afforded by some well-flowered specimens of *Hydrangea* and *Lilium japonicum*.

Messrs. JOHN WATERER & SONS, LTD., Bagshot, made a display with tall plants in pots of *Vitis Henryi*, *Ilex aquifolium*, Perry's Weeping Holly (a silver, variegated variety), *Taxus fasti-*

hibit contained many other rare and interesting plants.

Messrs. CARLTON WHITE, Florists, 55, New Bond Street, had a variety of objects of the topiary art.

Mr. AMOS PERRY, The Hardy Plant Farm, Enfield, showed an assortment of *Nymphaeas* of the more choice varieties, also *Richardias* and Japanese *Iris*es. Subjects that attracted our notice were *Nymphaea Paul Heriot*, a white-petalled flower, having a deep-carmine colour at the centre—very striking; *N. Ellisiana*; *Delphinium belladonna grandiflora*, with flowers of a clear, light blue; *D. Mrs. Thompson*, of a deep blue tint; potful of *Heimerocallis obovata*; and *Richardias* of yellow and creamy-white colours.

Messrs. W. WOOD & SON, LTD., Wood Green, N., set up a pergola, covering it partially with such Rambler Roses as *Dorothy Perkins* and *Lady Gay*.

Messrs. W. FROMOW & SONS, Sutton Court Road, Chiswick, showed Japanese Maples in variety, Comfeyous plants, *Bambusas*, *Hydrangeas*, *Aralia pentaphylla variegata* (an effective plant), and *Andromeda cassinifolia*, covered with its white, bell-shaped flowers.

Mr. CLARENCE ELLIOTT, Six Hills Nursery, Stevenage, arranged a rock-garden exhibit, on

FIG. 11.—MR. BEAMISH'S EXHIBIT OF PRISMATIC ROOFING AT HOLLAND HOUSE SHOW.

giata Standishii (a yellow-leaved Yew), and a few other rare plants.

LEOPOLD DE ROTHSCHILD, Esq., Gunnersbury House, Acton, had an extensive exhibit of "terrace" plants. We noted big bushes, 7 feet to 8 feet high and 4 feet in their greater diameter, of Myrtles struck from cuttings 20 years ago, *Aloysia citriodora*, rooted about as long ago, and having stems 3 inches in diameter, and of a height of about 6 feet. Sweet-scented Cape species of *Pelargoniums* were of wonderful dimensions, many of them being 10 feet to 12 feet in width, trained on flat trellises. The varieties were *Quercifolium*, *Pretty Polly*, *Richard Dean*, *capitatum*, *Pheasant's Foot*, and *Attar of Roses*.

Messrs. PAUL & SON, Cheshunt, showed *Catalpa speciosa pulverulenta*, *Prunus Pissardii nigra* (having a leaf-colour darker than the type), *Vitis Thompsonii* (having red foliage), *V. Henryi*, *Populus lasiocarpa* (the leaves, when fully grown, being 8 inches in length and 4 inches in breadth; the youngest leaves are of a reddish-green tint, as are the veins at all stages). Other plants noted in the group were *Picea pungens glauca Kosteri*, a very distinct variety of this fine Conifer; several forms of *Cupressus Lawsoniana*; a yellow-leaved variety of *Retinospora filifera*; and *R. tetragona*. The young growths of *Cupressus Westermanni* have a yellow tint. *Philadelphus Yokohama* is very floriferous; the individual blooms are of the size of a florin; *P. maculata purpurea*, with a purple stain at the base of the white petals; and *Picea excelsa magnifica*, with yellowish-green needles. The ex-

which he displayed in a natural manner a number of interesting Alpines. Many were species of *Campanulas* seldom seen in gardens, viz., *C. Stansfieldii*, *C. pusilla*, *C. pulloides*, *C. pulla*, and *C. pusilla pallida*. Other plants shown by Mr. ELLIOTT included the bright-scarlet-flowered *Dianthus Atkinsonii*, *Erigeron caucasicum*, *Wahlenbergia saxicola*, *Epilobium obovatum*, *Prunella Webbiana*, and *Orchis maculata*.

Messrs. JOHN FORBES, LTD., Ilwaco, made a striking display with flowers of *Delphiniums*, *Pentstemons*, and shrubby *Phloxes*. Some splendid *Violas* and *Pansies* completed this exhibit.

Messrs. BARR & SONS, Covent Garden, showed pigmy trees in Chinese porcelain pots and bowls.

A choice collection of topiary objects was shown by Messrs. W. CUTBUSH & SON, Highgate, London, N.

IMPLEMENTS AND SUNDRIES.

Messrs. WM. WOOD & SON, Wood Green, had an extensive exhibit of Orchid fibre loam, peat, and Fern rhizomes for the drainage of Orchid pots, "Nidas," a favourite Orchid compost, and many other garden requisites, together with a variety of sprayers and syringes, boxes and packing materials, cutlery for the gardener, wooden trugs to carry fruit, flowers, and weeds, and other useful things.

Mr. J. H. BEAMISH, 27, Regent Street, London, showed a model greenhouse (see fig. 11) with the system of prismatic roofing referred to in the issue for June 18, p. 416.

Messrs. T. SYER & Co., 45, Wilson Street, Finsbury, London, showed telescopic ladders, garden seats, folding tables, tools, cutting instruments, syringes, watering-pots, and mats of wire capable of being rolled up.

THE MOSTELLE GRAPE JUICE CO., 7, Great Tower Street, E.C., showed unfermented wines.

DE LUZY FRÈRES, Camberwell, S.E., showed their National sprayer, Ideal bellows, and Ideal bird scarer. This scarer is hexagonal-shaped, with looking-glass sides, and furnished with a swivel, so that it may be hung in a tree and turned round perpetually when the wind is blowing.

THE BOUNDARY CHEMICAL CO., Cranmer Street, Liverpool, showed their Kap-All fimer and Climax disinfectant, and Alpol, a preparation for destroying underground pests.

MESSRS. BENTON & STONE, Birmingham, "Enots," showed a good assortment of sprayers and syringes.

MR. C. W. ARMITAGE, 104, Kenyon Street, Fulham, showed "Quixol," for cleaning cloth, &c.

The Alpha sprayer sold at Ross, Herefordshire, appears to be a handy knapsack appliance for the extinguishing of fires.

MESSRS. ABBOTT, BROS., Southall, showed fruit-preserving bottles with silvered caps.

Fruit and general bottling outfits were shown by Messrs. G. FOWLER, LEE & Co., Reading, Berks.

Garden earthenware was displayed by Messrs. D. DOWELL & Co., Ravenscourt Avenue, Hammersmith; and artistic-looking plant-tubs from Messrs. PRADEL & Co., 18, Windmill Street, W.

THE FOUR OAKS NURSERY CO., Sutton Coldfield, Birmingham, showed sprayers in copper and tinned copper, and corrugated syringes.

MESSRS. FENTON & SON, Tudor Street, Dorset Street, London, E.C., showed gas-heated baths, radiators, boilers, &c.

THE LAMP PUMP SYNDICATE, LTD., 12, Carey Street, Westminster, S.W., showed a lamp pump in action of the shallow-well type, a machine that delivers, at a height of 60 feet, 300 gallons per hour.

MESSRS. B. MAGGS & Co., Bristol, showed garden seats of various patterns in Oak and Teak, under the names Blenheim, Arethusa, and Agamemnon.

Mrs. G. E. WATTS, The Village Industry, Compton, Guildford, showed pots, vases, sundials, and window-boxes.

Garden seats, hammocks, and garden tents without centre pole, were shown by Messrs. C. & W. BUSWELL, Victoria Works, Torquay.

Castle's man-of-war Teak-wood garden seats were shown by Messrs. CASTLE & Co., Baltic Wharf, Millbank, London, S.W.

Lawn mowers were shown by Messrs. LLOYD LAWRENCE & Co., who displayed those known as Pennsylvania mowers.

MESSRS. DOULTON & Co., LTD., Lambeth, S.E., showed vases, plinths, statues, and pedestals in artificial stone, well finished and artistic in character.

THE PATENT LADDER CO., Peterborough, showed specimens of their ingenious goods for the use of gardeners.

MESSRS. PIPER, Bayswater, W., showed red earthenware, tubs, pots, vases, &c.

Wall trellises, pergolas, seats, ladders, shading for glasshouses and other garden sundries were exhibited by Messrs. WALTER & Co., Amberley Works, Croydon.

MESSRS. TOOME & SON exhibited oil and gas stoves and other heating appliances.

MR. A. C. HARRIS, Leicester, showed a clipper and holder for use in gathering flowers and fruit and for weeding.

Other exhibitors of garden requisites were Messrs. W. HERBERT & Co., Hop Exchange, S.E.; CORRY & Co., LTD.; W. E. CHANCE & Co., Oldbury; and Messrs. F. G. WOOD, 161-163, Walworth Road, S.E.

AWARDS MADE BY THE COUNCIL.

GOLD MEDALS.

The Duke of Portland, Welbeck Abbey, Worksop (gr. Mr. J. Gibson), for fruit; Sir Jeremiah Colman, Bart., Gattop Park, Reigate (gr. Mr. Collier), for Orchids; Hon. Vicary Gibbs, Aldenham House, Epsom (gr. Mr. Beckett), for fruits and vegetables; Leopold de Rothschild, Esq., Gunnersbury House, Acton (gr. Mr. Hadson), for terrace plants; Jas. Carter & Co., High Holborn, for Japanese gardens; W. Cuthbert & Son, Highgate, for Carnations, &c.; H. B. May & Son, Upper Edmonton, for flowering plants and exotic Ferns; Paul & Son, Cheshunt, for Roses; Wm. Paul & Son,

Waltham Cross, for Roses; Rivers & Son, Sawbridge-worth, for fruit trees in pots; Amos Perry, Enfield, N., for Delphiniums; L. R. Russell, Richmond, Surrey, for Ivies and Water Lilies; Sander & Sons, St. Albans, for Orchids; Sutton & Sons, Reading, for Sweet Peas and Veitchian Peas; J. Veitch & Sons, Chelsea, S.W., for stove and foliage plants, &c.; and R. Wallace & Co., Kilmfield Gardens, Colchester, for a streamside and paved garden.

SILVER CUPS.

Sir Randolph Baker, Bart., Blandford, Dorset, for Sweet Peas; the Marquis of Salisbury, Hatfield (gr. Mr. Prime), for fruit; the Rt. Hon. Lord Langatock (gr. Mr. Coomber), for Pineapples and Strawberries; T. C. Raphael, Esq., Shenley (gr. Mr. A. Grubb), for Carnations and vegetables; S. Heilbut, Esq., for fruit trees in pots; W. Cuthbert & Son, Highgate, for shrubs and herbaceous plants; J. Veitch & Sons, Ltd., Chelsea, for Carnations and flowering plants; S. Low & Co., Enfield, for Orchids, Carnations, Roses, and berries; Barr & Sons, Covent Garden, for pigmy trees, Irises, Gladioli, herbaceous plants, &c.; G. Jackman & Son, Chard, for Roses, herbaceous flowers, and Clematis; T. S. Ware, Ltd., Feltham, for Begonias, Alpines, and herbaceous plants; Blackmore & Langdon, Bath, for Begonias and Delphiniums; G. and A. Clark, Ltd., Dover, for herbaceous plants and hardy flowers; W. Fromow & Sons, for Japanese Maples and hardy plants; G. Bunyard & Co., Ltd., Maidstone, for herbaceous plants; B. R. Cant & Sons, Colchester, for Roses; A. Dickson & Sons, Ltd., Newtownards, for Roses; D. Russell & Son, for hardy trees and shrubs; Dobbie & Co., Mark's Tey, for Sweet Peas; Miss H. Hemus, Holdfast Hall, for Sweet Peas; Mr. H. Burnett, Guernsey, for Carnations; Charlesworth & Co., Haywards Heath, for Orchids; Hugh Dickson & Sons, Belfast, for Roses; Mansell & Hatcher, Ltd., Rawdon, Yorkshire, for Orchids; Maurice Prichard, Christchurch, for water garden; and J. Cheal & Sons, Crawley, for pergola group.

SILVER-GILT HOGG MEDALS.

Leopold de Rothschild, for fruits, and Laxton Bros., Bedford, for Strawberries.

SILVER-GILT FLORA MEDALS.

E. J. Johnstone, Esq., Groombridge (gr. Mr. Paskett), for Sweet Peas and Carnations; G. Paul & Son, Cheshunt, for hardy shrubs and herbaceous plants; W. Artindale & Son, York, for hardy plants, Violas, &c.; J. Cheal & Son, York, for pergola group and Alpines; J. Peed & Son, West Norwood, for Caladiums, Gloxinias, &c.; Hobbies, Ltd., Dereham, for Roses; F. Cant & Co., Colchester, for Roses; A. F. Dutton, Iver, for Carnations; Frank Lilley, Guernsey, for Gladioli; G. Lange, Hampton, for Carnations; and R. and G. Cuthbert, Southgate, for flowering plants.

SILVER-GILT KNIGHTIAN MEDALS.

Mr. W. Poupert, jun., Twickenham, for bottled fruits.

SILVER FLORA MEDALS.

L. R. Russell, Richmond, for stove and greenhouse plants; Hon. Vicary Gibbs, Elstree (gr. Mr. Beckett), for Pelargoniums; Lord Burnham, Beaconsfield (gr. Mr. Johnson), for Carnations; H. S. Goodson, Esq., Putney (gr. Mr. G. E. Day), for Odontoglossums; S. Bide & Sons, Farnham, for Sweet Peas; C. W. Breadmore, Wimbledon, for Sweet Peas; C. Engelmann, Saffron Walden, for Carnations; Messrs. Forbes, Ltd., Hawick, for Phloxes, Pansies, &c.; R. Harkness & Co., Hitchin, for Roses; H. Hemley, Crawley, for Alpine plants and rock garden; Misses K. and E. Hopkins, Shepperton, for herbaceous plants and Alpine garden; E. W. King & Co., Coggshall, for Sweet Peas; W. J. Unwin, Histon, for Sweet Peas; J. Waterer & Sons, Bagshot, for evergreens; Whitelegg & Page, Chislehurst, for herbaceous plants; Carter Page & Co., London Wall, for Dahlias, Pelargoniums, and Violas; H. H. Crane, Highgate, for Violas and Violettas; Gunn & Sons, Olton, for Phloxes; B. Ladhams, Ltd., Southampton, for perennials, &c.; H. Newman Ellison, West Bromwich, for exotic Ferns; W. Wood & Sons, Wood Green, for pergola; C. and W. Buswell, Torquay, for garden tents, &c.; The Four Oaks Co., Sutton Coldfield, for sprayers, &c.; Alex. Hamilton, 87, Great Portland Street, for tubs for shrubs, &c.

SILVER KNIGHTIAN MEDALS.

S. Mortimer, Rowledge, for Melons and Cucumbers, and Le Lacheur & Sherres, for Melons.

SILVER-GILT BANKSIAN MEDALS.

Kelway & Son, Langport, for Delphiniums and hardy plants and Sweet Peas; King's Acre Nursery Co., Hereford, for fruit trees in pots and Roses; Charles Turner, Slough, for Roses and Carnations; R. H. Bath, Ltd., Wisbech, for Carnations and Roses; G. Routh, Keston, for hardy plants and shrubs; Bertie Bell, Guernsey, for Carnations; Chas. Blick, Hayes, for Carnations; W. H. Page, Hampton, for Roses, Carnations and Liliums; R. C. Notcutt, Woodbridge, for hardy plants, Roses and shrubs; Geo. Prince, Oxford, for Roses; and Carlton White, Oxford Street, London, for clipped trees.

SILVER BANKSIAN MEDALS.

E. S. Hanbury, Esq., for fruit; the Rt. Hon. Col. Lockwood, Romford (gr. Mr. G. Craddock), for Tracheliums; W. J. Brown, Peterborough, for herbaceous plants; Godfrey & Sons, Exmouth, for Campanulas; Mallett & Co., Cheddar, for Irises and herbaceous flowers; Clarence Elliott, Stevenage, for Alpine and rock garden; J. Piper & Son, Bayswater, for Box and Yew trees; H. J. Jones, Ltd., Lewisham, for Pelargoniums and Sweet Peas; R. Sydenham, Ltd., Birmingham, for Sweet Peas; A. Young & Co., Elgin, for herbaceous plants; G. Gibson & Co., Yorks., for herbaceous plants; J. King & Sons, Coggshall, for Sweet Peas; H. C. Pullham, Elsenham, for herbaceous plants and Alpines; Scragrave & Co., Sheffield, for Violas; B. es, Ltd., Liverpool, for Primulas and her-

baceous plants; A. L. Gwillim, New Eltham, for Begonias; and the Alpha Extinguisher Co., Herefordshire, for spraying machines.

BRONZE FLORA MEDALS.

Messrs. Bastock & Son, Birmingham, for Violas and Galgas; the Guildford Hardy Plant Nursery, Guildford, for herbaceous plants; Jarman & Co., Chard, for Centaureas; G. Stark & Sons, Norfolk, for Sweet Peas; A. J. Harwood, Colchester, for herbaceous plants; the Castle's Shipbreaking Co., Ltd., Millbank, for garden furniture; W. E. Chance & Co., Oldbury, for bell glasses; B. Maggs & Co., Bristol, for teak seats; the Meath Home, Godalming, for garden baskets; John Pinches, Crown Street, for Rose exhibition boxes, tubs, &c.; and J. P. White, Bedford, for garden seats.

WINDSOR ROSE.

JULY 2.—An excellent show was held by this society on the above date, in the grounds of Windsor Castle, permission to hold the exhibition being granted by His Majesty the King.

The entries were much more numerous than in former years, and all that was needed to ensure success was fine weather: this, unfortunately, was not forthcoming, as one or two very heavy rainstorms fell during the day. The exhibits, and especially those in the open classes, were of excellent quality. The 48 blooms which won the King's Cup for A. DICKSON & SONS, Newtownards, were exceptionally fine, the varieties Mrs. Cornwallis West, Horace Vernet, Mrs. W. J. Grant, Mamie, Mildred Grant, Countess of Annesley, Mrs. David McKie and Lady H. Vincent were all shown in excellent condition. Messrs. BEN. R. CANT & SONS, Colchester, were placed 2nd, and Messrs. D. PRIOR & SONS 3rd.

In the class for 18 Tea or Noisette varieties, distinct, Mr. G. PRINCE, Longworth, Berks., was awarded the 1st prize, having an excellent lot of fresh blooms. Mme. de Watteville, Mme. Jules Gravereaux, and Molly Sharman Crawford were splendid. Messrs. FRANK CANT & Co. were a good 2nd, and Mr. HENRY DREW, Longworth, Berks., 3rd.

Messrs. A. DICKSON & SONS were placed 1st in the class for 12 distinct varieties, three blooms of each kind, with a magnificent stand. Some of their more notable flowers were those of Ulrich Brunner, Marquise Litta, Horace Vernet, Bessie Brown, Mildred Grant and Mrs. W. J. Grant (adjudged the best bloom in the show). Messrs. D. PRIOR & SONS were awarded the 2nd prize with fine blooms, and Messrs. BEN. R. CANT & SONS the 3rd prize.

For 12 blooms of any H.P. or H.T. variety, Messrs. HARKNESS were placed 1st with splendid blooms of Mrs. J. Laing; 2nd, Messrs. A. DICKSON & SONS with Lady Ashton; 3rd, Messrs. B. R. CANT & SONS with Dean Hole.

MESSRS. DICKSON & SONS were placed 1st in the class for 12 blooms of any Tea or Noisette variety with an excellent stand of Mrs. Foley Hobbs; 2nd, Messrs. B. R. CANT & SONS with Mme. Jules Gravereaux.

In the class for 18 bunches of decorative Roses, Mr. CHARLES TURNER, Slough, was awarded the 1st prize. Lady Battersea, Liberty, Mme. A. Chatenay and Joseph Lowe were notable blooms in this excellent exhibit. Messrs. FRANK CANT & Co. were a close 2nd; 3rd, Messrs. W. & J. BROWN, Peterborough.

Messrs. F. CANT & Co. excelled in the class for 12 blooms of any crimson variety mingled with 12 blooms of any white kind, having fine flowers of J. B. Clarke and Frau Karl Druschki; 2nd, Mr. HENRY DREW; 3rd, Messrs. G. & W. H. BURCH, Peterborough.

In the class for six distinct varieties of Roses shown in vases, five blooms of each in a vase, Messrs. A. DICKSON & SONS won the 1st prize with a very fine exhibit, their examples of Mrs. Theodore Roosevelt, Gertrude and Lady Helen Vincent being excellent; 2nd, Messrs. D. PRIOR & SONS.

AMATEUR CLASSES.

The Windsor Challenge Cup was offered as the 1st prize in the class for 24 blooms, distinct. It was won by E. B. LINDSELL, Esq., with excellent flowers of Bessie Brown, Frau Karl Druschki, Mildred Grant, Helen Keller and others. 2nd, F. DENNISON, Esq.; 3rd, G. A. HAMMOND, Esq.

For eight varieties, three blooms of each, the Princess Alexis Dolgorouki's Cup was offered. E. B. LINDSELL, Esq., was again successful with a beautiful stand of blooms including Frau Karl Druschki, Mrs. T. Roosevelt, and Mildred Grant; 2nd, F. DENNISON, Esq.; 3rd, Rev. PEMBERTON.

CONWAY JONES, Esq., excelled in the class for 12 Teas or Noisette varieties. F. DENNISON, Esq., was placed 1st for three distinct varieties, five blooms of each.

The Rev. PEMBERTON showed the finest 12 bunches of decorative Roses with a very fine exhibit of Mme. A. Carriere, Red Province, Seagull, Claire Jacquier and Rosa Mundi; 2nd, E. MOCATTA, Esq.

Other prizewinners in the amateurs' classes included Messrs. W. ONSLOW TIMES, W. JARRATT, MORPE, CHALMERS HUNT (Rev.), J. B. SHACKLE (Rev.), A. C. TURNER, E. MOCATTA, and E. B. LEHMANN.

There was good competition in the local classes. The "Islet" Challenge Cup was won outright by J. B. FORTESCUE, Esq., with a beautiful stand of flowers. White Manan Cochet in this exhibit was adjudged the best bloom of a Tea variety in the local classes.

E. MOCATTA, Esq., won Lady Evelyn Mason's Cup offered for six bunches of decorative Roses. In the class for growers of fewer than 500 plants, E. F. BROWN, Esq., won the 1st prize. R. HOUSE, Esq., was 1st for six Teas or Noisettes, and the same exhibitor was 1st for six blooms of any variety.

E. WAGG, Esq., won the Marchioness of Normandy's Cup offered for a group of plants consisting of Orchids, Carnations, Gloxinias, Caladiums, Francoa ramosa, Ixoras and Ferns.

The Lady Mayoress of Windsor offered a cup in the ladies' class for the best decorated dinner-table. This was won by Mrs. MAX ERSTEIN with an excellent table arranged with pink "Malmaison" Carnations, Gypsophylla and Asparagus plumosus.

Lady TRESS BARRY showed the best Sweet Peas; Mr. J. B. FORTESCUE the best hardy flowers; Mr. J. H. BENSON the best table plants; and Mrs. MOSS COCKLE the finest group of plants and cut flowers.

TRADE EXHIBITS.

Messrs. J. VEITCH & SONS, LTD., Chelsea, showed Sweet Peas and Roses; Messrs. H. B. MAY & SONS, Edmonton, a large collection of Ferns; Messrs. W. PAUL & SONS, Waltham Cross, a stand of the new Rose "Juliet," which attracted much attention; Mr. C. TURNER, Slough, a splendid show of Gloxinias, Iris and hardy flowers; Messrs. G. JACKMAN & SON, Woking, a large group of Roses; and Messrs. TITT & SON, Windsor, floral designs.

Mr. Brice and Mr. Dunn, the joint secretaries, are to be congratulated on the excellent manner in which the arrangements of the show were carried out.

LOUIS VAN HOUTTE CENTENARY.

The fêtes organised to celebrate the hundredth anniversary of the birth of Louis Van Houtte, the great Belgian nurseryman, were held on Sunday, June 26 last, at Gendbrugge. Early in the morning the populace was astir, flags and banners floated in the air in the fronts of the houses, and Venetian masts were erected in the streets, with baskets of flowers half-way up, and surmounted with banners.

At 10.30, the Burgomaster of Gendbrugge held a reception, at which he was supported by the Burgomaster of Ypres, where Van Houtte was born, M. Fred Burvenich, Chairman of the Organising Committee, Louis Van Houtte, the deceased's son, the Sheriffs of Gendbrugge, the members of the Town Council, and the members of the Fêtes Committee. Among the visitors present at the reception, were Messrs. De Bast, de Lanier, Léger, Alexis Callier, Mechelynck, Van Cleemputte, Maenhaut, Roels, A. Ceuterick, Bodaert, Albert Maertens, Fiet, Aug. and Ad. Van den Heede, Henri De Wilde, Jos. de Hemptinne, G. De Ruyck, Kuyck, Jules De Cock, Aug. Van Geert, Peeters, Léon de Smet, R. Monnier, Firmin Lambeau, Cordonnier, Dumont, Edg. Wartel, Baron Casier, Ch. Pynaert, Lucien de Cock, Alphonse Gallet, Maurice Duquesnoy, Arthur De Smet, Baron Léon de Pélichy, Florent Van Hal, Heursel de Meester, Louis Gentil, E. Draps, Firmin de Smet, Van der Valck, Jurissen, A. De Smet, Jurr., Herreweghe, Séghers, A. Dachy, Henno and others.

The Burgomaster of Gendbrugge reminded the assembly that, in 1879, they unveiled a statue to the memory of Louis van Houtte, and that they were there on this occasion to celebrate the cen-

tenary of the birth of this great man, who might justly be called the founder of Belgian horticulture. Gendbrugge was proud of him, of his many achievements, and of his nursery, from which was issued *La Flore des Serres*. For 22 years he worthily fulfilled the duties of magistrate. Louis Van Houtte's biography had already been written by M. F. Burvenich, and would be distributed in book form among the visitors and subscribers to the fête. The Burgomaster then complimented M. Burvenich upon the part played by him in inaugurating and carrying out the commemoration.

M. Burvenich replied. There were still some old employés of Van Houtte in the nursery, and he had pleasure, in the name of the Fête Committee, in handing to each of those present souvenirs of their long connection with the firm. The Burgomaster then drank to the success of the Fête, and the *Livre d'Or*, with an illuminated front page, was signed by all those present.

The delegates from the various horticultural societies then proceeded in a procession to the Van Houtte monument, where M. Burvenich made a speech, relating the chief incidents in Van Houtte's career. It was a lengthy and eloquent recital of the great nurseryman's achievements. He referred also to the revolution of 1830, in which Van Houtte took an active part, and reminded his hearers that Belgium was not wanting, as some supposed, in patriotism. She was a young nation, and her independent existence only dated back to 1830, therefore they had not many occasions to celebrate.

The Burgomaster replied, accepting, on behalf of the town, a bronze plaque presented by the committee to commemorate the event, which would remind future generations that June 26, 1910, was a memorable day for all the friends of gardening. The gathering afterwards placed at the foot of the monument wreaths and bouquets of flowers, in the name, and on behalf of, the many societies represented.

The procession then reformed, and proceeded in the direction of the Van Houtte nurseries, where, at half past 12, the official opening of the Horticultural Exhibition took place. This remained open until the Tuesday evening. The Managing Director and other members of the board welcomed the visitors in a speech to the following effect: "When the Louis Van Houtte Centenary Committee asked us to participate in the fête, we accepted with the greatest pleasure, for we thought with them that his memory might well be recalled in the establishment which he founded. It was in 1837, after an adventurous voyage to Brazil, that Van Houtte settled here. He began in a small way, with not much land and a few greenhouses. Of course, horticulture existed long before Louis Van Houtte, but he gave to it a great impetus. He really created scientific horticulture, and made of it a branch of education. This is so far true that, in 1849, the Government, by Royal decree, started the two first schools of horticulture in Belgium—the practical school at Vilvorde, and the scientific school, entrusted to Louis Van Houtte, in his own nursery. Van Houtte was quite equal to the task that the Government put upon him. He undertook the charge of the school, got together his co-workers, and his pupils soon became professors. Years have passed, and Van Houtte and most of the early scientific horticulturists are gone, but one still remains as young as ever, M. Fred Burvenich, whom I am pleased to see here to-day. Louis Van Houtte was also a writer. He started *La Flore des Serres*, and published in it many articles that attracted the attention of the whole world. Still he remained a nurseryman, still he worked, still he wrote. A limited liability company has taken the place of the old firm. Above all, it religiously keeps up the name of its founder, and the board is pleased to have in its midst M. Louis Van Houtte, the son of him of whom I have been speaking."

The visitors then proceeded to view the show prepared for them in the Van Houtte nurseries. The 82 greenhouses and gardens were visited in turn. At 1.30 p.m. the visitors adjourned to lunch; M. Verdonck presided.

Afterwards there was a grand procession of triumphal cars, many of them carrying allegorical representations of different important horticultural events. It was preceded by gendarmes on horseback, and, at intervals, bands of music followed.

The day's proceedings were brought to a close

by a grand banquet held in a saloon of the Royal Agricultural and Botanical Society. Again, M. Verdonck presided, being surrounded by a numerous company of Belgian horticultural celebrities. Among the speakers were M. Burvenich, M. Verdonck, the Burgomaster of Ghent, the Burgomaster of Ypres, M. Callier, M. de Hemptinne, the Baron de Pélichy, M. Arthur de Smet, M. Louis Van Houtte, and others.

THE WEATHER.

THE FOLLOWING SUMMARY RECORD of the weather throughout the British Islands, for the week ending July 2, is furnished from the Meteorological Office:—

GENERAL OBSERVATIONS.

The weather.—A very unsettled condition prevailed throughout the week, precipitation generally in showers being very frequent. Thunderstorms were experienced at a few stations in eastern England on Wednesday, at many places in that district and in some parts of northern England on Thursday, and over the eastern half of England and at some places in the east of Scotland on Friday, while on Saturday they were very general over the eastern half of England, and also occurred at some western stations and in Scotland.

The temperature was below the normal, the deficit being about 2½° in the English Channel and between 3° and 5° elsewhere. The highest of the maxima were generally recorded either on Monday or Tuesday, and ranged from 70° in England S.E. to 63° in England N.W. At many of the western and northern stations, and also at Portland Bill, the thermometer remained below 60° during the greater part of the week. The lowest of the minima, which were registered at most stations early in the week, ranged from 30° in Scotland E. (at Balmoral on Tuesday) and 38° in Scotland W. to 46° in Ireland N. and to 47° in Ireland S. and the English Channel. The lowest grass readings reported were 26° at Balmoral, 32° at Crathes, 33° at Hereford, 34° at West Linton and Shetland, and 35° at Durham, Glasgow, Newton Rigg, and Llanganoch Wells.

The mean temperature of the sea was generally higher than during the corresponding week of last year in the east, and lower in the west and north. At Wick it was nearly 7° lower. The mean values ranged from about 61° at Margate and Eastbourne, 60° at Newquay, and 59° at Seahfield, to below 54° on most parts of the north-west, north, and north-east coasts of Britain, and to 50° at Wick.

The rainfall exceeded the mean in all districts, the excess being large in several parts of England and in Ireland N., very slight in Scotland W., and the English Channel.

The bright sunshine was less than the normal, the deficit being considerable except in the south of England and the English Channel stations. The percentage of the possible duration ranged from 49 in the English Channel, 39 in England S.E., and 35 in England S.W. to less than 20 in the north of Ireland and the north and east of Scotland, the lowest value being 12 in Scotland N.

THE WEATHER IN WEST HERTS.

Week ending July 6.

Another cold, wet, and sunless week.—During the last fortnight there has not been a single warm day, and during the past week only one warm night. On the two coldest nights of the week the exposed thermometer fell to within 7° of the freezing point. The ground is at the present time 2° colder at 2 feet deep, and 3° colder at 1 foot deep than is seasonable. Rain has fallen on nine of the last 13 days, and to the total depth of 2½ inches. Two and a quarter gallons of rain water have come this morning through the bare-soil gauge, and about three-quarters of a gallon through that on which short grass is growing. The latter gauge had previously been quite dry for nearly three weeks. The sun shone on an average for only five hours a day, which is more than an hour a day short of the mean duration for the time of year. The wind has been as a rule rather high, and throughout the week the direction has been some westerly point of the compass. The mean amount of moisture in the air at 3 p.m. exceeded a seasonable quantity for that hour by as much as 10 per cent.

JUNE.

A warm and wet month.—Taken as a whole, this was the warmest June for 11 years, although throughout the last week the temperature remained persistently low for a summer month. The nights were as a rule more unseasonably warm than the days. On the warmest day the temperature in the thermometer screen rose to 79°, which is about the average extreme maximum for the month, and on the coldest night the exposed thermometer registered a temperature only 3° above the freezing point, and yet this is rather a high extreme minimum for June. Rain fell on only 11 days, but to the aggregate depth of 3½ inches, or 1½ in excess of the average for the month. There was a very heavy rainfall of short duration on the 6th, when 1½ inch was deposited in 15 minutes—the total fall on that day being 1½ inch. In the middle of the month there was a dry period lasting 12 days. The sun shone on an average for six hours a day, which is 10 minutes a day short of the average duration for June. The winds were as a rule light, and in the windiest hour the mean velocity was 18 miles—direction W. The mean amount of moisture in the air at 3 o'clock in the aft noon exceeded a seasonable quantity for that hour by 4 per cent. *E. M. Berkhamstead, July 6, 1910.*

GARDENING APPOINTMENTS.

(Correspondents are requested to write the names of persons and places as legibly as possible. No charge is made for these announcements, but if a small contribution is sent, to be placed in our collecting box for the Gardeners' Orphan Fund, it will be thankfully received, and an acknowledgment made in these columns.)

Mr. W. MERT, for the past 10 years Gardener to W. BAILEY HAWKES, Esq., and previously for 4 years Foreman at Aldenham House, Elstree, as Gardener to E. CHANDLER WALKER, Esq., Willstead, Walkerville, Ontario, Canada.

Mr. H. V. MANN, for the past 8 years Gardener to Sir CHARLES BUGGE PRICE, Bart., Spring Grove, Richmond, Surrey, as Gardener to Sir EDWIN CORNWALL, M.P., Oaklands, Horley, Surrey.

Mr. G. W. WHYMAN, formerly Gardener to the late Mrs. GODDARD, The Elms, Crawley, Sussex, as Gardener to J. J. W. MILLER, Esq., Colwood, Warmingind, Haywards Heath, Sussex.

Mr. C. CHANDLER, for the past 1 year and 8 months Gardener to R. C. FORSTER, Esq., Vesterne Manor, Wootton Bassett, as Gardener to Sir HENRY EARLE, Norton Lodge, Yarmouth, Isle of Wight.

Mr. WILLIAM CAIRNS, for the last 24 years Gardener to Mrs. PHILLIPS, Taver-hold House, Bicester, Oxon., as Gardener to F. SELNE-RAUCLIFFE, Esq., J.P., Hitchin Ferry, Hitchin, Herts.

Mr. C. H. SNOOK, for the past 17 years Gardener to the late Mrs. JULIA SCARAMANGA, West Hill, Shanklin, I.W., as Gardener to C. SCARAMANGA RALLI, Esq., at the same place. (Thanks for 2s. received for R.G.O.F. Box.—EDS.)

Mr. W. C. DAVIS, late Gardener at Coleshill Park, Birmingham, as Gardener to ERNEST STEVENS, Esq., Prescott House, Stourbridge, Worcestershire.

DEBATING SOCIETIES.

BRISTOL & DISTRICT GARDENERS'.—A well attended meeting of the above society was held on June 30, at St. John's Parish Rooms. Mr. Hayball presided. Mr. Hollingsworth, horticultural lecturer for the Gloucestershire County Council, gave a lecture on "Some Points About Pruning." Mr. Hollingsworth said the first object of pruning was to establish form. Standard trees require little pruning beyond the removal of unsuitably placed shoots and the weaker ones, where they are crowded; but trained trees require severe branch pruning, as well as root pruning. A special feature at the meeting was a competition for bunches of wild flowers, shown by under gardeners. Mr. Fred Clark was placed first, and Mr. J. Perry second.

BATH GARDENERS'.—The monthly summer meeting of this society was held on Monday, June 27, in the Foresters' Hall, Bath Street. The president, Mr. C. T. Foxcroft, presided over a large attendance. Mr. C. Wakefield, of the Bristol Association, gave a lecture on the "Tuberous Begonia." He reviewed the history of the Begonia and gave full cultural details.

Obituary.

DAVID PLENDERLEITH.—The sudden death of this well-known Scottish gardener from heart disease, on June 18, is recorded. Mr. Plenderleith was a successful exhibitor at the shows of the Royal Caledonian Horticultural Society, being a skilful cultivator of greenhouse plants.

JOHN MAXWELL.—We learn from the American gardening papers of the death of this nurseryman, a native of England, who settled in California some 25 years ago. His business was at Napa, where he died on May 27, at the age of 55 years. He was a successful grower of fruit trees and nursery stock.

ABIES DOUGLASHI AND LARCH: *H. P.*, *Aber-garrany.* Both trees are badly affected with *Botrytis Douglasii*, a fungus that is most injurious to *Conifers* in nurseries. Spraying with Bordeaux mixture is the most certain means of checking the disease.

CINERARIAS, CALCEOLARIAS, AND PRIMULAS: *Constant Reader.* Although these plants may be grown to flower in the early winter months, the best results are obtained from those which bloom late in winter and spring. For that purpose seeds of *Cineraria* and *Primula sinensis* should be sown in May and June, whilst seeds of herbaceous *Calceolarias* may be sown in June and July. The seed pans or pots should be well drained, and filled to within an inch of the rims with a compost consisting of three-parts loam and one part leaf-soil and sand. The soil should be well watered before the

seed is sown. Seed of *Cinerarias* and *Primulas* should be only lightly covered with soil, and that of *Calceolarias* must be sown on the surface. Lay a sheet of glass or paper on the pans, and place the latter in a frame; afford shade during sunshine, or, preferably, place the frame on the north side of a wall, and keep it somewhat close and moist until the seedlings appear. When these are strong enough to handle, they should be transplanted into pans, and returned to the cold frame or pit. They will soon be ready to be potted into 3-inch pots, and later into larger ones. These plants succeed best in a cold frame or pit during the summer, but in the autumn the *Primulas* should be placed in the greenhouse. *Cinerarias* and herbaceous *Calceolarias* succeed well during the winter in a shallow pit where artificial heat can be afforded, so as to maintain a minimum temperature of 38° to 40°. If the plants are in a position exposed to the sunshine during the heat of the day, a light shading should be employed.

CULINARY PEA: *G. J.* Your Pea is evidently one of the French field or grey Peas, and most resembles *Pois Gris de Printanges*, a tall variety, or *Pois Perdix*, also one of the same strain. These Peas are grown in the field in France as forage plants, and have no edible value otherwise. They are not suitable for garden cultivation.

EARLY MARKET BEANS: *J. D.* The supplies of Beans in Covent Garden market in early spring are sent principally from France, and the Channel and Canary Islands. The principal varieties marketed at that season are *Negro Long Pod*, *Canadian Wonder*, and *Ne Plus Ultra*. You can obtain the addresses of the principal growers by applying to some salesman in Covent Garden Market who deals in this produce.

EXPORTING WATER LILIES TO SOUTH AFRICA: *Correspondent.* If the plants for exportation are growing in pots, they may be sent safely at the present time, packing them in damp moss. If they are not in pots, they should be kept for three months until the growth is better matured; in the latter case, they would arrive in South Africa at the beginning of the growing season, and they might be depended upon to recommence growth almost at once. In this instance, as in the former, they should be packed in damp moss. The safest method, however, of exporting *Nymphaeas* is by seeds.

GOOSEBERRY LEAVES DROPPING: *C. P. & Co.* The foliage is smothered with red spider. Spray the bushes with a solution of soft soap and paraffin. No fungus disease is present.

GRAPES DISEASED: *P. G. B.* The berries are affected with "spot." See reply to *W. McG.* in the last issue, p. 12. The specific recommended will not injure the branches.

HELIOTROPE DISEASED: *E. L. A.* A fungus, *Phoma heliotropii*, is causing the injury. Dip the plants in a rose-red solution of permanganate of potash or spray them with the same specific three times at intervals of three days.

NAMES OF PLANTS: *H. B.* 1. *Inula glandulosa*; 2. *Centranthus ruber* var. *albus*; 3. *Spirea filipendula* fl. pl.; 4. *Thalictrum aquilegifolium*; 5. too scrappy for identification; 6. *Hieracium aurantiacum*.—*W. A. H.* *Erysimum Perovskianum*.—*W. R. P.* *Digitalis lutea*; *Centauria dealbata*; *Hemerocallis fulva*.—*G. H. Haig.* *Syringa japonica*.—*J. F. D.* 1. *Gladiolus segetum*; 2. *Iris orientalis*; 3 and 4, forms of Spanish *Iris* (*I. Niphium*); 5. *Lycnis chalcidonica*; 6. *Potentilla atrosanguinea* fl. pl.; 7. *Allium Moly*; 8. *Erigeron philadelphicus*; 9. *Hemerocallis fulva*; 10. *Allium neapolitanum*; 11. *Rubus odoratus*.—*F. B.* 1. *Spirea discolor*; 2. *S. japonica* var.; 3. *Lysimachia* sp. (too scrappy for identification); 4. *Gilbea tritridata*.—*H. A. T.* The variegated variety of *Agapanthus umbellatus*.—*R. H.* 1. *Odontoglossum Lindleyanum*; 2. *Onocidium flexuosum*; 3. *Gongora portentosa*; 4. *Maxillaria picta*; 5. *Brassia verucosa*.—*F. M.* 1. *Pteris tremula*; 2. *P. serrulata*; 3. *Adiantum hispidulum*; 4. *Blechnum brasiliense*; 5. *Adiantum assimile*; 6. *A. pedatum*.—*T. J. H.* (*Dartmouth*). 1. Not recognised; 2. *Galega officinalis*; 3. *Hypericum patulum*; 4. *Polygala*

Dalmaiseana; 5. *Eccremocarpus scaber*; 6. *Cotoneaster Simonsii*.—*J. W. A.* Send a flower of the *Vanda*.

PACKING STRAWBERRIES: *G. T.* Your method of packing Strawberries in shallow boxes is the one generally adopted. The box should be first lined with cotton-wool; over this place a sheet of thin paper, then pack the fruits firmly in a soft leaf, with their points tilting in an upward direction. Young Strawberry leaves are quite suitable for this purpose, and if they are gathered overnight and placed in the packing-room, they will become softer, and not so liable to rub the fruit. We do not recommend the use of cotton-wool to cover the fruits when packed. The better plan would be to place a layer of vine leaves over the fruit, as these keep the fruit much cooler than would be the case with cotton-wool. It must be seen too that the whole is quite firm when packed to prevent any movement during transit. The depth of the boxes should be about 2 inches, and each box should be large enough to contain 1 lb. of fruit only.

PEACH LEAVES: *H. D. L. C.* The leaves are affected with "Blister," caused by the fungus *Exoascus deformans*. As a preventive, plant the trees against walls facing south in a sheltered part of the garden. Remove any diseased leaves as soon as detected, burn them, and prune those branches bearing diseased leaves beyond the point of infection. Spray with dilute ammoniacal solution of copper carbonate at intervals.

PEACH STONES SPLITTING: *E. K.* Although the main cause of Peaches splitting at the stone is an excess of moisture at the roots, the defect is largely constitutional, and trees liable to stone splitting should be replaced by others. Your case appears to show that it is due to some weakness in the individual, as none of your other Peach trees develops fruits with split stones.

POTATOS DISEASED: *T. B.* The common Potato disease is present. Spray the plants with Bordeaux mixture, which is the only means of preventing the spread of the disease.

SOIL FOR EXAMINATION: *W. B.* The sample of loam appears, from a superficial examination, to be suitable for the cultivation of Melons, but this cannot be stated with certainty unless the loam is analysed. If you are a Fellow of the R.H.S., you can submit the soil for analysis to the Society's chemist, Dr. Voelcker, 22 Tudor Street, E.C., who will accept the task for a small fee.

SWEET PEAS AND ONIONS: *Bostonian.* The Pea roots are destroyed by millipedes, and the Onions are attacked by the Onion maggot. A good dressing of gas lime would clear the soil of these pests.

TEAK WOOD FOR SHELVES IN PLANT HOUSES: *N. L.* Unpainted teak wood is commonly used for forming shelves and stages in Orchid houses, and it is found to be very durable and it is not liable to harbour fungus, even when old. We assume you mean shelves for fixing over the paths or along back walls. Teak or Oak wood would do well for either purpose. Shelves are usually formed of whole planks, but wide shelves might be made trellis-like with spaces between the strips of wood similar to an open wood work stage. In all cases where shelves are placed over staging bearing plants, the cultivator must take means to prevent injury to the stage plants arising from drip.

TRIFOLIUM MINUS: *G. & M.* Do not include any variety of Clover in lawn Grass seeds unless they are specially ordered.

WISTARIA: *W. A. H.* No disease is present to account for the trouble, which must be looked for in some other direction; most probably the roots are in an unsatisfactory condition.

DENDROLOGICAL NOTES.*

GRAF VON SCHWERIN, the President of the German Dendrological Society and editor of its publications, contributes a somewhat elaborate and—horticulturally, at least—complete monograph of the genus *Sambucus*. No synopsis of all the species of *Sambucus* has appeared since that in De Candolle's *Prodromus*, vol. iv., 1830, and Graf von Schwerin's work will be found a most useful addition to the literature of garden plants.

THE GENUS SAMBUCUS.

Sambucus comprises about a score of species widely dispersed in both the old and new worlds, though none has hitherto been found in extra-tropical South Africa. They inhabit temperate and sub-tropical regions, all round the northern hemisphere; extending southward in America, in the Argentine Republic, to about 45°; in Africa to German East Africa, south of the equator; and in Australasia to Tasmania. The distribution of all the species is illustrated by means of maps with outlined areas in colour, supplemented by localities after each description. We are somewhat puzzled by the areas outlined for the two Australian species, *S. Gandichaudiana* and *S. australis*, both of which areas include nearly the whole of New Guinea, though no species, so far as we are aware, has been re-

corded from any part of that country. But on coming to the details of the distribution of the two species in question, we are surprised to find the range given as East Australia and New Holland. At first it seemed that New Holland might be a slip for New Guinea, but this is disproved by the record—Australia: Brisbane, Bailey; New Holland: Montes Caerulsi, Lesson!

With regard to the one species found in German East Africa, Graf von Schwerin appears to have overlooked Dr. Engler's publication of it as a variety of *S. Ebnulus* (which it is) and has referred it to an Indian species, *S. adnata*, Wall., with the remark that it must certainly have been carried to Africa by birds of passage. In this connection it may be mentioned that a revision and definition of the Indian species of *Sambucus*, by Mr. J. Hutchinson, appeared in the *Kew Bulletin* for 1909, pp. 190-192. Full synonymy is given by Graf von Schwerin under each species and variety, from which it appears that there has been great confusion in the application of names to plants under cultivation. The author defines no fewer than twenty-five varieties of *S. nigra*, differing in the cutting, colour or variegation of the leaves, and in the colour of the fruit. Curiously enough, under domestic applications of *S. nigra*, he makes no mention of Elderberry wine, formerly generally made in the south of England, and still not uncommon in some parts of Sussex. A very showy coloured plate represents the ripe fruit of *S. intermedia* var. *neo-mexicana*, *S. nigra* var. *viridis*, *S. canadensis*, *S. melanocarpa*, *S. calli-carpa* and *S. racemosa* var. *flavescens*. We might extract many more interesting details, but anyone interested in the genus must not fail to consult this monograph. Graf von Schwerin gives a list of the species and varieties which he had in cultivation in 1909. It includes seventeen out of twenty-one known species and about fifty varieties. He appeals to cultivators for seeds or cuttings of the missing ones. We may add that *S. Fontenaysii* of Carrière is the only hybrid recognised by the author, and that the parentage given is *S. cœrulea* ♀ × *S. nigra* ♂.

THE DOUGLAS FIR.

The contribution on the coast and mountain forms of the Douglas Fir deserves attention, as it includes a great variety of information. According to the author, E. H. Frothingham, no other North American tree of commercial importance is so widely distributed as the Douglas Pine, nor has any other conifer introduced into Europe found the same favour with foresters. The Douglas Fir ranges through about 25 degrees of latitude, from the 35th degree northward, and about as many degrees of longitude, from the hundredth meridian westward. The coast form—the superior form—occurs in Oregon from sea-level up to 6,200 feet. With respect to the greatest height attained by the coast form of the Douglas Fir, Mr. Frothingham gives some figures which can only be accepted as approximations. Some reliable measurements are given in vol. xlvii. of the *Gardeners' Chronicle*, p. 69 and p. 203, of the height of the tallest trees in the world, where Mr. Frothingham's figures are discussed. Mr. Frothingham describes the coast form of the Douglas Fir as much superior to the mountain

form, and as having spreading branches and larger female cones (flowers) with appressed bracts (carpellary scales). The mountain form has ascending branches and smaller cones with spreading bracts. Frothingham's paper is repeated in summary, in the *Mitteilungen*, without any explanation,† but it is supplemented by some remarks on the cultivation in Germany of the Douglas Pine and the Sitka Spruce, from which we learn that the coast and mountain forms of the former are there distinguished as the green and grey varieties respectively, otherwise *Pseudotsuga Douglasii viridis* and *P. Douglasii glauca*. Of all the foreign timber trees cultivated on a considerable scale in Germany the Douglas Fir, it is stated, stands well first, and its cultivation is rapidly extending. It is highly prized in that country, both on account of its rapid growth and the excellence of its timber.

JAPANESE CHERRIES.

Prof. E. Koehne contributes a critical, descriptive account of the Japanese, ornamental Cherries of the section *Pseudocerasus* introduced into German gardens. He recognises eight types or species, namely: *Prunus Sargentii*, *P. serrulata*, *P. paracerasus*, *P. pseudo-cerasus*, *P. subhirtella*, *P. pendula*, *P. Herincquiana*, and *P. canescens*, with definitions of numerous varieties. As the author remarks, he has attempted a very difficult task, and if he has not succeeded in reaching finality he has produced a most useful classification of all the garden varieties.

CORNUS MACROPHYLLA.

The same author has an article headed "What is *Cornus macrophylla*?" As long ago as 1896 Dr. Koehne attempted to clear up the confusion existing in the nomenclature of the Asiatic species of *Cornus* having respectively alternate and opposite leaves. Unfortunately, the named specimens at Berlin on which he relied were incorrectly determined; consequently his new name *C. corynostylis* became attached to the wrong species. In the June number of the *Botanical Magazine* of 1909 a figure (plate 8,261) of *Cornus macrophylla*, Wall., was published, and incidentally the synonymy was corrected by the writer, according to his views of the species. Subsequently, in October, 1909, a more detailed exposition of the facts appeared in the *Kew Bulletin*, pp. 329-335, together with descriptions of some new species and determinations of other specimens collected by Mr. E. H. Wilson, on his second mission to China, in which work the author had the valuable assistance of Dr. C. K. Schneider. In the present article, Prof. Koehne accepts the revised synonymy, except that he regards *C. brachypoda*, C. A. Meyer, as specifically different from *C. macrophylla*, Wall., basing his view on characters which could not be tested on the majority of the numerous specimens we had before us. More recently Dr. W. Wangerin has published a monograph of the Cornaceæ in Engler's *Das Pflanzenreich*, Heft 41, April, 1910, where he states that *C. brachypoda* and *C. macrophylla* appear to be quite distinct species. This is not the writer's opinion, based upon dried specimens and fresh material of the plant figured in the *Botanical Magazine*, plate 8,261.

* Extracted, with comments, from the *Mitteilungen der Deutschen Dendrologischen Gesellschaft*, 1909, Octavo, pp. 407, with numerous illustrations.

† Since the above extracts were made we have discovered that Frothingham's paper first appeared in English as Circular 150 of the Forest Service of the United States Department of Agriculture; to which we find no reference in the *Mitteilungen*.

RECENT INTRODUCTIONS FROM CHINA.

Mr. Alfred Rehder, of the Arnold Arboretum, Boston, U.S., contributes a list of the genera of shrubs and trees raised in that establishment from seeds and cuttings collected by Mr. E. H. Wilson, independently of the collections made by the latter for Messrs. James Veitch & Co. The list includes 151 genera, many of them represented by a number of gatherings, though, of course, not necessarily by the same number of species. Thus: *Acer*, 23; *Actinidia*, 8; *Berberis*, 24; *Betula*, 10; *Celastrus*, 16; *Celtis*, 9; *Clematis*, 27; *Cornus*, 7; *Cotoneaster*, 21; *Deutzia*, 5; *Evodia*, 10; *Gleditschia*, 4; *Ilex*, 7; *Lespedeza*, 7; *Ligustrum*, 5; *Lonicera*, 24; *Neillia*, 3; *Photinia*, 6; *Pinus*, 22; *Prunus*, 53; *Pyrus*, 15; *Quercus*, 44; *Rhamnus*, 9; *Rhododendron*, 63; *Ribes*, 15; *Rosa*, 24; *Rubus*, 48; *Salix*, 21; *Schizandra*, 11; *Smilax*, 13; *Spiraea*, 15; *Staphylea*, 6; *Vaccinium*, 4; *Viburnum*, 29; and *Xanthoxylon*, 3. Many others are represented by two or more gatherings. Adding these to the immense collections made by Mr. Wilson during his first two journeys for Messrs. Veitch, we have a total unequalled by any previous collector in any part of the world.

THE LARGEST AND OLDEST LIME TREE IN GERMANY.

A figure is given of a veteran Lime tree, supposed to be the thickest and oldest in all Germany. It is growing in the neighbourhood of the town of Staffelstein, in the district of Oberfranken, Bavaria. The main trunk, of which the remains are from 12 to 15 feet high, is 24 metres (80 feet) in circumference. The age of this tree is estimated at 2,000 years. From the rim of the trunk, which, near the top, is encircled by a hoop of iron, rise several secondary stems, and they appear to be flourishing. W. H. B.

ORCHID NOTES AND GLEANINGS.

CATTLEYA WARSCEWICZII (GIGAS) ALBA IN AMERICA.

This plant (see fig. 12), imported last year by Messrs. Lager & Hurrell, of Rutherford, N.J., had its first public exhibition at the Orchid Show of the Massachusetts Horticultural Society in Boston, Mass., U.S.A., May 26 to 30, 1910. The plant was received by Messrs. Lager & Hurrell in the latter part of August, 1909, and was potted early in October. It made a strong bulb, and opened its flowers the first week in the following May. The sepals, petals and lip are pure white, and the throat greenish yellow. The plant is now dormant, but it will probably send forth two, if not three, growths in the coming season, judging by the eyes now showing. G. P. P., for the Horticulture Publishing Company, Boston, Mass.

CATTLEYA MENDELII "STUART LOW."

Our illustration (see fig. 15) represents the two plants of the pure, white-flowered form of *Cattleya Mendelii* exhibited by Messrs. Stuart Low & Co., Bush Hill Park, Enfield, at the Royal Horticultural Society's exhibition at Holland Park on July 5 this year, when it gained a First-class Certificate from the Orchid Committee. *Cattleya Mendelii* is not so prolific in albinos as most of the others of the *C. labiata* section, and this form was the finest yet seen. It would be difficult to imagine a more perfect white *Cattleya*. It is an interesting circumstance that Messrs. Low showed the first albino of this species as *Cattleya Bluntei* at a great show at the Royal Aquarium, Westminster, and reported in the *Gardeners' Chronicle*, June 3, 1876, p. 735, "Under the name of *Cattleya Bluntei*, Messrs. Hugh Low & Co., Clapton, exhibited a new and very fine, pure white variety, somewhat resembling *C. Mendelii* in form, and having a beautiful fringed lip." That plant is generally admitted to be an albino of *C. Mendelii*.

DENDROBIUM CARINIFERUM.

FLOWERS of this pretty Burmese *Dendrobium* are sent by Mr. C. Wright (gr. to the Hon. N. Charles Rothschild, Ashton Wold, Oundle), the plant from which they were taken having a good show of bloom. The flowers, which are nearly 2 inches across, are in pairs and threes, the deeply-keeled, sepals are ivory-white, tinged with buff-yellow at the backs and outer halves. The broader, ovate petals are white and the labellum orange-red at the base, the colour being continued into the whitish margin along the vein, which bears long, woolly hairs. *D. cariniferum* is of the nigro-hirsute section, which includes *D. Draconis*, *D. formosum*, and *D. infundibulum*, and requires similar treatment to these species.

BRITISH ALPINE GARDENS.

(Concluded from page 13.)

I HAVE known the gardens at Wisley since 1885, and was there with my late friend Wilson, when they were first opened. Since then, I have been to Wisley four times, but I do not yet know how to reach that very out-of-the-way place. On

What is there to be said of South Lodge and Leonardlee that has not been said already? Both places are marvellous, and nobody must be surprised if I call that corner of England a Terrestrial Paradise.

South Lodge is a beautiful picture to the eyes, and Leonardlee a solace to the heart. Which of them is the dearer to me I cannot say. The artist would prefer South Lodge, the naturalist and the sportsman, Leonardlee.

At South Lodge, the shrubs—all the shrubs of the world are there, at least those which will succeed in England—are grouped artistically, enframed in dark green trees, and the colours are so combined that they gave value one to another.

The *Rhododendrons* and *Azaleas* were beautiful, and not too many of them were grouped together. Herbaceous and Alpine plants were alternated with the shrubs, so that the whole picture was full of life and colour. Nothing is more inartistic than masses and masses of uniform plants which prove the wealth of the owner, but not his good taste. In the rock-garden of South Lodge everything is healthy and well grown. I saw there the best of the Alpine plants,

FIG. 12.—CATTLEYA WARSCEWICZII ALBA.

former occasions it has been my privilege to be taken there by a friend in a carriage or motor-car. This time I tried to go by myself, and I now believe that it is easier to reach the top of the Matterhorn than the gardens of the Royal Horticultural Society. After half-a-day's exploration, I arrived there about one o'clock on a bicycle which I had hired at Horsley village after many hours walk and inquiries.

Wisley has been much developed lately. The rockery is a good one, although wrongly situated, judged from an aesthetic point of view, it being near the glasshouses. The climate is exceedingly good and plants in the woods grow luxuriantly. The birds singing in the trees, the flowers gleaming, and the sun shining upon everything; I had a very good impression of the work done by the R.H.S.

In a pretty little garden at Langhurst, near Warnham, I saw some beautiful *Romneya Coulteri*, Oriental Poppies and other good herbaceous plants grown much better there than anywhere else I have seen; the soil is said to be very bad, but the climate is capital for this kind of thing. In a small rockery I found Alpine *Anemones* flourishing as they do in the Alps.

together with plants of every part of the world. *Myosotidium nobile* was beautiful near the orange-coloured *Lithospermum canescens*, the ideal and superb Chilean *Crimodendron Hookeri* hanging its deep-red flowers upon a carpet of *Linnaea borealis*, and the rare *Rhododendron kamtschaticum*, near *Grevillea alpestris*. The *Ramondias* were particularly good, and also the blue *Meconopsis*. Terrestrial Orchids were very fine, the best, perhaps, I saw in England after those of Sir Frank Crisp at Friar Park.

Leonardlee, just opposite to South Lodge, is such a big place that it is rather a country than a garden. Well known by everybody who loves flowers, that marvellous park may be described as quarter a botanic garden, quarter a zoological garden, quarter an artistic picture, and quarter a wild wood or garden. Here, *Solanum crispum* is a tree, and the *Camellias*, the *Azaleas* and *Rhododendrons* are so big that they form a wood, and one can walk in their shade. A natural valley has been transformed by the artist-owner of this into an Eden covering something like 100 acres of land with three lakes sleeping in its hollows. These lakes are adorned by the gigantic forms of *Gunnera manicata*, sneltering

the smallest of the genus, *Gunnera Monroia*. There the *Caltha polypetalata*, the first introduced into England, covers the stretch of water, mixing its beautiful, yellow flowers with those of the blue *Myosotis palustris*.

Sir Edmund Loder, who, like myself, is an enthusiast, showed me the enormous flower of a white-flowering *Rhododendron* which he has raised and nursed for eight years. The flowers have two lobes more than is usual in *Rhododendrons*. He may well be proud of his collection.

The visitor must not be astonished if in the garden he meets some curious animals rambling strangely, with their young in their pocket, and leaping curiously over the ground, for Kangaroos (big and small) are at home in the garden, as well as many kinds of tortoises and colonies of beavers, etc., in the park.

The rock-garden, one of the best in England, interested me very much. It includes many rare things, amongst which I remarked the beautiful Chilean *Philisia buxifolia* flowering near a patch

tune's Yellow Rose which was brought to Mr. Rodgers's grandfather by Fortune himself; and here also is probably the first introduced *Chamaerops Fortunei*, a tree more than 50 years old and about 35 feet high and beautifully shaped. Sheltered from north winds by a limestone hill, the garden is altogether charming. A terrace in front of the house reminds me of the terraces of Italian Villas, and is framed by beautiful trees, shrubs and climbers (*Arbutus*, *Cypresses*, *Taxus adpressa* 15 feet in height, &c.). A rock-garden has been built lately which is enframed in the most beautiful site that could be imagined. The great *Rhododendrons*, *Tree Ericas*, and *Crinodendrons* are famous.

Near to this beautiful place at Beech Mount, Sevenoaks, is an avenue of *Araucaria imbricata*. I dare not say that it is an artistic marvel; I shall not be accused of exaggeration if I say that it is a natural one, and that there are few things more picturesque and original. *Henry Correvon, Geneva.*

absolute in their determination of a particular flora. Elevation and aspect also count. We recollect a year or two ago seeing, late in August, in the upper regions of the Lotchen-thal, a small hollow still blocked with the avalanche-snow that had fallen months before, and, at the foot of the melting mass, *Soldanella* was blooming along with many other spring flowers, which elsewhere were only to be found, if at all, at far higher altitudes at that time of year.

We think some of the writing about the risks attendant on gathering Alpine flowers (pp. 89 and 90) might profitably have been replaced by a few sensible remarks on the nature of the risks and the common-sense precautions which so many tourists so ignorantly neglect. The number of so-called "Alpine Accidents" is preposterously large, but they are due generally to sheer stupidity. It is worse than absurd to see many of our own countrymen, and especially countrywomen, pottering about on the grass of steep hillsides in boots which put a heavy premium on a slip that may easily end in disaster.

But Mr. Fleming has written a tolerably pleasant book for an idle hour. We think that he has himself expressed his purpose with sufficient aptness in the sentence: "We are out for a little mild botany, not for cloudy philosophy."

M. Correvon, the well-known Swiss botanist, contributes the preface, and the publishers have done their share in presenting the work in an attractive form.

LILIES AT HOLLAND PARK.

A GREAT number of species and varieties of *Lilium* were represented at the recent exhibition at Holland Park. Large masses of a few kinds were less numerous than usual, but, taken altogether, the show of Lilies must be looked upon as satisfactory, considering that the season is not a specially good one.

Perhaps the most attractive feature among Lilies, though by no means the most imposing, was a group of the new *Lilium tenuifolium* "Golden Gleam" in Messrs. Wallace's group. This Lily, variously described as a hybrid from *L. tenuifolium*, and a selected seedling therefrom, is certainly very pretty, and should become a general favourite. It has, both in foliage and in flower, the lightness and grace of *L. tenuifolium* itself, but the flowers are, according to the description, of a pure golden-yellow colour, though in the tent and under somewhat dull conditions of weather they appeared to have a suffusion of apricot.

Lilium parviflorum, a comparatively new and decidedly rare species, was also represented in the same collection. This species is a native of the Sierra Nevada Mountains of Northern and Central California, that is from much the same region as the typical *L. Humboldtii*. In general appearance, *L. parviflorum* may be likened to *L. parvum*, except that the segments of the flowers are revolute, as in *L. pardalinum*. In common with several North American Lilies, the flowers of *L. parviflorum* vary in colour; as shown, they are of a warm apricot-yellow, with dark-coloured spots towards the lower part of the segments. The sub-genus *Martagon*, to which belong both of the plants already named, was also represented by many other species.

Lilium canadense in a cut state is a delightful subject for the furnishing of medium-sized vases. The small, partially-reflexed flowers are so delicately poised on slender, yet firm stems that they are seen to very great advantage. Both the yellow and the red forms are very pretty, while the newer *Lilium Grayi*, with deep-coloured blossoms, is nearly related to it.

Lilium Dalhousonii, a hybrid between the dark-coloured form of *L. Martagon*, known by the varietal name of *dalmaticum*, and the Japanese *L. Hansonii*, was also shown well. It is a distinct Lily, the colour of its parents being blended in a peculiar manner in the flower.

Lilium Hansonii itself was represented in a

FIG. 13.—CATTLEYA MENDELII "STUART LOW."
(See p. 34.)

of big *Ramondias*. The garden contains a *Creeping Spruce*—a real beauty.

But the best features of this place are the Roses, which grow 20 to 30 feet high between the trees and climbing over the branches, fall as beautiful flowering arches of every colour and shape. I never saw such a beautiful effect anywhere else, and wondered very much that under the much derided English climate Roses can do rather better than at Cannes or Mentone.

Now I must say a word of the beautiful trees (*Beeches*) of St. Clare, near Kemsing, and of the little, much too little, wall garden there, where the *Phyteumas*, the rarest *Campanulas*, the *Rock Primroses*, *Geranium argenteum*, and others are doing their best.

Near to Sevenoaks, in a site reminding one of Switzerland, there is an old beautiful garden, the work of three generations of gardeners. I mean that fine place called River Hill, where the house is sheltered by the most luxuriant *Conifers* and *Palms*. Here is the first introduced plant of *Cedrus Deodara*, the first introduced plant of *Fer-*

NOTICES OF BOOKS.

ALPINE FLOWERS AND GARDENS.*

THIS book is fittingly described by the title. The paintings are well reproduced, and some are very charming—so much so that we are tempted to ask to see the originals, which a slip inserted in the volume states are on sale at the publishers. The characters of the flowers, as they occur in a Swiss meadow, are given with really remarkable fidelity, and awaken pleasing recollections of walks in the Alps and the wooded slopes girdling the mountain sides.

The letterpress, however, we confess strikes us as "thin." There is not much that the student of the Alpine flora will glean from these pages. They may, nevertheless, be useful to visitors who wish to know what sort of plants they are likely to meet at different seasons. The author, however, does indicate the fact that the seasons in the Alps are relative rather than

* *Alpine Flowers and Gardens*, painted and described by G. Flenwell. (A. and C. Black.)

great many stands. It proves very amenable to cultivation in this country, and is both distinct and pretty. The flowers, which are borne in a terminal, deltoid raceme, do not reflex to the same extent as in the true Martagon, while the segments are of an unusually thick, wax-like texture. The colour is yellow, with dark spots.

Lilium Marhan (see fig. 14) is another hybrid Lily, between the white variety of *L. Martagon* and *L. Hansonii*. As might be expected from the tint of the Martagon employed in its production, this hybrid Lily is altogether lighter in colour than *L. Dalhansonii* previously mentioned. The finest form of *L. Marhan*, known as *Ellen Willmott*, was also noted in good condition.

Lilium Martagon showed great variation in colour, while some forms of the white variety (*album*) were greatly superior to others.

Lilium monadelphum and its variety *Szovitzianum* (see fig. 15) are beautiful Lilies, particularly in the open ground or in the lofty exhibition tent, but in a confined place their heavy perfume is too pronounced to be pleasant. This latter remark applies with equal force to several other members of the sub-genus *Martagon*, including the species from whence it takes its name.

Lilium pardalinum, the Panther Lily of North America, has curious rhizomatous bulbs, which delight in an open vegetable compost and a fair amount of moisture. These conditions prevail in *Rhododendron* beds, hence it is one of the most satisfactory Lilies for associating with those shrubs. Not only the typical kind, but the deeper coloured form known as *Michauxii* was also shown.

Lilium pomponium, that deep-red Lily for which a poor, dull-coloured flower sometimes does duty, is a striking species. The suffix *verum* is frequently applied to the best form. This Lily needs to be planted in good, loamy soil and then allowed to remain undisturbed.

Lilium testaceum, sometimes called *L. excelsum*, is, from the nautic tint of its blossoms, quite distinct from any other species. It is one of the best for the open ground, where it will flower well the first season after planting. It also succeeds in pots, and the perfume is not too powerful to prevent its use in a cut state indoors.

Among the representatives of sections other than the *Martagon* group, may be mentioned *L. longiflorum*, which is probably the most popular Lily. The splendid flowers produced by Japanese bulbs and the good varieties now received from Japan are very apparent to one who, like myself, remembers the early days when the supplies of this Lily were drawn almost entirely from Holland.

L. speciosum, which rivals *L. longiflorum* in popularity, was represented by both white and coloured varieties. These two Lilies have proved to be the best of all for retarding, for which purpose many of the large consignments sent from Japan are eagerly bought up. So generally are these two Lilies grown by those who supply Covent Garden market that flowers are now obtainable throughout the entire year.

Lilium auratum is always a striking Lily, but it is decidedly erratic in its behaviour. In one or two instances, it was particularly well shown at Holland Park, and in Messrs. Wallace's group that noble variety *platyphyllum* was very conspicuous.

Lilium Brownii, whose long ivory-white trumpets are tinged outside with chocolate, is a noble Lily; while *L. candidum* (the Madonna Lily), a universal favourite, stood out boldly in many exhibits. The tall-growing *L. Henryi*, which does so well in many gardens, was also noted. Of the upright-flowered Lilies corresponding with the subgenus *Isidorium* of Mr. Baker, both *L. davuricum* or *dahuricum* and *L. elegans* or *Thunbergianum*, and several varieties were freely represented.

Lilium croceum, noted here and there, seems to be much less common than formerly; I have seen instances where a poor form of *L. davuricum* has

been supplied for it. This is a pity, for *L. croceum* (the old Orange Lily) is one of the most beautiful of border plants, while the individual flowers remain fresh and bright for a longer period than those of most of its immediate relatives, except the decidedly uncommon *L. bulbiferum*.

The last Lily to mention, but by no means the least important, is the Himalayan *L. giganteum*, of which a few fine examples were shown. The large, heart-shaped, shining green leaves of this Lily are very handsome, while the tall shaft-like stem, furnished towards its upper part with long, tubular blossoms, causes it in every way to stand out from all other Lilies. To obtain its full development this Lily needs to be grown on in the spot in which it is to flower. It is a great mistake to plant large bulbs obtained at a high price, as they flower before they become established and are seldom satisfactory.

I ought to add that it is quite possible that I have overlooked some other Lilies worthy of mention, though I endeavoured to see them all.

FIG. 14.—LILium X MARHAN: *L. MARTAGON*, WHITE VAR., X *L. HANSONII*.

HOME CORRESPONDENCE.

(The Editors do not hold themselves responsible for the opinions expressed by correspondents.)

PANSIES AND VIOLAS.—With reference to the paper by Mr. Cuthbertson which appeared on p. 9 in your issue of July 2, I may say that 12 months ago I had Pansies planted here in comparative shade, yet where they had the full benefit of the morning sun, but the results were most disheartening. From these plants I had cuttings taken in October and placed in boxes in a cold frame for want of room elsewhere. In January these boxes had to take refuge under an Apple tree. However, in March I decided to give my young plants a fresh start, choosing a very dry border with a south aspect, where the sun has full power all day. The quantity and quality of flowers which I have gathered from

these are sufficient for me to advise all who admire the beautiful Pansy, both in vases and on borders, to grow them as above in full sunshine on a warm border free from shade. Referring to the *Viola*, I had cuttings also taken in October and put on a warm border, of many sorts, all of which stood the winter without the loss of even a cutting. Now Mr. Cuthbertson does not mention the best one of the lot, and that is *Kitty Bell*. These cuttings were transplanted in March around standard *Roses*, in ground which was prepared with a mixture of turf manure from an old Mushroom bed, and a liberal supply of Thompson's plant manure. All these 20 beds are planted with *Kitty Bell*, and it is called the prettiest spot in the garden by all who see it. I enclose a few blooms for inspection by the Editors. *M. Brennan, Head Gardener, Acton Park, Wrexham.* [This *Viola* is of a very delightful shade of blue. The best aspect for *Violas* in one district may not be so in another locality.—Eds.]

THE EFFECTS OF THE WINTER 1909-1910.

—Several interesting lists have lately appeared dealing with the effects of the late severe winter on plants in various districts: one of the most instructive being that of Mr. Bean, in the *Kew Bulletin*, but there is this difference between the English and Scotch lists that the former country escaped the severe November frosts that wrought havoc on the north side of the Border. Your correspondent, in last week's *Gardeners' Chronicle*, in Northumberland, writes indeed in formâ pauperis, and lest it should be considered typical of the East Coast, perhaps you may be able to find space for the following list. It has several points of interest, but I may draw attention particularly to *Paulownia*, which usually has the shoots injured, but which this winter escaped uninjured though planted under varying conditions. *Actinidia Kolomicta* is flowering profusely, and Professor Bayley Balfour informs me that he has not previously seen it flowering in the open in Scotland. The following list will, I think, compare favourably with that of my friend Sir Herbert Maxwell from the West Coast of Scotland. It is by no means exhaustive, simply including those plants noticed in a walk round the grounds:—

KILLED OUTRIGHT.

<i>Cotoneaster angustifolia</i> (a few plants alive).	<i>Veronica</i> (several bushy species).
<i>Olearia stellata</i> .	<i>Escallonia pterocladon</i> .
<i>Hebechrysum diosmifolium</i> .	<i>Oreodaphne californicum</i> .
<i>Rhynchospermum jasmimoides</i> (wall).	<i>Dracena indivisa</i> (nearly all).
<i>Physanthus megapotamicus</i> (wall).	Bamboos (some specimens of several species).

KILLED TO GROUND BUT STILL ALIVE.

<i>Griselinia littoralis</i> .	<i>Ceanothus dentatus</i> .
<i>Olearia Huastii</i> (all large plants; small in nursery untouched).	<i>Veronica Knightii</i> (some).
<i>Olearia nitida</i> .	<i>Abutilon vitifolium</i> .
<i>Myrtle</i> (protected by branches during winter).	<i>Veronica parviflora</i> .
<i>Escallonia macrantha</i> (for the most part).	<i>Veronica salicifolia</i> .
	<i>Bigelovia viscidiflora</i> .
	<i>Eucalyptus uraegera</i> var. <i>Whittinghamiensis</i> .

ON WALLS KILLED TO GROUND.

<i>Paeziflora Constance Elliot</i> .	<i>Senecio eleagnifolius</i> .
<i>Jasminum primulinum</i> .	<i>Bridgesia spicata</i> .
<i>Jasminum revolutum</i> .	

DAMAGED IN OPEN GROUND.

<i>Phormium tenax</i> and varieties.	<i>Escallonia macrantha</i> (nests).
Bamboos various, including aneeps.	<i>Stauntonia hexaphylla</i> (wall).
<i>Rosa bracteata</i> (on wall).	<i>Cesalpinia sepiaria</i> (wall).
<i>Rosa</i> (many climbers).	<i>Banksian Rose</i> (white, on wall).

NOT INJURED.

<i>Daphniphyllum glaucescens</i> .	<i>Olearia nunnularifolia</i> .
<i>Philexia decora</i> var. <i>Vilmoriana</i> .	<i>Buddleia variabilis</i> , <i>B. Humbleyana</i> , <i>B. Veitchiana</i> , <i>B. globosa</i> , and <i>B. Colvilei</i> .
<i>Tree Pines</i> .	<i>Rhododendron himalayan</i> (eight or ten species).
<i>Paulownia imperialis</i> .	<i>Aneklaudia</i> flowered splendidly.
<i>Ceanothus Gloire de Versailles</i> (wall).	<i>Parrotia persica</i> .
<i>Eriobotrya japonica</i> (wall).	<i>Siphora tetraltera</i> .
<i>Atriplex canescens</i> .	<i>Berberis cuneifolia</i> .
<i>Vitis Romaneti</i> (wall).	<i>Giamerops australis</i> .
<i>Vitis Henryi</i> (wall).	<i>Camelthas</i> .
<i>Vitis Cogardae</i> (wall).	<i>Pinus Ayacahuite</i> .
<i>Vitis Veitchii</i> and others (wall).	<i>Abies Marcesii</i> .
<i>Eucernocarpus</i> .	<i>Cupressus Macnabiana</i> .
<i>Decasneea Fargesii</i> .	<i>Cupressus Benthamii</i> (Kushana).
<i>Escallonia lamelyensis</i> .	<i>Arthrotaxis cupressoides</i> .
<i>Carrenteria californica</i> (near wall).	<i>Dacrydium Franklinii</i> .
<i>Actinidia Kolomicta</i> (wall).	<i>Azara mucronifolia</i> .
<i>Choupa tetralita</i> .	<i>Arbutus Andinae</i> .
<i>Coraria himalaica</i> .	<i>Arbutus Menziesii</i> .
<i>Abelia</i> (two species).	
<i>Limonia tripetala</i> .	

Archibald Buchan-Hepburn, Smeaton, East Lothian

THE LABOUR PROBLEM.—The remarks in your last issue under this heading seem to call for some reply by those immediately interested. It is easy to criticise the fit of a boot, but only the man who wears it is fully qualified to give a reliable opinion as to its merits. The writer seems to take it for granted that either short-sighted policy or native meanness are the only reasons that prevent a higher rate of remuneration for nursery employes. Neither of these is the case. The very nature of the nursery busi-

ness demands the closest supervision of every detail, which induces more intimate personal intercourse and friendly relations than exist in almost any other trade between employer and employed, and nurserymen generally would be only too pleased to give their staff a higher remuneration if only the conditions of the trade would allow it. What, however, are the circumstances? For the last twenty years there has been a

steady decline in the prices of nursery stock, and an equally marked rise in the expenses of production. We have a catalogue published by our firm 100 years ago, when wages were 2s. per day and half the taxes now levied had not been thought of, and the prices in almost every instance are markedly higher than at the present time, but the most serious decline has been within the period above-named. The market grower is no happier; Grapes at 6d. during most of the season, and a serious percentage of his

assessment committees always assess nursery land at double or treble its value. This is neither law or justice, but one has to pay or fight a powerful authority with a bottomless purse. Add to these things that now nearly every branch of the trade is cut up by foreign competition. German nurserymen are flooding the country with forest trees, Frenchmen with Roses, the Dutchman dump their surplus shrubs (after their American orders are filled) at auctions all down the East Coast and everywhere else where their is water-carriage; the bulb trade is cut up by auction sales and direct offers by the lower class dealers and growers; Belgian Grapes are offered at 1s. a pound in Christmas week—but the catalogue grows wearisome. In spite of all this, the position of the nursery hand compares pretty favourably with that of the gardener. Our labourers, though nominally earning 18s., average 25s. the year through by piece-work, with Saturday half-holiday from May to September, and no responsibility; skilled men in proportion, and this in the country, with rent at 2s. 6d. to 3s. 6d. However, we shall welcome the prospect of improving matters when the public realises its obligation to help the home producer instead of taxing him to extinction to enable his foreign rivals to flourish more abundantly. *Chas. E. Pearson, Loudham.*

—I was pleased to see the article on this subject on p. 6. It is a subject that deserves to be discussed in our gardening papers, for any suggestions that will tend to promote the mutual interests of capital and labour are surely worth the attention of both employer and employe. It would appear to me that no one can deny the truth and justice of your remarks, and, if employers would only act upon the suggestions put forward in your article, it would create a far better feeling amongst employes in general than exists in so many instances at the present time. Is it to be wondered at that men lose interest in their work when they are so badly paid? I myself have had over 30 years experience, both in large private establishments, and in some of the leading nurseries, and, although in the prime of life, I have not been able to obtain more than 18s. per week for several years past. For these last 18 months I have been engaged in making a kitchen garden and laying out the grounds of a new grammar-school here at Newark. This is skilled work, and I get no more than 18s. per week, and I have to lose the time in bad weather when I cannot work. When there are so many cases like this, can anyone be surprised at the younger men leaving gardening and engaging in other occupations where the hours are shorter and the wages higher? I have heard more than one employer make the remark that he thought gardeners were deteriorating, but is it to be wondered at when there is so little encouragement given them to make greater efforts or take more interest in their work? *Gio. Stevenson.*

ALPINE FLOWER PICTURES.—Some interesting water-colour drawings of Alpine flowers and gardens and general Alpine views, by George Flemwell, are now on exhibition at the Baillie Gallery, Bond Street. Twenty of these pictures have been reproduced in the artist's book on *Alpine Flowers and Gardens* (see p. 75). Among the others may be mentioned No. 26, a large drawing of *Gentiana Kochiana* and *Anemone sulphurea* on the Col de la Forclaz. The snow-covered Col de Balme in the distance and the clouds are as good as the flowers are brilliant and natural, but the grass is just a little crude. A fellow to this is "Hayfields in Flower at the Col de la Forclaz," in which the mauve effect of extensive masses of *Geranium sylvaticum* is more beautiful than the mountains and sky, which are somewhat hard. It must be remembered, however, that most of these drawings have been done for the express purpose of illustrating a book, though it is very likely that both originals and reproductions would be still better had the former been executed in pure water colour, and not in "body-colour." I have not seen any paintings of Alpine flowers and fungi so brilliant in colour and accurate in form as those of Mr. Flemwell which I was privileged to see in Switzerland. In No. 23, another exquisite picture of those unrivalled Alpine "Hayfields," the delineation and massing of the minute flowers is so accurate that it is easy to distinguish the Rampions from the Campanulas, and to pick out the Pinks and Orchids, the Globe-flowers and the

(Photograph by T. Ernest Wadham.)

FIG. 15.—LILIIUM MONADELPHUM SZOVITZIANUM.

ness demands the closest supervision of every detail, which induces more intimate personal intercourse and friendly relations than exist in almost any other trade between employer and employed, and nurserymen generally would be only too pleased to give their staff a higher remuneration if only the conditions of the trade would allow it. What, however, are the circumstances? For the last twenty years there has been a

flowers going to the dust-cart at the present time are not encouraging. On the other hand, the local rates and taxes rise year by year, and are now in many places double what they were a few years ago. Then, too, the new land taxes will hit the nursery trade harder than any other section of land-owners, owing to their premises being usually situated in suburban districts. These hardships are accentuated by the fact that

Daisies. The subject reminds one of MacWhirter's well-known "June in the Austrian Tyrol," but Flemwell has gone one better in the portrayal of a far more complex mass of blossom in the foreground than the Daisies and Campanulas of the Tyrolean meadow. The picture of "Saxifrage and Alpine Eglantine, with the Glacier des Grands," should give landscape gardeners an excellent idea of rock formation, and the way in which Saxifraga aizoon, Saponaria ocymoides, and other plants establish themselves on the ledges of rock; while Rosa alpina is shown hugging the very same rocks, for it is always in such places that its blossoms are of the deepest colour. Perhaps the best picture in the show is "Thistles, the Apollo Butterfly, and the Aiguille du Tour." Here the slightly-opaque medium has not destroyed the true atmospheric effect, and the result is a veritable gem. The lemon-yellow patches in the drawing are Anthyllis vulneraria, which, in that district and nearer Chamonix, transforms acres of the mountain-side into sheets of gold in August. An extremely delicate drawing is of Anemone alpina on the summit of the Rochers de Naye, overlooking the Lake of Geneva and the mountains of Savoy. There are several pictures of the Linnaea Garden at Bourg St. Pierre; the Rambertia Garden on the Rochers de Naye, and the Thomasia above Bex also figure, and in these the natural rock-work is much in evidence. "Croceus and Soldanella at Le Plaus" indicates in a very clever manner the way in which these delicate flowers carpet the still brown sward from which the snow has only just melted. Other very beautiful spring scenes depict Hepatica in the woods at Bex, Gentiana verna and the Glacier de Plan Nève, and Primula farinosa, Oxlips, and Marsh Marigolds at Les Plaus, with the Argentine peak behind, looking at this early season so much like the Matterhorn as seen from Zermatt. These and other April scenes should do much to tempt lovers of Alpine plants to visit their native haunts three months earlier than the average rush of tourists takes place. *H. S. Thompson.*

VERONICA EDINENSIS.—I send you herewith specimens, in flower, of an interesting hybrid Veronica, which has flowered this month for the first time. It is the result of a cross raised in July, 1901, from *V. Hecctori* ♀ and *V. pimelleoides* ♂. I purpose calling it *V. edinensis*. *R. Lindsay.*

THE RURAL EDUCATION CONFERENCE.—I have read the very long list of names (see p. 7) of persons appointed to form the Rural Education Conference, and have been surprised to find that it does not include one single person who can claim to represent practical gardening. It may be that the President of the Board of Agriculture holds gardening as a subject of rural education in small esteem, but having regard to the widespread instruction in gardening now given in elementary schools some respect for that vocation might have been looked for from the Education Department. In these days of small holdings which, to be successful, must be cultivated as gardens, of cottage gardens and allotments, and school gardening, it is folly to ignore gardening. Really, it is one of the most important and valued forms of rural instruction. Of course, I mean practical horticulture and not experimental gardening of a quasi-scientific character. In rural districts to-day there is no greater need than for a wide expansion of gardening. *A. D.*

ORIGIN OF THE DOUBLE PRIMROSE.—I note that you inform a correspondent that experiments are now in progress to determine the origin of the Polyanthus. It is most probable that they will show that the florists' gold laced strain, and the now widely-grown and larger-flowered border Polyanthus had diverse origins, as they are very distinct. Of greater interest, from a floral point of view, as doubtless also from a purely botanical one, would be an inquiry as to the origin of the race of double garden Primroses with which we are so familiar, and of which we still have some 10 or 12 distinct varieties. The best known are the double white, mauve-purple, sulphur-salmon, and crimson, none of which produce seed, or can be so increased, and hence, unlike the Polyanthus, show no form of reversion in their progeny. That they all originated from single Primroses appears probable; indeed, I

have seen cases in which both the white and the mauve have reverted to single form and so remained, no higher culture affecting them to reproduce doubling. I used to grow perfectly true garden Primroses of many bright and beautiful colours, and raised fresh batches of them from seed year by year, but not a flower ever showed evidence of doubling. I believe practically every one of the doubles in commerce came to us from the Continent. In any case, I know of no record of their origin here. These doubles, because they cannot be reproduced from seed, lack the accommodating constitution of the single garden Primrose or of the wild ones, although they will thrive well in cool, moist districts, especially in Ireland. In the South of England they are very difficult to keep alive even during summer. Some 40 years ago I met with a very beautiful single, crimson Primrose in a garden at Shirley, near Southampton. It was found there and there alone. It was put into commerce as *Primula auriculaeflora*, and was really a large pin-eyed, single lilac-coloured Primrose. I got from that cross the parent of the fine race of garden Primroses that were once so beautiful at Bedford. I believe that single crimson variety was the old double crimson in a state of reversion to its normal condition. However, the subject opens a wide and very interesting field of inquiry. *A. Dean.*

BOURNEMOUTH PARKS AND GARDENS.—Bournemouth is 100 years old, and, like most centenarians, is proud of the fact. No pains have been spared to let all the world know that Bournemouth is having a birthday, and it is being celebrated—July 6 to 16—in a fashion worthy of so delightful a watering place. Nothing has contributed to the rapid growth and charm of the town so much as its beautifully-kept parks and gardens. In the month of May, Bournemouth is at its best, and the Rhododendrons in Branksome Chine, Meyrick Park and elsewhere are in themselves well worth a visit. But even in April some of the earlier kinds are in full bloom. The peaty, sandy soil of the district suits the Rhododendron remarkably well, so that it is naturalized in most of the plantations, growing well with Portugal Laurel, Scotch and other Pines, Silver Birch, Evergreen Oaks, Gorse, Broom, Heather and occasional Fir trees (*Abies*), which together go to form a landscape typical of the district. The Scotch Pine (*Pinus sylvestris*) is probably native at Branksome, in Talbot Woods, etc., but *P. Pinaster*, Ait. = *P. maritima* Lam. was introduced in 1805, and is now locally abundant and self-propagating. It was introduced to occupy the barren heath-land between Poole and Christchurch, which had proved too dry for *P. sylvestris*. When new gardens are made, the soil is often trenched two spits deep and well limed, while basic slag forms a useful fertilizer for many plants, especially for Narcissi. The climate of Bournemouth in winter and spring is no warmer than that of most places in the south of England, and occasionally there are very low temperatures, though there is an abundance of sunshine. The beauty of the Bournemouth and Boscombe Public Gardens is well known, and, although neatly kept and well supplied with flower-beds, their natural beauty has been so well maintained, and, indeed, improved, that all the year round there is something charming about them. It is unfortunate that the same cannot be said of certain modern "improvements" on both the East and West Cliff, where the everlasting terracing and building of new houses is rapidly spoiling the charm of the place. It must, however, be confessed that many of the Bournemouth houses have been designed by architects who are artists. The cottage in the Boscombe Public Gardens is an example of a picturesque building, delightful in its simplicity. It is occupied by Mr. Stephenson, the Superintendent of the Public Parks and Gardens. In the Central Gardens, which fill the narrow, sheltered valley of the little river Bourne, an improvement might be made by planting water-plants by the side of some of the higher reaches of the stream. Near the square, although the scene is pretty with gaily-coloured shrubs, well-laid-out flower-beds, and lawns bedecked in spring with Daffodils, yet, by an increase and careful adaptation of the stones already by the waterside, a very beautiful rock-garden might be made right in the centre of the town, in the small, sloping enclosure, lined with choice Rhododendrons

and Azaleas, at present closed to the public. In planting such a rocky with Alpine and other plants, it should not be forgotten how frequently in winter this narrow valley harbours damp, cold mists, which would probably kill certain species of Alpines, though many of the hardier kinds should do well there. The adjoining town of Poole, which had an interesting and stirring history centuries before the first house in Bournemouth was built, has a large public park, of which the ancient borough may well be proud. It comprises a huge salt-water lake and a smaller area of fresh water, planted with tall Bamboos and other plants, which give shelter to swans and smaller water-fowl. *H. S. T.*

IRIS TINGITANA.—Has Mr. Fitzherbert told us the whole secret of growing this Iris (see p. 17)? I followed his instructions in 1907, and was rewarded by 11 blooms from 12 bulbs. Then my troubles began, for the bulbs, after flowering, broke up into innumerable small bulblets, very much after the fashion of *Lilium giganteum*. These bulblets have, apparently, to be nursed on for years before they reach flowering size, so that I have ceased to wonder at Mr. Irwin Lynch's suggestion that they are hardly worth the trouble of cultivation. Of their beauty there can be little doubt. *Basil Levitt, Wychnor Park, Barton-on-Trent.*

THE NATIONAL VEGETABLE SOCIETY'S CABBAGE TRIALS.—When the committee of this Society undertook to conduct trials of autumn-sown Cabbages last year, no intention was expressed to revise seedsmen's nomenclature. If any seedsman having a stock, say, of Ellam's Early, or of any other variety, makes selections from it which improve the stock, such seedsman is entitled to name it their selection, or to give it, if so pleased, some other name to differentiate the selection from the original stock. It is of far less importance what name a stock or strain may have than that it should be shown to be a good one for its purpose. The object in view was to ascertain which varieties or selections gave, from sowings made on July 30, the earliest and best hearts for spring cutting. That was done so far that so many as 11 diversely-named varieties were so good that they were specially recommended. Not a few others were found good for later-hearting, and some few were absolutely unfit for sowing early. So far as the second sowing on September 14 gave results, they showed that very few plants, even of varieties that bolted badly from the first sowing, bolted from the second sowing, but all the plants from that sowing were more leafy and, relatively, much later in hearting than those raised from the first sowing, hence it was conclusively proved that, for supplying very early Spring Cabbages, certain varieties, sown on July 30, will beat all others. Those who want first early Spring Cabbages will be able to make their own selections from the list of good varieties published. *A. D.*

A PRIVATE ROSE SHOW.—An exhibition of a novel character took place at Finborough Hall, Suffolk, recently, in connection with a garden party on July 1. Mr. Petteward, the owner of Finborough Hall, thought that a private Rose show would give an opportunity for many of his friends to compete together in growing and exhibiting the best Roses. The expense was borne by Mr. Petteward, who had schedules printed, had a large tent erected, provided tables and cloths for table decoration, and gave the prizes—which took the nature of higher-class books on various gardening subjects, and light tools, such as an Ahol syringe, secateurs, &c. On the whole, the show was successful, and the result exceeded the promoter's most sanguine expectations. There was a large number of entries, and the quality of the flowers was excellent. The judges were Major Courtney, of Bury St. Edmunds, and Mr. A. Gamlin. The prize for the finest flower in the show went to Miss Tidwell, of Bosmere, for a very fine example of the Lyon Rose, good in every way and colour splendid. The gardeners who attended the show on behalf of their employers were entertained to tea by Mr. Petteward. Not the least attractive feature in the show was a magnificent table of Sweet Peas (not for competition), staged by the gardener at Finborough Hall, from plants grown on the single-stem system on poles. There were 17 glasses of the very best varieties and two small glasses of *Lathyrus pubescens* or Lord Anson's Pea. *G.*

THE WASP PEST.—The wasp pest is likely to be felt acutely during the present season. Seldom have so many queens been seen in southern districts. In a garden close at hand, 70 were killed in a very short time. The variations in the numbers of wasps which make their appearance from year to year are extremely interesting. They are governed principally by the nature of the weather in late winter and early spring. Two years ago, wasps were remarkably rare on account of the severe storms and frosts in April, which killed many queens. There is very little to be urged in defence on the common wasp. Certainly it acts as a pollinating agent, and also, at certain seasons, is responsible for the removal of many insect pests in the larval state. I have witnessed its predations upon the larvae of the eyed hawk moth (*Smerinthus ocellatus*), which feed on Apple foliage. As the trees were special specimens, which I was tending for purposes of observation, the descent of the wasp in this instance did not impress me very favourably, although it is obvious that such work on its part is distinctly helpful to the fruit grower. When the queens are providing food for their first batch of maggots they prey widely upon many forms of larvae. The real trouble comes in autumn, when the broods hatch, and the wasps attack ripening fruits. I have found the use of benzoline very effective in destroying the nests. The nests are soaked with the liquid and on lighting this the flames

a few weevils before, but never in such quantities, and the mystery is, where did they come from? Some half-dozen temporary vines are grown in tubs in the centre of the same house, which has a spaa roof, and no trace of weevils has been seen on these, though they have been top-dressed with the same kind of soil. All the soil used for top-dressing last winter was, as a precautionary measure, charred, so there is reason to suppose the larvae were in the old portion of the border. I have the leaflet of the Board of Agriculture, but no remedy suggested there is so good as bird-lime; in fact, one of the recommendations is decidedly wrong, that of using soot and lime together. Has anyone tried the effect of Vaportite on the larvae of this insect? *Wm. Taylor, Bath.*

JUNE HAILSTORM IN YORKSHIRE.—I am sending you a photograph showing the result of a terrific hailstorm which visited this district on June 30 last. The storm has done incalculable damage to growing crops in the kitchen garden, and it has completely ruined the summer bedding plants; some 56 beds of Begonias, Calceolarias, Salvias, and Ivy-leaved Pelargoniums were cut to pieces, as were Roses and Sweet Peas on the borders. Amongst the vegetables, Beetroot, Celery, Onions, Lettuces, Potatos, Peas, and Beans all presented the appearance of having been thrashed down with a birch. The fruit crops have suffered severely; there is scarcely an

included that species, as he calls them *Primula veris elatior pallide flore* in his catalogue of plants growing round Cambridge. As to what Shakespeare meant by "bold Oxlips," I do not profess to express an opinion; but the modern, popular usage of the name "Oxlip" is a good instance of the confusion which usually characterises popular names, although several dictionaries I have consulted ignore the "hybrid Oxlip" (i.e., the Cowslip Primrose) altogether, and recognise *P. elatior* only as entitled to the name "Oxlip." It will probably interest *B.* to know that the caulescent form of the Primrose shares with the above-mentioned hybrid the name of "Oxlip," but I regret I cannot at present quote references to this, nor do I know where it obtains. In parts of Essex, I understand, *elatior* is known as the Cowslip and the Paigle, both names being also applied to the Cowslip in other parts, as in Suffolk, where the Oxlip is called "Five Fingers." In other parts the Cowslip is a "Paigle," and *elatior* a "Cowslip," and, again, the hybrid Oxlip is called a Cowslip in other places. Hence, there is hopeless confusion among the popular names, and I must say that I strongly uphold the propriety of distinguishing *Primula elatior* as the "true" Oxlip, since there is no other true "Oxlip." If *B.* objects, what name would he propose for *P. elatior*? *C. Nicholson.*

The Week's Work.

THE FLOWER GARDEN.

By E. BECKETT, Gardener to the Hon. VICARY GIBBS, Aldenham House, Hertfordshire.

The shrubberies.—The heavy rains experienced recently have given to the shrubberies a bedraggled appearance, and it will be necessary, when the weather permits and the ground is sufficiently dry, to overhaul them and make them tidy. The removal of decayed growths and the shortening of any that may need it will add neatness, but it must not be overdone or the effect will be formal. Remove weeds and thoroughly loosen the surface with the draw hoe, and well rake over the ground. At this season of the year, there is a less showy display of flowering shrubs, and, as I have suggested in former Calendars, the inclusion of some of the more robust, hardy perennials in the more open positions of the shrubberies imparts considerable brightness to the surroundings. Amongst shrubs that do flower, however, during the month of July must be mentioned the *Philadelphus* or Mock Orange, of which there are many charming varieties of great merit. Of free growth, and not at all fickle as to their requirements, these plants are well worthy of extended planting, producing as they do a profusion of white flowers, many of them sweetly scented. Especially beautiful are the hybrids that have been raised from time to time of *P. Lemoinei*, such as *Boule d'Argent*, *Conquete*, *Fantasie*, *Gerbe de Neige*, *Candelabra*, *Mont Blanc*, and *purpureo-maculatus*, a most distinct flowering shrub, the base of each petal being marked with a purple blotch. *P. coronarius*, the common species, has also several varieties of striking merit, especially the two variegated forms. *P. microphyllus*, with small leaves and flowers, the latter sweetly scented, is worthy of inclusion in every collection. Another useful genus now flowering, both as wall specimens or otherwise, are the *Escallonias*, such as *E. exoniensis*, *E. floribunda*, *E. × langleyensis* (a hybrid of garden origin and a beautiful shrub), *E. macrantha*, and *E. Phillipiana*. Two species now flowering of the Broom family are *Cytisus austriacus*, a dwarf grower, and *C. nigricans*, a profuse bloomer and quite distinct.

Antirrhinum.—*Antirrhinum* are procurable now in a great variety of distinct and beautiful colours. They are well adapted for furnishing long beds or borders, or ribbons of distinct colour. The plants may either be raised early in the same year in heat and gradually nursed along or sown now in drills in the open ground, if not already done, on a semi-shaded border, where a fine tilth of soil may be prepared. Afterwards they should be transferred to nursery beds, where they will withstand the winter. Both the tall varieties and those of the dwarf or Tom Thumb section may be had in distinct and striking colours, and may be relied upon to come perfectly true from seed, if purchased from a good house.

FIG. 16.—JUNE HAILSTORM IN YORKSHIRE.

are such that they not only destroy those present in the nest, but also many of those returning for the night. *W. Francis Bankine, Churt, Surrey.* [An excellent method of destroying wasps is that of placing cotton wool soaked in cyanide of potassium in their burrows.—Eds.]

A PLAGUE OF WEEVILS.—A small viney measuring 24 feet by 20 feet, to which I pay periodical professional visits, is infested with weevils, of which I send you a sample. The vines were planted in a newly-made border five years ago, in July, and they did—and still are doing—remarkably well. Last year, for the first time, weevils appeared, and 232 were caught. This year there appears to be no diminution in their numbers, and about 200, so far, have been caught by the persevering gardener in charge. Now we have stopped their doing damage to the leaves of the vines by placing bird-lime on cardboard on the ground round the stems. Many are caught on the bird-lime, and still more under sheets of newspaper, where they are found in the early morning. So far, it will be seen that the difficulty as regards the part of the vine above ground is overcome; but what about the roots, on which it is understood the larvae operate? At present, no ill-effects have been seen, except a few nibbled leaves; but possibly, were the vines in a less vigorous condition, the effects of damaged roots would be noticeable. I have seen

Apple or Pear which does not bear signs of severe bruising. Gooseberries are the same, and Strawberries were completely covered with hailstones. Chrysanthemums on the kitchen-garden paths were nearly stripped of all foliage. Not in the memory of the oldest resident has anything like it been seen before in this district at Midsummer. The photograph shows the front lawn and beds white over with the hailstones. *H. Wilson, The Gardens, Saltmarsh Hall, Howden, East Yorks.*

THE TRUE OXLIPI.—The question as to what plant is entitled to be called the "Oxlip" is not so simple as *B.* supposes (*Gard. Chron.*, vol. lvii., p. 409). In the first place, it is decidedly doubtful what was meant by the old writers he mentions. Their works are not illustrated with sufficient accuracy and completeness, and their descriptions are scarcely precise enough to render the identity of their "species" certain in all cases. Parkinson, for instance, in his *Paradise* (1656), pp. 244 and 245 describes a "single Oxelippe" and a "Cowslip Primrose," which rather upsets *B.*'s contention that, in those days, the "Oxlip" was the "Cowslip Primrose." Ray describes what he calls great Cowslips or Oxlips, and, as he lived near the true Oxlip district, in Essex, and made frequent journeys through the heart of it to Cambridge, it is probable that his great Cowslips are the true Oxlips, or, at least,

FRUITS UNDER GLASS.

By B. GOODACRE, Gardener to Sir ERNEST CASSEL, G.C.B., Moulton Paddock, Newmarket.

Alpine and perpetual-fruiting Strawberries.

—Plants in pots will require careful attention with respect to watering and feeding. Place the plants more thinly apart as growth advances in order that they may have the full benefit of light and air. When they are well rooted in the pots, feed them with liquid manure and soot water, varied by an occasional sprinkling of some good fertiliser.

Peach trees.—Ripening crops will require a warm and fairly dry atmosphere. During dull or wet weather and on cold nights, a gentle heat in the water pipes, with top and bottom ventilation, will be necessary to create a circulation of air, otherwise but little fire-heat will be used. The trees should be looked over daily for the purpose of gathering ripe fruits. This is preferable to placing nets under the trees, as the fruits are apt to be bruised by coming in contact with the net. Any leaves which obstruct the light may be tied back so that the Peaches are exposed fully.

Later Peach houses.—Attend to the watering of the borders, especially during hot, dry weather, as a few days' neglect at this stage may seriously affect the crop. The surface of the borders is not always a reliable guide to the state of the roots, as the syringings tend to make the surface soil wet and pasty. It is an excellent plan to prick up the surface occasionally with a fork so that the air may penetrate, taking particular care not to injure the roots during the operation. A mulching of short, well-decayed manure is of great assistance in keeping the surface roots in good health. Established trees may be given liquid manure and soot water.

Wall cases and unheated Peach houses.—These are useful for maintaining a supply of fruit in succession to the supply from heated houses. As these crops are largely dependent on the weather, full advantage should be taken of fine days by closing the structure early enough to retain a little sun heat. Ventilate freely whenever outdoor conditions are favourable. Syringe the trees vigorously in the afternoons of sunny days, but avoid throwing a lot of water about when dull, cold weather prevails, as such conditions favour the growth of mildew. Regulate and tie in the growths as necessary, allowing each shoot ample space on the wall or trellis. A little more space should be given than with trees in heated houses, otherwise there may be some difficulty in ripening the wood if the autumn is cold and wet. Keep a sharp look-out for thrip and other insect pests, and take prompt measures for their eradication. Mildew may be destroyed by the use of a sulphur vaporiser.

Cucumbers.—Plants which have ceased to bear freely may be replaced by young stock, which rapidly attain to a fruitful size at this season of the year. Maintain a considerable heat and a moist atmosphere, with full exposure to sunshine, although it is advisable to provide a light shade for a few days after planting. Ventilate carefully during hot weather to prevent scorching of the foliage, admitting air early in the day and increasing it as the sun gains power. Close the house at about 3 p.m. with plenty of moisture. Apply water liberally to the roots, and, when the plants are in full bearing, generous supplies of liquid manure will be of great benefit. When applying top-dressings of fresh compost see that it is first warmed to the atmosphere of the house, or the tender rootlets may be injured. Keep a sharp look-out for red spider, which spreads rapidly if unchecked. Seed may be sown now to provide a crop during the autumn months.

THE HARDY FRUIT GARDEN.

By A. R. SEARLE, Gardener to the Marquis of NORTHAMPTON, Castle Ashby, Northamptonshire.

The Loganberry and Blackberry.—The weak, basal growths of the current season should be removed from both these plants, retaining six or seven of the strongest shoots for training to the stakes or trellis according to the method of training adopted, so that they will not become twisted or broken by rough winds or by the necessary moving about amongst the plants. If early attention is given to this matter, the canes will be better exposed to the light and air, therefore they will be more likely to mature properly. When fastening them in, they should be trained

as far apart as possible, and away from the fruiting wood, so as not to shade the fruits. These two useful plants, no less than the Raspberry, are gross feeders, and require to be kept well mulched and given frequent waterings with liquid manure when the fruits are swelling. The fruiting canes should be removed immediately all the fruit has been gathered.

Fruit trees on walls.—Every attention should be given to the training of the shoots of Peaches, Plums and Apricots. Pinch all sublateral growths at the first leaf; see that the shoots are so placed that they receive as much sunlight as possible, and, at the same time, leave the fruits well exposed. Make sure that sufficient quantities of water are applied to the roots. Attend to the mulching on all fruit tree borders and renew anywhere it may be necessary. Trees that are growing in light soils and carrying heavy crops of fruit, also all trees planted in the spring, will need special attention in regard to mulching and watering during dry weather.

General work.—Now is a good time to take a look round and make a note of all fruit trees making rank growths; these will require root-pruning in the autumn, also those not growing sufficiently strongly should be noted; these will require some assistance in the shape of a good top-dressing. Continue to use the hoe frequently on all the fruit quarters, or large weeds will soon be in evidence after the recent showery weather. The rains have been most acceptable here, but sunshine is needed now for all fruit crops. Advantage should be taken of sunny weather for the gathering of any fruits for preserving, remembering that it is essential they are thoroughly dry for this purpose. Earwigs are very plentiful this season, and as they are most destructive to Apricots, traps should be set for them. The form of trap we find most useful is a 48-size pot partly filled with Hay; these are examined each morning, and the insects destroyed, either by pinching or shaking them into a vessel containing paraffin.

THE KITCHEN GARDEN.

By JOHN DUNN, Kitchen Garden Foreman, Royal Gardens, Windsor.

Celery.—The late batch of Celery should be planted without delay, and sufficient water given to settle the soil about the roots. These late plants will stand the winter better than the early plantings, through the heads may not be so large. Before any soil is applied to the plants, the bed should be examined, and, if necessary, a good soaking of water given. In earthing-up Celery great care should be taken to prevent any soil getting into the crown of the plants. Before applying the soil the plants should be cleared of all decaying leaves and the side growth; when this has been done, gather the leaves together and tie with pieces of matting or string, which should be removed after sufficient soil has been placed round the plants. It is better to apply the soil a little at a time than to cover the plants too much at once.

Winter Greens.—Proceed with the planting of all winter Greens as quickly as possible, so that by the end of July most of the winter crops will be planted. Plots which were recently occupied by early Peas may be prepared and planted with Coleworts or Turnips so that these crops may be gathered and the ground again prepared for early Potatoes in the following spring. If matters such as this are regulated now, it will be easy to find sheltered places for early crops next spring.

Winter Spinach.—A good sowing of prickly Spinach should be made now for use in late autumn, and another sowing may be made in 10 days' time for winter and early spring crops. It is better to make two or three sowings during the month than to sow a large quantity at one time. The ground for this crop should be in good condition to ensure a free growth. If it was manured for the previous crop it will require to be deeply dug and allowed to remain untouched for a few days until the surface is dry enough for treading, previous to which a good dressing of soot may be given, so that by treading and raking the bed it may become thoroughly mixed with the surface soil. When the bed has been made smooth and level, drills may be drawn at 18 inches apart and 2 inches deep. A careful watch for slugs should be kept over the plants raised this month. If by any means this crop is

destroyed, the season may be too far advanced to replace it. When the plants are large enough to be out of danger, let them be freely thinned, as plants with plenty of room will stand the winter better than if allowed to remain close together in the rows. A few rows of Spinach Beet sown now will be found useful in case of failure with the ordinary winter variety.

Cucumbers.—Seeds should be sown now to provide plants for fruiting in autumn. Sow them singly in small pots and place them in a gentle hotbed composed of stable manure and leaves. When the heat of the soil is 85° the plants may be safely planted at distances of 5 feet apart. If the temperature of the bed is inclined to rise, a few holes may be bored round each mound to allow the steam to escape. Plants fruiting freely should be given frequent watering of liquid manure, and light top-dressings of loam and farmyard manure in equal quantities may be applied as often as the young roots appear above the surface. Keep the plants freely thinned and stop the young growth at the second joint beyond the fruit. Syringe the walls frequently and the foliage twice daily on fine days, shutting up the house as early in the afternoon as possible.

Tomatos in the open air.—The unsettled weather has been sadly against Tomato cultivation out-of-doors. The plants should be kept free from side shoots to enable the light and air to pass freely amongst the bloom. When a few trusses have been set on each plant the tops may be taken out. To encourage the development of the fruit a top-dressing of artificial manure should be given and pricked into the soil with the point of a digging fork.

PLANTS UNDER GLASS.

By JOHN DONOGHUE, Gardener to JOSEPH PICKERSGILL, Esq., Bardon Hill, Weetwood, Yorkshire.

Schizanthus.—The present is a suitable time to make a sowing of Schizanthus in order to raise plants for spring flowering. *S. Grahamii* and *S. retusus* affording such variation in colour, and specially in shades of lilac, orange, and rose, are not only useful as pot plants, but they provide excellent flowers for cutting. *S. Wisetonensis* and *S. pinnatus* are especially suitable for the decoration of the conservatory; either in pots or in baskets for suspending they are equally charming. Care should be taken to sow the seeds thinly, as any overcrowding at the start would produce failure. When the seedlings are large enough to handle, transfer them into pots or shallow pans, and place these receptacles in a cool frame as near to the glass as convenient. As a rooting medium for the plants during their early stages of growth, a compost consisting of rich fibrous loam with a small amount of half-decayed leaf mould prepared from Oak leaves and a moderate quantity of coarse silver sand would be suitable. If the cultivator desires large specimen plants, he should place four to six seedlings in a pot and pot them into larger pots without dividing them. If it is found that the plants fail to produce side shoots, the extreme points of the growths may be pinched whilst the plants are still young. For two or three days following repotting, the plants may be given a little shade from hot sunshine; at all other times they should be exposed fully to the sun. This is the case even during the period of flowering, for the flowers are always brighter in colour if they are kept permanently in the sunshine.

Eucharis grandiflora (amazonica).—Plants of *Eucharis* which were placed in the intermediate house after they completed their growth in spring are now showing their flower-spikes. Therefore, if it is wished that the season of flowering should be prolonged as much as possible, small batches of plants may be placed in the stove at intervals of a few weeks. It is desirable to plunge the pots up to their rims in tan or other suitable plunging material. Before removing such plants they should be immersed in a tank of tepid water, where the roots may get a thorough soaking. The foliage should be cleansed thoroughly, removing any mealy bug or insect pests by sponging the leaves with an insecticide.

Euphorbia (Poinsettia) pulcherrima.—The later batch of this species may now be transferred into their flowering pots. When the roots again become active, more ventilation should be given the plants and they should be exposed gradually to the sunshine. *E. jacquiniiflora* is

also ready for its final repotting, and this species should be treated in a like manner to *E. pulcherrima*, except that the temperature at night must never be allowed to fall below 55°. When the plants have filled their last pots with roots, alternate waterings with soft water and clear water may be given; also very slight top-dressing of an approved chemical fertiliser at intervals of a week or ten days. The greatest care must be exercised in the use of chemical manures, as the roots of *Euphorbia* are specially liable to injury if subjected to excessive applications.

THE ORCHID HOUSES.

By W. H. WHITE, Orchid Grower to Sir Trevor Lawrence, Bart., Burford, Surrey.

Cypripedium.—Most of the warm-growing *Cypripediums*, as *C. Rothschildianum*, *C. Lathamianum*, *C. Curtisii*, *C. ciliolare*, *C. super-*

ascertain if additional rooting space is needed, remembering that they must not be allowed to remain in a pot-bound condition. Select clean, sound pots of sufficient sizes to allow of at least two seasons' growth. The pots should contain clean crocks for one-third of their depth, and the compost should consist of fibrous loam with the finer particles sifted out, *Osmunda* fibre, and *Sphagnum*-moss in equal proportions; the fibre and moss should be cut up moderately fine, for, when used in this way, it incorporates better with the loam than if used in a rough condition. Add plenty of small crocks and thoroughly mix the whole well together. Be careful not to injure the roots unnecessarily. Pot each plant with moderate firmness, but not so firm that the water cannot pass rapidly through the soil. Keep the surface of the soil just below the rim of the pot so as to make watering easy. After root-disturbance place the plants all together where they can

by piece, leaving the centre as compact as possible, and, if the plant is rooted well all round the drainage, leaving the crocks intact. Then the whole mass is placed in a large pot, keeping the base of the leaves just on a level with the rim. Fill around the roots to about half the depth of the pot with small clean crocks, and use similar compost as above advised, making it quite firm about the roots. Plants that are healthy and have room for further development should not be disturbed, but, if the compost has deteriorated, it should be allowed to become quite dry; then carefully loosen it with a small stick, and shake out as much of it as possible, replacing with fresh compost. Whatever is done in the way of repotting these plants, it should be carefully performed, as the roots of all of these species and their hybrids are very brittle and easily injured. Before water is afforded, the plants should be allowed to become

FIG. 17.—COLLECTION OF VEGETABLES EXHIBITED BY THE HON. VICARY GIBBS AT THE HOLLAND HOUSE SHOW.

(See report in issue for July 9, p. 29.)

ciliare, *C. barbatum*, *C. Stoneri*, *C. Mrs. F. Wellesley*, *C. St. Albans*, *C. Maudiae*, *C. callosum* and its variety *Sanderae*, and *C. Lawrenceanum* and its variety *Hyeana*, have finished flowering for the season. The *Selenipedium* section, which includes such plants as *C. Schröderae*, *C. macrochilum*, *C. grande*, *C. Sedenii*, *C. S. cardinale*, *C. S. candidulum*, *C. leucorrhodum*, *C. calurum*, *C. Cleola*, and *C. nitidissima* are not grown very generally, the principal reason being that they have but little pecuniary value; nevertheless they help to form a collection, are easily cultivated, and all produce very pretty flowers. Such varieties as *C. macrochilum* and *C. nitidissimum* produce six or seven flowers, all open together on the same spike. After these and others of the same category have flowered, it is desirable to examine each plant in order to

be given extra shade from strong light. For several weeks afterwards, the surface of the compost should be kept just moist, and damping should be done between the pots several times each day, so that the atmosphere is kept humid. *C. Cleola* thrives best in a shady part of the intermediate house. During warm, bright weather, the plants should be given a light spraying overhead with tepid soft water. When damping overhead, care should be taken not to spray too heavily, as, if water is allowed to remain low down in the axils of the leaves, especially of some species, they are liable to decay. Plants of *C. niveum* section having passed out of bloom may also be repotted if necessary, and, in so doing, the plants should not be turned out in the ordinary way, but the pot should be broken carefully all round, taking the crocks away piece

thoroughly dry at the roots and remain so for several days, then dip the pots up to the rim in tepid rain-water, so as to ensure a thorough soaking. The plants should be allowed to become quite dry again before more water is afforded. These species, and many of their hybrids, as *C. Lawrencei*, *C. macrochilum*, *C. Chapmanii*, *C. Berkeleyi*, *C. Olenus*, *C. Arnoldae*, *C. Gertrude Hollington*, and *C. Venus*, thrive well when elevated close up to the roof glass in the warmest house in a position where fresh air can circulate freely around them; they must be shaded at all times when the sun is likely to shine on them. Small thrips can be kept in check by the periodical use of the XL-All vapouriser or similar insecticide. When sponging the leaves, take care not to raise them too high, as the midrib is easily cracked and this injures the leaf permanently.

EDITORIAL NOTICE.

ADVERTISEMENTS should be sent to the PUBLISHER, 41, Wellington Street, Covent Garden, W.C.

Special Notice to Correspondents.—The Editors do not undertake to pay for any contributions or illustrations, or to return unused communications or illustrations, unless by special arrangement. The Editors do not hold themselves responsible for any opinions expressed by their correspondents.

Letters for Publication, as well as specimens of plants for naming, should be addressed to the EDITORS, 41, Wellington Street, Covent Garden, London. Communications should be written on one side only of the paper, sent as early in the week as possible and duly signed by the writer. If desired, the signature will not be printed, but kept as a guarantee of good faith.

Local News.—Correspondents will greatly oblige by sending to the Editors early intelligence of local events likely to be of interest to our readers, or of any matters which it is desirable to bring under the notice of horticulturists.

Illustrations. The Editors will be glad to receive and to select photographs or drawings, suitable for reproduction, of gardens or of remarkable plants, flowers, trees, &c., but they cannot be responsible for loss or injury.

Newspapers.—Correspondents sending newspapers should be careful to mark the paragraphs they wish the Editors to see.

APPOINTMENTS FOR THE ENSUING WEEK.

TUESDAY, JULY 19—
Royal Hort. Soc. Coms. meet. (Lecture at 3 p.m. by Mr. Fred. Enock on "Insects Affecting Crops.") Roy. Scottish Arboricultural Soc. Forestry Exh. at Dumfries (2 days).

WEDNESDAY, JULY 20—
Cardiff & County Hort. Soc. Sh. (2 days). Liverpool Sweet Pea and Rose Sh. (2 days).

FRIDAY, JULY 22—Handsworth Fl. Sh. (2 days).

AVERAGE MEAN TEMPERATURE for the ensuing week deduced from observations during the last Fifty Years at Greenwich—63.2°.

ACTUAL TEMPERATURES:—
LONDON.—Wednesday, July 13 (6 P.M.): Max. 71°; Min. 53°.

Gardeners' Chronicle Office, 41, Wellington Street, Covent Garden, London—Thursday, July 14 (10 A.M.): Bar. 30.2; Temp. 63°; Weather—Bright.

PROVINCES.—Wednesday, July 13; Max. 74° Bath; Min. 55° Malin Head.

The Development of Sweet Peas.

During the past quarter of a century, floriculture has developed ideals very different from those which guided the work of the older florists. The precision of form and marking which they regarded with so much enthusiasm is no longer considered of paramount importance. Thus, the old Show Pansy, the Show Dahlia, the Laced Pink, the stage Carnation, the Ranunculus, the Show Tulip, the Gold-laced Polyanthus, and the hooded-flowered Sweet Pea are now seldom seen? Certainly they are not abandoned, for some of them are still lovingly grown by old enthusiasts, though some are in process of being driven out by new-comers, and we see the operation going on under our eyes, especially in the cases of Dahlias and Sweet Peas. It would be a mistake to say that the waved form has entirely displaced the older form of Sweet Pea. The latter is still largely grown, but not by growers who count in the forward march of things. Visits to the Shows of the National Sweet Pea Society are sufficient to demonstrate that the proportion of waved to hooded flowers is as ten to one. This change has been effected in less than ten years. At the Bicentenary Sweet Pea Show at the Crystal Palace in 1900 there was not such a thing as a waved Sweet Pea. Has any flower, we wonder, ever undergone so hasty a metamorphosis?

Our present object is to consider the principal colour sections into which Sweet Peas are grouped, with a view to showing the nature of the work that still awaits raisers of new varieties.

The section having, for the moment, the greatest fascination for raisers, is the so-

called yellow and buff section, represented by Clara Curtis, a waved flower of primrose tint; James Grieve, primrose, with an upright standard; Mr. Collier, a hooded flower; and Dora Breadmore, a buff-coloured flower. It is the ambition of every raiser to obtain a yellow Sweet Pea, and in this section we find, at the present moment, the nearest approach to yellow, but it must be admitted that James Grieve, which gives the deepest tone of colour, is a long way from being a pure yellow. It is well known that in the Sweet Pea there is no such thing as yellow sap-colour, and this it is which, as it would seem, makes the outlook so hopeless. The primrose tint in all so-called yellow Sweet Peas is produced by chromoplasts. Now, unless yellow sap-colour can be introduced into the constitution of the Sweet Pea by hybridisation, it will be difficult to intensify or deepen this colour. A bolder flower than Clara Curtis, and one possessing rather better substance should be the aim of raisers working with the material at present available.

In the white-flowered section, the leading flowers are Etta Dyke, waved; Nora Unwin, less waved; and Dorothy Eckford, hooded. There is room for a waved flower of decidedly better substance than Etta Dyke—shall we say larger, of better substance and not quite so crinkled? Nora Unwin does not quite fill the bill. In some respects it is better than Etta Dyke. It never has that excess of crinkling sometimes characteristic of Etta Dyke, which spells confusion in a bunch; but, being of the Unwin type, it can never have the effectiveness of a true Spencer. Possibly a cross between the two would produce a valuable variety.

Amongst pink flowers, Countess Spencer, the forerunner of the Spencer race, has many closely-allied forms. A pale form is Mrs. Harcastle Sykes and a deeply-coloured variety is the apparently unfixable Audrey Crier. Countess Spencer on a cream instead of the original white ground develops into Constance Oliver, Mrs. Henry Bell, Mrs. Hugh Dickson, and a host of other names. There is not much room in this class for further development except to attain fixity, if that is possible, in flowers of the Audrey Crier type, one of the most beautiful forms of Sweet Pea.

In the orange shades, Helen Lewis, waved; St. George, slightly waved; and Miss Willmott, hooded, are the selections of the Sweet Pea Society. Two or three new-comers will contest with Helen Lewis the proud position of being top in the Society's election—Edrom Beauty, certificated by the N.S.P.S. last year, Earl Spencer, and Nancy Perkin. The two latter are much alike; in fact, there is not room for both. Their colour is a rich orange-salmon, which is admired universally; the same colour appeared in the old Henry Eckford, but the new-comers are waved. To make greater confusion in this colour class, we have Stirling Stent and Orange King appearing this year, both having gained an award from the R.H.S., whilst Stirling Stent was awarded a Silver Medal by the N.S.P.S. Society as recently as Tuesday last. There is room here for raisers to breed orange-salmon flowers, which will not bleach in the sunshine.

Of rose and carmine flowers, John Ingman and Marjorie Willis represent the best waved

forms and Prince of Wales the old type. John Ingman has probably more aliases than any other Sweet Pea. It is a bold, fine flower, and will be difficult to excel. There does not appear much opportunity for raisers here.

In the class for crimson and scarlet varieties, The King, waved; King Edward, and Queen Alexandra, both of old type, are given by the Sweet Pea Society. It is obvious that there is room for new varieties, especially as The King, the largest and representing one of the best types, does not stand strong sunshine well. Several so-called sunproof crimsons are on offer. Dobbie's Sunproof Crimson having been certified by both the R.H.S. and the N.S.P.S., but what is really wanted is a crimson of The King type which is sunproof. This, no doubt, will be attained sooner or later. A really first-class flower of the colour of Queen Alexandra is wanted. George Stark was at one time expected to satisfy this need, but there is ample room for others.

The place for lavender colour was well filled some years ago by Lady G. Hamilton (hooded), one of the most charming Sweet Peas ever raised. Now, Mrs. Chas. Foster and Frank Dolby, both waved flowers, take precedence. Mrs. Chas. Foster is an almost perfect Sweet Pea, but it has been well nigh impossible to obtain a pure stock of it. Masterpiece is a new competitor in this class, and it is said to be fixed.

There is plenty of room for good Spencer blues. It has been pointed out by Professor Bateson, and it is known to most raisers, that, up to the present, the Spencer form will not associate with Lord Nelson or Navy Blue colour, nor even with the paler, pure blue represented in Mid Blue. There are blue-waved flowers, Zephyr for example, but that is not a fine large Spencer, nor is it fixed. Kathleen McGowan and Anglian Blue have yet to be tried by the general growers. None of them appears in the N.S.P.S. Classification List. It will be interesting to get the combination, which we believe is possible between the true blue in colour and the true Spencer in form, and this is a field open to raisers. This season a variety named Mrs. George Charles has been sent out. It gives promise of being a Spencer of Navy Blue colour. The first flowers seem easily scorched, but, still, it is promising. What is wanted is a real good Spencer of Lord Nelson colour.

Dark Maroon is represented in the classification of the N.S.P. Society by two varieties, both of the old type—Black Knight and Hannah Dale. This indicates that no dark maroon, waved variety has come before the Society in its trials that has been fixed enough to obtain the Society's approval. Quite a number of darks have been sent out, but growers still wait for one they can depend upon to come true.

Of Picotee-edged flowers, Elsie Herbert, white with pink edge, and Mrs. C. W. Breadmore, cream buff with rose edge, are both excellent in their way, and both have big, waved flowers. There is scope in this class for numerous new combinations.

Striped, Fancy, and Bicolor flowers appeal to fewer cultivators, but among these sections Aurora Spencer, waved cream with rose stripes, and Mrs. Andrew Ireland, waved cream and rose bicolor, are distinct and very

beautiful. There is room for fine waved types of good substance in the classes represented by Helen Pierce, Prince Olaf, Sybil Eckford, and a few others.

We need hardly remind those who are beginning for the first time to raise new varieties that it is an operation that requires much patience and a considerable extent of ground. All seedlings must be grown on for several years before the possibilities of a cross are exhausted. The most important lesson to enforce is they must all be grown on from single plants, the produce of two plants never being mixed, however similar they may appear. With such work in prospect, raisers will be well advised to think out clearly what they desire to obtain, and, in order to give the necessary attention, it will be best to make but comparatively few and carefully-considered crosses.

OUR SUPPLEMENTARY ILLUSTRATION.—

Senecios are well represented in South Africa, but very few of the species appear to possess any great value from a cultural point of view. *S. glastifolius* belongs to a small section, in which all the species have purple flowers. Judging from collected, wild specimens, it is a somewhat variable plant with respect to both habit and size. It is found in South Africa growing on Table Mountain and eastward to Algoa Bay. The stems are suffruticose and reach a height of 2 feet to 3 feet, with the lower leaves 3 inches to 4 inches long and toothed, and about $\frac{1}{2}$ inch wide. Higher up the stem the leaves gradually become smaller till ultimately they are like small bracts. The plant illustrated, which was sent us by Mr. Råbjohn, was raised from seeds received from Algoa Bay, and is much more free in habit than the more rigid type. There is a record of the same variety having been raised from seed in the year 1900 by Messrs. SUTTON & SONS, who received the seeds from the district of George, in South Africa. It is well adapted for cool greenhouse treatment, such as is given to *Cinerarias*, and it makes a handsome decorative plant.

ROYAL HORTICULTURAL SOCIETY.—The next meeting of the Committees of this Society will take place on the 19th inst., at the Vincent Square Hall. In the afternoon a lecture on "Insects Affecting Our Crops" will be delivered by Mr. FRED ENOCK, F.L.S., F.E.S.

HORTICULTURAL CLUB.—The honorary secretary, Mr. E. T. COOK, informs us that the club excursion will take place on Thursday, the 28th inst., not 30th, as stated in the preliminary notice. By the invitation of Mr. N. N. SHERWOOD, the members will visit Prested Hall, Kelvedon, Essex. The train, to which saloon carriages will be attached, will leave Liverpool Street Station at 10.55 a.m. All applications for tickets, which are 7s. 6d. each, should be made to Mr. HARRY J. VEITCH, Royal Exotic Nursery, Chelsea, S.W., before July 20, in order that the necessary arrangements may be completed. The return train leaves Kelvedon at 7.30 p.m., arriving at Liverpool Street at 9.3 p.m., but should any member desire to leave earlier, a train leaves Kelvedon at 4.32 p.m., reaching Liverpool Street at 5.43 p.m.

AMERICAN GLADIOLUS SOCIETY.—A Gladiolus Society was established at Boston on May 27 last. At the inaugural meeting an interesting paper was read by Mr. H. YOEUELL, of Syracuse, New York, on "The Gladiolus as we Knew and Grew It Fifty Years Ago." The communication was of especial in-

terest, as Mr. YOEUELL'S father was one of the largest growers of Gladioli in England half a century ago, and was responsible for the introduction of *Gladiolus Brenchleyensis* about the year 1860. The plant was found by Mr. W. CASEY, one of Mr. YOEUELL'S foremen, in a cottage garden at the village of Brenchley, in Kent, to which locality it had apparently been brought from Africa by a sailor-son of the owner. The variety became immensely popular, and between 1860 and 1864 the sales from Mr. YOEUELL'S nurseries at Great Yarmouth amounted to about 300,000 corms annually. That the *Gladiolus* is a flower capable of great possibilities is obvious to all who have noticed the vast improvement in form, colour and other qualities which has been accomplished in recent years in the *Gandavensis* section alone. Much remains to be done with the *Lemoinei* and *Childsii* hybrids, as well as with other forms, and we wish the society every success in its work.

BRUSSELS BOTANIC GARDENS.—On Sunday, July 3, a fête was held to celebrate the 40th anniversary of the taking over of these Botanic Gardens by the State. The fête included a demonstration in memory of PIERRE-FRANÇOIS GINESTE, who drew up the original plans for the laying-out of the gardens and the buildings which contain the valuable collections. A bronze plaque to his memory was unveiled, recording the fact and giving the dates of his birth and death—1769-1850. Originally founded by a botanical society, the Brussels Botanic Gardens are now a Government institution. The staff is comprised of the following:—Messrs. DURAND, Director; DE WILDEMAN, Keeper of the Herbarium; BOMMER, Professor of Botany; LOUIS GENTIL, Curator; and LAURENT, also connected with the Herbarium. The garden is also under a Governing Committee composed of eminent Belgian professors of botany. During the evening of the 3rd inst. the buildings and greenhouses were brilliantly illuminated with festoons of coloured electric light. A concert was given that was much applauded by the 50,000 people gathered together inside and outside the garden. M. LÉON GROSJEAN, member of the Governing Committee, gave a dinner to 40 guests, eminent in the botanical and horticultural world. The dining hall was beautifully decorated with Orchids, and speeches suitable to the occasion were made. After the dinner a choir gave a selection of songs; the band of the Guides Regiment performed some choice pieces of music, and there was a display of fireworks. Each guest found by the side of his plate an artistic souvenir, consisting of a view of the Botanic Gardens in 1830 and in 1910, and, in addition, the president, M. GROSJEAN, presented to each guest a medal commemorating the event which the occasion celebrated.

CHIEF OFFICER FOR THE LONDON COUNTY COUNCIL PARKS.—The following advertisement appeared in the *London County Council Gazette* for the 11th inst.:—"The London County Council invites applications for the appointment of chief officer of its Parks Department, who will be required to give his whole time and energies to the duties of his office. Members of the staff of the Council are not precluded from making application for the position. The person appointed will be responsible for the management of all the parks, gardens, and open spaces maintained by the Council, which at present are 114 in number, and of an aggregate area of about 5,100 acres. He will also be responsible for organising the recreative arrangements in the parks, including gymnasiums, boating, game pitches, and bands; for the management of the conservatories and the horticultural and other buildings therein, for

over-seeing the refreshment facilities, and for the management and discipline of the staff employed in the parks service. The average number of staff is 1,000, including in its ranks men well qualified as specialists in their separate departments; and, while for the chief officership knowledge of surveying, landscape gardening, forestry, and horticulture is desirable, the principal requirement must always be a capacity for intelligent general supervision of the very varying duties which have to be performed under the chief officer's authority. The person appointed will not be allowed to take any private business or other paid employment, and any fees received by him, either as a witness or in any other capacity, are to be paid to the Council. He must not be more than 45 years of age on September 1, 1910. The commencing salary attaching to the appointment is £700 a year. No fixed allowance will be made to him for travelling expenses, but he will be repaid any such expenses as he may actually incur. Applications for the appointment must be on the official forms, which may be obtained from the Clerk of the London County Council, Spring Gardens, S.W. They should contain full particulars of age, qualifications, and experience, and should be accompanied by copies of not fewer than three testimonials as to character and fitness for the office, with special reference to the qualifications above mentioned. The latest time for receiving applications is 11 o'clock a.m. on Thursday, September 1, 1910. Any form of application which is not fully filled up, or which in any respect fails to comply with the terms of the advertisement, will not be laid before the Council. The appointment will be subject to the successful candidate passing satisfactorily a medical examination by the Council's medical examiner."

M. LOUIS GENTIL.—We learn with pleasure that our friend and correspondent, M. LOUIS GENTIL, Curator of the Brussels Botanic Gardens, and editor of *La Tribune Horticole*, has recently been honoured by the National Horticultural Society of France by being appointed a corresponding member of that Society. M. GENTIL, we may add, is likewise a corresponding member of our own R.H.S.

VISIT TO EAST BURNHAM PARK.—About forty members of the Committees of the Royal Horticultural Society availed themselves of the invitation of Mr. and Mrs. HARRY J. VEITCH to visit East Burnham Park on Thursday, July 7. The party left Paddington at 10.40 a.m., and was conveyed in brakes to East Burnham Park. The beautiful gardens were inspected, and the extensive rockeries and wild garden were much admired. They contain some of the original plants of the species collected by WILSON in China. The pretty water-garden, with its Water Lilies and marsh plants at the sides, the Rosary, the model dairy, and the many rare trees, including some fine examples of *Cedrus atlantica glauca*, are among the most interesting features. After lunch, members spent the rest of the time according to their several desires. Mr. VEITCH accompanied one party to Burnham Beeches, pointing out the peculiarities of the old trees; other parties played bowls or cricket, or continued their inspection of the gardens until tea-time. Several apologies were received from those who kept the appointment open until the last moment, hoping to be present. In replying to an address of thanks at the lunch, Mr. VEITCH alluded to this point, and said that he hoped that, by arranging for an earlier visit next year, some friends who were now unavoidably absent would be able to honour him and Mrs. VEITCH with their presence.

THE HOLLAND HOUSE SHOW.—In addition to the exhibits at this show mentioned in the report published last week, we are reminded that a collection of watering-cans was exhibited by Mr. J. HAWS, and that Mr. L. R. RUSSELL showed a large group of tree and standard Ivies, for which he was awarded the Society's Gold Medal. The Delphinium known as Rev. E. Lascelles was shown by Messrs. ALFRED A. WALTERS & SON, Kensington Nurseries, Bath.

BOTANICAL INSTITUTE OF BUITENZORG.—The botanical garden of Buitenzorg, in Java, so ably developed and administered by Dr. TREUB, is well known among botanists as a centre where the scientific study of tropical vegetation has been prosecuted with much vigour and success. Although established in 1817, it was not until about 1840 that the garden assumed much of its present shape, when TEYSMANN gathered together a collection of some 10,000 species. In 1880 Dr. TREUB was appointed director by the Dutch Government, and, soon after his arrival in Java, conceived the idea of making the garden a centre for the study of tropical plants. In 1885 a laboratory was built and well equipped for the use of botanists from all parts of the world. Advantage has been taken of the splendid facilities offered there for research by representatives from many countries, and in the *Annals* of the garden are published numerous papers of great scientific and practical interest by visitors as well as by the director and his colleagues. Little by little, the organisation of the garden has been extended, and special laboratories have been erected for the study of physiology and pathology of tropical plants, and the chemistry of the medicinal products which they yield, as well as for the investigation of problems connected with the soil. Through the efforts of Dr. TREUB and his staff, our knowledge of the Malayan flora has been greatly improved, and horticulture has benefited by the introduction of many new forms and species of Orchids, Palms, Ferns and other warm-house plants. A smaller, supplementary garden has been formed in the forest of Tjibodas, on the north-east flank of the volcanic mountain of Gedeh, at an elevation of 5,000 to 6,000 feet, for the study of plants which do not thrive in the hot, humid climate of Buitenzorg. An area of some 600 acres of virgin forest is also annexed, and will be retained in its primitive state. Since 1905, the work of the gardens at Buitenzorg has been included in the purview of the newly-formed Department of Agriculture for the Dutch Indies, which is concerned with the forestry of the colony, as well as with the cultivation of Rubber, Quinine, Tobacco, Sugar cane, Rice, and other crops for which Java is specially suited.

SOCIETIES.

NATIONAL ROSE.

GREAT SUMMER EXHIBITION.

JULY 8.—The thirty-fourth summer exhibition of this Society was held on the 8th inst. in the Botanic Gardens, Regent's Park. These exhibitions keep pace with the importance of the Society, which is the most successful of all associations devoted to a special flower. The blooms were not quite so good as last year, owing to the recent heavy rains, but in other respects the exhibition was one of the finest Rose shows held in the Metropolis. The entries were numerous, the exhibition attracting not only the principal trade growers, but also a large body of amateurs, who contribute very largely to the success of the Society. The weather was fine, but dull, which was, in some respects, an advantage, since the blooms remained fresh. The pub-

the afternoon, visitors awaited in a long line their turn to inspect them; a sight such as is seldom witnessed at a flower show.

NURSERYMEN'S CLASSES.

Not only is the class for 72 blooms of distinct varieties the champion class in the nurserymen's division, but it is also regarded as the most important in the show. On this occasion there were six competitors, sufficient to afford a good contest. Messrs. A. DICKSON & SONS, LTD., Newtownards, Ireland, had no difficulty in beating their rivals, showing large, well-coloured blooms, with few damaged outer petals, such as were conspicuous in blooms on other stands. Their varieties were Frau Karl Druschki (shown grandly), Comtesse d'Oxford, Princesse Marie-Mertschersky, Killarney, Marquise Litta, Bessie Brown, Lohengrin, Mildred Grant (a magnificent bloom), William Shean, Mrs. Theodore Roosevelt, Mme. Edmee Metz, Ulrich Brunner (a grandly-coloured flower), Gustave Grunerwald, John Ruskin, Mrs. R. G. Sharman Crawford,

[Enograph by W. J. Vasey.]

FIG. 18.—HYBRID TEA ROSE "MRS. FOLEY HOEDS."

(Award of Merit at the Holland House Show, and Silver Gilt Medal at N.R.S. Exhibition).

lic patronised the show extensively, and we should think that the attendance was larger than at any previous exhibition held under the Society's auspices. Some inconvenience was caused by the soddened condition of the turf in the tents, the gangways in some cases being very muddy; as this obtained at last year's show, there was some justification for the complaints. In other respects everybody's convenience was studied by the hard-working secretary, Mr. Edward Mawley, and his colleagues. A glance at the exhibits sufficed to show that it was a season of red Roses, for in all the collections the deeply-coloured blooms were the best. Our fancy selected Horace Vernet as the Rose of the show, whilst of the lighter kinds, Mrs. Edward Mawley was most beautiful. Four new Roses received the Society's Gold Medal, and four also were awarded Silver-gilt Medals. The new varieties were accommodated in a tent by themselves, and, all through

Suzanne Marie Rodocanachi, Charm (a bright shade of rose), Mrs. John Laing, Marie Baumann, Her Majesty, Chas. Lefebvre, Marchioness of Londonderry, John Stuart Mill, Caroline Testout, Alfred Colomb, Heinrich Schultheis, Gustave Piganeau (a grand flower), Mme. Melanie Souper, White Maman Cochet, Chas. Darwin, Elizabeth Barnes, Comtesse de Raimbaud, Xavier Olibo, Walter Speed (rich, velvet-like crimson), Ellen Drew (extra good), Lady Sheffield (a pale shade of rose, a beautiful bloom), Alice Hill Gray, Lyon Rose, Dr. Andry, Mollie Sharman Crawford, Duchesse de Morny (a magnificent bloom of fine shape), Mrs. Cornwallis West, Muriel Graham, A. K. Williams (a grand red Rose), Ferdinand de Lesseps, E.Y. Teas, Horace Vernet (of beautiful shape and rich colour), Lady Moyra Beauchamp, Ben Cant, Mrs. Ed. Mawley (a big, soft-tinted bloom), Etienne Levet, Bridesmaid, George C. Waud, Dean Hole, Prince

Arthur, Duchess of Portland, Chas. J. Graham, Mrs. Foley Hobbs (see fig. 18), Mrs. Bate-man, Mrs. Hubert Taylor, Lady Ashtown, Lady H. Vincent, Florence Pemberton, Victor Hugo, Mme. Vermorel, Ulster, J. B. Clark, Mrs. G. W. Kershaw, Helen Keller (good), and Mrs. David McKee (a choice light variety). 2nd, Messrs. D. PRIOR & SON, Colchester, a selection of whose flowers are Dupuy Jamin, Mrs. Edward Mawley, Dr. O'Donel Browne, Horace Vernet (richly-coloured), Dr. Andry (an elegantly-flowered Rose), Her Majesty, Mrs. T. Roosevelt, Gustave Piganeau, Marie Baumann, Mrs. W. J. Grant, J. B. Clark (extra large), and Mme. Chas. Crapelet. 3rd, Messrs. B. R. CANT & SONS, Colchester; 4th, Messrs. FRANK CANT & Co., Colchester.

The next class on the schedule was for 40 distinct varieties shown in triplets, this large number of blooms requiring five boxes for each exhibit. There were five competitors. Again Messrs. ALEX. DICKSON & SONS excelled, having some of the finest Roses in the show. Blooms of Mildred Grant were charming, and others that were especially fine are Ulrich Brunner, Victor Hugo, Marie Baumann, Mrs. R. G. Sharman Crawford, Duchesse de Morny, Lyon Rose, A. K. Williams (a magnificent red Rose), Frau Karl Druschki (extra fine), and Horace Vernet (this magnificent dark-red Rose was especially good on most exhibits). 2nd, Messrs. B. R. CANT & SONS, Colchester, with smaller blooms, conspicuous varieties being Earl of Dufferin, J. B. Clark, Capt. Hayward, George C. Waud (of bright-rose colour), Mrs. Edward Mawley, and Mrs. W. J. Grant. 3rd, Messrs. D. PRIOR & SON.

A splendid competition resulted in the class for 48 blooms of distinct varieties, no fewer than nine exhibits being forthcoming. There was not a great deal to choose between the stands that were awarded the four prizes, but Mr. GEO. PRINCE, Oxford, showed rather the best, having a good, even lot of flowers, nothing remarkable as to size, but fine in shape and brightly coloured. A big bloom of Dean Hole was grand, also those of Konigin Carola, White Maman Cochet, Mrs. Edward Mawley (this fine Rose was conspicuous on other stands, being one of the best light Roses this season), Gustave Piganeau, Capt. Hayward, and Victor Hugo (of exquisite shape and deepest-red colour). 2nd, Mr. HUGH DICKSON, Royal Nurseries, Belfast, having choice blooms of Joseph Hill, Etienne Levet, Mrs. David Hanna, Mrs. John Laing, Leslie Holland, J. B. Clark, and Lady Ursula. 3rd, Mr. HENRY DREW, Longworth, Berkshire, in whose collection was a magnificent flower of Avoca.

There were also nine competitors in the class for 24 blooms of distinct varieties, the 1st prize being awarded to Mr. JOHN MATTOCK, New Headington Nursery, Oxford, who had Lohengrin, C. J. Graham (of fine red colour), Dean Hole, Countess of Caledon, Mildred Grant, Frau Karl Druschki, and Horace Vernet, especially good. 2nd, Mr. JOHN PIGG, Royston, Hertfordshire, with big blooms, some being full-blown, a defect on the exhibition table. 3rd, Messrs. PERKINS & SONS, Birmingham, with small but finely-shaped blooms—a good, even collection, Avoca being shown grandly.

In the class for 16 distinct varieties, shown in triplets, there were eight exhibits, those in the 1st prize collection, shown by Messrs. G. & W. H. BURCH, Peterborough, being well matched in size, but not extra large. We noticed amongst the finer examples J. B. Clark, Gustave Piganeau (one bloom of the trio was magnificent), A. K. Williams, Dean Hole, Mrs. John Laing, Mme. Eugene Verdier, and Horace Vernet. The 2nd prize exhibit, which we preferred to the former, was shown by Mr. GEORGE PRINCE, and included choice examples of Marie Baumann, Mildred Grant, Victor Hugo, Hugh Dickson, Mrs. John Laing, and J. B. Clark. 3rd, Mr. W. LEGGETT, Colchester.

HYBRID TEA ROSES.

These Roses were not extra good, for which the season must be blamed. There were six contestants in the class for 16 distinct varieties, the 1st prize falling to Mr. HUGH DICKSON for small, but refined blooms of Joseph Hill, Countess of Gosford, Mme. Jules Grolez, General McArthur, Lyon Rose, Pharisæer, Richmond, and others; 2nd, Mr. JOHN MATTOCK; 3rd, Messrs. FRANK CANT & Co.

TEA AND NOISSETTE ROSES.

The D'Ombraïn Cup was offered as the 1st prize in the class for 24 varieties, the successful exhibitor being Mr. GEO. PRINCE, who won easily. The variety Mrs. Ed. Mawley was his finest specimen. Others that were notable were White Maman Cochet, Mme. Jules Gravereaux, Molly Sharman Crawford, and Muriel Graham. 2nd, Mr. HENRY DREW, whose choicest blooms were Mrs. Ed. Mawley, Mme. Constant Soupert, Medea, and Auguste Comte.

For 12 blooms of these Roses, Mr. MATTOCK had the best amongst six exhibitors, Messrs. J. BURRELL & Co., Cambridge, being placed 2nd, and Mr. JOHN PIGG 3rd.

For 14 varieties, shown as triplets, in vases, Mr. GEO. PRINCE excelled, having much the best flowers, Mrs. Edward Mawley, White Maman Cochet, and The Bride being outstanding varieties. 2nd, Mr. HENRY DREW; 3rd, Messrs. FRANK CANT & Co.

VASE CLASSES.

These made a pleasing change from the exhibition boxes, the flowers appearing more graceful.

tion of all types of the flower is permissible. As usual, two growers only competed in the class for a floor group, viz., Messrs. G. PAUL & SON, Cheshunt, and Messrs. HOBBIES, LTD, Dereham, Norfolk, who won in the order named. Both firms showed finely, making a free use of pillar varieties, the beautiful Shower of Gold in Messrs. PAUL's group being magnificent. Messrs. PAUL had also the new Mme. Second Weber, Lady Godiva (a light Rambler of flesh-pink tint), Paradise (pink, with a white "eye"), Evangeline (a bluish Rambler), Coquina, Victor Hugo, and others.

The imposing groups of Roses staged on tabling measuring 100 square feet were magnificent. The first prize was awarded to Mr. JOHN MATTOCK for a display of choice blooms, attractively presented. The next two were of equal merit, and received equal 2nd prizes, the exhibitors being Messrs. GEO. MOUNT & Co., Canterbury, and Messrs. W. & J. BROWN, Peterborough. Mr. F. M. BRADLEY, Peterborough, also showed finely, having a lovely epergue of the pure white, large-flowered, single Simplicity. The other exhibitor was Messrs.

(Photograph by W. J. Vasey.)

FIG. 19.—HYBRID TEA ROSE "MARY COUNTESS OF ILCHESTER": COLOUR DEEP ROSE, WITH SLIGHT VIOLET SHADE. (Award of Merit at the Holland House Show.)

The class for 12 varieties, to include not more than six Tea or Noisette kinds, brought four good displays, amongst which it was an easy task to select the winning blooms. They were shown by Messrs. A. DICKSON & SONS; these vases of Roses were as near perfection as possible. They included Mildred Grant, Horace Vernet, Mrs. W. J. Grant, Mary Countess of Ilchester (see fig. 19), Frau Karl Druschki, and A. K. Williams. 2nd, Messrs. D. PRIOR & SON, whose best variety was Liberty.

For nine varieties of Tea or Noisette Roses Mr. GEO. PRINCE led with a good set, of which White Maman Cochet was the finest.

In the classes for Decorative Roses, Mr. JOHN MATTOCK, Mr. A. TURNER, Messrs. FRANK CANT & Co., and Mr. GEO. PRINCE won 1st prizes.

GROUPS OF ROSES.

These classes afford opportunity for the trade growers to make imposing groups, as the inclu-

R. HARKNESS & Co., Hitchin, who had also a fine display.

In the colour classes, the finest crimson variety was J. B. Clark, shown by Mr. WALTER BENTLEY; the finest white or yellow kind, Frau Karl Druschki, exhibited by THE KING'S ACRE NURSERY Co.; and the finest of any other shade Mrs. Theodore Roosevelt, shown by Messrs. D. PRIOR & SON.

The best nine blooms of a new Rose were shown by Messrs. ALEX. DICKSON & SONS, who staged the creamy-coloured Walter Speed.

Tables of Roses formed a feature in one of the tents, and Messrs. G. JACKMAN & SON, Woking, had a quantity of decorative varieties, such as Tausendschon, Rene André, Alberic Barbier, Mrs. F. W. Flight, and others, displayed on a table about 4 feet square. Mr. C. TURNER, The Royal Nurseries, Slough, had a similar one, but the Roses displayed on it were different. The 2nd prize in this—the 14th class—was taken by

Messrs. W. SPOONER & SON for Rambler Roses in variety. There were many such tables.

AMATEUR'S CLASSES.

The competition in most of the classes for cut blooms was very keen, and the blooms, taken as a whole, were of more than average good quality.

In the champion class, open to all amateurs, irrespective of the number of plants they grow, for 36 blooms, distinct varieties, E. B. LINDSELL, Esq., Hitchin, was 1st, winning the Champion Trophy and Gold Medal, with a very fine lot of flowers. We name the varieties:—Horace Vernet, Chas Lefebvre, Ulrich Brunner, Marquise Litta, Marie Baumann, J. B. Clark, and Win. Shean. In the same class, R. DENNISON, Esq., Cranford, was 2nd, his finest blooms being Ulrich Brunner, Capt. Hayward, Mrs. J. Laing, H. Watson, J. S. Mills, and Horace Vernet; 3rd, CONWAY JONES, Esq., Hucclecote, Gloucester, with very fine examples of Countess Oxford, J. B. Clark, Capt. Hayward, Mrs. Sharman Crawford, and Mrs. Theo. Roosevelt, a little spoilt by rain. A 4th prize was awarded to the Rev. F. G. W. HENSLOW, Stanton Street, Quinton, Chippingham. The competitors were numerous and the competition severe.

Twenty-four blooms, distinct.—E. B. LINDSELL again won the 1st prize, and his best flowers, grand in size, were Ulrich Brunner, Duchess of Bedford, Dean Hole, Hugh Dickson, and a very fine specimen of Mrs. T. Roosevelt; 2nd, G. A. HAMMOND, Esq., Cambrian House, Burgess Hill, Sussex; altogether a splendid exhibit, the blooms being not over large, and of fine form; 3rd, F. DENNISON, Esq., Cranford.

Twelve blooms, distinct (trebles).—CONWAY JONES, Esq., was 1st, his best flowers being G. Figeaux, Mrs. T. Roosevelt, A. K. Williams, J. B. Clark, Alfred Colomb, a fine old Rose, appearing in many of the exhibits; and Lady Ashdown; 2nd, A. TATE, Esq., Downside, Leatherhead; 3rd, Rev. F. G. W. HENSLOW.

Nine blooms of any variety of the Rose excepting Tea or Noisette.—1st, R. F. HOBBS, Esq., Thornloe, Worcester, who exhibited blooms of Frau K. Druschki, quite even in regard to their size; 2nd, E. B. LINDSELL, Esq., who showed Mrs. T. Roosevelt; 3rd, the Rev. F. G. W. HENSLOW, with excellent flowers of La France.

CLASSES FOR GROWERS OF FEWER THAN 3,000 PLANTS.

Twenty-four blooms, distinct.—E. M. EVERSFIELD, Esq., Denne Park, Hoxham, won the 1st prize and the "Hobbies" Challenge Cup with a splendid collection. The finer blooms were J. B. Clark, Florence Pemberton, Mrs. J. Laing, Marie Baumann, Marquise Litta, Charles Darwin, Suzanne Marie Rodocanachi, and Mrs. E. Mawley; 2nd, Rev. J. A. L. FELLOWES, Attleboro', his best blooms being Marquise Litta, Mrs. W. J. Grant, and Alfred Colomb; 3rd, W. BOYES, Esq., Middleton-on-the-Wolds, E. Yorkshire.

The best nine blooms in this division came from E. M. EVERSFIELD, Esq., the variety being Frau Karl Druschki; 2nd, W. BOYES.

GROWERS OF FEWER THAN 2,000 PLANTS.

W. J. THORPE, Esq., Hucclecote, Gloucester, had the best collection of 24 blooms, winning the N.R.S. Challenge Cup. His best flowers were J. B. Clark, Mrs. David McKee, a creamy-white flower; Francois Michelon, A. K. Williams, Horace Vernet, Comte de Rainbaud (a variety but little esteemed now), Prince Arthur, and Angelo Peluffo, a pink-coloured Rose, very choice in form; 2nd, W. R. HAMMOND, Esq.; 3rd, W. O. TIMES, Esq., Hitchin.

Eighteen blooms, distinct.—G. R. BONNER, Esq., Tillingbourne, Gloucester, was 1st, whose best blooms were J. B. Clark, Charles Lefebvre, A. K. Williams, Marechal Niel, Gladys Harkness and G. C. Waud; 2nd, Dr. T. E. PALLET, Earl's Colne, Essex; 3rd, GULLIVER SPEIGHT, Esq., Market Harborough.

For six blooms of any Rose except Tea or Noisette, W. R. HAMMOND, Esq., and C. C. WILLIAMSON, Esq., Welstead, Canterbury, were divided equal 1sts.

For 8 distinct varieties (trebles).—1st, W. O. TIMES, Esq., with excellent blooms, even as to size, and perfect in shape and condition; 2nd,

Mrs. BEVELLE FORTESCUE, Dropmore, Maidenhead; 3rd, W. J. THORPE, Esq.

GROWERS OF FEWER THAN 1,000 PLANTS.

Twelve blooms, distinct.—C. F. H. LESLIE, Esq., Epscombe, Hertford, won the 1st prize with fine blooms of Mme. Melanie Soupert, Horace Vernet, Queen of Spain, Mme. Jules Gravereaux, J. B. Clark, and Mrs. E. Mawley; 2nd, Dr. C. LAMPLUGH, Alverstoke; 3rd, M. WHITTLE, Esq., Belgrave Avenue, Leicester.

GROWERS OF FEWER THAN 750 PLANTS.

Twelve blooms, distinct.—Rev. L. C. CHALMERS HUNT, Hitchin, showed the best collection, and he had very fine blooms of Ulrich Brunner, Oscar Cordel, and Mrs. J. Laing; 2nd, H. L. WETTERN, Esq., Waratha, Sanderstead.

DECORATIVE ROSES.

In a tent apart from the rest of the show, were bowls of Roses, and tables laid out with various decorations with Roses, all more or less graceful and beautiful. A bowl filled with the single-flowered Damas Rose was the prettiest shown; but the judges gave the 1st prize to one filled with the variety Irish Elegance. This last was shown by Miss LANGTON, Raymond, London. The table decorations, carried out with Irish Elegance, were charming beyond measure.

A piece of plate, presented by A. Tate, Esq., and a 1st prize fell to Miss E. S. SCOTT, for table decorations carried out with the Lyon Rose.

GOLD MEDAL ROSES.

The Society's Gold Medal was awarded to the four novelties following:—

Lady Hillington.—A richly-coloured yellow Tea variety, of conical shape and with petals of good substance. Shown by Messrs. LOWE & SHAWYER.

Rayon d'Or.—A moderately-tall flower of a canary-yellow colour. Shown by Dr. A. R. WADDELL, Baldoak.

Edward Mawley.—A deep-crimson variety, possessing considerable fragrance. Shown by Messrs. S. MCGREY & SON, Portadown.

Joseph H. Welch.—A large flower of a deep-pink colour, having a conical centre. Shown by Messrs. MCGREY & SON.

OTHER NEW ROSES.

MESSRS. LOWE & SHAWYER exhibited their seedling hybrid Tea Mrs. George Sawyer. The flower has the colour of the favourite "old rose" pink, has a long Niphetos-like shape, and appears to be fairly full of petals. (Silver-gilt Medal.)

MESSRS. B. R. CANT & SONS, Colchester, showed Rose St. Helena, H.T., of their raising. The flower is of a delicate flesh colour, tinted with yellow, somewhat pointed in shape before being fully expanded, and possesses a pleasing contour. (Silver-gilt Medal.)

MESSRS. B. R. CANT & SONS likewise showed a H.T. named Colestria, a flower of a cerise tint, and possessing much substance in the petals and with sufficient of these to make a full flower. A card of Commendation was awarded.

MESSRS. MCGREY & SON showed H.T. Rose Evelyn Dauntsey, apparently developing to an unusually large size. The colour is pale-flesh on the inner side of the petals and of a deep purplish-cerise on the outer side. The flower has a cone-shaped centre, and much fragrance. (Silver-gilt Medal.)

MESSRS. ALEXANDER DICKSON & SON, Newtownards, showed a new seedling Rose, Mrs. Foley Hobbs (see fig. 1d) white, with a faint flesh tinge. The flower is full and has a pointed centre. (Silver-gilt Medal.)

MESSRS. DICKSON & SON showed Rose Mrs. Gordon Sloan, of a charming flesh tint; the flower has a filbert-like centre and the colour is more intense at this part than elsewhere. It received a card of Commendation.

PREMIER BLOOMS.

Nurserymen.—H.P. Horace Vernet, shown by Messrs. ALEXANDER DICKSON & SONS; H.T. White Maman Cochet, shown by Mr. GEORGE PRINCE; T. Melaine Soupert, shown by Messrs. SAMUEL MCGREY & SON.

Amateurs.—H.P. Beauty of Waltham, shown by Mr. JOSEPH DODWELL; H.T. Mrs. T. Roosevelt, shown by Mr. CHARLES COOKE; T. Maman Cochet, shown by Dr. F. H. COOKE.

MISCELLANEOUS EXHIBITS.

Several collections of cut flowers were displayed in the entrance corridor, and a few sundriesmen found places for their wares.

Messrs. STUART LOW & CO., nurserymen, Bush Hill Park, exhibited an astonishingly large collection of Souvenir de la Malmaison and perpetual-flowering Carnations, a host of beautiful varieties of Roses, and, under a great cloche, a dish each of the Lowberry and a hybrid Rubus named Phenomenal. Both of these fruits have been praised by those who have partaken of them.

Messrs. R. H. BATH, LTD., Wisbech, showed an immense collection of Delphiniums in great variety.

Mr. HOWARD H. CRANE, of Highgate, N., had a beautiful display of Violas and Pansies.

Messrs. DOBIE & CO., Edinburgh, were exhibitors of Sweet Peas, which have seldom been so lavishly brought before the public.

The Misses HOPKINS, Shepperton-on-Thames, showed an Alpine garden furnished with appropriate plants.

NATIONAL SWEET PEA.

JULY 12, 13.—The tenth exhibition of this Society was held at the Royal Horticultural Hall, Vincent Square, and, despite the unpropitious season, the flowers were finer than ever. The show itself was not quite so large, the exhibits being fewer in the smaller classes. It is pleasing to note a record attendance; the Hall was quite crowded in the afternoon of the first day.

The gallery was beautifully decorated with large Palms and Sweet Peas by Messrs. C. H. CURTIS and H. D. TIGWELL. It was well done, and was greatly admired by the visitors.

The "Sutton" Cup class for 18 bunches, distinct, the trade excluded, resulted in a fine competition, though it must be said that the disqualification of Sir Randolph Baker, Bart., M.P., Ransome House, Blandford (gr. Mr. A. E. Usher), for a single spray above the number was a regrettable incident which robbed him of a well-earned honour. His exhibit was in every way superb. The 1st prize was awarded Mr. J. HAYCOCKS, Wrexham, who staged some very fine flowers. The varieties employed were Menie Christie, Clara Curtis, Mrs. A. Ireland, Countess Spencer, Helen Lewis, Marquis, Elsie Herbert, Frank Dolby, Mrs. Harcastle Sykes, The King, Mrs. H. Bell, Etta Dyke, Evelyn Hemus, Aurora Spencer, Helen Pierce, John Ingram, Nora Unwin, and Constance Oliver. The Right Hon. Sir G. O. TREVELYAN, Bart., Wallington Hall, Cambridgeshire (gr. Mr. E. Keith), was 2nd, having capital examples of Helen Lewis, Mrs. A. Ireland, Elsie Herbert, Countess Spencer, Constance Oliver, Helen Pierce, and Clara Curtis. The 3rd prize was awarded to Lady F. HESKETH, Towcester (gr. Mr. G. T. Hallet), for a pretty display, while Mrs. A. TIGWELL, Harrow View, Greenford, was awarded the 4th prize.

For 2½ bunches, distinct, Mrs. A. TIGWELL was awarded the 1st prize for a collection which included the following varieties:—George Herbert, Miriam Beaver, Mrs. Townsend, Evelyn Hemus, Helen Pierce, King Edward (Spencer), Masterpiece, W. T. Hutchins, Dazzler, Prince Olaf, Tennant (Spencer), Senator, Mrs. H. Sykes, Mrs. Tigwell, Elsie Herbert, Flora Norton (Spencer), Marjorie Linzee, Mrs. H. DICKENS, Doris Burt, Arthur Unwin, and Zero. The 2nd prize was won by Mrs. A. J. NORRIS, Longshaw, Chipstead (gr. Mr. S. Horscroft), who had some beautiful vases of Captain of the Blues, Paradise Ivory, Apple Blossom (Spencer), Clara Curtis, and Mrs. Harcastle Sykes.

The *Erkford Memorial Class for 12 bunches, distinct*, excited the keenest competition, and the flowers were good throughout. Mr. A. E. USHER, however, won handsomely. The varieties were Mrs. C. W. Breadmore, Clara Curtis, The King, Elsie Herbert, Helen Lewis, George Herbert, Mrs. H. DICKSON, Marjorie Linzee, Miss A. Crier, and John Jugman. E. G. MOCATTA, Esq., Woburn Place, Addlestone (gr. Mr. T. Stevenson), showed splendidly for the 2nd prize, his best varieties being Prince of Asturias, Constance Oliver, Elsie Herbert, Princess Juliana, and Earl Spencer. Mr. T. JONES, Bryn Penylan, Ruabon, was awarded the 3rd prize for flowers that appeared to be rather overdone, while F. A. WELLSLEY, Esq., Westfield, Woking (gr. Mr. W. Hopkins), secured the 4th prize with splendid flowers, that lacked length of stem.

In the class for 12 bunches, distinct, Mrs. A. TIGWELL secured the 1st prize with a good, level display. The best were Etta Dyke, Lord Nelson, The King, John Ingman, Clara Curtis, and Prince Olaf. Mr. G. F. HALLET was 2nd, with good vases of Mrs. Chas. Foster, Etta Dyke, Clara Curtis, and Lord Nelson.

The "Breadmore" Challenge Class was for 12 bunches, distinct. This class was a very popular one. Mr. W. H. PROPHET, Par Station, Cornwall, won with the varieties Dazzler (splendid), Prince of Asturias, Mrs. Breadmore, Paradise, Red Flake, George Herbert, James Grieve, Prince Olaf, Mrs. Ireland, Etta Dyke, Henry Eckford, Mrs. H. Bell, and F. Unwin. Dr. J. E. PHILLIPS, Malpas, was 2nd, and Mr. E. COWDY, Greenhall, Longhall, Co. Armagh, 3rd.

For six bunches, distinct, Mr. E. KEITH captured 1st honours, having a very even exhibit, which included excellent flowers of Tom Bolton, Princess Juliana, and America Spencer. Mr. F. G. HARRISON, Rosedene, Ulverston, was a close 2nd, for he had fine vases of Elsie Herbert, Mrs. H. Sykes, and Asta Ohm. A. W. STIRLING, Esq., Holme Lee, Goring (gr. Mr. A. Moring), was 3rd, while E. OTTER, Esq., Stankope Park, Greenford (gr. Mr. F. Fairbairn), was awarded the 4th prize.

The "Humphrey" Cup class for three bunches of comparatively new varieties found Mr. A. E. USHER again to the fore with very fine examples of Lavender George Herbert, American Spencer and a glorious bunch of Earl Spencer. Mr. T. STEVENSON occupied the 2nd place, and he had grand flowers of Silas Cole. Mr. W. H. PROPHET was 3rd.

The "classification" class, open to all, was for 18 bunches, distinct.—Mr. A. E. USHER continued his success by winning the 1st prize for this class, staging Mrs. C. W. Breadmore, Constance Oliver, Marquis, Aurora (Spencer), Helen Lewis, Helen Pierce, Mrs. H. Sykes, Rosie Adams, Clara Curtis, Marie Christie, Frank Dolby, Hannah Dale, Mrs. A. Ireland, The King, Countess Spencer, Etta Dyke, Prince Olaf, and John Ingman, a really fine exhibit. Mr. C. W. BREADMORE, Winchester, was 2nd with good, even flowers, his best varieties being Clara Curtis, Mrs. H. Sykes, The King, and Marquis. 3rd, Mr. JAS. BOX, Lindfield.

Sixteen bunches.—There were but two entrants in this class. Mr. A. E. USHER won the 1st prize; and Mrs. A. TIGWELL the 2nd prize.

The class for 24 bunches was very strong, and here Mr. C. W. BREADMORE carried off 1st honours with a splendid collection. His best varieties were Dusky Monarch, Constance Oliver, Lavender George Herbert, Ivy Herbert, Countess Spencer, Dazzler, Sybil Eckford (really fine), Princess Juliana, Senator Spencer, Marjorie Willis, Mrs. H. Bell, and Prince Olaf. Mr. A. E. USHER was 2nd.

Twelve bunches.—Messrs. E. W. KING & Co., Coggeshall, won the 1st prize in this class with beautifully fresh flowers, though hardly developed. The most striking were Constance Oliver, Mrs. W. King, Anglian Orange, Anglian Pink, Rosabelle, and Evelyn Hemus. Mr. W. HOPKINS was 2nd, showing much larger flowers, but they were rather weather-stained; while Mr. S. MILLER, Newport, Isle of Wight, was 3rd.

NEW VARIETIES.

The single bunches of new varieties formed an attractive competition. Mr. C. W. BREADMORE won the 1st prize with Iris, a beautiful shade of salmon. The varieties Earl Spencer and Dazzler won the 2nd and 3rd prizes respectively.

FLOWERS WITH WAVED STANDARDS.

The following classes (trade excluded) were for varieties with waved standards:—

For 12 bunches.—Mr. THOS. STEVENSON was to the fore with some splendid flowers. They were Clara Curtis, Mrs. Chas. Foster, Dazzler, Black Knight (Spencer), John Ingram, Mrs. Hugh Dickson, America Spencer, Rosie Adams, Helen Lewis, Evelyn Hemus, Etta Dyke, and Sunproof Crimson. E. J. JOHNSON, Esq., Burrs Wood, Groombridge (gr. Mr. A. J. Paskett), had good, clean flowers for the 2nd prize; while the 3rd prize was won by Sir CHAS. HADDEN, K.C.B., Rossway, Berkhamsted (gr. Mr. O. Hayles).

In a class for six bunches, H. LE BLANC SMITH, Esq., The Lordship, Standon (gr. Mr. Maclean), won the 1st prize with a very neat exhibit of good colour. His varieties were Elsie Herbert,

Constance Oliver, Princess Juliana, and Mrs. C. W. Breadmore. Mr. F. G. HARRISON was 2nd, and Mr. A. MORING 3rd.

The class for four bunches was not a popular one, Mr. A. E. USHER leading off with fine examples of Colleen, Queenie, and Winsome.

For three bunches, distinct, Mr. W. H. PROPHET was 1st with George Herbert, Paradise Ivory and Lavender George Herbert, Messrs. J. HAYCOCKS and A. L. THOMAS, Kenley, winning the other prizes respectively.

For three bunches of waved, pink varieties, the exhibitors staged three kinds, which was not required. However, they were judged on their merits, Mr. W. H. PROPHET winning with fine vases of Audrey Crier, Mrs. H. Sykes, and O. Bolton. Dr. J. E. PHILLIPS, Malpas, followed with Olive Ruffell, Syeira Lee and Countess of Northbrook. Mr. F. G. HARRISON was 3rd.

The cream-pink varieties were represented by Mrs. H. Bell and Constance Oliver. The 1st prize was won by Mr. W. H. PROPHET. The other variety in the class was Syeira Lee.

SPECIAL PRIZES.

The "E. W. King" Challenge Cup, for 12 varieties, was won handsomely by Mr. W. H. PROPHET with Elsie Herbert, Mrs. Chas. Foster, Menie Christie, Mrs. C. W. Breadmore, St. George, Phenomenal, Mrs. A. Ireland, and George Herbert. The Rev. O. TURNER, Woburn Park, Weybridge (gr. Mr. A. Basile), was 2nd, and Dr. J. E. PHILLIPS 3rd.

Mr. ROBERT BOLTON, Carnforth, won the "W. Atlee Burpee" Challenge Trophy for a display of Sweet Peas; this being Mr. BOLTON's third win, the trophy becomes his property. His table was nicely arranged and formed a centre of attraction. The new variety Charles Foster was very prominent, as were also vases of R. F. Felton, Earl Spencer, Clara Curtis, Etta Dyke, Montor, Elsie Herbert, and O. Ruffell. Mr. JAS. BOX, Lindfield, was 2nd, with a somewhat similar exhibit, while Messrs. J. KELWAY & SON, Langport, were 3rd.

For 12 varieties of scheduled names, Mr. A. E. USHER once again proved the victor, having delightful examples of Asta Ohm, F. Morse (Spencer), Flora Norton (Spencer), Othello (Spencer), Tennant (Spencer), and Queen Victoria (Spencer). Mr. T. JONES was 2nd for fine vases of Flora Norton (Spencer), Mrs. Routzahn and Marie Corelli, while Mr. ROBERT WRIGHT, Balsall Lane, Formby, was 3rd.

In a class for six varieties, Mr. A. E. USHER won 1st prize with splendid examples of King Edward (Spencer), Etta Dyke, George Herbert, Othello (Spencer), Countess Spencer, and Clara Curtis. Messrs. T. JONES and F. G. HARRISON were the other winners in the order named.

For four varieties of American varieties, Mr. A. E. USHER was 1st with Miriam Beaver, Marie Corelli, W. T. Hutchins, and Senator (Spencer).

In the class reserved for market growers, there were many exhibits. The 1st prize was won by Mr. G. REID, Downfield, Dundee, who had a good exhibit; Dr. J. E. PHILLIPS was 2nd.

The "Horace Wright" Challenge Cup class secured a large entry. Mr. F. GREEN, Morris Road, Southampton, won with good, fresh bunches of Helen Lewis, George Herbert, Clara Curtis, Evelyn Hemus, John Ingman, and Asta Ohm. Mrs. HOWARD YOUNG, Filton Avenue, Horfield, Southampton, was 2nd, and Mr. L. C. B. HOCKIN, High House, Sutton Green, 3rd.

The "Walter Voss" Challenge Cup for six bunches to represent the different class colours was secured by Mr. E. D. MARSHALL, Early Rise, Reading, with good typical vases of Mrs. H. Sykes, Etta Dyke, and Elsie Herbert.

DECORATIVE CLASSES.

These classes were well filled, the best dinner table decoration was arranged by Mrs. W. MASLIN, Ongar Hall Cottages, Addlestone, who used pink and cream-coloured flowers. Mrs. A. ROBINSON, Park Hill, Carshalton, followed, using similar colours. Mrs. DE BURIATTE, Wraybury, was 3rd. The exhibits were very numerous, and occupied all the centre of the hall.

Mrs. MASLIN was again successful with an epergne, a fine light design; Mrs. VOKES, Horsall, Woking, was 2nd; and Miss M. JONES, Wem, 3rd. The vases were equally good, as were also the button-holes and sprays.

TRADE GROUPS.

The miscellaneous groups of Sweet Peas were all backed to the wall. Arches were freely used, as were also trails of Smilax. The following were the exhibitors:—Messrs. JARMAN & Co., Chard; JONES & SONS, LTD., Shrewsbury; J. KELWAY & SON, Langport; E. W. KING & Co., Coggeshall; SUTTON & SONS, Reading; C. W. BREADMORE, Winchester; Messrs. H. J. JONES' NURSERY, LTD., Lewisham; Miss HEMUS, Upton-on-Severn; R. BOLTON, Carnforth; DOBBIE & Co., Edinburgh; ATLEE BURPEE & Co., Philadelphia; G. STARK & SON; J. BOX, Lindfield; W. DEAL, Kelvedon; BIDE & SONS, Farnham; W. CANTLEY, Bury St. Edmunds; G. & A. CLARK, LTD., Dover; G. STEVENSON, Wimborne; J. AGATE, Havant; W. J. UNWIN, Histon; R. SYDENHAM, LTD., Birmingham; J. R. KING & SONS, Coggeshall; and Mr. W. E. ALSEN.

The Silver Medal was awarded Mr. J. AGATE for Stirling Stent, while Awards of Merit were Arthur Green, from Messrs. DOBBIE & Co.; to Mrs. Hugh Dickson, from the same firm; to Masterpiece, also from Messrs. DOBBIE & Co.; and Chery Ripe, from Messrs. GILBERT & SON.

MEDALS.

Gold.—Messrs. E. W. KING & Co., SUTTON & SONS, C. W. BREADMORE, R. BOLTON, and DOBBIE & Co.

Silver-gilt.—Messrs. W. E. ALSEN, W. J. UNWIN, JONES & SONS, JAS. BOX, and Messrs. C. H. CURTIS and H. D. TIGWELL.

Silver.—Messrs. JARMAN & Co., G. STEVENSON, J. R. KING & SONS, R. SYDENHAM, LTD., J. KELWAY & SONS, Miss E. HEMUS, G. STARK & SON, W. DEAL, S. BIDE & SONS, W. CANTLEY, and G. & A. CLARK, LTD.

HANLEY HORTICULTURAL FETE.

JULY 6, 7.—The weather on the opening day of the fourteenth annual show, held in the Hanley Park, Staffordshire, was unpropitious in the extreme. It commenced to rain on the evening of the 5th, and continued throughout the greater part of the first day of the show; this fact was responsible for the very meagre attendance of visitors. The number of exhibitors and entries exceeded those of last year, and six big tents were required to accommodate the exhibits.

The park in which the show is held is adjacent to the Stoke railway station, and is well served by trains and trams from Tunstall, Burslem, Longton, Stoke, Fenton, Newcastle, and other towns in the Potteries. The schedule was divided into four sections, and comprised 89 classes. Prizes amounting to upwards of £650 were offered, in addition to silver cups, gold and silver medals. A silver challenge cup, value £10 10s., offered for the best trade exhibit, was well won by Messrs. WEBB & SONS, Stourbridge, who now retain the cup, having won it upon two previous occasions.

GROUPS OF PLANTS.

The leading group class was for collections of plants in or out of flower, arranged on spaces of 500 square feet down the centre of the big tent. The prizes, amounting to £76, and special prizes of the value of six guineas and three guineas, were added to the 1st and 2nd prizes by Messrs. Brown-Westhead, Moore & Co. and Messrs. Taylor, Tunnilliff & Co., respectively. There were five entries, and, after a close contest, Messrs. JAS. CYPHER & SONS, Cheltenham, won 1st prize, and Mr. W. A. HOLMES, Chesterfield, 2nd prize. The centre of Messrs. CYPHER's group consisted of a big mound crowned by a handsome Kentia, round which Codieums, Alocasias, Dracenas, Liliums, Clerodendron fallax, and Kalanchoe flammula were skilfully arranged. Smaller mounds at the corners and sides were clothed with small Palms, and a pleasing variety of foliage and flowering plants, including Cattleyas, Fuchsia triphylla, and Kalanchoe flammula. The undulated groundwork of the group was composed of Dracenas, Begonia Rex, Caladium argyrites, Ferns, Nertera depressa, Fuchsia triphylla, Verbenas, choice Orchids, Lantanas, and broken up here and there with tall specimens of Humea elegans. The 2nd prize group was arranged on similar lines to that of Messrs. CYPHER's, but the effect was marred by the too free use of dwarf blue Lobelia plants. 3rd, Mr. W. VAUSE, Leamington; 4th, Mr. W. R. MANNING, Dudley.

The next important class was one for a group of Orchids, and in this Messrs. JAS. CYPHER & SONS were the only competitors. A hundred square feet of flat tabling was allotted at the end of the principal plant group tent; the collection of plants set up by the Cheltenham firm produced a grand effect, and was much admired. They showed well-flowered examples of *Cattleya Mossiae* and *C. Mendelii*, *Laelio-Cattleya Canhamiana magnifica*, and *L.-C. Aphrodite*; *Odontoglossum Pescatorei*, with large, handsome flowers, possessing a finely-spotted lip. Also *Epidendrum prismatocarpum*, carrying nine spikes of flowers, *Cypripedium Harrisonianum superbum* (very good), and a specimen of *Stanhopea tigrina* bearing a pair of unusually large flowers.

In a class reserved for eight Orchids, Messrs. JAS. CYPHER & SONS easily beat Mr. W. VAUSE, whose plants were poor and much below exhibition standard. Included in the 1st prize set were very good specimens of *Odontoglossum percutum*, *Laelio-Cattleya Canhamiana*, *Vanda cœrulea*, and *Epidendrum prismatocarpum*, the latter carrying 18 spikes, with an average of 29 large flowers on each spike.

The Right Hon. the Earl of SHREWSBURY, Ingestre, Stafford (gr. Mr. E. Gilman), was the only exhibitor in a class provided for Carnations, to occupy an area of 100 square feet. A good selection of Malmaison and Tree varieties were well shown, the flowers being large, well-formed, and of clear colours.

The best half-dozen specimen plants in flower (Orchids excluded) came from Messrs. JAS. CYPHER & SONS, whose plants of *Clerodendron Balfourii*, *Statice Gilbertii*, *Allamanda nobilis*, and *Ixora Pilgrimii* were very good. Mr. W. VAUSE, who gained the 2nd prize, had splendid examples of *Statice profusa* and *Erica Cavendishiana*; 3rd, Mr. W. R. MANNING, Dudley.

In a class for six plants in flower and six foliage plants, Messrs. JAS. CYPHER & SONS again beat Mr. W. VAUSE. The 1st prize collection contained beautifully-flowered specimens of *Clerodendron Balfourii*, *Ixora Shawii*, and *Bougainvillea Cypheri*, but the *Codiaeums* were inferior to those exhibited by Mr. W. VAUSE. Messrs. JAS. CYPHER & SONS also won 1st prizes for (1) six fine foliage plants, and (2) six Palms, Mr. W. VAUSE being 2nd in each class.

Only one exhibitor came forward in a class reserved for a dozen *Caladiums*. The 1st prize was awarded to T. TAMS, Esq., The Hayes, Stone (gr. Mr. A. H. Ruff), whose plants were large but indifferently coloured.

Mrs. MEAKIN, Darlaston Hall, Stone (gr. Mr. G. F. Goodhill), was awarded 1st prize for a dozen beautiful table plants; 2nd, B. HOWSON, Esq., Market Drayton (gr. Mr. A. Townsend).

In the amateur classes, T. TAMS, Esq., Stone (gr. Mr. A. H. Ruff), won the 1st prize for a group of foliage and flowering plants arranged for effect on a space not exceeding 200 square feet. The group was very bright, and the colour scheme was well carried out. Well-coloured *Codiaeums*, *Caladiums*, *Dracenas*, *Colens*, *Palms*, and graceful *Bamboos* were the principal foliage plants employed. The flowering plants included *Gloxinias*, *Clerodendron fallax* (very good), *Verbenas*, *Liliums*, *Carnations*, and *Humex elegans*; 2nd, Mrs. SWANN, Halston Hall, Oswestry (gr. Mr. C. Roberts). The foliage plants in this group were not nearly so well-coloured as were those in the 1st prize collection. The general arrangement, however, was good, but inclined to be heavy.

In a class for six specimen stove or greenhouse plants the last-named exhibitor beat three contestants. Excellent plants of *Bougainvillea Sanderiana*, *Allamanda nobilis* and *Gloriosa superba* were included in this exhibit; 2nd, Mrs. MEAKIN, Darlaston Hall, Stone (gr. Mr. G. F. Goodhill).

Mr. W. H. WHITE, Newcastle, had the best six Exotic Ferns, distinct, and Mrs. MEAKIN (gr. Mr. G. F. Goodhill) showed 12 well-coloured plants suitable for table decoration.

ROSES (OPEN).

Forty-nine entries were made in the 11 classes reserved for Roses, for which upwards of £100 were offered in prizes.

In the premier class, which was for 72 blooms, distinct, there were five exhibits. The 1st prize of £10 was awarded to Messrs. R. HARKNESS & Co., Hitchin, Herts., whose flowers were of good form, substance and colour. Varieties of outstanding merit included *La France '89*, *General Jacqueminot*, *William Shean*, *Prince Arthur*,

Ulrich Brunner, *Lyon Rose*, Mrs. Edward Mawley, *Captain Hayward*, *Dupuy Jamain*, Mrs. Cocker, *Mildred Grant*, *Marie Baumann*, *Gustave Piganeau*, *Sir R. Hill*, Mrs. F. W. Sandford, *Hugh Dickson*, and *Alfred Colomb*; 2nd, KING'S ACRE NURSERY Co., LTD., Hereford, who had exquisite flowers of *Mildred Grant*, Mrs. W. J. Grant, *Lyon Rose*, Mrs. Sharman Crawford, *Heinrich Schultheis*, *Earl of Warwick*, *John Ruskin*, and *Killarney*; 3rd, Mr. W. H. FRETTINGHAM, Beeston, Nottingham.

Messrs. HARKNESS & Co. also gained 1st prize in a class for 48 blooms. A few of their flowers were disfigured and past their best, but those mentioned below were of first-rate quality:—*Capt. Hayward*, *Dr. Audry*, Mrs. W. J. Grant, *Horace Vernet*, *Mme. Eugene Verdier*, *Ulrich Brunner*, Mrs. Theodore Roosevelt, *Alfred Colomb*, and *Dean Hole*. 2nd, THE KING'S ACRE NURSERY Co., with shapely flowers of *Gustave Piganeau*, *George C. Waud*, *Elizabeth Barnes*, *Ben Cant*, *Rhea Reid*, *Duke of Albany*,

Mme. Melanie Soupert, *William Shean*, *Bessie Brown*, *Lady Ursula*, *J. B. Clark*, *Joseph Hill*, *John Cuff*, *Dr. O'Donel Browne*, *Rhea Reid*, *Earl of Warwick*, and *Mildred Grant*. 2nd, Messrs. R. HARKNESS & Co., whose best flowers were *J. B. Clark*, *Lyon Rose*, *Mme. M. Soupert*, and *Mrs. Theodore Roosevelt*. 3rd, Mr. W. T. MATTOCK, Headington, Oxford.

The last-named exhibitor had the best 24 Tea or Noisette Roses. His blooms of Mrs. Edward Mawley, *Maman Cochet*, *Bridesmaid*, and *Catherine Mermet* were very meritorious. 2nd, Mr. W. H. FRETTINGHAM, who had a particularly good bloom of *Molly Sharman Crawford*.

The best dozen white Roses (one variety) was *Frau Karl Druschki*, exhibited by Messrs. R. HARKNESS & Co. Blooms of the same variety gained 2nd and 3rd prizes for THE KING'S ACRE NURSERY Co., LTD., and Messrs. PERKINS & SONS respectively.

The last-named firm had the best 12 blooms of any yellow variety in *Mme. Melanie Soupert*.

FIG. 20.—HYBRID TEA ROSE "MRS. DAVID JARDINE": COLOUR OF FLOWER, PINK.

Prince Camille de Rohan, *Florence Pemberton*, and *Ulrich Brunner*. 3rd, Mr. W. H. FRETTINGHAM.

The 1st, 2nd, and 3rd prizes in the next class, which was for 36 varieties, three blooms, were won by the last-named exhibitors in the order named.

The best dozen Roses introduced during the years 1905, 1909, and 1910 came from Mr. W. H. FRETTINGHAM. The varieties were as follows:—*Grace Molyneux*, *Miss Cynthia Ford*, *Rhea Reid*, *Molly Sharman Crawford*, *Mrs. David Jardine* (see fig. 20), *John Cuff*, Mrs. P. H. Coats, *George C. Waud*, *Mr. W. Smith*, *Dr. O'Donel Browne*, *Florence Coulthwaite*, and *Lady Ursula*.

Of the six competitors in a class provided for 24 hybrid Teas, distinct, Messrs. PERKINS & SONS, Coventry, were awarded 1st prize for handsome blooms, among which the undermentioned varieties were prominent:—*Mrs. David McKee*, *Marquise Litta*, *Lyon Rose*, *Liberty*, *Dean Hole*,

2nd, Mr. W. T. MATTOCK; 3rd, Mr. W. H. FRETTINGHAM.

Mrs. John Laing, exhibited by Mr. W. H. FRETTINGHAM, was the best pink-flowered Rose. Flowers of the same variety gained 2nd prize for Messrs. R. HARKNESS & Co., who took the lead in the class for 12 red or crimson Roses. They had splendid blooms of *Ulrich Brunner*. 2nd, Mr. FRETTINGHAM, also with *Ulrich Brunner*.

There were five exhibits in a class provided for dinner-tables, each 8 feet by 4 feet, decorated with Roses and foliage only. Plants in pots were allowed. The 1st prize was awarded to Mr. W. T. MATTOCK, Headington, Oxford, for a very pretty table. The centre stand contained blooms of *Irish Elegance*, and pale pink single flowers were used in smaller receptacles. Long sprays of dark-coloured Rose foliage completed a charming combination of colours. 2nd, Messrs. J. TOWNSEND & SONS, Worcester; 3rd, Mr. CHARLES HOLDER, Erdington.

SWEET PEAS.

Although Sweet Peas were not extensively shown, the quality of the flowers was of a very high order of merit. Of the six contestants in a class for 12 varieties of Sweet Peas, Mr. W. CHIPMAN, Erdington, won 1st prize. 2nd, Mr. STEPHEN SIMS, Borrowash. 3rd, Mr. W. MARPLE, Penkridge.

In Mr. H. Eckford's class for 12 varieties, there were three exhibits, and the 1st prize was well won by Mr. ROBERT MADELEY, Market Drayton, whose collection of strong-stemmed, big-petalled flowers included the following varieties:—Constance Oliver, Evelyn Hemus, Etta Dyke, John Ingman, Queen of Norway, Mrs. Henry Bell, and Frank Dolby. 2nd, Mr. J. BOWLER, Market Drayton.

Messrs. Baker's prizes were offered for six varieties: 1st, Mr. ROBERT MADELEY; 2nd, Mr. J. BOWLER. Both exhibitors showed beautifully fresh flowers of the best quality.

Messrs. Webb & Sons offered prizes for six varieties. The 1st prize was awarded to Mr. J. BOWLER, who showed superb flowers of Eucharantess, John Ingman, and Evelyn Hemus.

MISCELLANEOUS CUT FLOWERS.

In a class for hardy perennials (shrubs excluded), occupying table space of 16 feet by 4 feet, four good exhibits were set up. The 1st prize of £10 was won by Messrs. HARKNESS & SONS, Bedale, who showed a handsome collection, in which English and Spanish Frises, Gailardias, Campanulas, Iceland Poppies, Gladiolus, Inula glandulosa, and Delphiniums were noteworthy. 2nd, Messrs. J. GIBSON & Co., Bedale, with a good selection, but not very well arranged. 3rd, Messrs. W. ARTINDALE & SON, Sheffield.

There were 10 tables, each 8 feet by 4 feet, decorated with flowers (Roses excluded). The 1st prize table consisted of lovely pale pink Carnations, on long stems, also Gypsophila and Lilies of the Valley, relieved with Codium leaves, Smilax, and Selaginella sprays; shown by Mr. ALEC J. BLAIR, Bashford, Stoke-on-Trent. The 2nd award went to Mr. STEPHEN SIMS, Borrowash, who used pink and lavender-coloured Sweet Peas. 3rd, Mr. T. W. MATTOCK, Oxford.

The best display of floral designs came from Messrs. M. JENKINSON & SON, Newcastle, Staffs., whose collection was very comprehensive and exceedingly well executed. 2nd, Messrs. LEWIS & SPROSON, Shelton, Hanley; 3rd, Mr. A. CARR, Cheadle.

FRUIT.

The premier class was one for a collection of fruit, not exceeding 14 dishes, to be shown on separate tables measuring 10 feet by 4 feet 6 inches, decorated with flowers and foliage. Plants in pots were allowed, but Orchids, silver, electro-plate, and glasses were excluded. Four exhibits were placed before the judges, who awarded 1st prize to the Earl of HARRINGTON, Elvaston Castle, Derby (gr. Mr. J. H. Goodacre, V.M.H.), for a beautifully-decorated table. The dishes exhibited were as follow:—Belgarde and Dymond Peaches, Spencer Nectarine, Golden-gage Plum, Appley Towers, Muscat of Alexandria, Foster's Seedling and Black Hamburg Grapes, Lady Sudeley Apples, Dr. Jules Guyot Peas, and two Melons. The decorations consisted of Schizanthus, Heucheras, and Francoas, relieved with grasses and sprays of Selaginella. J. DRAKE, Esq., Orford House, Market Rasen (gr. Mr. W. Parker), gained 2nd prize. 3rd, Lady BEAUMONT, Carlton Towers, Yorks. (gr. Mr. W. Nicholls).

Collection of 12 dishes.—This collection was to include not fewer than eight kinds, and not more than two varieties of a kind; black and white Grapes to be represented; to occupy a space of 6 feet by 4 feet. Each collection to be decorated with flowers and foliage. The 1st prize was again awarded to the Earl of HARRINGTON, Elvaston Castle (gr. Mr. J. H. Goodacre), who showed Peaches, Nectarines, Strawberries, Plums, Muscat of Alexandria and Black Hamburg Grapes, one Pine, and one Melon, all in first-rate condition. The flowers used for decoration consisted of Ivy-leaved Pelargoniums, Francoas, and Gypsophila, and were displayed in six vases. 2nd, J. DRAKE Esq.

Collection of 6 dishes., to include two bunches of black or white Grapes.—Of the two exhibits in this class, the one from Lord BAGOT, Blith-

field Hall, Rugeley (gr. Mr. T. Bannerman), was the better. It consisted of good Peaches, Nectarines, Figs, Grapes, Strawberries, and one Melon. 2nd, Mr. N. BUXTON, Gedling, Notts.

The Earl of HARRINGTON showed the best four bunches of Grapes—two black and two white, in well-finished samples of Muscat of Alexandria and Black Hambro'. 2nd, J. DRAKE, Esq., Market Rasen (gr. Mr. W. Parker).

The last-named exhibitor won 1st prize in a class for two bunches of Black Hambro' Grapes; 2nd, Lady BEAUMONT, Carlton Towers, Yorks. (gr. Mr. W. Nicholls).

Lady BEAUMONT led in the next class for two bunches of Black Grapes (Hambro's excluded). The variety exhibited was Madresfield Court. 2nd, J. DRAKE, Esq., Market Rasen (gr. Mr. W. Parker).

The Earl of HARRINGTON won 1st prize in classes for (1) two bunches of White Muscat Grapes; (2) two dishes of Nectarines; (3) one green-fleshed Melon; and (4) one dish of Cherries.

J. DRAKE, Esq. (gr. Mr. W. Parker) was awarded 1st prizes for (1) two bunches of white Grapes (Muscats excluded); (2) one scarlet fleshed Melon; and (3) 12 Tomatoes.

Lord BAGOT (gr. Mr. T. Bannerman) led in a class for six Nectarines, and in another for a white-fleshed Melon. He also had the winning dish of eight Figs.

Mr. N. BUXTON, Gedling, beat five contestants in a class for two dishes of Peaches, distinct varieties.

VEGETABLES.

For Messrs. Sutton & Sons' prizes for six distinct kinds of vegetables only two exhibits were staged. The 1st prize was awarded to Lady BEAUMONT (gr. Mr. W. Nicholls), who showed excellent Cauliflowers, Peas and Tomatos; 2nd, T. TAMS, Esq. (gr. Mr. A. H. Ruff), whose produce was poor, especially Cauliflowers, and indifferently set up.

Messrs. Webb & Sons' prizes.—The 1st prize was won by Lady BEAUMONT (gr. Mr. W. Nicholls), who showed a very good collection, consisting of Early Mammoth Cauliflower, Stourbridge Glory Potato, Stourbridge Marrow Pea, New Standard Carrot, Monster White Tripoli Onion, and a dish of unnamed Tomatos; 2nd, Mr. A. H. HICKMAN, Cookley; 3rd, Mr. N. BUXTON, Gedling.

In a class for a collection of nine distinct kinds of vegetables, Lady BEAUMONT was again to the fore with a handsome lot; 2nd, Mr. N. BUXTON, Gedling, Notts.

NON-COMPETITIVE EXHIBITS.

MESSRS. JARMAN & CO., Chard, Somerset, showed Roses, Sweet Peas, Zonal Pelargoniums, Carnations and Centaureas (Silver Medal); Mr. HENRY ECKFORD, Wem, a large collection of Sweet Peas (Small Gold Medal); Messrs. CLIBRAN & SONS, Altrincham, a group of foliage and flowering shrubs (Silver Medal); Mr. H. N. ELLISON, West Bromwich, a collection of small Ferns (Silver Medal); Messrs. WEBB & SONS, Stourbridge, an exhibit of choice flowers, fruit and vegetables (Large Gold Medal and Silver Cup); Mr. W. L. PATTISON, Shrewsbury, a collection of Violas (Silver Medal); and Messrs. DICKSON'S, Chester, an assortment of hardy herbaceous flowers and Roses (Small Gold Medal).

CERTIFICATE OF MERIT.

Sweet Pea "Federation."—This is a large, bright, rose-coloured variety of good substance. (Shown by Mr. W. MARPLE, Penkridge.)

WOLVERHAMPTON FLORA FETE.

JULY 12, 13, 14.—Although the number of entries were not quite so numerous as last year, when special efforts were made to celebrate the attainment by the society of its majority, this year's show ranks amongst the best held in the beautiful West Park. The weather was glorious, and the attendance on the opening day was very large. Although it was hot and close in the tents, the gangways were so spacious that visitors were not inconvenienced by crowding. The groups of plants, rock-garden exhibits, and Roses were the principal features of the exhibition.

GROUPS OF PLANTS.

The groups were arranged in an exceptionally large marquee, there being ample room for their

proper display, and the canvas was not heavy, so that the brightly-coloured foliage and flowers showed up well.

The principal class was for a group of plants in or out of bloom, occupying a space of 30 feet by 12 feet. There were four exhibits that ran the whole length of the centre of the tent, presenting a front of unusual beauty of flower and leaf. It was no "run-away" competition, for although Messrs. J. CYPHER & SONS, Cheltenham, were rightly placed 1st, each of the displays merited warm approval. Messrs. CYPHER'S group had an undulating front, a bank of Orchids, set in variegated Vitis, Codiaeums, Asparagus plumosus, and surmounted by a Cocos Palm forming a centre-piece; on either side of this, there were arches decorated with Pink Carnations, and suitable groups were displayed at the corners. The general body of the exhibit was comprised of Dracenas, Begonias, Codiaeums, Caladiums, Anthuriums, Clerodendron fallax, and Kalanchoe flammula, broken at points with banks of Lilies, a tall, graceful Humera or a plant of Papyrus, and with overhanging sprays of Oncidium. The front was bright with Nertera depressa in fruit, Caladium argyrites, Heliconia illustris, Ferns, and other handsome-leaved subjects. The 2nd prize was awarded to Sir GEORGE H. KENRICK, Birmingham (gr. Mr. J. Macdonald). Banks of finely-flowered White Phloxopsis set in a bronzy-leaved Selaginella were prominent in this group, which contained a wealth of finely-grown foliage plants, but the group needed a few more showy flowers to brighten it. The groundwork and front were remarkably effective; 3rd, Mr. W. A. HOLMES, Chesterfield; 4th, Mr. W. VAUSE, Leamington.

There was another class for a group of plants, but flowers were not permitted. The area was smaller (250 square feet), and the height was restricted to 8 feet. The best of three groups was put up by Messrs. CYPHER, who employed finely-coloured Codiaeums with good effect, and beneath them Caladiums, Ferns, Aralias, Alocasias, Coleuses, Palms, and many other plants of attractive foliage; 2nd, Mr. W. A. HOLMES, Chesterfield, who showed fine examples of the rose-tinted Ananas sativa (Pineapple) and some good Codiaeums, but the group was not so richly coloured as the 1st prize exhibit; 3rd, Mr. W. VAUSE, Leamington.

Three exhibitors showed in the class for a collection of decorative plants and bunches of cut flowers arranged on tabling. The displays were only medium, the 1st prize being awarded to Messrs. BASTOCK & SON, Moseley, Birmingham.

Considerable latitude was permitted in the class for a group of flowering plants of one kind only. Any subject was permissible, and the method of arrangement was left to the taste of the exhibitor. There were six exhibits, two of Begonias, two of Carnations, and one each of Hydrangea hortensis and Erica. The Begonias shown by Mr. F. DAVIS, Pershore, and Messrs. BLACKMORE & LANGDON, Bath, were awarded the 1st and 2nd prizes in the order named; the Ericas, shown by Messrs. JAS. CYPHER & SONS, being placed 3rd. The Begonias were shown grandly in both instances.

For a collection of Caladiums in not fewer than six distinct varieties, there were two entries, but neither was considered worthy of the 1st prize.

Colenses were shown by only one exhibitor, F. SIMPSON, Esq., Barton Grove, Wolverhampton (gr. Mr. W. B. Burchill), but they were good, and worthy of the 1st prize, which they received.

Begonias were not extra good in the class for 12 plants, open only to amateurs, the best of three displays being shown by B. H. MAUNDER, Esq., Trysull (gr. Mr. C. Weaver).

Some good Gloxinias were shown by F. SIMPSON, Esq., in the class for 12 plants in the amateurs' classes.

The best six vases of Carnations were shown by the Duke of NEWCASTLE, who had blooms of Princess of Wales, Duchess of Westminster, H. J. Jones, Prime Minister, Old Flush, and Maggie Hodgson. 2nd, Lady GREY, Stourbridge, with remarkably long-stalked flowers and extra vigorous foliage.

In the class for 20 plants in pots not exceeding 3 inches in diameter, there were three exhibits. The schedule stipulated that not fewer than eight of the specimens should be in flower. Mr. W. VAUSE was placed 1st with, principally, Ixora Duffii and varieties of Codium. 2nd,

Messrs. J. CYPIER & SONS, with greater variety, including *Allamanda Hendersonii* and *Acalypha Sanderiana*.

The best group of plants arranged for effect in the amateurs' classes was exhibited by Mr. H. WAKEMAN, Wolverhampton.

ROCK GARDEN EXHIBITS.

There were three of the large rock-garden exhibits which have become so popular at provincial shows. Each was allowed an area of 25 feet by 12 feet. Messrs. J. BACKHOUSE & SONS, LTD., York, were awarded the 1st prize for a realistic design, with rockery of large stones, a winding path leading by a pool of water that was planted with *Nymphaeas* and other Water Lilies. A stream trickling down one corner ran beneath a rustic bridge. The outlying parts were surmounted with tall-growing, graceful, shrubby species, the crannies of the rockery being planted with a great assortment of alpine and border flowers. 2nd, Mr. J. E. KNIGHT, Tottenhall Nurseries, Wolverhampton, with a well-arranged exhibit, including a pretty water pool, the stones being draped with Alpines in flower. 3rd, Messrs. W. ARTINDALE & SONS, Sheffield.

ROSES.

Roses were a strong feature of the show. The largest class was for 72 blooms of distinct varieties. This attracted five exhibitors. Mr. HUGH DICKSON, Belfast, led with a notable collection of fine, highly-coloured blooms, including grand flowers of *Lohengrin*, *Dean Hole*, *Hugh Dickson*, *Comtesse de Ludre*, *Leslie Holland* (grand), *Mildred Grant*, *Ulster*, *Konigin Carola* and *Marquise Jeanne de la Chataigneraye*; 2nd, KING'S ACRE NURSERY Co., Hereford. We noticed a remarkably fine bloom of *Mildred Grant* in this collection; 3rd, Messrs. R. HARKNESS & Co., Hitchin.

There were six exhibits in the class for 48 distinct varieties, the competition being close. Messrs. HARKNESS were placed 1st, having well-matched, brightly-coloured flowers of *J. B. Clark*, *Alice Lindall*, *Mme. Jos. Bonnaire*, *Prince Arthur*, *Lyon Rose*, *Ellen Drew*, *Duke of Edinburgh*, and others; 2nd, Mr. HUGH DICKSON, Belfast; 3rd, Messrs. J. TOWNSEND & SON, Worcester.

Some good blooms were seen in THE KING'S ACRE NURSERY Co.'s exhibit of 12 varieties shown in triplets, this firm beating four other exhibitors, Messrs. J. TOWNSEND & SON, Worcester, and Messrs. R. HARKNESS & Co., Hitchin, winning the 2nd and 3rd prizes in the order named. A selection of the best flowers in the premier stand includes *Mildred Grant*, *Duke of Teck*, *Alfred Colomb*, *Gustave Piganeau*, and *Mrs. John Laing*.

For 24 distinct varieties, shown as single blooms, there was a good competition amongst seven growers, the 1st prize being secured by Mr. W. T. MATTOCK, Headington, Oxford. Some of the outer petals in his flowers showed damage by rain. Mrs. Ed. Mawley, J. B. Clark, Mrs. J. Laing, Earl Dufferin, *La France* (89) (bright rose), and *White Maman Cochet* are a selection of Mr. MATTOCK's best varieties. 2nd, Messrs. PERKINS & SONS, Coventry; 3rd, KING'S ACRE NURSERY Co.

An interesting class was that for 12 blooms of new varieties sent into commerce since 1907. In this THE KING'S ACRE NURSERY Co. easily led, having *Lady Ursula*, *Joseph Lowe*, *Mrs. E. J. Holland*, *Walter Speed*, *Pie X.*, *Lyon Rose*, *His Majesty*, *Mrs. Harold Brocklebank*, *Col. R. S. Williamson*, *White Killarney*, *Rhea Reid* (remarkably fine), and *Margaret*; 2nd, Mr. HUGH DICKSON, the varieties *Mrs. Stewart Clark* and *Mark Twain* being especially good; 3rd, Messrs. FRANK CANT & Co.

The best 12 blooms of a dark Rose were of the variety *Hugh Dickson*, shown by the raiser, Messrs. FRANK CANT & Co. excelled in the class for 12 light Roses with the variety *Mrs. Theodore Roosevelt*; whilst Mr. W. T. MATTOCK showed the best Tea Roses in 12 varieties.

Although not more than three exhibitors contested in the class for a display of decorated Roses, this made a fine class, the quality of each collection being splendid. The 1st prize was awarded to Mr. JOHN MATTOCK, who showed superb bunches of *Edu Meyer*, *Papillon*, *Lady Roberts*, *Mme. Abel Chatenay*, *Blush Rambler*, *Countess of Gosford*, *Mme. Melanie Soupert* (exceptionally good), *Mme. Antoine Mari*, *Hebe's Lip*, *Richmond* and *Marie Van Houtte*; 2nd, Mr.

W. T. MATTOCK, Oxford; 3rd, Mr. JOHN BARROW, Oadby, Leicester, who had a vase of the rich *Ecarlaté* of a shade approaching scarlet.

In the classes restricted to amateurs, R. FOLEY HOBBS, Esq., Worcester, had the winning stand of (1) 36 varieties, of (2) six varieties, shown in triplets, and of (3) 12 varieties, distinct, but he was 2nd to J. A. L. FELLOWES, Esq., Attleborough (gr. Mr. J. O. Hinckley), in the class for 24 varieties, who followed Mr. HOBBS in the class for 12 varieties.

Mr. FELLOWES excelled in the class for 12 Tea Roses, whilst Mr. J. EGGINTON, Wolverhampton, showed best in the class for 18 varieties.

There were numerous classes for Roses in the amateurs' section, the principal prizewinner being Mr. F. A. GEORGE, Worcester, who excelled for 18 varieties and for 12 varieties, Mr. W. MOSELEY, Wolverhampton, being 2nd in the former and Mr. SHORTHORSE, Hammerwich, in the latter class.

Some pretty exhibits were seen in the class for a vase of Roses, Miss E. A. DAVIS, Pershore, excelling with a tall stand of first-rate blooms, red and white kinds intermixed.

HARDY FLOWERS.

Although these were not so numerous as at some other provincial shows, the quality of those displayed was excellent, especially in the class for a group arranged on a table space of 15 feet by 5 feet. There were three exhibits in this class, the 1st prize being won by Messrs. W. M. ARTINDALE & SON, Sheffield, for a choice display, which did not contain a duplicate bunch; 2nd, Messrs. HARKNESS & SONS, Bedale.

Hardy flowers were also well shown in the class from which traders were excluded, bold vases of *Gaillardias*, *Iris*, *Lupins*, *Mallows*, *Aconitums*, *Campanulas* and others being shown by Mr. C. HOLDER, New Oscott, who was placed 1st, the 2nd prize being won by Lieut.-Col. C. T. MAUDE, Tottenhall Wood (gr. Mr. Simpson), whose vase of *Iris*s was magnificent.

In the class for a collection of hardy flowers, open only to amateurs, there were three exhibits. Mr. HOLDER again showed grandly, and was awarded the 1st prize, being followed by F. BOUSKELL, Esq., Nuneaton (gr. Mr. G. Holles).

Delphiniums, in a class for a collection of these flowers, made a brilliant display, Messrs. BLACKMORE & LANGDON, Bath, winning the 1st prize, followed by Messrs. HARKNESS & SONS.

The best display of *Pansies* and *Violas* was shown by Mr. W. PEMBERTON, Bloxwich, who had a very pretty group of these border flowers.

SWEET PEAS.

In the Society's class for a collection of 18 varieties there were four exhibits, the best being displayed by G. H. F. ROBERTSON, Esq., Griston (gr. Mr. E. Jones), who showed grandly, having *Dorothy Tennant*, *Triumph* (Spencer), *George Herbert*, *Asta Ohu*, *Etta Dyke*, *Tom Bolton*, and other well-known sorts; 2nd, Mr. W. MARPLE, Penkridge.

In Mr. Henry Eckford's class for 12 varieties, Mr. ROBERTSON was again easily 1st, followed by Mr. A. H. HICKMAN.

Messrs. Robert Sydenham, Ltd., also offered prizes for a collection of 12 distinct kinds, and again Mr. ROBERTSON easily out-distanced his rivals.

In Messrs. Sydenham's class for six varieties, the 1st prize was won by Dr. J. E. PHILLIPS, Malpas (gr. Mr. W. Maiden), in a strong competition. This exhibitor also excelled in Messrs. Bakers' class for 12 kinds.

Messrs. Ed. Webb & Sons offered prizes for six bunches, in which Mrs. CHAPPELL, Westbourne Hall, Warminster, carried off the 1st prize.

FRUITS AND VEGETABLES.

In the class for a collection of six varieties of fruits, from which traders were excluded, there were three entries, a magnificent collection shown by the Duke of WESTMINSTER, Eaton Hall (gr. Mr. N. F. Barnes), being awarded the 1st prize. A dish of *Apple Lady Sudeley* was remarkably fine. There were also very choice dishes of *Williams's Bon Chrétien Pears*, *Pineapple Nectarines* (intensely coloured), *Grapes Madresfield Court* and *Muscat of Alexandria*, with a large Melon of *Hero of Lockinge* variety. 2nd, Duke of NEWCASTLE, Worksop (gr. Mr. S. Barker).

The Duke of WESTMINSTER also won the 1st

prize in the open class for a collection of fruits, being followed by J. DRAKES, Esq., Market Rasen (gr. Mr. W. Parker).

Grapes were not a strong class. The Duke of NEWCASTLE won the 1st prize for four bunches, his best examples being *Buckland Sweetwater* and *Black Hamburg*, both heavy bunches.

The best Melons, both green and scarlet-fleshed, were shown by Mr. MUNTZ.

The Duke of NEWCASTLE excelled with *Peaches* and *Nectarines*; whilst Lord HATHERTON, Penkridge (gr. Mr. H. Taylor), had the best *Strawberries* in *Bedfordshire Champion*.

THE KING'S ACRE NURSERY Co., Hereford, were the only exhibitors in the class for a display of fruit trees in pots, receiving the 1st prize. They showed a circular group on a dais, having trained *Gooseberries*, *Cardinal Nectarines*, *Blue Rock Plums*, *Beauty of Bath Apple*, *Scuvenir du Congrès* and *Pitaston Duchess Pears*, and *Figs*, *Grapes*, and other kinds.

VEGETABLES.—In the society's class for a collection of 10 kinds, there were four entries, two being of outstanding merit, exhibited by the Duke of PORTLAND, Welbeck Abbey (gr. Mr. Jas. Gibson), and the Marquis of NORTHAMPTON, K.G., Northampton (gr. Mr. A. R. Searle), who were placed 1st and 2nd respectively, F. E. MUNTZ, Esq., Hockley Heath (gr. Mr. H. S. Foster), being 3rd. The 1st and 2nd prize groups were very close in regard to quality. Mr. Gibson had splendid *New Intermediate Carrots*, *White Leviathan Onions*, *Canadian Wonder Beans*, *Globe Beet*, *Matchless Cucumbers*, and *Centenary Peas*. The Marquis of NORTHAMPTON's strongest dish was of *Duke of Albany Peas*, which were superb. He had also choice *Tomatoes*, *Onions*, *Carrots*, and *Cauliflowers*.

The Marquis of NORTHAMPTON won the 1st prize in Messrs. Webb's class for eight kinds; and Mr. H. WATSON SMITH, Stourbridge (gr. Mr. H. Davis), excelled in this firm's class for six kinds.

Messrs. Sutton and Sons also offered prizes for six kinds, the 1st prize falling to the Duke of PORTLAND (gr. Mr. Gibson); 2nd, Marquis of NORTHAMPTON.

The Duke of NEWCASTLE showed the best two bunches of *Money-maker Tomato* in the class in which the prizes were offered by Messrs. Dickson & Robinson, Manchester.

AWARDS.

First-class Certificates were awarded to *Sweet Peas Sunproof Crimson*, *Edrom Beauty*, *Masterpiece*, *Mrs. H. Dickson*, and *Earl Spencer*, all exhibited by Messrs. DOBBIE & Co.; also to *Viola Moseley Perfection*, of a canary gold colour, shown by Messrs. BASTOCK & SON, Moseley.

An Award of Merit was granted to *Chrysanthemum A. Welham*, a double-flowered, creamy-yellow *Marguerite*. Shown by Mr. A. WELHAM, Bridgenorth.

NON-COMPETITIVE EXHIBITS.

Messrs. SUTTON & SONS, Reading, put up a remarkably pretty exhibit of flowers, fruits and vegetables, representing choice produce from their strains of seeds. Melons were represented by 100 fruits in 60 varieties, embracing several promising seedlings. The vegetables were of high quality throughout, *New Red Intermediate Carrots* being especially good. (Special Gold Medal.)

Messrs. CLIBRANS, LTD., Altrincham, arranged a bank of pillar Roses with groups of *Hydrangeas* and a new golden-leaved *Elder* in front. They had also *Ivies* in variety, *Aralia sinensis alba*, ornamental vines and other subjects. (Silver Medal.)

Some of the best Carnations we have observed at exhibitions were staged by Lady GREY, Enville Hall, Stourbridge (gr. Mr. F. Green). The plants were remarkable for the vigour of foliage and their general good culture. (Gold Medal.)

Messrs. ED. WEBB & SONS, Wordsley, Stourbridge, filled two large tables with flowers, fruits and vegetables, an alcove of *Sweet Peas* joining the two. *Gloxinias*, *Sweet Peas*, *Delphiniums*, *Liliums*, and other flowers brightened the general effect. (Special Gold Medal.)

Mr. EDWIN MURRELL, Shrewsbury, had an assortment of Roses, including some excellent blooms of the beautiful *Lyon Rose*. (Silver Medal.)

Messrs. JARMAN & Co., Chard, staged an effective group of *Roses*, *Sweet Peas*, *Zonal Pelargoniums* and *Centaureas*. (Silver Medal.)

Messrs. ROBT. SYDENHAM, LTD., Birmingham, arranged a delightful display of Sweet Peas, set up in silver-plated table stands. (Silver Medal.)

Messrs. DOBBIE & Co., Edinburgh, had a remarkably fine show of Sweet Peas in about 50 varieties; also a selection of Pansies and Violas. (Special Gold Medal.)

Messrs. DICKSONS, Chester, showed Roses and border flowers, having a good selection of each. We noticed a splendid group of Lilium Brown var. odorum in this group. (Gold Medal.)

Mr. C. H. HERBERT, Acocks Green, Birmingham, showed perpetual-flowering Pinks, the variety Progress being of rosy-mauve colour. (Silver Medal.)

Messrs. WM. ARTINDALE & SONS, Sheffield, had a very large collection of Pansies and Violas, with arches of Rambler Roses in front and vases of Gladioli between. (Silver Medal.)

Sweet Peas were shown by Messrs. W. H. SIMPSON & SONS, Birmingham, who also showed a new system of raising Sweet Peas in deep, square boxes of cardboard, each of which is planted with a single seed. (Silver Medal.)

Mr. C. F. WATERS, Balcombe, Sussex, showed a group of Carnations, having both border and perpetual-blooming varieties. (Silver Medal.)

Mr. H. LEE, Wolverhampton, also showed Carnations. (Bronze Medal.)

A Silver Medal was awarded to the WOLVERHAMPTON CORPORATION (gr. Mr. A. Webster), for a group of flowering plants that contained a wealth of beautiful foliage and flowering subjects.

Floral devices were shown by Messrs. E. & H. SUCKLING, Wolverhampton. (Gold Medal.)

Mr. CHAS. BARNETT, Albrighton, near Wolverhampton, had bunches of Tomatos and vases of hardy flowers. (Bronze Medal.)

Mr. H. N. ELLISON, West Bromwich, exhibited a group of Ferns, including plumose varieties of Nephrolepis exaltata. (Silver Medal.)

Mr. GEO. E. BROWN, Wolverhampton, showed a miscellaneous exhibit of tools, garden sundries, tents, ladders, summerhouses and other garden furniture.

CASTLE'S, LTD., Westminster, displayed garden seats and tables, made from teak wood of old ships.

Messrs. READE BROTHERS & Co., LTD., Wolverhampton, exhibited fertilisers, weed killers, and insecticides.

Messrs. F. C. HILL, LTD., Wolverhampton, showed garden seats and summerhouses.

Messrs. TOM B. DOBBS & Co., Wolverhampton, set out a garden design with groups of flowers and shrubs, enclosing it with a rustic fence. A rosary occupied the centre, and there was a "wishing" well in one corner. The whole was fenced by Larch palings, there being numerous entrances, each spanned with a rustic arch. (Silver Medal.)

Mr. THOS. RICKHUS, Wolverhampton, showed garden furniture; Mr. JOHN E. KNIGHT, Wolverhampton, displayed rustic arches, garden seats, pillars of rustic work for Roses, with beds of scarlet Pelargoniums, and a few other flowers. Mr. GEORGE HILL, Wolverhampton, displayed a large group of various articles of use in gardens, such as summerhouses, barrows and ladders.

BRIGHTON ROSE AND HORTICULTURAL.

JULY 5, 6.—The Brighton Rose and Sweet Pea exhibition was held in the Dome and Corn Exchange on the above dates. It was a great improvement on the show of previous years, both in entries and gate money, whilst the flowers were much better than last year.

In a class for a group of Roses, either plants or cut flowers, Messrs. G. MOUNT & SONS, Canterbury (the winners of last year), and Mr. G. W. PIPER, Uckfield, were close contestants. Both exhibits were much admired, the premier award going to Messrs. G. MOUNT & SONS. This firm were the only exhibitors in the class for a smaller group.

For 48 blooms, distinct, Mr. FRANK WOOLLARD, Lewes Road Nursery, Brighton, was 1st, with a fairly clean lot of blooms. Lyon Rose, Mrs. John Laing, and Queen of Spain were good.

E. M. EVERSFIELD, Esq., Denne Park, Horsham, was well ahead of Mr. F. WOOLLARD for 36 varieties. The winner had good flowers of Mrs. Theodore Roosevelt; in fact, this was shown as well as any variety in several classes. Messrs. MOUNT & SONS were 3rd in this class.

E. M. EVERSFIELD, Esq., had the best 24 Teas and Noisettes, showing good flowers, but, like the Sweet Peas, much bruised by the recent winds.

Some very tasteful tables of Roses were shown. Mr. J. BOX, Lindfield, won the 1st prize, followed by Mr. G. W. PIPER, Uckfield. Mr. E. W. MORRIS, a rising amateur from Uckfield, was 1st in three classes for Roses.

Some good Carnations came from Mr. C. T. WATERS, Balcombe, who also showed the best Sweet Peas.

For a hall-room and bride's bouquet of Roses, Mr. F. WEBBER, Tonbridge, and Miss KATE JAMES, Bedford Street, Brighton, won the best prizes.

Baskets of Sweet Peas were a feature. Mrs. RAYLEY, Warblington House, Havant, was placed 1st in a strongly-contested class. The best white Sweet Peas, 50 spikes, came from Mr. W. H. SMITH, George Street, Hailsham. O. E. D'AVIGDOR GOLDSMID, Esq., Somerhill, Tonbridge, showed the best Grapes.

CROYDON HORTICULTURAL.

JULY 6.—The forty-third summer exhibition, held in the Park Hill recreation ground, was not quite so good as usual. Roses were fewer than last year, Messrs. E. J. HICKS, Twyford, Berks., being almost the only trade exhibitor. He won the 1st prize for 48 blooms, distinct, with good flowers, Duchess of Bedford, Lyon, and White Killarney being among the better flowers. Mr. HICKS was also awarded the 1st prize for 18 Teas and Noisettes, excellent blooms of Mrs. E. Mawley and Muriel Grahame, the latter very highly coloured, being in this stand.

For 12 blooms of one variety, Mr. HICKS was successful, with well-coloured Lyon Rose, followed by Mr. J. JEFFERIES, Colwyn Road, with some clean Frau Karl Duschki. Mr. JEFFERIES won the 1st prize for 24 blooms distinct; O. Terks and Earl of Dufferin were the best blooms. Mr. HICKS was also 1st for the best 12 blooms of one variety, showing Mme. Jules Graveraux, followed by Mr. JEFFERIES with Souvenir de Pierre, Nottingham.

H. L. METHEN, Esq., took the 1st honours for nine blooms distinct, and C. ASHERLY, Esq., Bleinheim Gardens, Wallington, was 1st for six blooms. This exhibit contained a good Silver Medal winner in Mrs. Theodore Roosevelt.

In the local classes, H. L. METHEN, Esq., Sandstead, was successful for six hybrid perennials, for six Teas, and for six blooms of any one variety, winning in the latter class with very good examples of Caroline Testout. It was disappointing to see so few Roses, more especially as a large number of competitors had entered.

Some of the groups of plants were good, the largest group, arranged for effect, coming from E. W. COLES, Esq., Caterham (gr. Mr. C. Lane), who also had the best table of plants and flowers. For 24 bunches of hardy cut flowers, grown in the open, Miss WILLIAMS, Duppas Hill, Croydon (gr. Mr. G. Lewy), won the 1st prize.

BRITISH GARDENERS' ASSOCIATION. (LONDON BRANCH.)

JULY 9.—On this date, members of the London branch paid a visit to the Priory Gardens, Rehampton, by invitation of the head gardener, Mr. D. Campbell.

The party were met by Mr. Campbell at Barnes Station, and conducted to the cricket grounds, where a match had been arranged between the Priory team and the B.G.A.

The game was declared closed at 5.50, and members assembled to a tea which had been laid under the spreading branches of a clump of Elms.

A tour of inspection through the Priory ground followed. Mr. Campbell, assisted by his foreman, Mr. Smith, pointed out the many interesting features of the gardens. The plants in the pleasure ground and flower gardens were full of interest and beauty.

A short visit was also paid to "The Grove," the residence of Captain Wilson. The head gardener, Mr. Maclean, invited members to see these beautiful grounds whilst they were in the neighbourhood. Conspicuous amongst the many interesting features of these gardens was a collection of perpetual-flowering Carnations.

SOUTHAMPTON HORTICULTURAL.

JULY, 5, 6.—The annual summer show was held in the county cricket ground, and was a distinct success. Roses, Sweet Peas and vegetables were strong features. Trade exhibits added materially to the interest of the show.

ROSES.

In the open classes for Roses, the leading one was for 48 blooms, distinct. Four competed, the best, a level lot of blooms, being shown by Messrs. D. PRIOR & SON, Colchester. Oberhofgartner Terks, Mrs. T. Roosevelt, Dean Hole, Maurice Bernardin, White M. Cochet, Avocet, and Mrs. W. J. Grant were the most noteworthy varieties. Messrs. B. CANT & SONS, Colchester, were 2nd, and Messrs. F. CANT & Co., 3rd.

In the class for 12 trebles, Messrs. B. CANT & SON won the 1st prize, and Messrs. D. PRIOR & SON the 2nd prize.

Tea and Noisette varieties were fairly well shown by Mr. H. DREW, Longworth, Berks., who won premier awards with clean, if small, blooms, Messrs. D. PRIOR & SON being 2nd.

For six blooms of any one dark variety, Messrs. D. PRIOR & SON won easily, with exceptionally nicely coloured specimens of Horace Vernet. Messrs. B. CANT & SONS were 2nd, with Ben Cant.

In a similar class for any light variety, Messrs. PRIOR & SON were 1st, with handsome specimens of Mrs. Theodore Roosevelt.

For the best display of decorative Roses, in a space 7 feet by 3 feet, there were three entrants, Mr. E. J. HICKS, Twyford, Berks., having much the finest display. Messrs. B. LADHAMS & Co., Shirley, Southampton, won the 2nd prize.

Several classes were confined to gardeners and amateurs. The principal one was for 18 blooms, distinct, for which the "Munt" silver cup was offered. There were five competitors, Dr. C. LAMPLOUGH, Alverstoke, being an easy 1st, with clean, shapely examples.

The best Tea and Noisette blooms were staged by Mr. G. H. KENT, in the class for 12 blooms, and he was awarded the 1st prize.

Messrs. D. PRIOR & SON won the silver-gilt medal for the best bloom in the show, with a handsome specimen of Mrs. T. Roosevelt, and the silver medal for the best bloom in the open classes, with Horace Vernet. Dr. LAMPLOUGH securing a similar award in the amateur division with Mme. C. Graveraux.

The best basket of Roses came from Mrs. E. LADHAMS, Shirley, Southampton—a charming display of Farben Konigin.

SWEET PEAS.

Sweet Peas were shown remarkably well. For Messrs. Toogood's prizes for six bunches distinct, there were eight competitors. The best flowers were shown by Mr. H. H. LELS, Warblington, Havant, an extremely fine display. Sir R. BAKER, M.P., Blandford (gr. Mr. Usher), was 2nd.

Sir R. BAKER won Messrs. Webb's 1st prize for six bunches.

FRUIT AND VEGETABLES.

Exhibits of fruit were not numerous. The best black and white Grapes were shown from L. WALKER MUNRO, Esq., Brockenhurst.

Mr. J. F. BENNAN, Douglas House, New Milton, had the best Peaches—Condor—nicely coloured.

W. H. MYERS, Esq., Swannore House, Bishop's Waltham (gr. Mr. C. Ellwood), won the 1st prize in the classes provided by Messrs. Toogood, Sutton, Webb, and Carter, showing fine produce in every case. Mrs. TRAGETT, Ambery Dunes, Romsey (gr. Mr. H. Pearce), was 2nd in several classes.

HONORARY EXHIBITS.

Mr. C. F. WATERS, Balcombe Nurseries, Sussex, had a handsome group of Carnations; Messrs. B. LADHAMS & SON, Shirley, Southampton, arranged at one end of the large marquee an imitation of an old English garden; Messrs. Toogood & SONS had an extremely fine display of Sweet Peas and culinary Peas; Messrs. W. H. ROGERS & SON, The Nurseries, Southampton, had a group of Roses, plants, and cut blooms, the latter representing many of the new varieties; Mr. J. STEVENSON, Sweet Pea specialist, Wimbome, had 50 bunches of Sweet Peas; and Mr. E. WHITE, Winchester Road Nurseries, Southampton, had miscellaneous plants and floral work.

GARDENING APPOINTMENTS.

[Correspondents are requested to write the names of persons and places as legibly as possible. No charge is made for these announcements, but if a small contribution is sent, to be placed in our collecting box for the Gardeners' Orphan Fund, it will be thankfully received, and an acknowledgment made in these columns.]

Mr. G. J. SCIBBS, late Gardener to Sir WILLIAM COOPER, Bart., Whittlebury Lodge, Towcester, as Gardener to Sir ROBERT GRESLEY, Bart., Drakelowe, Burton-on-Trent.

Mr. JOHN MURRAY, for the past 3 years Foreman at Lackham, Lacock, Wilts., as Gardener to Lady BRINKMAN, Binstead House, Ryde, Isle of Wight.

Mr. W. L. CREEK, for the past 3 years Foreman in Plaw Hatch Gardens, East Grinstead, Sussex, as Gardener to W. K. ARBUTHNOT, Esq., at the same place.

Mr. GEO. FRANCIS, for the past 11 years Gardener at the Croft, Hillmorton, Rugby, as Gardener to W. E. CLAY, Esq., Bramcote Hills, Nottingham.

CATALOGUES RECEIVED.

T. SMITH, Daisy Hill Nursery, Newry—Bulbs and Tubers.

THE WEATHER.

THE FOLLOWING SUMMARY RECORD of the weather throughout the British Islands, for the week ending July 9, is furnished from the Meteorological Office:—

GENERAL OBSERVATIONS.

The weather was rainy over the kingdom generally during the earlier days of the period, but the conditions improved after the 5th, at first in the west and subsequently in the east. Thunderstorms were experienced in places over a large area in England on the 3rd, and heavy rain occurred at several western and north-western stations on the 5th.

The temperature was below the average, the difference being large in nearly all parts of England. The highest of the maxima were recorded on the 4th at most of the eastern and northern stations, and on the 9th in the west and south-west. They ranged from 76° in Ireland S., and 75° in Scotland E. and W. to 67° in England N.E., and to 66° in the English Channel. During several days the maxima were very little higher than 60° over a considerable portion of Great Britain, and on some occasions below 60°. The lowest grass minima reported were 30° at Hereford and Sheffield, 31° at Llangamarch Wells, 32° at Markree Castle, and 34° at Newton Kigg.

The mean temperature of the sea was lower than during the corresponding week of last year on most coasts, as much as 5° at Wick. The mean values for the week ranged from 61° at Eastbourne, 60° at Margate and Newquay, and 59° at Seafield to 52° at Aberdeen and to 51° at Bournemouth and Wick.

The rainfall was less than the average in Ireland, England S.W. and Scotland N., the deficit being large in the last district. Elsewhere there was an excess—very considerable in nearly all parts of England. Falls of an inch or more were measured at many stations in the north-west of England and in Wales, as well as at West Linton; the largest quantities reported were 1.32 inch at Aspatria and 1.66 inch at Aberdovey. At Worthing as much as 1.19 inches fell on the 3rd.

The bright sunshine was less than the normal in almost all parts of England, the deficit being large in the eastern, central and southern districts. In Ireland and in the east and west of Scotland there was an excess. The percentage of the possible duration ranged from 52 in Scotland W., 40 in Ireland N., and 39 in Ireland S. to 20 in England N.E. and to 15 in England E.

THE WEATHER IN WEST HERTS.

Week ending July 13.

The third cold week in succession.—Throughout the past three weeks there have been only two unseasonably warm days, and but five warm nights. The two warm days of this cold period occurred during the past week, when the highest reading in the thermometer screen was respectively 71° and 72°. On the other hand, on three days of the week the same thermometer did not rise higher than 58°, or 12° below the average maximum temperature for the time of year; and on the coldest night the exposed thermometer indicated a reading within 7° of the freezing point. Both at 1 and 2 feet deep the ground is now about 2° colder than is seasonable. Rain fell on the first two days of the week, but since then no measurable quantity has been recorded. Some rainwater has come through both of the percolation gauges on each day during the week, but in gradually diminishing quantities. The sun shone on an average for only 2½ hours a day, which is not much more than one third of the usual duration in July. One day proved altogether sunless, while on three other consecutive days the total record of sunshine amounted to only about an hour. The winds have been light, and have come principally from some northerly point of the compass. The mean amount of moisture in the air at three o'clock in the afternoon exceeded a seasonable quantity for that hour by as much as 11 per cent. E. M., "Rosebank," Berkhamsted, July 13, 1910.

Editors and Publisher.—Our Correspondents would oblige by delay in obtaining answers to their communications, and save us much time and trouble, if they would kindly observe the notice printed weekly to the effect that all letters relating to financial matters and to advertisements should be addressed to the *Publisher*; and that all communications intended for publication, or referring to the Literary department, and all plants to be named, should be directed to the *Editors*. The two departments, Publishing and Editorial, are distinct, and much unnecessary delay and confusion arise when letters are misdirected.

* * * *The Editors will be glad to receive, for consideration, large photographs of horticultural subjects, suitable for reproduction as Supplementary Illustrations in this Journal.*

ACALYPHA SANDERIANA: A. M. S. The spots on *Acalypha* leaves are known as "sap warts," caused by an excess of moisture in the air. The *Codiaeum* (*Croton*) leaves are also injured by an excess of moisture during a period of low temperatures. There is no fungous disease present.

AMPELOPSIS VEITCHII: W. F. & Co. The plant is attacked by eelworms, which are present in abundance. A cure is practically impossible, but some good may be done by watering at intervals of four days with a solution of formalin in water—1 in 1,000 parts might be tried.

BOLTED CAULIFLOWERS: W. M. The Cauliflowers appear to be of an inferior strain. Your culture seems to have been all right, but from a sowing made in August, the plants being wintered in a frame and planted out in spring, the heads should have been ready for cutting a month earlier. If you planted them out too early and the plants got cut by frost, they would then suffer a severe check; but should not produce bolters instead of good heads. Get a change of stock another season.

CAULIFLOWER PLANTS ATTACKED BY GRUBS: G. W. Fork a quantity of soot and lime into the rows, and treat the land, after the crop is cleared, with gas-lime, changing the crop next season.

CHRYSANTHEMUM: T. J. H. This condition is known as fasciation. It is not uncommon, but the cause is unknown, and there is no cure.

DISEASED CARNATIONS: C. D. M. Your Carnations are badly attacked by thrips. An occasional fumigation with a nicotine vaporising compound is recommended, or an insecticide may be used.

DISEASED LEAVES: W. M. & Co. The leaves are affected with scorch.

FIG: C. O. Wicklow. There is no fungus present on the Fig branches. The injury may have been caused by keeping the roots too wet.

FRENCH BEANS: Westminster. Eelworms are present in the French Beans. Put lime in the soil after the plants are removed.

GRAPES SENT BY RAIL: Correspondent. Grapes sent by rail should be packed in baskets known as "handles," and tied by the stalks around the top of the basket. The weight per basket should not exceed 8 lb. to 10 lb. See that a suitable label is affixed, on which is prominently printed "Grapes, with care."

LILIUM AURATUM AND L. GIGANTEUM: J. E. The plants are attacked by *Botrytis cinerea*, a common disease which attacks Lilies. No certain remedy for this disease is known. The plants may be sprayed early in spring with a weak solution of potassium sulphide or dusted with flowers of sulphur. It is best, however, to burn the old bulbs and procure a fresh stock, planting them in a situation as far away from the old site as convenient.

LOGANBERRIES FAILING TO SET: B. The flowers are sterile, due to some constitutional defect in the plant. This is sometimes seen in Strawberries, Blackberries, and other members of the Rosaceae. The unfavourable summer of last year may be responsible for the trouble.

Thin out the branches, leaving the strongest only to become well ripened.

MALFORMATIONS ON ALPINE RHODODENDRON: O. O. W. This is caused by a fungus *Exobasidium rhododendri*. All diseased portions should be removed, otherwise the disease spreads quickly.

MIGNONETTE: H. E. F. We can give no reason for the leaves dying off. There is no fungus present.

NAMES OF PLANTS: Henry Corder.—*Aspidium angulare*, *Phacelia tanacetifolia*, *Veronica salicifolia*.—*Archie Loue*. *Bromus sterilis*, *Festuca myurus*.—C. S. & Co. *Lathyrus sativus*.—L. H. *Campanula latiloba*, *Iris orientalis*.—E. V. B. *Cotyledon umbilicus*.—C. J. M. *Hemerocallis fulva*.—C. W. 1, *Spiraea filipendula*; 2, *Lychnis (Agrostemma) coronaria*; 3, *Campanula glomerata*; 4, *Leycesteria formosa*; 5, next week.—W. P. R. 1, *Spiraea Aruncus*; 2, *Eriophorum angustifolium* (Cotton Grass); 3, *Orchis Morio*; 4, *Astrantia major*; 5, next week.—J. J. H. *Erinus alpinus*.—Chas. S. *Cuscuta medicaginis* from South Africa (long-stalked form).—G. P. These are all varieties of *Lychnis Haageana*.—T. A. H. (a) *Gentiana cruciata*; (b) *G. brevidens*.—H. N. 1, *Dendrobium moniliforme*; 2, *Galeandra devoniana*; 3, *Eria acervata*; 4, *E. marginata*; 5, *Zygopetalum erinitum*; 6, *Odontoglossum blandum*.—F. S., Perth. 1, *Cheilanthes elegans*; 2, *C. hirta*; 3, *Davallia bullata*; 4, *Pteris longifolia*.—C. H. *Lycium chinense*.—E. M. R. *Cotoneaster frigidus*.—G. H. We cannot name the *Dianthus* from such a specimen.—G. W. W. & Co. *Phacelia campanularia*, so far as can be determined from the specimen before us.

ORCHID: J. K., Dulwich. The species shown in the photograph is *Acineta Barkeri*, from Mexico. Several of the species are nearly alike in appearance, showing only a little colour variation.

PEAS DISEASED: W. B. C., Dumfries. The cause of the injury is a fungus in the soil belonging to the genus *Rhizoctinia*.

PLANTS AND WEEDS DISEASED: J. P. P. The injury is caused by the fungus—*Hormodendron Hordei*, which first develops on decaying plants. Spraying with dilute Bordeaux mixture will check its progress.

POTATOS: J. D. J. The leaves and shoots are attacked by *Hormodendron Hordei*. A spraying with Bordeaux mixture will check this pest and also the common Potato disease.

RUCELLIA MACRANTHA: S. H. G. This species is a very easy plant to cultivate in a stove or in temporary house. If the specimens are old and unsightly, it will be desirable to take cuttings root them in the ordinary way, and pot them on to flower next year. It is better to proceed in this way than to retain old plants. For the potting medium use a compost of loam, with little sand and leaf-soil mixed with it.

ROSE LEAVES DISEASED: I. J. The leaves are affected with Black Blotch. Spray the plants at intervals of three days with 1 oz. of liver of sulphur in two gallons of water.

THE NATIONAL VEGETABLE SOCIETY: J. A. T. The promoters of this Society were actuated by the desire to spread information concerning the best varieties of vegetables and their culture. The Society is conducting trials of vegetable in order to obtain information such as was published in the report on autumn-sown Cabbage printed on p. 423. The Society will hold an exhibition of vegetables in the Horticulture Hall, Vincent Square, Westminster, on September 28 next. The Secretary is Mr. E. C. Quick, Kelmiscott, Harrow View, Wealdstone.

MONT CENIS IN JUNE.

ENCOURAGED by Mr. Stuart Thompson's articles in the *Gardeners' Chronicle*, I arrived on Mont Cenis on June 22, and, for wealth of gorgeousness, I have never yet seen anything to equal the display then made by hill and meadow. In front of the Hotel de la Poste, all down to the Lake, *Gentiana verna* and *G. angulosa* were extended in sheets of colour; *G. acaulis* also occurred, *Dianthus neglectus* was present, but, of course, indistinguishable in bud. The whole sward was a vast carpet everywhere (visible from miles away) of *Viola calcarata*, in every shape and shade, from pure white to dark violet, with azure slabs of *Gentiana verna* interspersed, and wide mats of *Globularia cordifolia* giving a softer and mistier tone of blue. Here and there the indigo trumpets of *G. acaulis* came like deep notes of music in a lighter composition. *Erysimum pumilum*, *Potentilla alpestris*, and *Alyssum montanum* struck a general chord of yellows. *Dryas* was just beginning to bloom; *Hugueninia* lurked in hollows; *Daphne Mezereum* and *Pulmonaria angustifolia* were passing over.

Higher up, behind the hotel (on one slope

only), *Anemone Halleri* was giving place to *Rosa alpina* and *Anthericum liliastrum*. But *A. alpina* was everywhere, in a riotous magnificence that convinced me I am right, in preferring the species to *A. a. sulphurea*. Its beauty was overwhelming: each slope was snowed over with big clumps of pure white flowers, golden-eyed and dazzling. There were double forms, and giant forms, and windmill-shaped beauties with sepals that did not fit: some were blue on the reverse, and others pink, and others purple as a Plum. They were in all stages of development: each clump carried from two to ten flowers; and each clump, each flower, was a thing to pause over in rapture. *A. alpina* was almost universally white, like all the local rocks, but a yellow form occurred rarely (with intermediate creamy varieties), yet it was not *A. a. sulphurea*. Was it *A. burseriana*? Here and there, in gullies, *A. baldensis* was unfolding buds; *A. vernalis* on the higher fells, was passing, from its exquisite prime into its disreputable and dishonoured old age.

Specially beautiful, too, was *Ranunculus pyrenaicus*—to all those who have not collected it in flower, a perfect revelation. For its forms vary indefinitely: many are starry, poor and worthless; but many try to equal *R. alexandricus*; and others have imbricated rows of petals, whilst there are pure white flowers (like Banksian Roses), and white and yellow forms, with golden stamens, or green leafy carpels, birking amid a loose, double, or triple row of petals. All the hills are white with *Anemone alpina*, but everywhere, too, there is an underlying snowdrift in all the hollows of this wonderful *Ranunculus pyrenaicus*. But *R. rutabohus*, which abounds on the Col, and on the Little Mont Cenis, is a poor thing: its dull, green-eyed flowers not large enough to carry off the beautiful rue-like foliage; *R. acuminifolius* was but just coming into bloom, in stretches of marsh, where the fierce orange sheets of *Caltha* were making what headway they could against the bland citron-yellow of *Trollius*, which covered acres of ground.

The high alpine, of course, were either still asleep or barely stirring from their slumbers. Indeed, deep snow still masked all the mountain lakes and upper shingles. However, *Ranunculus glacialis* was already opening its golden eye on a shale-slope like the reuse of a coal-pit, and, I was also able to collect a quantity of *Eritrichium*, *Iberidella*, *Campanula cenisia*, and *C. Allionii*. *Petrocallis*, too, were abundant in the high-stone-slides. *Geum reptans* was awakening amid the granite-blocks. Of *Androsace glacialis* I only discovered one uncovered plant. A little lower, and *A. Vitaliana* was spread in saffron sheets over every stone in the short alpine herbage. The real *A. carnea* was common on grassy ridges, and lower still, *A. brigantia* peered among the *Gentians*. I only struck on one plant of *Saxifraga biflora*, as yet revealed. *S. oppositifolia*, though, was in full magenta magnificence high up, and in one valley, after walking through glades of *Primula pedemontana*, I came on an oasis in the snow, where, round a rock, *Saxifraga retusa* was brilliant and exquisite, like a glorified version of *Azalea (Loiseleuria) alpina*.

Aquilegia alpina gave promise by the million, but was only in bud. In bud, too, in

one precious gully, was *Cortusa Matthioli*, peeping up among the violet bells of *Soldanella montana*, in a sodden glen of wintry brushwood that carried me back to the sere woodland gorges of Nantai-san as they appear in March. Round all the melting snow-patches (and there were many) *Soldanella alpina* was a film of purple. Amid *Crocus vernus albiflorus*, belying its name by producing myriads of striped, flaked, splashed and feathered flowers, from tenderest lavender to darkest violet, *Primula farinosa*, too, rolled by acres over the marshes, although colour-forms were rare, and, among the *Crocus*, *Bulbocodium vernum* lingered, like a belated little *Colchicum*. On the south side, *Saponaria lutea* was far down in bud. *Senecio Doronicum* was busy giving a flat contradiction to my notes and experience, for I had never before realised its polymorphism. In Oberland and Valais it is a gorgeous orange splendour; but on Mont Cenis, in the Cottian Alps, and here, in the Maritime Alps, it is a teebly yellow, no better than that of *S. arnica*, and not so good as a Dandelion. But never, never, apparently, in any district, does it take to running at the root and forming a wide-spreading patch, like the bald and weed-like plant which too often bears its name in gardens. *Reginald Farrer.*

NEW OR NOTEWORTHY PLANTS.

A NEW TULIP FROM BOKHARA.*

(See Supplementary Illustration.)

DR. FEDTSCHENKO sends a description of a brilliant and striking species of *Tulipa* native of the Central Asiatic desert and grown in Mr. C. G. Van Tubergen's gardens at Haarlem. *T. Hoogiana* is a member of the section *Enobulba*, having the outer bulb scales covered on the inside with reddish hairs. The stem, including the flower, varies from 6 to 18 inches in height, but is generally 9 to 12 inches; it is quite smooth. The leaves, which are described as quasi-opposite, are four to six in number, lanceolate-tapering and smooth, but with a very narrow, membranous, white, shortly ciliated margin; the lowest leaf is 8 to 10 inches long and 1½ to 3 inches broad. The flower is scarlet, with a large, black blotch bordered with orange on each petal within the cup, and a corresponding yellowish blotch on the exterior. The broad petals are somewhat abruptly acuminate at the apex. The filaments of the stamens are linear-lanceolate, blackish-violet in colour, and bear blackish anthers.

In its general habit and in the great black eye contrasting brilliantly with the bright scarlet of the flower, *Tulipa Hoogiana* recalls the well-known *T. Oculus-solis*, a species belonging to the same section. The section includes other Central Asiatic species, such as *T. Borszczowii*, with a deep blue blotch on the red or yellow petals, the more widely-spread *T. montana*, and the smaller yellow-flowered *T. chrysantha*. *Boris Fedtschenko, Principal Botanist of the Imperial Botanical Garden, St. Petersburg.*

* *TULIPA HOOGIANA*, B. FEDTSCH., n. sp.—Bulbus ovato-oblongus, tunicis fuscis, exterioribus intus rufolanatis. Caulis cum flore supra terram (15-24-31-(45) cm. altus, glaber. Folia 4-5-6, quasi-opposita, omnia lanceolata, sensim attenuata, inferiora latiora, omnia glaberrima, margine angustissime albo-membranacea, breviter ciliolata; folium minimum 20-25 cm. longum, 3, 5-7 cm. latum, folium supremum 13-14 cm. longum, 1-2½ cm. latum. Flos unicum, coccineum. Sepala exteriora tria a petalis interioribus tribus divergentia. Sepala et petala oblongo-lanceolata, versus apicem acuminata, coccinea, extus basi lutescentia, intus basi nigro-maculata, macula elliptica, luteo marginata, sepalorum et petalorum similis, vel macula sepalorum paulo latior, apice retusa, macula petalorum tunc angustior, apice acutiuscula. Filamenta nigro-violacea, lineari. Lanceolata anthera nigrescens.

Patris Buchara. planta hanc speciosissima in floris Tubergen. (r. Haarlem) colitur, amique rati in S. M. C. Hoog dedico.

THE ROSARY.

NOISETTES AND THEIR HYBRIDS.

So closely do some of the Noisette Roses resemble in habit of flowering the freest-blooming Tea-scented varieties that some of them are classed in different sections even by experienced growers. In fact, the Teas and Noisettes, with their hybrids, might almost go as one class, were it not that some have a less tendency to flower in large bunches, such as Mildred, Avoca, Charles J. Grahame, Lady Ashtown, and William Shean.

There are a few older varieties of Noisettes and hybrids that do not receive due recognition in the gardening Press. *Jaune Desprez*, a Rose of 1830, is not often seen, except as aged plants in a few gardens. Where it thrives, this old Rose is very charming, with its varying colours of red, buff, and sulphur-yellow, while there are few sweeter scented. *Lamarque* was also introduced in 1830, and is still one of the best, pale lemon-whites for a warm wall. This Rose does not come "sulphur yellow" with me, as described in Messrs. W. Paul & Son's list; but *Solfaterre*, sent out 13 years later, is, to my eye, one of the clearest sulphur-yellows we have. *Ophir* (1841) is distinct, with its chaste shadings of mauve and copper, and we have few more reliable autumnal Roses than this variety. *Joseph Bernacchi* is a yellowish-white, with an almost sulphur-yellow centre, and with very long buds. I am surprised that it is not more grown; its reputation for shy blooming is not deserved. Simply refrain from pruning it, and give it a fairly warm position, and few yellow-flowering, climbing Roses will be more satisfactory. *Triomphe de Reines* (1857) is a canary-yellow-coloured flower, and often very pretty. *Fortune's Yellow* (1845) is unapproachable in its rich shades of orange-yellow, shaded and splashed with carmine and metallic red. The flowers vary much, and the plant needs a warm wall, or the help of a cool conservatory. It is a tremendous grower, and it is not improved by pruning. Those already mentioned are a few of the older and true Noisettes that are in danger of neglect in the rush for newer varieties. *Aimée Vibert*, *Alister Stella Gray*, *Céline*, *Forestier* *Mme. Pierre Cochet*, *Rêve d'Or*, *Bonquet d'Or*, *L'Idéal*, and *William Allen Richardson* are not likely to be missed, and need no description here.

But there are some newer Noisettes not so well known, among which are *Golden Queen* (1903), a Rose somewhat resembling *Rêve d'Or*, but deeper in colour, more uniform in its rich, golden yellow, and a distinct shade of copper. I find it more tender than *Rêve d'Or*, and impatient of the knife, except with respect to the cutting out of bad wood. *Souvenir de Madame Viennot* (1897) is a very attractive Rose. I note that some growers put this among the Teas, and the National Rose Society so classes it. This is a clear carmine and rose upon a yellow ground, not very double, sometimes splashes, and in immense typical Noisette trusses carried upright, each flower well away from its fellows. There is also a pale yellow form of the old favourite, *Aimée Vibert*, which was sent out in 1906, and it promises well.

I cannot close without saying a few words upon the older hybrids of Noisettes. *Boule de Neige* and *Mme. Alfred Carrière* are well known, *Mme. Plantier* (1855) is one of the very hardiest and earliest Roses we have; the blooms are flat and not very large, the plants are certain bloomers, and the variety is one of the purest whites for massing. I have seen this Rose growing in an old quickset hedge, and the effect is very pleasing. It is one of the few varieties that can be trimmed up with bill-hook or shears, and will still flower freely early in the season. *Cognette des Blanchés* and *Perle des Blanchés* are two favourite, pure-white varieties. *Mme. Alfred de Rougemont* (1863) is a small, globular flower, pure white in the centre, with a distinct rosy tinge at the edges of its petals. *Mme. François Pittet* is a very useful little white Rose for

pot-culture or for bedding. This is simply one mass of flower. *Crepuscule* is a new Noisette that already ranks as one of the very best in its class: a vigorous grower and very free flowering. The following colours are all in the flower, rich coppery-yellow, rayed and tinted with deep Nasturtium red and yellow; the buds are long, retain their shape well, and perhaps I may be allowed to call it a link between *L'Idéal* and *William Allen Richardson*. It has been very pleasing here during the past three seasons. *A. Piper*.

ORCHID NOTES AND GLEANINGS.

DENDROBIUM REGIUM.

THIS pretty species, which those who do not cultivate it successfully are apt to look upon as too near to *D. nobile* to warrant its being grown extensively, has probably never been seen in such good condition as in the specimen now in flower in the collection of J. Gurney Fowler, Esq., Glebelands, South Woodford (gr. Mr. J. Davis). The flowers are much larger than those of the best forms of *D. nobile*, and all the segments are equally broad and the labellum very finely developed. The outer parts of the segments are of a bright rose-purple tint, the inner part white, the labellum having a clear lemon-yellow disc. With such flowers, the affinity to *D. nobile* is quite lost, and there is no other *Dendrobium* comparable with *D. regium* in its section.

LÆLIA GRANDIFLORA (MALAIS).

MR. H. HADDOX, gardener to J. J. Neale, Esq., Lynwood, Penarth, writes that the plants of *Lælia grandiflora*, which usually flower well at Lynwood grown in the house in which the *Sarracenas* and other cool-house plants are cultivated, are now in perfection, and among them a distinct variety, a flower of which is sent. The chief difference is that in the flower sent there are no rose-coloured lines in the lip, the base and the side lobes being white, the front only being tinged with rosy-lilac of a similar shade to the sepals and petals. The substance of the flower is firmer than usual in the species.

CATASETUM RUSSELLIANUM, HOOK. = C. THYLACIOCHILUM, LEM.

AN interesting question is raised by the proof of the variability in *Catasetum russellianum* now furnished in a plant in the collection of J. Gurney Fowler, Esq., Glebelands, South Woodford (gr. Mr. T. Davis). When it flowered previously the blooms were typical *C. russellianum*, being whitish, striped and tinged with green, the basal portion of the lip concave and slightly enlarged in the fore part, and the margin of the lip fringed. This year the plant produced a more dense inflorescence, the flowers being smaller, and the elongated pouch beneath the labellum more shallow. In fact, the last flowers were identical with the small illustration of *Catasetum thylacochilum*, Lem., accompanying the description in *Illustr. Hortie.* III. (1856), Misc. 90, the plant being recorded from Mexico, whereas *C. russellianum* was originally recorded from Guatemala, both regions having some plants in common. In the absence of any botanical feature to separate the two plants, and in view of the fact that both belong to that very small section of three or four species which have no antennæ to the column, and are known as *Ecirrhus*, together with the now known variation proved in Mr. J. Gurney Fowler's collection, there seems to be no doubt as to the identity of *C. thylacochilum* with the earlier recorded *C. russellianum*, especially as the same author's reliability is discredited by the fact that his *Catasetum trimerochilum*, *Illustr. Hortie.* IX. (1862), t. 374, is not a *Catasetum*, but *Mormodes lineata*. The variability of *C. russellianum* suggests that the small section not fur-

nished with cirrus may vary, and, consequently, the other two known in gardens—*C. Warszewiczii* and *C. Scurra*, which are closely allied to each other—may be the same species.

So far as it has been tested, a sensitive part of the surface of the columns in this small section performs the same object of causing the pollina to be ejected when touched by an insect as the cirrus does in the larger section. *J. O'B.*

TREES AND SHRUBS.

TREES AT CLAREMONT.*

IT is a considerable distinction for a garden to possess the finest specimen in the kingdom of even one kind of tree, but Claremont has within its boundaries four or five for which we believe precedence may be claimed over all others of the same species in the British Isles. Writing in 1838, J. C. Loudon observed that Claremont at that time contained "a great many exotic trees, particularly Cedars of large dimensions, very large Cork Oaks, Tulip trees and others of foreign origin" which had been planted by "Capability" Brown for the great Lord Clive about 1768. Many, no doubt, that were in their prime in Loudon's time have since disappeared. Claremont, as is generally known, is now the residence of H.R.H. the Duchess of Albany, and it is gratifying to know that Her Royal Highness takes a keen interest and pleasure in her trees and their preservation. Some valuable specimens have been promised for the new Museum of British Forestry now in course of formation at Kew.

Gymnocladus canadensis (Kentucky Coffee tree) is represented by the finest specimen in the British Isles. It is over 60 feet high and its trunk is 7 feet in girth. *Sassafras officinale* with a trunk girthing 7 feet 2 inches (at 1 foot from the ground) and a height of about 50 feet, is the only fine specimen in the kingdom. *Magnolia macrophylla*, whose extraordinary leaves are often 2 to 2½ feet long and 9 or 10 inches wide, is 40 to 45 feet high and the trunk 2 feet 11 inches in girth. This tree is exceedingly rare in Britain, and we know of no other that approaches these dimensions. A specimen of Redwood (*Sequoia sempervirens*) is in perfect health and shape. It is over 100 feet high and its trunk is 13 feet 7 inches in girth, clothed from base to summit with branches and forming a slender pyramid. These four trees we believe are unrivalled in our islands, and scarcely inferior of its kind is an immense *Pterocarya caucasica*, equalling the splendid trees near Vienna. It branches very low down and the short trunk is over 19 feet in circumference; the head is about 50 feet high with a diameter of 100 feet. This tree flowers freely. According to Mr. Elwes it is surpassed by a tree at Melbury, Dorset. Of the Cork Oaks (*Quercus Suber*) mentioned by Loudon, one huge specimen at least remains; its trunk is 8 or 10 feet high and 13 feet 10 inches in girth, bearing a wide-spreading head of branches which is, unfortunately, badly damaged on the south-west side.

The following specimens whilst not the finest of their kind are certainly in the very first rank among British trees: *Magnolia acuminata*, 60 feet high, 5 feet 10 inches in girth; *Deodar* (*Cedrus Deodara*), 8 feet 5 inches in girth; *Bishop's Pine* (*Pinus maritima*), 80 feet high, 7 feet 10 inches in girth; *Cryptomeria japonica*, 60 to 65 feet high, 8 feet in girth; *Cunninghamia sinensis* rarely seen in good form is here a shapely tree 35 feet high and 3 feet 10 inches in girth.

Of smaller-growing species, there are three excellent specimens of the broad-leaved Holly, *Ilex latifolia*, 16 feet high and bushy; *Buxus balearica*, 13 feet high and 9 feet through; and the *Nopal Juniper* (*Juniperus recurva*), with an umbrella-like head of branches 22 feet across.

* *H. J. B.*, in *Kew Bulletin*, No. 5, 1910.

NURSERY NOTES.

MR. PERRY'S HARDY PLANT FARMS.

MR. AMOS PERRY, the founder and proprietor of the hardy plant farms at Enfield, being one of the pioneers in hardy plant culture, has seen this phase of gardening raised from the depths of obscurity to its present popularity. He knew the time when the only exhibitors of a dozen or two specimens were Parker, Rollison, or Ware—rarely all showing at the same time, and when hardy plants were so little esteemed that it was considered a concession to afford space for them at any London exhibition. To have lived through the days of the scarlet Pelargonium, the pattern gardening, and other

50,000 plants of Delphinium, the myriads of towering spikes forming an imposing spectacle. The collection is rich, not, however, in endless varieties, for there is rigid selection and re-selection of distinct and good things which experience of the established examples has proved to be indispensable. In looking at this imposing array of flowering plants, hundreds or, perhaps, thousands of a single variety, with their big, wide-spreading flowers, in this case royal purple, in that palest blue, whose pure white or dark "bee" centres are often in pleasing contrast with the main body colour of the flower, one instinctively recalls the Larkspurs of former years and their tall, lean spikes of small, much hooded flowers. To-day, however, the gardener has in the Delphinium a plant of moderately tall habit,

whose intense deep blue flowers, finely cut leafage and dark stems render it one of the most distinct varieties; Julia, gentian-blue with white eye, and Amos Perry, metallic blue, with a small, dark eye.

These are but a selection from the better ones to illustrate the predominating colours. Apart from the general collection are many others, named and unnamed, which have been selected for further trial. Some of these, such as "73" and "76," are great gains, whose depth of colour, dark Aconitum-like buds and good habit render them conspicuous among their fellows. Others promise to eclipse even that remarkable variety, the Rev. E. Lascelles. Then, of course, there is the white-flowered section, or that section of the flower which at one extreme embraces the whitest as yet, and from this leads through ivory and cream to the palest primrose or sulphury yellow shades at the other end of the chain. So far, no rapid progress has been made in either direction, despite the fact that both white-flowered and yellow-flowered varieties or species do occur in the group. To raise either of these colour shades to the same high standard of excellence as is seen in the blue-flowered forms will naturally require much time, and the fulfilment of the promise may remain for future generations. To-day, however, one thing is clear that whereas blue-flowered varieties of the best types will sell in their hundreds or thousands, the whites and allied shades appeal only to a small number of specialists.

The Larkspurs, however, although one of the great features of Mr. Perry's place in June and July, are but a solitary item in the nurseries. There are Irises by the acre, including the more grotesque of the cushion forms, the hybrids or cross-breeds nearly or distinctly related thereto, together with a great number of interesting species, to say nothing of the wonderful array of flag Irises, and that ever fascinating race of Japanese flags, *I. laevigata*, which appears as a fitting finale to a flowering period which continues unbroken for many months. Lilies, Eremuri, Michaelmas Daisies, and Spiraeas are grown in great numbers, Spiraeas forming a fine group of plants for water-side gardening. Aquatics, including the hybrid Nymphaeas, are cultivated on a large scale. In this department *Thalia dealbata* in flower, if not showy, was a most interesting subject, while the giant form of *Saxifraga peltata*, rising to several feet in height, is equally valuable for the waterside and shady places. In the Alpine department many things claimed attention, but I can only mention the pretty *Parrya Menziesii*, which may be likened to a purple-flowered Alyssum; *Phyteuma comosa*, and its still rarer variety, *P. c. alba*; and *Osmia decipiens*.

The hardy Fern department is an extensive and modern addition to the establishment, where thousands of plants receive proper shade and accommodation in lattice-work sheds that render an inspection of them at once easy and convenient. Seedling Ferns are being raised in their thousands. *E. H. Jenkins.*

FIG. 21.—ROSE "SIMPLICITY": WHITE, SINGLE VARIETY.

types of summer bedding, and to witness how hardy plants are now in the forefront of good gardening, whilst there are numerous nurseries wholly devoted to their cultivation, is an experience indeed.

Instrumental as Mr. Perry has been in the introduction of not a few good hardy plants to this country, he naturally has many reminiscences, but I will confine my remarks to the nursery. Those who saw his "blue tent" at the recent Holland House Show, when he arranged some 25,000 or so of cut spikes of Delphiniums, will not need to be told that the Enfield resources in this particular line are great indeed. It is the first time, and I speak with an experience of nearly 40 years of London exhibitions, that an entire tent has been devoted to a single group of plants. At Enfield, there are some

whose stately spires of richly-coloured flowers are very handsome. In short, to the July garden these Larkspurs have become indispensable, not a few of the plants producing a secondary flowering in September or thereabouts. The following are some of the more conspicuous in Mr. Perry's collection: Queen Emma, azure blue, brown bee centre, very fine; Lizzie, sky-blue with white eye; Rev. J. J. Stubbs, sky blue with a dark centre; Duke of Connaught, deep gentian-blue and conspicuous white eye; Mme. Violet Goslin, intense blue, flecked with mauve; General Baden Powell, metallic blue with greyish centre; Dragon Fly, royal purple with white centre; Blue Tendre, palest sky-blue with white eyes; Portia, azure-blue with large, dark, bee centre; King of Delphiniums, semi double, royal-purple with conspicuous white eye; Lamartini,

ROSE "SIMPLICITY."

THIS beautiful hybrid Tea Rose may be best described as a single flower, although the blooms possess more than a single row of petals, for its yellow centre contributes very largely to its effectiveness. The petals are pure white, like those of Frau Karl Druschki, and so large as to make the blooms very striking. At the Holland House Show an esperegne furnished with flowers of Simplicity was one of the most conspicuous features in Mr. Hugh Dickson's fine exhibit of Roses. The variety was also displayed in several of the nurserymen's exhibits at the National Rose Society's Show, held in the Royal Botanic Society's gardens, on the 8th inst. The plant is described as a very vigorous grower, so that it may be expected to prove a good garden Rose.

THE ALPINE GARDEN.

SENECIO DORONICUM.

MR. REGINALD FARRER is concerned because of the marked difference between the big patches of *Senecio Doronicum* growing at Kew Gardens and at Oxford, which are "almost completely lacking in tomentum and have thin-textured, flaccid leaves of a clear green," and those in his own nursery in Yorkshire, which "retain their Alpine character without swerving." And he asks "is this alteration simply due to long cultivation or is it specific?"

I may be allowed to point out that *Senecio Doronicum* is known to be one of the most polymorphic of Alpine plants, and therefore little importance need be attached to the forms which it adopts under cultivation in England.

Mr. Farrer is at present staying at Mt. Cenis. If he will look into some of the curious pits in the rough ground immediately opposite his hotel, he may perhaps find green, attenuated examples

others to add to the already vast maze of useless names and synonyms, knowing full well that many so-called varieties and forms are not constant.

I will give but two examples of the coining of undesirable new names by nurserymen which have come under my notice during the past month. In a nursery garden I observed some pots of good, typical plants of *Veronica fruticulosa* L. labelled "*V. saxatilis rosea*," the very existence of the Linnean name being unknown in the nursery. The excuse is that the beautiful blue *V. saxatilis* is a well-known plant in rock-gardens and on a few Highland summits, while the less common, pink-flowered and shrubbier *fruticulosa* one might expect to come more under the heading of "novelties" in certain catalogues. Grenier and Godron called *V. saxatilis* Jacq. the variety *pilosa* of *V. fruticulosa* L., which is far more reasonable than to ignore the older Linnean name altogether.

Again, I was recently shown by a gardener as something exceptional in his really beautiful

The plant described by Mr. Farrer in the *Gardeners' Chronicle* of June 25 as grown at Kew and Oxford as *Senecio Doronicum*, which differs so materially from the Alpine form, is one which I have known for many years. I believe Jacquin is the authority for the name of this plant, which is said to have been introduced in 1705, but I have not access to his description. The non-Alpine form, if I may use such a term, is the more plentiful, and it is sold almost universally in nurseries as *Senecio Doronicum*. It is of no special beauty, and is a great grower in most gardens. Mr. Farrer has done well to call attention to the difference and to the superior beauty of the form with true Alpine characteristics. *S. Arnott.*

In the *Gardeners' Chronicle* for June 6, p. 424, Mr. R. Farrer asks for the history of the plant grown under the name of *Senecio Doronicum* at Kew and elsewhere. There appears to be no record as to the origin of this plant, which

FIG. 22.—ASTER DIPLOSTEPHIOIDES: RAY FLORETS MAUVE, DISC YELLOW.

(See p. 57.)

of *S. Doronicum* 18 inches long, and, probably thus drawn out in their endeavour to reach the light; while, if he climbs a gully at the back of his hotel, he will possibly find clumps of the plant which are intermediate both in stature and in the amount of tomentum, between the thin-textured flaccid-leaved form and the truly Alpine plant, which grows 1,000 feet higher.

A great deal too much importance is being attached by nurserymen in England to minute differences, or even marked differences, of form and character, exhibited by individuals of certain hardy plants. I have heard some of them complain that it is useless to send a possibly new form to Kew, for it will be returned with merely the specific name. The botanists at Kew, and those who have had great experience of seeing plants grow in their native haunts, are accustomed to the immense variability of certain species, and, fortunately, they are not disposed to encourage nurserymen and

rock-garden, some miserable and small-headed specimens of the common *Orchis maculata* labelled "*superba*"! They had been bought a year or two previously from a well-known London firm. It came as a shock to this man to be told that he could find far handsomer specimens of this common *Orchis* on the heathy commons in his own district. But such cases could be multiplied, for the temptation in the trade is greater even than that of the young American botanists who sometimes wish to gain kudos by the rash application of new names to plants which may have been known for many years and properly determined.

The question of "novelties" in trade catalogues is another point to which attention might be drawn, for even though the term be used in a relative sense, it looks ridiculous to see such common and widely-spread plants as *Biscutella levigata*, *Calamintha alpina*, and *Ajuga pyramidalis* figuring as "novelties." *H. Stuart Thompson*

probably came with others in a collection presented to Kew when the rock-garden was formed.

On looking through the specimens in the Herbarium, it is evident that *Senecio Doronicum*, collected in various countries, differ very much both in habit and in the amount of tomentum on the leaves and stems. The Kew plant appears to more nearly resemble forms that are found in Transylvania and Hungary, which have received the name var. *glaberrimus*. There is also a specimen of *S. Doronicum* collected in the Tyrol without the usual tomentum and closely resembling our plant. Nyman, in the *Conspectus Florae Europaeae*, gives three distinct varieties: var. *transsylvanicus*, var. *ruthenicus*, and var. *Gerardii*. The var. *glaberrimus* is referred to as a synonym of the var. *transsylvanicus*. There is also a fourth variety, *S. Doronicum* var. *Hosmariensis*, from the limestone rocks of Northern Morocco, which is figured in the *Botanical Magazine*, t. 6101. It may thus be inferred that the Kew plant is not an instance of degradation, but

merely a geographical form that makes quite an ornamental plant for the rock-garden on account of its free habit and general floriferousness. W. I.

VIOLA VALDERIA.

BURNAT gives this very rare and interesting Pansy as synonymous with *V. alpina*, which is a species of the Eastern Alps, differing from *V. cenisia* in the possession of a single tap-root, of a strictly tufted habit and of a less greyish colouring in its foliage. (*V. cenisia* is often of a livid colour, like iron.) On the other hand, some declare that *V. Valderia* is close to *V. heterophylla*. I am far from all authorities here, but in the midst of *Viola Valderia*. From so much acquaintance I should certainly say it was a very close relation of *V. cenisia*, and only the remotest cousin of *V. heterophylla*. It occurs on stone slopes invariably, has a tap-root and a tufted habit; its foliage, thoroughly villous, is of a greener colouring than *V. cenisia*; otherwise the two plants are very close together, though *V. Valderia* grows at lower elevations than the high, shingle slopes affected by *V. cenisia*. Here, in its name-place, *V. Valderia* inhabits rubble-slides at about 4,000 to 4,500 feet, as against the 7,000 feet at which, in my experience, you may first begin to hope for *V. cenisia*. The flowers of *V. Valderia* are charming; they are variable, but not to the extent of *V. catarata*, longish and starry outline, like refined *V. cornuta* pulled into a better shape. The lateral and lower petals have a pencilled purple dash and beard at their junction, which gives intelligence to the expression of the soft lavender flowers, with their delicate, golden eye. One may hope that this exquisite and rare treasure may be amenable to moraine culture; in open ground it would probably grow coarse and unattractive, its flowers not being large enough to admit of any further development in leafage or habit. On the contrary, like *V. cenisia*, it may prove difficult and hard to satisfy, unless treated carefully as a plant of the high moraines. At first sight, however, I must confess it looks as if it might well turn out a more amenable plant than the wonderful, beautiful *V. cenisia*. *Reginald Farrer, Baths of Valderia.*

NOTES ON IRISES.

SOME CALIFORNIAN IRISES.

THE various species of Iris native of the Western States of America seem to be well known and less generally cultivated than they deserve to be. The chief reason for this neglect appears to be that they do not lend themselves to the nurseryman's habit of moving all herbaceous plants in the autumn. If the plants are uprooted then, the more delicate of these species invariably die. They are somewhat erratic in their behaviour at any time, but, if treated carefully, they may be moved with very reasonable success at any time from April till early September, though, by preference, I should choose the earlier part of this period for the operation. By careful treatment is meant that the young root-fibres must not be ruthlessly trimmed off after the neat fashion in which Iris rhizomes arrive from Holland, for the slender rhizomes send out comparatively few of these fibres, and if these few are mangled, the plant stands little chance of re-establishing itself in new quarters. These Irises are best suited in a light soil that is free from lime and rich in humus.

It is a curious fact that American Irises seem to go in pairs, the individual members of which are, in most ways, almost identical, though their other characters are so distinct that we cannot group them together as one species. Of such pairs, *I. bracteata* and *Purdyi*, *I. longipetala* and *missouriensis*, *I. Watsoniana* and *Douglasiana*, *I. hexagona* and *hexagona Lamancei* are examples, though the two latter are, of course, natives of the Eastern States.

I. bracteata is one of the most beautiful of all Irises. It derives its name from the fact that its stem is clothed in short, leafy bracts, and its evergreen habit is certainly a point in its favour. The flowers are yellow-veined conspicuously, and yet delicately, with a colour that comes very near to crimson, while the deep-green, glossy leaves set off the flowers to great advantage. *I. Purdyi* is very similar. The leaves are rather narrower and shorter, but the flowers bear the same crimson veins on a yellow ground, although, in this case, the shade is a little lighter. In both species, the pointed falls are held horizontally, and the only real difference lies in the fact that, in *bracteata*, the perianth tube is very short, while in *Purdyi* it is nearly 2 inches in length. The plants are obviously different when growing side by side, and yet it would be very difficult accurately to define the difference between them if it were not for this distinct feature of the length of the tube.

I do not know of any record of other hybrids of *bracteata*, but this year I have had in flower here a dwarf plant which bore six or seven stems, and beautiful pink flowers of the characteristic shape of *bracteata*. The pollen parent I cannot give, as the seed parent would seem to have been fertilised naturally. It was growing in close proximity to both *Douglasiana* and *tenax*, and I incline to think that, to judge from the dwarf, somewhat spreading habit of the foliage, the pollen must have been that of *Douglasiana*. However that may be, the hybrid is certainly far more floriferous than its mother, and a delightful plant for some sunny corner in the rock-garden.

I. Hartwegii is one of those species which catalogues describe as of botanical interest, meaning, of course, that they do not wish to be ineluctable to any plant. The small flowers are of a pale straw colour, and two or three are produced on a slender but wiry stem, 4 or 6 inches long. My plants are growing where the seeds were sown in the open, and they are apparently quite hardy, at least in a light soil. They have flowered well both last year and this, and I hope they will consent to give me a fresh stock of seeds before any evil fate overtakes them.

I. chrysophylla, from Oregon, looks a picture of ill-health, and yet, since it flowers annually, I am beginning to think that its yellow leaves are enough to distinguish it from *macrosiphon*, with which it agrees in many ways. The stem is short, but the flowers are borne upon a long tube over 2 inches in length. They are of a creamy-white, with a few golden veins in the centre of the falls that seem to sparkle in the sun.

I. tenax is so called because of the wiry fibres of its leaves, which the Indians used to twist into twine of considerable strength. The stems rise well above the leaves, and bear comparatively large flowers, which may vary in colour from the palest pearly-grey, through delicate shades of mauve, to a deep, rich, claret tint. This really valuable plant suffers, I believe, from a note as to its cultivation in a certain popular book on the Iris, which describes it as thriving in peat kept moist with Sphagnum in partial shade. Under these conditions, my plants certainly did not thrive, but in dry sand, in a sunny position, they thrive amazingly and flower well.

For some time, I have been trying hard to solve the mystery of the longipetala, missouriensis, tolmeciana group, but only become more and more puzzled, and must obtain more material before coming to a definite conclusion. The examination of a large number of herbarium specimens collected in different localities has not thrown much light on the subject; but I incline to think that what was first described as longipetala has deep-green leaves of lax, almost evergreen habit, longer than the stem, which always bears more than two flowers on pedicels of unequal length, while missouriensis was applied to an earlier flowering plant with somewhat yellow-green leaves, which are more or less erect at flowering time, and distinctly shorter than the

stem, which bears only two flowers. This theory, however, received a shock this year, when a batch of seedlings raised from Californian seed, and having the foliage of missouriensis, produced the inflorescences of longipetala. It is possible that the seed was from plants that had accidentally become cross-fertilised; unless this was the case, it would seem almost impossible to keep up any distinction between the two species. I am endeavouring to raise a second generation from these plants, and the results ought ultimately to throw some light on the question of the validity of the two names.

Its macrosiphon I have never yet had in cultivation, but from all accounts, and to judge from herbarium specimens, it must be a desirable plant. It varies very much in colour, and is readily distinguished by the long (2 to 3 inches) tube.

I. Douglasiana and *Watsoniana* are obviously very similar, if not merely local forms of the same species. Both have practically evergreen leaves, with pinkish base, that are at their best in winter; but while those of *I. Douglasiana* are narrow and lax, those of *I. Watsoniana* are broad and stiff, and spread in almost horizontal, fan-shaped tufts. A number of seedlings that I have raised here from plants of uncertain origin seem to show that these characters in the foliage are transmitted unchanged, but the plants are in other respects so similar that they hardly deserve to rank as more than subspecies. The colour of the flowers is extremely variable. It may be a deep rich violet with white veinings on the upper part of the blade of the fall, or these markings may be almost wholly absent. Other plants bear flowers of a pale lilac or lavender shade, and yellowish examples are not unknown. One fine large-flowered seedling has almost white flowers, with a faint tinge of lilac and some yellow at the throat, while another is heavily veined with violet on a silvery-white ground, producing a flower not unlike a small *I. longipetala*. Such seedlings flower in one or two years at the most from the time the seeds germinate, and it may be that this fact has only to be more widely known than it appears to be to induce many gardeners to embark on the fascinating pursuit of raising Irises from seed. *W. R. Dykes, Charterhouse, Godalming.*

ASTER DIPLOSTEPHOIDES.

THIS species (see fig. 22) forms one of a group of three very attractive Himalayan Asters, to which the attention of gardeners may well be directed. The others are *A. subcaeruleus*, now well known and extensively cultivated in some districts as a florists' flower, and the new *A. Falconeri*, figured and described in the *Gardeners' Chronicle*, vol. XLVII, p. 395. The flowers of *A. diplostephoides* are borne on unbranched stems 18 inches high; they measure 5 or 4 inches across the petals, the ray flowers being rich mauve with the satiny sheen of *A. sericeus*; the disc flowers are yellow, passing to light orange. The lustrous green leaves are arranged in a series of rosettes, and extension is by surface runner growths. In my Mendip gardens the plants are not thrifty and flower but sparsely, particularly where the rock comes up near the surface, but in the home nurseries it flourishes in the deep alluvial soil, making rosettes of leaves 9 to 12 inches in diameter and flowering profusely. The illustration (p. 59) shows one of several patches, simply formed by inserting 9 or 12 small rosettes in a square yard of border space, 12 months ago. Treated liberally as to soil and divided annually (in summer) by preference, *A. diplostephoides* is capable of giving an amazing patch of bright colour to the border, and of yielding quantities of flowers for cutting. *Georg. B. Mallott, Cheddar.*

**CAMPANULA PORTERSCHLAGIANA
VAR. MAJOR.**

THIS variety of Bellflower, commonly called *C. muralis* in gardens, is a much better garden plant than the type. The flowers are borne profusely in leafy sprays which collectively form imposing mounds of considerable size. The plant is better adapted to the conditions of the hardy plant border than a dry, rock-garden, but where rockeries are arranged on a broad scale, with large soil areas, this *Campanula* will prove very attractive. The specimen illustrated in fig. 23 is a yard in diameter and was planted as a rooted cutting two years ago. It has been a never-varying mound of blue for five weeks, and at the time of writing, despite un congenial weather, it is still attractive. I believe the variety is of garden origin. The flowers are coloured bluish-purple, but there is much more blue than purple. Grown adjacent to *C. muralis*, it at once attracts attention by its vigour and richer colouring, whilst the flowers are nearly twice as large, the finest measuring 1½ inch across the expanded tube. It is suitable for planting in the flower border and grows satisfactorily but less vigorously in a wall-crevice. My finest plants are planted in a rich loam overlying fissured limestone, and they have made a blue mat several square yards in area—a fascinating patch of true Alpine scenery. *George B. Mallett, Cheddar.*

NOTICES OF BOOKS.

DISEASES OF CULTIVATED PLANTS AND TREES.*

MR. MASSEE is so well known as a student of mycology, and his contributions to the science are so important that his new volume is assured of a hearty welcome. Though this volume covers much the same ground as that traversed by his *Text-book of Plant Diseases*, yet it is a worthy successor to that latter admirable work. For, whilst retaining the excellent features of the older work, the new volume is fuller, and, of course, up-to-date. The main work of the book—that of the description of the parasitic fungi, is preceded by a general introduction to the subject, in which the causes of disease, the modes of distribution of fungus-spores, and similar important topics are discussed. The only comment we would make on this part of the book is that the sections on spraying might be extended with advantage. The method of spraying, crude as it undoubtedly is, constitutes the most important means of combating fungus pests which we have at present. Therefore, a text-book which, like that of Mr. Massee's, appeals not only to the student but also to the practical man, should, in our opinion, deal more fully with this subject. Thus, for example, the only kind of lime-sulphur fluid to which reference appears to be made is the "self-boiled" mixture. If, however, we may rely on recent work in America, the self-boiled lime-sulphur fluid is not so good for fruit-tree spraying as the preparation made by boiling the ingredients with water. Nor is reference made to what is proving of undoubted importance to fruit-growers, viz., the lime-sulphur arsenate of lead mixture. We hope that in the next edition Mr. Massee will enlarge considerably the sections which deal with sprays and spraying, and that he will also draw up and include "spray-calendars" for garden and orchard crops.

The bulk of the volume under review is occupied by admirably terse descriptions of disease-producing fungi, descriptions which show at every page that they are drawn by a master hand. Occasional misprints, of course, occur, but for a work which presents so many pitfalls

* *Diseases of Cultivated Plants and Trees.* G. Massee, Assistant Keeper, Herbarium, Kew, (London: Duckworth & Co., 1910.) 7s. 6d. net.

for printers as this, the number of errors is surprisingly small.

We are by no means sure that Mr. Massee has done wisely—though, in so doing, he justifies the title of his book—in including sundry animal pests within its pages. To deal with the diseases of plants due to animals in 26 pages (pp. 534-560) is to attempt the impossible. Mr. Massee's frequent references to the work of others prove that his reading is almost as wide as his own first-hand knowledge. Occasionally, however, we fail to find reference to work which, in our view, is important enough to deserve citation. To give but one or two instances, in the account (p. 441) of Bean anthracnose (Pod Scab) Whetzel's investigations are omitted; nor is reference made to those of Smith and Swingle with respect to winter rot of Potatos.

We recognise fully that, to include all recent work of importance would increase unduly the size of the book. This, however, might perhaps be met by extending considerably in a subsequent edition lists of the more important researches bearing on the several diseases. A brief chapter on culture-methods would also enhance the value of the book. Details such as these, however, do

not prevent us from recognising that Mr. Massee has produced a most valuable work, and one which will add to the already high reputation which he has made for himself as a student of mycology. We feel confident that Mr. Massee's efforts on behalf of this science are bound to lead an increasing number of botanists to take up seriously, from the research point of view, this study, the foundations of which were laid in larger part by Berkeley, many of whose discoveries were first published in these pages. The mycologists of this country, though of high ability, are small in number, and in research, as in other contests, numbers count.

CITY, SUBURBAN AND WINDOW GARDENING.*

THIS little book aims at helping the owners of town gardens to make them attractive. The following extract gives a fair idea of the character of the contents:—"Liquid manure.—To make this put a quantity of soot in a small

* *City, Suburban and Window Gardening.* By D. Grant McIver. (London: Dawbarn and Ward, Ltd.) 6d. net.

GARDENING FOR ALL.*

THIS practical handbook has already had many things said in its favour, for its usefulness is undoubted. We could have wished, however, that the author had extended his revision to some of the lists of flowers. Sweet Peas, for instance, which is several years belated. The list of 15 varieties of Apples for culinary purposes contains only three late sorts. Nevertheless, the volume is a very trustworthy guide to the beginner in gardening. No better gift could be bestowed on a working man with a garden and a wife, who is also considered by the author. *B.*

WINDOW AND INDOOR GARDENING.†

THIS is a more pretentious volume than the title would lead one to suppose. In addition to

the usual things included in horticulture for the home, there are chapters on roof gardens, balconies, verandahs, the furnishing of the outside walls of the house with suitable vegetation and floral decorations. It is indeed somewhat bewildering in its scope, and reveals a condition of domesticity in the City that few previously unacquainted with details would credit. Compared with Burbidge's *Domestic Floriculture*, not yet quite out of date in much of its contents, I should be inclined to say that, in spite of a wider purview, it comes short of that work in the lucidity of its remarks and in the value of its plant lists, many of the best house plants being unnoted, and, as in the case of *Aspidistra*, the less suitable species recommended. On the whole, however, it provides a vast amount of information on a fascinating subject. *R. P. Brotherston.*

HARDY CRINUMS.

WHEN Crinumms were first introduced into this country, they were grown in heat, but after experiments had been made in cold houses, and later in the open air, *Crinum capense* was found to be hardy. It is a fact that finer results are obtained when these bulbs are grown permanently in the open air than when they are confined to pot-culture. The ground where the Crinumms are to be planted should be well drained at a depth of 4 feet with broken bricks, clinkers or rubble, and the bed should be composed of porous soil which will not be over-retentive of moisture during the winter. At the same time, Crinumms are sometimes seen doing well in heavy, adhesive soil with no drainage whatever. If full-sized hulbs are procured, a hole at least 3 feet deep must be prepared for them, as the largest are often nearly a foot in diameter at the base, and almost 3 feet in length to the top of the tapering neck. It is often advised that they should be planted in front of a south wall, preferably that of a hothouse, but in the counties of Devon and Cornwall this is unnecessary, as they succeed admirably in the open ground far distant from

spikes are from 3 feet to 4 feet in height, and on old clumps that have not been disturbed for many years, 20 to 30 scapes will often appear simultaneously. There is a white variety that is handsomer than the type, but neither is worthy of culture when finer species and varieties are obtainable.

C. MOOREI (syn. *C. Mackenii*, *C. Colensoi*, *C. Makoyanum*, *C. Macowanii*, *C. Schmidtii*, *C. natalense*, *C. ornatum africanum*).—This Crinum suffers from being over-named, and many have purchased it under one of its titles only to find that they already possessed it under another name. This is the species shown in the illustration in fig. 24. The plants are growing in a portion of the public gardens at Torquay known as the Rock Walk. The situation is absolutely sheltered from the north and east by a perpendicular cliff over 100 feet in height, which is immediately behind the long bed in which the Crinumms are growing. In this bed there must be fully 300 flowering hulbs. The spot is exceptionally favoured, and on the cliff face grows *Plumbago capensis*, which flowers profusely; *Cestrum elegans*, which often blooms as late as November; while *Stauntonia latifolia* and *Physi-*

allowed to grow into large clumps, it bears several flower-spikes at the same time. Its leaves are of a deeper green than those of *C. Moorei*, being also glossy and channelled. They are 4 feet in length and 4 inches in breadth. The flowers of the type are of a deep-rose tint, and, in vigorous plants, are borne in umbels of from 10 to 15, and are about 6 inches in diameter. There is a pale flesh-coloured form known as *intermedium*, and a very lovely, pure-white variety, *C. Powellii album*, this being the handsomest of all the Crinumms. It takes more after the pollen-parent than does the pink type, and has larger and better-shaped flowers.

C. YEMENSE.—This is a recently-introduced species, and differs from all the other Crinumms in being deciduous. Its leaves are somewhat like those of *C. Powellii* but shorter. It is a beautiful plant, producing more flowers on a scape than any other of its race. The blossoms are white, and are borne on scapes about 2 feet in height. As many as two dozen flowers are sometimes carried on a single scape. It is perfectly hardy in the south-west. *C. crassifolium*, syn. *Van Tubergen*, and *C. Schimperii* appear to be somewhat similar to *C. capense*, but they are finer forms, though they do not equal *C. Moorei* or *C. Powellii*.

Any amateur anxious to embark on the culture of Crinumms may be advised to limit his selection to *C. Moorei album*, *C. Powellii*, *C. Powellii album*, and *C. yemense*. *Wynndham Fitzherbert*.

NOTES ON APRICOT CULTURE.

ALTHOUGH the weather conditions have not been of the best for Apricots, for this fruit revels in an abundance of sunshine and warmth, yet the trees have made good growth, and they have plenty of clean foliage. Caterpillars have not given much trouble. Whether this is due to persistent spraying of the trees and walls every winter, I am not prepared to say, but certain it is that these pests are conspicuous by their almost complete absence this season.

The chief thing demanding attention just now is to stop or pinch back the superfluous growths to four or five buds, but preserving any shoots required for replacing branches which have died or appear to be useless, or for filling vacant spaces in other parts of the tree. Some varieties are prone to produce more spur growths than are desirable. If these are merely cut back, time after time, the spurs become much crowded, and this necessitates considerable thinning. This condition may be avoided in great measure by thinning out the young shoots, or, in other words, pulling them out in the same manner as in the disbudding of a Peach tree. The same principle may be applied to both Pears and Plums against walls with equally good results.

Young trees must have special attention paid them in this direction, so that ample provision is made for furnishing them both with main and subsidiary branches. The surplus should be pinched back to form spurs.

The next thing is to thin the fruits down to safe limits in all cases where the crop is an abundant one. It is not, I think, a good one generally, but those who were fortunate enough to have saved the blossoms from frost, and are now enjoying the spectacle of seeing the trees well loaded, should see to it that the energies of the trees are not overtaxed. If thinning is judiciously carried out every year, Apricots grown in suitable conditions as regards climate, position and soil will bear as regularly as Peaches, but the trees must be given adequate protection while in bloom. With respect to the actual thinning, it should be mentioned that one fruit to every 9 inches square of wall space covered by the tree will be an ample allowance. The smaller sorts or such as are usually employed for preserving purposes may stand as near together as 6 inches apart each way. Twins and triplets should be reduced to one, and the aim should be to have the fruits as evenly distributed over the tree as

FIG. 24.—CRINUM MOOREI FLOWERING OUT-OF-DOORS IN DEVONSHIRE.

walls. They should be abundantly supplied with water and liquid fertilisers during the late spring and summer months, and, on sloping ground, a saucer-like depression should be made round the stems to prevent the water from running away. The leaves are almost invariably killed by frost in winter, but the plants break into growth again in the spring. Specimens left alone for some years develop into enormous clumps, and gain strength each year. The hulbs work deep into the ground and become of immense size, often, in the case of *C. Powellii*, throwing up flower-spikes nearly 6 feet in height. The following kinds are best known:—

CRINUM CAPENSE (syn. *C. longifolium*, *Hippeastrum longifolium*, *H. longiflorum*).—This species has long, tapering, glaucous leaves, often over 5 feet in length, and it bears long-tubed, pink flowers in umbels of from 6 to 12. The blossoms are about 6 inches in length, 4 inches across, and sweetly scented, but as they droop and are never fully expanded, they are inferior in attractiveness to the flowers of others kinds. The flower-

anthus albens both blossom and bear fruit freely. By some, *Crinum Moorei* is held to be tender, but in the south-west it is absolutely hardy and requires no protection. It has roughish leaves of a light-green colour, about 3 feet in length and 5 inches in breadth, and it carries its handsome, rosy-pink flowers in umbels of from 10 to 12, on tall stems. The blossoms are widely expanded, and are often fully 6 inches in diameter. The white variety *C. Moorei album* is a very beautiful plant, precisely similar to the type, except that it bears pure-white flowers. There is also a variegated form of this Crinum, known as *C. Moorei variegatum*, which is said by some writers to be too tender for outdoor cultivation, but with me it is quite hardy. The flowers are said to be very beautiful, but my specimen has not as yet bloomed. It is valuable for its handsome foliage, the leaves being striped with broad, longitudinal bands of white.

C. × POWELLII.—This is a beautiful hybrid, raised by fertilising *C. capense* with the pollen of *C. Moorei*. It is quite hardy, and, when

circumstances permit. If any exception is made to this rule it should be in favour of extra vigorous branches, which may be allowed to carry rather more fruits than would otherwise be advisable.

If the alleys have not been pricked up and mulched with half-decayed manure, this should be done at once. The roots must also be kept well supplied with water, for the fruits will not swell freely if the border is in any way lacking in moisture. A good stimulant consisting of 3 lbs. superphosphate of lime, 1 lb. sulphate of ammonia, and 1 lb. of sulphate of potash, mixed together and applied at the rate of 2 ounces per square yard, may be applied prior to affording water. Another such dressing may be given when the fruits are as large as Walnuts.

The above formula may be varied by substituting bonemeal for the superphosphate and muriate of potash for the sulphate of potash. Another mixture is made by taking 1½ lb. each of superphosphate of lime and bonemeal and 2 lbs. of muriate of potash, mixing them together, and applying as above. Guano, dried blood, and nitrate of soda may also be employed with beneficial results, but manuring of any kind must not be overdone. Where liquid manure is plentiful, no better stimulant than this can be had for Apricots when the fruits are swelling towards maturity. A. H.

The Week's Work.

THE ORCHID HOUSES.

By W. H. WHITE, Orchid Grower to Sir Trevor Lawrence, Bart., Burford, Surrey.

Calanthe.—*Calanthes* of the *C. vestita* and *C. Veitchii* section have filled the pots with roots, and numerous roots are spreading over the surface of the soil. They require an abundance of water both at the root and in the atmosphere, the latter especially on bright, sunny days. It is desirable also to surface the top roots with rough, yellow loam, mixing with it some fine, dry cow manure and small crocks. After they have permeated the fresh soil, liquid manure made from cow dung may be given alternately with clear rain water. The liquid manure should be passed through a fine strainer, in order that it may be used as clear as possible, and, therefore, not clog the compost. These *Calanthes* need a comparatively high temperature, especially where the atmosphere of the house or position is naturally damp. At Burford the night temperature never falls below 70°, and more often than not at this season it is nearer to 75°. Low temperatures accompanied with moisture is one of the principal causes of "spot" so often seen on the pseudo-bulbs and leaves of these plants. If the *Calanthes* are grown amongst stove plants they should be placed altogether near the root glass, where no drip or water from the syringe can reach them. When grown in a lean-to house with a south aspect, the new growths often become drawn toward the light, and thus form themselves into a semi-arching position, instead of growing erect. In order to prevent this it is advisable to tie them back while in the young state to neat sticks, using broad, flat pieces of raffia so that they will not cut or mark the growths. The *C. Regium* section are somewhat later in making their growth, but when they become well rooted they will need similar treatment to the varieties of *C. vestita*. The pure white *C. veratrifolia* is an evergreen species which has passed out of flower, after being in full beauty for about two months. The young growths have already made considerable progress, and, any repotting the plants may require should be done at once, potting them like ordinary greenhouse plants, with the surface of the soil just below the rim of the pot, the compost being of a firm but porous nature, such as fibrous yellow loam, *Osmunda* fibre, leaf mould, and sphagnum-moss in equal parts, with the addition of a moderate amount of small, broken crocks. Give the plants plenty of root room, and about 2 or 3 inches of crocks for drainage. After the potting the plants should be placed in a well-shaded corner of the Cattleya-house; they must not be afforded much water until the roots are seen pushing freely through the compost. Other evergreen *Calanthes*, such as *C. japonica*, for which a cool intermediate house is most suitable, are now sending up their flower-spikes,

and will require an abundance of water at the root till the flowers open, when the quantity may be considerably lessened.

Phaius, &c.—The different sorts of *Phaius* as *P. Wallichii*, *P. Sanderianus*, *P. Blumei*, *P. grandifolius*, *P. Mishmensis*, *P. maculatus*, *P. bicolor*, and the hybrids *P. Cooksonii*, *P. Norman*, *P. Marthæ*, *P. Wiganianus*, &c., also *Phaio-Calanthe Arnoldiæ*, *P. C. Colmanii*, *P. C. Sedenii*, *P. C. irrorata*, &c., and the distinct *Phaio-Cymbidium Chardwarensis*, having started to grow, may be repotted if any of them are in need of fresh compost or larger pots. They all root well in the mixture already mentioned, and they may be potted in the same manner. They need similar cultural treatment to *Calanthe veratrifolia*. During their season of growth a decidedly moist atmosphere should be maintained, which may be done by damping well between the pots several times daily, and lightly spraying the plants overhead when the weather is suitable, but should the point of the leaves become black or discoloured, the moisture should be lessened. The pseudo-bulbs and roots being liable to attacks of mealy bug and scale, they should be frequently examined for these pests. *Phaius tuberculatus* may also be repotted, using rather more sphagnum-moss than for the other species and hybrids. The plant requires more heat and moisture than its congeners, and should be kept in a shady position at all times. Small, yellow thrips are the worst enemies of this species.

THE FLOWER GARDEN.

By E. DECAFFI, Gardener to the Hon. Vicary Gibbs, Aldenham House, Hertfordshire.

Ornamental grasses.—These comprise many different species of Grasses especially useful during the dull months of the year, when decorative material is difficult to procure. They include species of annual and perennial nature, varying greatly in their habit, some only a few inches high, others many feet. Those of annual duration make interesting subjects when sown on a narrow border in the garden, and require but little attention after sowing. A warm, well-drained soil suits them best, and for preference a site facing S.W. or W. Frequent stirrings between the rows with the Dutch hoe will do much to stimulate their growth, and hand-weeding, if necessary must be carried out with caution. There are many varieties, but a few of the best known and most useful are *Agrostis* in variety, *Anthoxanthum gracile*, *Avena sterilis*, *Brizas* in variety, *Brizopyrum siculum*, *Bromus briziformis*, *Chloris barbata* and *elegans*, *eragrostis* in variety, *Hordeum jubatum*, *Lagurus ovatus*, *Leptochloa gracilis*, and *Pennisetum villosum*.

Tropaeolum speciosum.—This climber makes an impressive sight when in full flower, but it is frequently very difficult to establish in the south of England. In the north, and especially in Scotland, the species thrives so well that it may be seen flowering in the greatest profusion on many cottages. Perhaps it is never so effective as when the shoots are allowed to ramble over some dark green background, such as is provided by *Rhododendrons*, *Hollies*, or *Yews*, and in such a position that whilst the growths and flowers are exposed to the sunshine, the roots remain in a cool and shaded place. This method of cultivation may well be tried by anyone wishing to succeed with this delightful plant; the presence of the *Tropaeolum* does not seem to injure the supporting shrubs in any way, but as soon as the growths become unsightly, being thoroughly ripened, they may be cut off and taken away.

Carnations.—Border plants will now need much attention in regard to tying up the flower-spikes. In the event of dry weather give thorough soakings of water, and keep a loose surface on the bed by frequent hoeings. Many growers will soon commence layering the plants for next season's stock, though this may easily be deferred for a few weeks if necessary. This work should, however, be done sufficiently early to allow the plants a good chance of becoming well-established before the approach of less favourable weather. If the ground is very hard, loosen it with a fork, and employ a mixture of fine soil, preferably loam, and leaf-mould with a good addition of sharp river sand or other of a gritty nature, to place the layers in. For some time afterwards, especially if the weather is dry, occasional dampings in the

morning and evening will greatly assist the layers to form roots.

Pinks.—These have passed out of flower, and will need looking over and the flowering-stalks removed. The present is a good time to propagate these plants by taking off the cuttings or pipings, as they are sometimes called, and inserting them in a sandy compost in a cool, shaded position, such as is afforded by placing a hand-light under a north wall or hedge. For general purposes this method is to be preferred to layering, as the growths of many are of such frail nature that these are soon broken, though with choice varieties of moderate growth layering may be more the reliable practice.

Pentstemon.—*Pentstemons* are now fast pushing up their flower-spikes. Use the Dutch hoe frequently between the plants to keep them free from weeds and to stimulate growth. *Pentstemons* make splendid subjects for bedding purposes; they embrace almost every shade from pure white to deep purple. Especially valuable also for massing is the variety *Newbury Gem*, and its sports.

The summer bedding plants.—These are now becoming established, and hand weeding is the only means of ridding the beds of weeds. It will be necessary to check the growth of many of the stronger growing plants where it is necessary to preserve the outline, as in carpet bedding. Tying must be attended to, especially in respect to the more robust and quick-growing plants in the sub-tropical border. Broad strands of raffia only should be used, and they must not be tied too tightly. Attend to the pegging down of the growths of the various plants used for carpeting, and remove decayed flowers and foliage in order to make the beds appear as tidy and fresh as possible. Beds laid out in grass should have the verges cut frequently with the edging shears. In hot, dry weather watering with a rose-can is best performed either in the evening or after the dew has evaporated in the morning.

PLANTS UNDER GLASS.

By JOHN DONOGHUE, Gardener to JOSEPH PICKERSGILL, Esq., Barton Hill, Weetwood, Yorkshire.

Stephanotis floribunda.—The flowering season of this plant may be prolonged if the roots are supplied with frequent top dressings of some approved chemical fertiliser and occasional waterings with clear soot water. As the season advances, thin out the weak growths, to secure for the permanent shoots full exposure to the light and air. Propagation may be effected from shoots inserted singly in small pots and plunged in a brisk bottom heat. They will root readily at this season, and later may be wintered on a shelf near to the glass, repotting them as they require more root room. Although young plants of *Stephanotis* do not flower so freely as the older specimens, they produce flowers of excellent quality.

The Fernery.—This house will now require a general overhauling, with a view to re-arrangement. Should any plants require repotting, this operation may be completed during the present month. Plants which are allowed to remain in the same pots should be grouped together, so that they may be watered with clear soot water and liquid from the farmyard. Many of the newer varieties of *Nephrolepis exaltata*, such as *Todeoides*, *Pierstoni*, *elegantissima*, and *Whitmannii*, are developing robust fronds; these should be looped carefully with thin green raffia-tape to a central stake. As the season advances, the atmosphere of the Fernery may be kept less moist by allowing a free circulation of air, the ventilators remaining open a little during the night.

Palms.—In the case of large specimens, autumn potting is to be recommended, in order that the plants may have ample time to recover before the spring. A selection of plants for potting ought to be made each year, so as to avoid having to use plants indoors during the winter which have been recently repotted. A suitable compost is one consisting of fibrous loam and peat in equal parts, with charcoal, lime rubble and coarse sand. Examine the roots previous to repotting, and if any are removed, take particular care the work is carried out with a sharp instrument. *Phoenix Robellini* is specially suitable for house decoration; it has a light, graceful appearance, and it keeps a long time in a healthy condition.

FRUITS UNDER GLASS.

By E. GOODACRE, Gardener to Sir ERNEST CASSEL, G.C.B., Moulton Paddocks, Newmarket.

Pineapples.—At this season little fire-heat ought to be necessary to maintain the temperatures needed, but the inclement weather lately experienced has occasioned extra care and attention in this respect. During hot weather, air may be admitted freely in the middle of the day; at other times, when the outdoor conditions are adverse, the temperatures may be kept up by fire-heat and enough ventilation allowed to prevent a stagnant atmosphere.

Succession plants.—Those plants which were potted on as advised in a previous Calendar will now have filled their pots with roots, and may be placed in the fruiting pots at once. Use the same sort of compost as before, and see that it is warmed to the same temperature as the house. Take particular care not to disturb the ball of roots and soil, leaving intact any parts of the drainage which have become attached to the roots. Syringe the plants overhead two or three times daily in the form of a fine spray. If heavily syringed the water collects at the base of the leaves and encourages the production of suckers at the expense of the main crown. Suckers which were twisted off the parent plant last month should now be ready to pot up, using pots from 3 inches to 5 inches in diameter, according to the size of the sucker. After the potting, plunge the pots to the rim in the hot-bed. Give the plants ample room and keep them well up to the glass. A slight shade may be necessary on bright days until they are established in the pots. A spell of hot, sunny weather may cause many fruits to ripen at once, but this can be avoided and a succession maintained by removing some of the plants to a cooler house or fruit room. Plants with fruits now swelling will need a hot moist atmosphere and generous supplies of liquid manure, which may be continued until the "pips" show colour, when a cooler and drier atmosphere will be necessary to ripen the fruit.

Insect pests.—White scale is a most troublesome pest, for it multiplies rapidly in the tropical atmosphere of a Pine stove. Examine the plants at regular intervals, and sponge them with some approved insecticide on the first appearance of the pest.

Melons.—On p. 21 under the heading of Melons, the directions after the eighth line refer to plants cultivated in frames.

THE HARDY FRUIT GARDEN.

By A. R. SEARLE, Gardener to the Marquis of NORTHAMPTON, Castle Ashby, Northamptonshire.

Strawberries.—If the ground has not yet been prepared for the planting of a few early plants, it should be got in readiness without delay, so that it will have settled nicely before the plants have to be put out. Land which has been deeply dug and well manured for early Peas will be suitable. When the Pea haulms and any weeds that may be present have been cleared off, such ground will need but little preparation excepting that it may be given a liberal dressing of soot, which should be forked in lightly. If ground of this nature is not available, it will be necessary to trench or double dig a plot for the Strawberry plants, working in a liberal amount of well-decayed manure; the ground should be allowed to settle and be made quite firm by treading, before putting out the plants. The distance apart of the plants should be determined by the vigour of the variety; some varieties make much more foliage than others; the variety Leader, for instance, does not need so much space as Royal Sovereign. A suitable distance to plant most varieties is 2 feet or 2 feet 6 inches apart each way; some growers prefer to plant much closer in the row, and after the crop has been gathered in the following season, they take out every alternate plant; this method may be recommended where space is limited. Give the young plants a thorough watering on the night previous to planting. Make the soil firm round about the plants as the work proceeds, and, if the soil be left a little concave near the plants, water can be more conveniently applied to the roots. Apply copious waterings in dry weather, and sprinkle the plants overhead each afternoon.

The packing of soft fruits.—If it is desired to send Strawberries some considerable distance, the berries should not be allowed to become over-ripe; they are best gathered late in the evening. Choice Strawberry fruits should be packed in shallow boxes one layer deep; a convenient

size is one large enough to take three or four dozen fruits; they should be packed singly in Lime-tree leaves or in their own foliage, which should be slightly withered before commencing to pack. Place the fruits closely together in a slanting position in the box, with the stalks uppermost; this will enable the person unpacking the fruits to take them out without actually touching them; a good packer will not allow his hand to touch the fruit in the packing process. There must be no vacant places in the box when all the fruits are in, or the berries will be shaken about in transit. Raspberries travel well when packed in shallow punnets wrapped singly in Lime leaves; two or three layers of fruits may be placed in each punnet, and the punnets packed closely together in a box just deep enough to take them. For culinary fruits, jars or wide-mouthed bottles are convenient; these can be securely fastened over and packed in the vegetable hamper.

THE KITCHEN GARDEN.

By JOHN DENN, Kitchen Garden Foreman, Royal Gardens, Windsor.

Peas.—The latest sowing of Peas should now be ready for earthing up. The stakes for this batch should be as strong as possible, and they should be pushed well into the ground, as the autumn winds often prove injurious to late Peas. The plants should be given liberal treatment from the beginning, thinning them out well whilst small as a precaution against mildew. If dry weather sets in, a good mulching of dung should be applied before the ground becomes very dry, in order to avoid having to give cold water to the roots, which is a fertile source of mildew.

Carrots.—The Carrots sown for autumn use should be thinned to 3 or 4 inches apart, and a sprinkling of soot should be applied on the approach of rain. Keep the Dutch hoe in use between the rows. Where young Carrots are in demand a sowing of the variety Early Gem or Scarlet Horn may still be made on a warm, south border.

Mint.—Overgrown Mint should be cut down to the ground, and allowed to make fresh growths for use in autumn. After the bed has been cleared of the old foliage, a topdressing of fine soil should be applied to give the bed a clean and tidy appearance. A plantation to be treated in this manner should be made on a north border or some other situation not exposed to the mid-day sun. Plant the roots in rows at 15 inches apart and water freely if the weather is at all dry.

Endive.—Make a good sowing of Batavian Endive to produce supplies through the winter months. Endive sown a month ago will now be ready for planting out.

Lettuce.—Small sowings of Lettuce should be made each week from the present time until the end of August. As the young seedlings become large enough, they should be transplanted on a south or west border, so that they may be left unprotected as late in the season as possible. These late batches of Lettuce should be planted extra thickly, and, as the season advances, all decaying leaves should be removed from the plants. Use the Dutch hoe freely between the rows to keep the soil clean and sweet about the plants. I have found Chelsea Imperial C's a good variety for autumn use, as it stands well into November if the plants are covered with box frames when frosts set in. The variety All the Year Round is also a good sort, and may be had the greater part of the winter if cold frames are available.

Asparagus.—Seedling Asparagus in rows should be thinned sufficiently to ensure the full development of the crowns, and a sprinkling of agricultural salt may be given between the rows to prolong their growth as late into the autumn as possible. The same treatment may be applied to the permanent beds, and a good watering with liquid manure given two or three times during the growing season. Keep the beds free from weeds by the careful use of a draw hoe between the plants or by picking over the surface of the beds with the points of a tork previous to applying manure water. Manure may also be dug into the alleys between the beds any time during the autumn to lighten and enrich the soil for surface dressing next spring. To secure the plants from being broken by rough wind, stout stakes should be driven into the ground along each row, and a wire securely fastened to the

stakes; the plants may then be tied up with matting, or whatever material is used for the purpose.

THE APIARY.

By CHLORIS.

Introduction of queens.—To introduce a queen successfully is sometimes a very easy task, and at others it is very tiresome. Everything seems to depend upon several conditions, e.g., when there is a good honey flow a queenless colony seems to accept a queen more readily than when there is a dearth. This being the case, it is well to feed the bees, if the flow of honey is not satisfactory owing to wet or very dry weather. A queen that has come through the post is not so easy to introduce as one which does not arrive in a fatigued state. Should a queen be received from a stranger, other care is needed, for, with a queen, several workers and food are sent, and disease may be introduced into the apiary. To avoid risk, let the queen and workers out of the mailing cage in a room with a closed window, and perform the operation near the window. As soon as the occupants walk out on the window pane kill the workers and immediately destroy the cage, for a queen has never been known to carry the contagion of foul brood. Then wash the hands with a caustic soap, keeping the queen well under observation. This done, re-cage her.

Removal of old queens.—Remove the queen to be dethroned a few hours before introducing a new one. If the new queen is one of your own, remove her from the hive about half an hour before dusk and release her in front of the entrance or at the top, allowing her to run down. By taking the new queen from her own hive half

FIG. 25.—CAGE FOR QUEEN BEES.

1. The cage cut and ready for bending. 2. The cage folded—the unravelling part is to press into the comb.

an hour before introduction, she will be hungry, and, instead of running hither and thither on the comb and thus creating a disturbance, she asks for food; this her return will give her, and perhaps caress her with their antennae. Should the bees commence to cluster round her and cling to her—this is known as balling—it may be known that the colony is not going to accept her readily. Give the ball a puff of smoke, blowing out to keep the smoke far enough off for the smoke to be cooled by the air, for hot smoke will only anger the bees. When this takes place rescue the queen as quickly as possible and cage her. A cage for the purpose may be made from a piece of wire cloth about 9 inches square. Cut out the corners about 1 inch and unweave 1 inch, and then bend. Fig. 25 (1) shows the cut corners and the unravelling, and fig. 25 (2) shows the cage completed. Cage the queen on a comb containing hatching brood, also a few cells of honey, first shaking off the bees. The young bees as they hatch will, of course, accept the queen. In 48 hours a hole may be partly cut through the comb from the opposite side and the bees will gnaw out the remainder, leaving the queen free to walk out, and her movements will probably be unnoticed by the colony.

A simpler method.—Whenever a queen is introduced into a hive which has been made up of frames of hatching brood from several hives, there is never any difficulty in the introduction. Under these conditions, the entrance is closed and plenty of quilts are put on, the operation being performed in the middle of the day when the weather is warm. Should the weather be cool at night it will be well to take the hive indoors at night. In about a week, the hive may be placed in its permanent position, but only open the entrance sufficiently wide for one bee to pass at a time.

EDITORIAL NOTICE.

ADVERTISEMENTS should be sent to the PUBLISHER, 41, Wellington Street, Covent Garden, W.C.

Special Notice to Correspondents.—The Editors do not undertake to pay for any contributions, or illustrations, or to return unused communications or illustrations, unless by special arrangement. The Editors do not hold themselves responsible for any opinions expressed by their correspondents.

Letters for Publication, as well as specimens of plants for naming, should be addressed to the EDITORS, 41, Wellington Street, Covent Garden, London. Communications should be written on one side only of the paper, sent as early in the week as possible and duly signed by the writer. If desired, the signature will not be printed, but kept as a guarantee of good faith.

Local News.—Correspondents will greatly oblige by sending to the Editors early intelligence of local events likely to be of interest to our readers, or of any matters which it is desirable to bring under the notice of horticulturists.

Illustrations.—The Editors will be glad to receive suitable photographs or drawings, suitable for reproduction, of gardens, or of remarkable plants, flowers, trees, &c., but they cannot be responsible for loss or injury.

Newspapers.—Correspondents sending newspapers should be careful to mark the paragraphs they wish the Editors to see.

APPOINTMENTS FOR THE ENSUING WEEK.

TUESDAY, JULY 26—

Nat. Carnation and Picotee Soc. Exh. at R.H.S. Hall, Westminster. Yorkshire Agr. Soc. Intern. Sh. at Roundhay, Leeds (3 days).

WEDNESDAY, JULY 27—

Leamington Fl. Sh. (2 days). Southampton Carnation and Sweet Pea Sh. Sweet Pea Exh. Borough of Gillingham, Kent (2 days).

AVERAGE MEAN TEMPERATURE for the ensuing week deduced from observations during the last Fifty Years at Greenwich—62.4°.

ACTUAL TEMPERATURES:—

LONDON.—Wednesday, July 20 (6 P.M.): Max. 63°; Min. 57°.

Gardeners' Chronicle Office, 41, Wellington Street, Covent Garden, London—Thursday, July 27 (10 A.M.): Bar. 29.7; Temp. 66°. Weather—Dull.

PROVINCES.—Wednesday, July 20; Max. 64° Guildford; Min. 53° N.E. coast of Scotland.

SALES FOR THE ENSUING WEEK.

MONDAY, JULY 25—

Freehold Nursery, Residence, Cottage and 11 acres land, at the Mart, London, by Protheroe & Morris, at 3.

**Chief
Officer of
L.C.C.
Parks.**

The post of Chief Officer of the London County Council parks is again vacant. The advertisement of the Council inviting applications for the post a copy of

which we published last week takes pains to set out at length the qualifications which, in the opinion of those responsible for its drafting, the successful candidate should possess. It is gratifying to find that from these qualifications a knowledge of practical horticulture is not excluded. But lest this should cause undue satisfaction it must be added that, according to the advertisement, such knowledge is not an essential condition for success. The argument of the advertisement would appear to run somewhat as follows:—“A Commander-in-Chief is required. It is desirable, though not essential, that applicants should possess a knowledge of military operations. So much administrative work is nowadays attached to the part of commander-in-chief, however, that a power of directing in the field the operations of his general of division, is not insisted upon. Accountants, kindly note.”

That this is no travesty of the attitude of the Council is evident from the fact that that body, before it advertised the post, was prepared to fill it from among its own officers,

other than those, of course, who are in any way connected with park management. The first choice of the Council, it is said, lighted on a member of the educative staff of the L.C.C. who refused it on the grounds that his present salary was larger than that attached to the post of the Chief Officer of Parks.

We need not review in detail the arguments we advanced last February in support of the contention that no man without technical and practical knowledge of park management is capable of properly carrying out the duties of Chief Officer. That he must have powers of organisation and administration and a capacity for the management of men no one disputes; but that these powers alone, without a knowledge of horticulture, will make the officer a bureaucrat and not an initiator is self-evident to all experienced men. It is the importance of the occasion and the past action of the Council that make it necessary to repeat the obvious fact that the head of the parks must be an expert in park management. The work which a properly-qualified horticulturist, acting in conjunction with the several park superintendents, could do in ameliorating and diversifying the London parks is enormous. What is required for this purpose is trained intelligence, such trained intelligence that none but the horticulturist can supply.

Now that the post is advertised publicly we advise horticulturists who have the necessary qualifications to become candidates for the post. The unwisdom which has guided the L.C.C. in the past cannot endure indefinitely. There is a chance that wiser councils may prevail. But whether this be so or not, it is the duty of horticulturists to do all that is within their powers to prove that there are among our ranks men who are in every way qualified to hold this post. If, in spite of this demonstration, the Council fails to appoint a properly-qualified man it will not be the fault of the horticulturists. In such an event we must appeal to the public to judge between them and the London County Council.

**Home
Reading.**

We direct the attention to two publications issued by the Cambridge University Press in connection with the celebration of the twenty-first anniversary of the foundation of the National Home Reading Union.

Everybody, young or old, will find much to interest them in Mr. George Redford's little book entitled *The Faculty of Reading**, though no doubt what will appeal most forcibly to those who live in rural districts is the account which it contains of the various efforts made by the Society to cultivate the habit of reading in all sorts of conditions of men and women whose lives are lived in the comparative isolation of the country. The great towns have their well-equipped libraries, but the villages, except in isolated cases, have no collections of books. Yet the love of reading is confined to no class. Every observant person has met with men who, in spite of great obstacles, have found means to satisfy their craving for reading. It cannot be doubted, therefore, that the number of people who would become readers of good literature is very considerable, if only the opportunity of

discovering the difference between good and bad were put in their way.

The young man who is conscious of the fact that many books are nothing but trash, and yet who has had no opportunity of learning how to discriminate between the valuable and the worthless book, will find the perusal of the pamphlet entitled *Our Inheritance*† of no little assistance in cultivating this desirable faculty. Not only will it prove to him by simple and apt illustration how splendid is the literature of this country, but also—and this is a point of the first importance—how much more interesting are the books written by great men than are those written by small men. From another point of view we commend the first-mentioned book to our younger readers. There is an art of reading—a method of attacking a book—just as there is a method of attacking a job. This method, which has for its result the getting of the goodness out of a book in the minimum of time, is one which only comes by experience. The man who has once learned the art never again scoffs, with the cynicism due to ignorance, at the value of books. He has learned to use them. Some of the books he thus starts out to use he scans quickly, extracting here and there a hint, and afterwards puts them aside for ever. With others, he keeps up an acquaintance, taking an occasional pleasure in their society. Some few become his friends in whose company he passes serene and happy hours.

It is a lack of this power of using books to the best advantage that exposes many book-lovers to the charge of being mere bookworms. He who knows how to use them is rendered thereby a more efficient man.

The American is not generally regarded as a visionary, and yet the Americans read more than any other people. In America, the country of vast distances, systematic efforts are being made to mitigate the isolation of the people in the country, and in these efforts the encouragement of reading takes a prominent place. There the State intervenes through the University. Thus in the State of New York the University of Cornell has a special department devoted to the dissemination of “literature” to the farming community. Not only does the farmer receive pamphlets bearing on his work, but the farmer's wife is also on the “mailing list” and may receive week by week bulletins which, if not exactly of a literary value, help her in her house-work and in her garden. The farmer's children are not forgotten either; to them also are sent printed helps to Nature study. It is true that this attempt on the part of the State to break down the isolation imposed by geographical conditions takes the form of “literature,” which is largely of a technical, agricultural form. That, however, need not disturb anyone but the pedant; for a man or woman may become cultivated at least as well by a study of the art and science of agriculture as by that of any other branch of learning. We hope at a subsequent date to draw particular attention to this work of the State Universities of America. Here we refer to it only to demonstrate that the task which the National Home Reading Union has undertaken is one which in one form or another is recognized by a progressive State to be not the least of its duties.

* *The Faculty of Reading*, by George Redford, M.A. (Cambridge: University Press.) Price 1s.

† *Our Inheritance*, by C. L. Thomson. (Cambridge: University Press.) Price 6d.

JAPAN-BRITISH EXHIBITION.—Messrs. KELWAY & SON inform us that they have been awarded a Gold Medal for their exhibit of plants in the grounds of this exhibition.

"FRENCH" GARDENING EXHIBITION AT REGENT'S PARK.—Under the auspices of the *Daily Mail*, an exhibition of "French" gardening was opened at the Royal Botanic Gardens, Regent's Park, on July 18, and will remain open to the public until the evening of August 1. The exhibition consists of about a quarter of an acre of ground facing between the south-east and south-west, laid out in the same manner as such gardens around Paris. The exhibition is intended to show the aspects of intensive cultivation at various periods of the year, from the making of the hotbeds to the mature crops. It is shown how Lettuces are sown under cloches, how they are transplanted later into other beds, in which Radishes or Carrots, or both, have been sown in advance; or how they are placed in the spaces between other Lettuces nearing maturity. The beds in which Carrots, Cabbage Lettuces, and Cauliflowers are growing simultaneously attract a good deal of attention, and visitors show interest in seeing the crops arranged for succession, and yet not interfere with each other. In the frames, examples of Cucumber and Melon growing are given, and, if fine weather prevails, there will be a good display of produce during the next week or so. Besides the frames and hotbeds, there are open spaces in which Cos Lettuces, Tomatos, Aubergines, Marrows, Strawberries, Violets, Celery, and other crops are growing—this portion of the garden being designed to show that, at certain seasons, neither lights nor cloches are necessary. An oil engine for pumping water, crates for packing the produce, specially-designed market wagons, and an excellent packing shed are other features of the show. Each day of the exhibition at 3 p.m. a lecture on some phase of "French" gardening is given by Mr. JOHN WEATHERS (author of *French Market Gardening*), who explains the various methods adopted by the French maraicher to secure a rapid succession of crisp and succulent salads.

"THE BOTANICAL MAGAZINE."—Illustrations and descriptions of the following plants appear in the issue for June.

BEGONIA MARTIANA VAR. GRANDIFLORA, tab. 8322 (see also p. 64).—This is a handsome tuberous-rooted Begonia with single, rose-colored flowers having a whitish centre. It is described as a garden race of *B. Martiana*, Link and Otto, a native of Mexico, which the late Mr. A. DE CANDOLLE considered to be itself no more than a variety of *B. gracilis*, KUNTH. Mr. ROLFE, however, has found it necessary to treat the plants as distinct species. *B. gracilis* it is said is always a smaller plant than normal *B. Martiana*, with more slender and never strictly erect stems, while it has more divided leaves and a different inflorescence. *B. Martiana* var. *grandiflora* grows about 2 feet in height and flowers freely in July.

IRIS CLARKEI, tab. 8323.—This is the species described by Mr. W. R. DYKES in *Gardeners' Chronicle*, 1909, vol. xlv., pp. 3 and 36, as *Iris Himalaica*.

PHILADELPHUS DELAVAYI, tab. 8324.—This is a species of *Philadelphus* which was first introduced into European gardens by the Abbé DELAVAYI, who sent seeds from Yunnan in 1890. It was again collected in 1904, by Mr. H. WILSON, and the plant now figured in the *Botanical Magazine* was raised from seed which Mr. WILSON introduced into Messrs. VEITCH'S Nursery. Mr. HUTCHINSON has doubts whether it should be considered specifically separable from

the Indian *P. tomentosus*, WALL., for the salient differences are only to be found in the greater degree of tomentum on the upper surface of the leaves, and the smaller fruits of this the Chinese representative of WALLICH'S plant.

ARISTOLOCHIA MOUPINENSIS, tab. 8325.—This hardy species was first discovered by PIERRE DAVID in Western China. It was again collected by Mr. E. H. WILSON on behalf of Messrs. J. VEITCH & SONS, at an elevation of 6,500 feet above sea level. The species flowered in Messrs. VEITCH'S nurseries at Coombe Wood, in June, 1908, and 1909, and the *Botanical Magazine* figure has been prepared from Coombe Wood materials. The plant so nearly resembles *A. Kämpferi*, that Mr. C. H. WRIGHT thinks that it may eventually prove that these two plants are conspecific. The perianth tube is pale-green outside, $\frac{1}{2}$ inch long, abruptly curved, swollen in the middle, narrowed both to the base and the apex, hirsute without, yellow within. The limb is obliquely three-lobed, $\frac{1}{4}$ inch across, yellowish, with red markings inside, and greenish towards the margin. The plant is perfectly hardy at Coombe Wood, and grows well in a loamy soil in a sunny position. No pruning is required beyond the removal of any weak or decayed wood.

RHODODENDRON FLAVIDUM, tab. 8326.—This is the plant described by Mr. W. BOTTING HEMSLEY in *Gardeners' Chronicle*, 1910, vol. xlvii., p. 4, as *R. primalinum*, Hensl. Mr. HEMSLEY now states that an examination of better material has satisfied him that there are no sufficient differences to separate the plant from *R. flavidum*, inasmuch as the form of the calyx lobes, the length of the corolla tubes, and the relative length of the stamens and corolla are by no means constant. In any case, the species is a welcome addition to the scanty group of species of *Rhododendrons* with yellow flowers.

MONUMENT TO ERNEST CALVAT.—To mark their appreciation of the valuable services rendered to horticulture by the late ERNEST CALVAT, it has been decided by the French National Chrysanthemum Society to raise funds for the erection of a monument to his memory. We understand that donations may be sent to Mr. HERMAN PAYNE, 141, Wellmeadow Road, Catford, S.E.

FATAL ACCIDENT TO A GARDENER.—GEORGE CORMACK, 56 years of age, in the employment of Messrs. WILLIAM SMITH & SONS, Nurserymen, Burnside Nursery, Aberdeen, died in the Aberdeen Royal Infirmary on the 7th inst., under somewhat peculiar circumstances. About a fortnight ago, it appears, CORMACK was engaged among some trees, one of which, when he was pulling it out of the ground, suddenly yielded, causing him to fall back, and to come into contact with the root of another uprooted tree. CORMACK appeared to be somewhat seriously injured, and was taken home. He afterwards resumed work for a day or two. Subsequently, however, he again seemed to suffer from the effects of his injuries, and he was again removed to the Royal Infirmary, where he died. Lockjaw is said to have been the ultimate cause of death. CORMACK was for 34 years in the employment of Messrs. BEN, REID & CO., Nurserymen, Aberdeen, and latterly for three years with Messrs. SMITH & SONS.

ROSES AT BAGATELLE.—The third international gathering of Rose growers at Bagatelle, near Paris, took place last month. The jury comprised many well-known men in the Rose world, including Messrs. E. G. HILL, of Richmond, Ind., U.S.A.; PETER LAMBERT, of Trevis; SOTTEY, of Luxembourg; A. W. PAUL, of

Cheshunt; DICKSON, of Newtownards, Ireland; PERNET-DUCHER, LEVÊQUE, BARBIER, ABEL CHATENAY, GRAVEREAUX, and MAURICE DE VILMORIN. Although some good varieties were shown, the jury were unable to make any award of the City of Paris Gold Medal. Sixty-nine novelties were shown, and four of these were certificated, viz., Molly Sharman Crawford (DICKSON), Mdlle. Marie Mascrand (BERNIX), Lady Alice Stanley (MacGREY), Commandeur Jules Graveraux (CROIBIER). A representative from the Ministry of Agriculture presented to Mr. PETER LAMBERT and Mr. E. G. HILL the diploma of Knight of the Merite Agricole. The lady patroness of the Rose Society awarded their Gold Medal to the varieties Georges Cain (GRAVEREAUX), Mlle. Alfred Tate (MacGREY), and Entente Cordale (GUILLOT). A little book, *Bagatelle et ses Jardins*, has recently been published by the Librairie Horticole, Paris. It contains 120 pages and a number of illustrations.

ROSE CONGRESS AT PARIS.—In the *Journal* of the National Horticultural Society of France for June there is a very full account of the International Rose Growers' Congress held in Paris last May. Apart from a verbatim report of the discussions, there is given an interesting list of synonyms. The whole account of the congress occupies about 40 pages.

DEVELOPMENT AND ROAD IMPROVEMENT FUNDS ACT, 1909.—The following resolutions of the Council of the Royal English Arboricultural Society have been forwarded to the Development Commissioners:—The Council is of opinion that Section 1 paragraph b (1), viz., "the conducting of inquiries, experiments, and research for the purpose of promoting forestry and the teaching of methods of afforestation," should be carried into effect as soon as possible, and that Section 1, paragraph b (2), viz., "the purchase and planting of land found after inquiry to be suitable for afforestation," should be postponed until after the result of such inquiries and experiments have been made known to the Commissioners. They believe such experiments and research should be carried out in connection with existing institutions, such as Armstrong College, Bangor University, Cirencester College, Oxford University, and Wye College, and that no new central institute requires to be created. In order to carry on such experimental areas, not to exceed 100 acres in each case, should be established in connection with each of the above-named institutes as soon as possible. Concerning inquiries, the Council would mention that the following subjects, amongst others, urgently require continued investigation and research at the present time:—(a) The selection, testing and distribution for trial of forest tree seeds, native and exotic. (b) The hybridisation of trees with the object of producing new and improving old varieties. (c) The best means of reducing the ravages of the diseases of the Larch. (d) The economic qualities of British-grown timber upon which there is a general want of knowledge. (e) Chlorosis, or the influence of lime in the soil on trees. (f) Influence of various methods of planting forest trees and the effect of grass upon their roots. Short free courses should be held in connection with the existing centres, such courses to be duly notified to the County Technical Education Committees. The Council considers that it would be greatly to the promotion of forestry if experts were attached to the Board of Agriculture. The Council would beg to recommend that an advisory committee on forestry should be appointed as provided for in Section 4, paragraph 3, and that this Society, consisting of over 1,200 members, should be represented upon such committee by, say, three members of their Council.

BARON SCHRODER'S WILL.—The will of the late Baron Sir HENRY SCHRÖDER has just been proved. The gross value of the estate is £2,079,611, of which the net personalty has been sworn at £1,970,927. It has been announced already that amongst the Baron's bequests are sums of £1,000 and £500 to the Gardeners' Royal Benevolent Institution and Royal Gardeners' Orphan Fund respectively. In his directions respecting bequests to servants, Baron SCHRÖDER included the following words:—To his gardener, HENRY BALLANTINE (in addition to the bequest of £1,000), one original Orchid, to be chosen by him, and all smaller plants which have been taken from it. To his Orchid foreman-gardener one original Orchid, to be chosen by him after HENRY BALLANTINE has made his choice, and also all smaller plants which have been taken from it. In addition, a sum of £3,000 is left for distribution by Baron SCHRÖDER's executors amongst all the servants in his employ at the time of his decease.

STATICE PEREZII, STAFF.—In Moeller's *Deutsche Gärtner Zeitung*, Dr. BURCHARD refers to the decorative value of this new Statice from the Canary Isles. The plant bears an abundance of violet-blue flowers, and is more branched and not so tall as its better-known relatives, *S. arborea* and *S. macrophylla*, being only about 24 to 30 inches high. While most of the representatives of the genus grow at sea level, *S. Perezii* is found inland at an elevation of about 2,500 feet at the limit of the forest region. It may be raised from cuttings or from seed; the latter germinate readily in the shade at a temperature of 55° to 65° F. in sandy loam. After the appearance of the first two or three leaves, the seedlings should be transferred to small pots containing a rather stiffer soil. The plant likes a warm, sunny aspect, and when well managed will flower the first season out-of-doors, after which it should be wintered under cover and planted out again about the end of May.

PUBLICATIONS RECEIVED.—*The Agricultural Journal of the Cape of Good Hope*. Published monthly. June, 1910. (Cape Town: Cape Times, Ltd.) Price 6d.—*Journal of Forestry*. July, 1910. (London: Laughton & Co.) Price 2s.—*Transactions of the Royal Scottish Arboricultural Society*. Vol. XXIII. Part II. July, by Lieut.-Colonel F. Bailey (Edinburgh: Douglas and Foulis, Castle Street.)

HOME CORRESPONDENCE.

(The Editors do not hold themselves responsible for the opinions expressed by correspondents.)

STUDENTS FOR WISLEY.—There are now but very few vacancies remaining for students wishing to commence the two years course of study at the Wisley Gardens of the Royal Horticultural Society in September next. Young fellows over the age of 16 wishing to avail themselves of the tuition and training offered by the Society should make application immediately on forms to be obtained from the Secretary of the R.H.S., Vincent Square, Westminster. An entrance fee of £5 5s. is charged, and students board and lodge at their own expense in the adjoining villages. The training given includes both a scientific and a practical knowledge of gardening, and various germane examinations are prepared for, including the Diploma of the School, given to students who show a sufficiently high standard of knowledge at the completion of the two years course. This information may be useful to youths about to leave their school. W. Wilks, Secretary.

BEGONIA MARTIANA GRANDIFLORA (see also p. 63)—The *Botanical Magazine* has just published a plate of *Begonia Martiana grandiflora*, with a very interesting note in which, however, the origin of this plant is not indicated in a precise manner. Would you allow us to relate certain circumstances connected with its origin. *Begonia racemiflora*, a species probably lost to cultivation and belonging to the same group as *B. diversifolia*, was found in the province of Colima (Mexico) by the botanist Benedict Roez, who sent

it to M. Ortgies, Director of the Botanical Garden at Zurich. It passed into the hands of M. Victor Lemoine, Nancy, who put it into commerce at the commencement of the year 1877. The flowers are of moderate size, white or with rose tint; they are developed in axillary bunches, and show themselves all on the same side. *Begonia racemiflora* was crossed with *B. diversifolia* in the establishment of M. V. Lemoine, and it produced two hybrids, which were put into commerce in 1882. These possessed larger flowers and grew 1 metre (= 3 feet 3 inches) in height. The names of the hybrids were *B. racemiflora rosea perfecta*, which had almost white flowers, and *B. racemiflora rosea grandiflora*, a rose-coloured flower. In the same year (1882) M. V. Lemoine put *Begonia Martiana gracilis* into commerce. This species was found by Dr. Parry near San Luis de Potosi (Mexico), and he sent it to M. Max Leichtlin, of Baden-Baden. It is a little bush-like plant covered with brilliant rose flowers. In crossing *B. Martiana gracilis* with *B. racemiflora rosea grandiflora*, M. V. Lemoine obtained, and put into commerce in 1884, the *B. Martiana racemiflora*, a variety of great vigour, with tall red stems and rose-coloured flowers. The following year (1885) *B. Martiana grandiflora* was put into commerce, having the same origin but distinguished by its green stems and more compact habit of growth. Some years later there appeared *Begonia Martiana pulcherrima*, produced from seed of *B. Martiana grandiflora*. These *Begonias* should be cultivated out of doors in summer in full sunshine, to which all the flowers turn. When they are cultivated in the greenhouse or in the shade they do not develop their true beauty. F. Lemoine's *et al.*

CHRYSANTHEMUM "A. WELHAM."—This variety obtained an Award of Merit at the Wolverhampton Show. The flowers were 3 to 4 inches in diameter, white, and as double as a fine *Victoria Aster*. So far as the flower was concerned, it appeared to be of the *C. coronarium* class, but the raiser declared he had raised it from tricolor, and the appearance of the foliage bore out the statement. It must have taken many years' work to get such a flower developed from *C. tricolor*. It does not seed in the Midlands, but it roots freely from cuttings, and the plants bloom from April till October. W.

GERMINATION OF UNRIPE SEED (see p. 19).—As between ripe and unripe Tomato seed, certainly all experience is in favour of the latter if sown green, i.e., without keeping. It is a fact that on the rubbish heaps before we can burn them, thousands of seedlings are seen in autumn. Again, if any green fruit is knocked off and trodden upon, seedlings soon appear. Now, as to the merit of unripe seeds for market growing; seedlings from them always produce an abundance of growth, but the fruit set with great difficulty. New Cucumber and Melon seed are much quicker in germination than old, but we growers prefer the ripe seed. I have not kept unripe seed for experimenting; perhaps some readers have done so. Stephen Castle, Walpole Marsh, Wisbech.

STYRAX JAPONICA.—The cold, wet summer of 1909, followed by early frost and a trying winter, was not favourable to a profusion of blossom this season on shrubs flowering on the old wood. There is the greater reason, therefore, to note the exceptions, among which none is more remarkable here than *Styrax japonica*, which displays at present (July 18) a shower of white, waxy bells, agreeably scented. I obtained a single plant from Newry four years ago; it is now 8 feet high, and has proved perfectly frost-proof in the open border without the slightest protection. Herbert Maxwell, Monreith.

PANSIES AND VIOLAS.—I was pleased to see Mr. Brennan's note on p. 36 respecting *Viola Kitty Bell*. On taking over the charge of these gardens last August, I found one plant growing in the herbaceous border. In the second week in September cuttings were taken from it, and these were rooted in boxes in a cold frame, where they remained until March. They were then hardened gradually, and afterwards planted out on an east border. The blooms were kept picked off, and the first week in June the plants were transferred to two large flower-beds

as a groundwork between dot-plants of the pink Ivy-leaved *Pelargonium Mme. Crousse*. Small plants of the variegated Grass *Dactylis variegata* were planted between the *Violas* sparingly. The whole is now a very pretty and effective combination. Of the free-flowering properties of this *Viola* there can be no question, and the colour is one that appeals to many. I agree with Mr. Brennan when he advises a sunny, open aspect, and I would add that in dry weather the plants must be well watered. Dead and faded blooms should be picked off at frequent intervals. B. W. Thatcher, The Gardens, Wistow Hall, Leicester.

CABBAGE TRIALS (see p. 38).—When Ellam's Early Cabbage was introduced, it quickly obtained favour for its earliness, non-bolting qualities and for its general excellence; it has retained its hold upon those who appreciate an early and good Cabbage. I fail to see what advantage there is in sowing on a particular date a number of stocks of so-called improvements upon the original variety because those who grow Cabbages select their dates for sowing according to locality and requirements. A true stock of Ellam's Cabbage is to-day just what it was when introduced, and the loading of lists with so-called improvements upon the original is a useless proceeding. A reduction of names would be much more to the point. E. M.

QUERCUS ILEX.—The Supplementary Illustration and note respecting the *Quercus ilex* at Wilton House induced me to measure a fine old tree of the same kind growing in the gardens here. The length of the trunk from the ground to the branches is about 7 feet, and it varies in circumference from 16 feet to 21 feet. The largest branch is 53 feet long and 8 feet 8 inches around its thickest part. The fattest across the tree, from tip to tip of the branches, is 98 feet. The lower branches spread out uniformly and almost horizontally, which gives the tree a well-balanced appearance. The circumference of the branches is 294 feet, so that, at a rough calculation, the tree covers about 8,100 square feet of ground. There is no authentic date as to the planting of this tree, but its size gives some idea of its great age. The lower branches are supported by wire ropes secured to the more upright branches. These supports are invisible to anyone standing a little distance from the tree, but this method entails careful annual examination to prevent the wires from cutting into the bark, although it is protected by thick leather bands under the ties. Chas. Stronach, Enys-y-Mawngwyn Gardens, Trawyn, N. Wales.

SWEET WILLIAM PINK.—Mr. Murison's description of his plant (see p. 19) is similar to that of the Double Dwarf Sweet William of Scottish gardens. Fairchild's Mule was not a "Sweet John," though, from the description, it partook of the habit of that section of Sweet William. It is, perhaps, not generally known that there is a very large number of Mule Pinks, and, so far as I could describe them, they are described in *The Book of the Carnation*. I would like to see a truss of the flower in question. Your correspondent might also send a specimen to Mr. Forbes, Buccleuch Nurseries, Hawick, who possesses a large collection of Mule Pinks. No one can say if Fairchild's Mule is still in existence. In one book a little later than his day, it is stated that there were many in cultivation. R. P. Brotherston, Tynninghame, N.B.

LEONARDSLEE.—The Rambler Roses on the trunks of living trees (see p. 35) are now in full bloom, the display being excellent this season. *Romneya Coulteri* is also very beautiful just now. Amongst other interesting plants in flower are *Mitraria coccinea* and *Desfontainia spinosa*. Contrary to general opinion, the *Desfontainias* are growing in a position where they are exposed to full sunshine. W. A. C. July 18.

ADVENTITIOUS OR AIR-ROOTS ON VINES.—In some excellent vineries recently, I noticed in several cases adventitious roots hanging from the vine rods. I had not seen them in previous years. Turning to the late A. F. Barton's work on the vine, I find he writes that air roots, when present in large numbers, indicate want of proper action on the part of the true roots. Also that the air-roots are a sign

of bad health, and that they may prove to be the forerunners of shanking. He further states that, for some reason, the proper roots are unable to supply the foliage with its needful sap, and, because the atmosphere of the vinery is close and moist, nature is, through these air-roots, seeking to supply the deficiency. In the case I refer to, the borders were in a sour condition, or the roots had got out of the surface soil into the subsoil, or the border may be so deep that it is badly aerated. The proper course to take is to lift the vine roots next winter and remake the borders, adding a good quantity of wood ashes, old mortar refuse, and finely-crushed bones, to make a sweet root medium. *D.*

SOCIETIES.

ROYAL HORTICULTURAL.

JULY 19.—The usual fortnightly meeting took place on Tuesday last in the Society's Hall, Vincent Square, Westminster.

The ORCHID COMMITTEE granted two First-class Certificates, three Awards of Merit, two Botanical Certificates, and two Cultural Commendations.

The principal exhibits before the FLORAL COMMITTEE were groups of Sweet Peas, Carnations, Roses, Begonias, and hardy flowers. The FLORAL COMMITTEE conferred no fewer than 14 Awards of Merit, two of these going to hybrid Astilbes, shown by Mr. Arends, Ronsdorf, Germany.

In the Fruit and Vegetable Section no award was made to a novelty, but a group of pot fruit trees exhibited by Messrs. James Veitch & Sons was probably the finest display in the show; besides gaining a Gold Medal, the highest award of the Society, the Committee recorded in the minutes an appreciation of the excellent culture shown in this collection. At the 5 o'clock meeting in the Lecture Room, a lecture on "Insects Affecting Crops" was given by Mr. Fred Enock.

Floral Committee.

Present: W. Marshall, Esq. (Chairman), and Messrs. H. B. May, C. T. Druery, E. A. Bowles, R. C. Notcutt, Jno. Green, T. W. Turner, Geo. Gordon, J. F. McLeod, R. Hooper Pearson, W. Howe, C. Blick, H. J. Cutbush, A. Turner, H. J. Jones, C. E. Shea, Chas. E. Pearson, W. Cutbertson, Jas. Douglas, Jas. Walker, W. B. Cranfield, George Paul, and Edward Mawley.

Messrs. W. PAUL & SON, Waltham Cross, filled an entire table with Roses, including Ramblers. The large blooms included the fine H.T. variety Earl of Warwick, Celia, Dean Hole, Richmond, Hugh Dickson, Antoine Rivoire, Lady Ashtown, Mme. Jules Grolez, Joseph Hill, Princesse de Bulgarie, Mildred Grant, Frau K. Druschki and Princess Marie Mertschersky. (Silver Flora Medal.)

Messrs. STUART LOW & CO., Bush Hill Park, Enfield, showed Roses in considerable numbers, among which were observed fine blooms of Mme. Ravary, His Majesty, Liberty, David McKee, Lady Alice Stanley, Betty, Mrs. W. J. Grant, Lyon Rose, and White Killarney.

Messrs. B. R. CANT & SONS, Colchester, made a show of cut Roses in vases. We noted the new H.T. Elizabeth, a seedling which had Fran Karl Druschki as one of its parents, and possesses the habit of that variety with its freedom of flowering; H.T. St. Helena, H.T. Lady de Bathe, a creamy yellow Rose with a pink tinge, globular and full; Betty, G. C. Wand, Mrs. T. Roosevelt, Grand Duc de Luxembourg, Pharis-aer, St. Helena and Colchester. (Silver Flora Medal.)

H. D. BROUGHTON, Esq., Beech Hurst, Andover (gr. Mr. Gregory), showed a boxful of H.T. Roses, some of them being of excellent merit.

Messrs. J. VEITCH & SONS, Chelsea, had a considerable exhibit of border varieties of the Carnation, shown as grown in 5-inch pots.

Mr. A. F. DUTTON, Iver, Bucks., had a long table to himself for a display of Carnations of all classes. The varieties Roy Dutton (deep cerise), Lemberg (a purple-edged Picotee), Iver Clove (well formed, very dark crimson), Bert Newman (a crimson flake), Iver Purple, and

Arthur Dutton (a perfectly-formed flower) were noticed. (Silver Banksian Medal.)

Messrs. H. CANNELL & SONS, Swanley, showed tuberous-rooted Begonias, with double flowers. Especially pleasing were Mrs. W. Marlow, Rosebud, Surprise, Orange King, Countess of Portsmouth, Sparkler, Sunflower, Blush Queen, and Avalanche. (Silver Flora Medal.)

Messrs. DOBBIE & CO., Edinburgh, staged a very handsome exhibit of Sweet Peas, which had been introduced or raised by the firm. The general arrangement was that of pyramids of flowers about 4 feet high, the same variety being extended to the front of the staging in vases, thus making an imposing display. Princess Victoria (pink), Mrs. A. Ireland (pink and white), Edrom Beauty (orange-scarlet), Masterpiece (blue), and Sunproof Crimson were noted as being especially fine. (Silver-gilt Flora Medal.)

Mr. J. DOUGLAS, Great Bookham, showed about two dozen vases filled with as many varieties of border Carnations, receiving a Silver Flora Medal. The varieties Hercules (dark crimson), Mrs. Trelawney (pinkish-orange in colour), Elizabeth Shiffner (deep fawn), Mrs. Robt. Gordon (of the old rose colour), Agnes Sorrel (very dark crimson), King of Spain (two tints of crimson), and Magnificent (of a soft shade of pink), are a selection of the finer varieties. (Silver Flora Medal.)

Mr. CHAS. TURNER, Royal Nurseries, Slough, showed border varieties of Carnations, viz., The Pearl, a pure white flower; John Pope, a perfect bloom of the "old rose" colour; Ethel, a soft canary-yellow flower; Sylvia, a wire, red-edged Picotee; and Sunset, a deep cerise variety, with a yellow tinge.

SIR DANIEL GOOCH, Bart., Hylands, Chelmsford (gr. Mr. Wilkinson), made a great display with Carnations at one end of the Hall, almost the entire space being occupied by his exhibit. There were remarked Carnation Souvenir de la Malmaison Duchess of Westminster, Princess of Wales, Sir E. Hambro', and H. J. Jones. These flowers were shown in great abundance in vases and bamboo flower-holders. Border varieties were arranged in the front lines, with perpetual-flowering varieties, and we noted Harlow-warden, Britannia, Lady Winifred Lancelot, Aurora, and The Mikado. (Silver-gilt Flora Medal.)

HARDY PLANTS AND ALPINES.

Messrs. WM. CUTBUSH & SONS, Highgate, brought a fine collection of garden flowers, amongst which hardy Water Lilies, Spiræas, Gaillardias, many good and showy Campanulas, Lilium Henri, L. pardalimum, and others were noticeable. Erica coccinea and E. cinerea alba were displayed in fine masses, and provided welcome touches of colour in the large, well-arranged group. The pretty Anematheca cruenta, with dainty sprays of scarlet blossoms, was very fine. (Silver Banksian Medal.)

Messrs. BARR & SONS, Covent Garden, London, had a showy exhibit of seasonable hardy flowers, a big feature being made of *Salvia virgata nemorosa*, with dark-chocolate-coloured spikes of flowers. Other choice subjects were Lilium testaceum, L. chalcidicum Heldreichii, L. Brownii, Phloxes, and *Physostegia virginica alba*.

Misses HOPKINS, Shepperton-on-Thames, showed an interesting group of Alpines and hardy flowers, amongst them being the pretty Campanula Wald-tenina, Potentilla Tanguetii, and Omphalodes Lucidiv, the last-named with pale, opalescent, blue flowers.

M. GEDRG ARENDS, Ronsdorf, Germany, had a fine set of hybrid Astilbes, of which Rosa Perle, Cream Pearl, Ceres (rosy-lilac), Salmon Queen, and Venus (deep rose) were the choicer varieties.

Messrs. G. BURNARD & CO., LTD., Maidstone, had a showy and extensive group of herbaceous flowers, Phloxes, Larkspurs, perennial Margerites, Pentstemons, white perennial Pea, Iris Kaempferi (dezigata) in variety, Dianthus Napoleon III., and Centaurea macrocephala were the chief subjects. (Silver Banksian Medal.)

Mr. M. PRICHARD, Christchurch, Hants, showed Scabiosa caucasica, Aster meso grandis in very dark-flowered kind, with thread-like ray flowers, Gaillardias, Astilbe Thunbergii, Campanula River-leaf, and Centaurea ruthenica. Phloxes also were good, and many interesting

Alpines were displayed. (Silver Banksian Medal.)

Mr. CLARENCE ELLIOTT, Stevenage, Herts., arranged a small rockery exhibit, Campanula pusilla in variety, with Androsaces, Tunica Saxifraga fl. pl., and Wahlenbergia saxicola being displayed to advantage.

Mr. FRANK LILLEY, Guernsey, had a showy group of the early-flowering Gladiol., of which Ne Plus Ultra, cardinalis elegans, formosissimus, and General Scott were among the more striking sorts in a large and comprehensive gathering. Sparaxis plucherrima in this group was very beautiful. (Silver Banksian Medal.)

Mr. AMOS PERRY, Enfield, made a very fine feature of waterside plants, moisture-loving Lilies and hardy Nymphaeas, Spiræas, and Astilbes being remarkably well shown. Of the Spiræas, S. venusta gigantea, with rosy-crimson flower-heads, is a particularly fine plant. S. aruncus and S. argentea (syn. Kamshatica), with white flowers, were also very effective. Many seedlings of merit, too, were shown, and we also noted several varieties of Astilbe Arendsii and A. chinensis. Lilies, such as L. pardalimum, L. superbum, L. Grayi, L. Parryi (rich, clear yellow), and L. Kraeneri were remarked, while Funkias and hardy Ferns, the latter acting as a margin to the Water-Lily pool, were appropriately arranged. (Silver-gilt Banksian Medal.)

THE GUILDFORD HARDY PLANT NURSERY staged Potentillas, Physostegia virginica alba, hardy Crinum, Lychnis chalcidonica, Helianthus, and other plants.

Mr. C. REUTHE, Keston, Kent, had an interesting exhibit, displaying, apart from a seasonable assortment of herbaceous subjects, varieties of Alpine Campanulas, of which C. stansheldii, C. pulloides, C. Waldsteniana, C. garganica, C. Raineri and others were remarked. Phyllyrea boxifolia and Plagiathus Lyallii were notable, too, among choice flowering shrubs. (Silver Banksian Medal.)

Messrs. GUNN & SONS, Olton, Birmingham, staged a particularly fine lot of herbaceous Phloxes, of which Komur pinki, Dr. Charet (blue), Ellen Willmott (blue), Tapis Blanc, and F. Von Lassberg were the more conspicuous. Messrs. GUNN also showed baskets of Viola cornuta, V. atropurpurea, and others. (Silver Banksian Medal.)

Messrs. T. S. WARE, LTD., Feltham, had an extensive bank of herbaceous flowers, showing Crinum, Phloxes, Platycodon autumnale, P. a. alba, many good Campanulas, Gaillardias, Eryngiums, and other seasonable subjects in great variety. (Silver Banksian Medal.)

Messrs. WM. WELLS & CO., Meinstham, effectively staged Phloxes, Violas, Pentstemons, Lupinus, and similar garden plants in some quantity.

Messrs. R. W. WALLACE & CO., Colchester, occupied a corner of the hall with Lilies, Kniphofias, and Poppies, on a stage, arranging at the ground level a really delightful bit of waterside gardening, in which Spiræas and Astilbes, Funkias, and a fine lot of Iris hexata were seen to advantage. (Silver-gilt Banksian Medal.)

Messrs. CARTER, PAGE & CO., London Wall, F.C., arranged, in pans, a most comprehensive collection of Violas in the leading commercial sorts, the beauty and freshness of the flowers gaining much admiration from visitors. (Silver Banksian Medal.)

MISCELLANEOUS EXHIBITS.

Messrs. J. VEITCH & SONS, Chelsea, showed their Auricula-eyed Sweet Williams, a strain in which the flowers are marked with crimson cables on a white ground. The individual flowers were remarkable for their large size and symmetrical shape. This firm also showed Abutilons, including Red Gauntlet in brilliant flower outside and inside, rosa-florum, Golden Fleece, and the old Boule de Neige. Fuchsias were shown in considerable numbers as standards and as bushes. We noted Mrs. Marshall, Mrs. Bumble, and Scandity among the former; and bushes of Sylvia, brilliant, Coralie of the cornifolia section, in colour orange-scarlet), Phenomenal White, and Phenomenal Rose, Beauty of Exeter, and Red Poodle. Messrs. VEITCH also showed Carna

indica in six beautiful varieties, of which we may mention R. Wallace (yellow) and Meteor (orange red). Other subjects exhibited by this firm were Kalanchoe flammula, Begonia Washington, and a number of Javanico-jasminiflorum Rhododendrons. (Silver Flora Medal.)

Mr. HENRY DIXON, Waudsworth Common, showed early-flowering Gladioli plants, so useful for affording flowers for cutting.

Mr. L. R. RUSSELL, Richmond, Surrey, exhibited a group of species and varieties of Fuchsia. (Bronze Flora Medal.)

Messrs. H. B. MAY & SONS, The Nurseries, Upper Edmonton, showed well-grown Codiaums, varying from 2 to 5 feet in height and well coloured, considering the weather of the present season. This firm also displayed a group of choice exotic Ferns, the various Nephrolepis being very ornamental. (Silver-gilt Flora Medal.)

E. J. PRESTON, Esq., Kelsey Park, Beckenham

pollen the seedlings possessed extraordinary vigour in regard to growth, but were very shy bloomers. The varieties of A. Arendii seldom, or never, grow more than 4 ft. in height, whilst their habit is all that could be desired. Mr. ARENDS exhibited a group of plants representing quite a number of varieties. Two of these were selected to receive Awards of Merit, namely, Venus, whose flowers were of deep violet-rose colour, and Salmon Queen, a variety with salmon-pink-coloured flowers.

Calendula (strain).—Messrs. DOBBIE showed double flowers of a grand strain of Calendula. The blooms were 4 inches or more in diameter, those of Sulphur Queen being exceedingly pale-yellow, whilst another variety exhibited a very deep orange tint. An Award of Merit was recommended for the strain.

Carnation "Robert Berkeley."—Mr. JAMES DOUGLAS showed this very distinct border Car-

Gypsophila carminea.—An annual Gypsophila and an exceedingly pretty plant, having a free-flowering, branching habit and single flowers nearly half an inch across, of a pale shade of carmine. From Messrs. DOBBIE & Co.

Rose multiflora "Flame."—This variety is said to grow 9 feet high. It has semi-double, rosy-crimson flowers, with whitish centre, and these are produced in fine, large trusses. Shown by Mr. CHAS. TURNER, Slough.

Senecio glastifolius var. Non. Vicary Gibbs.—This is a variety of the species figured in the Supplementary Illustration published in this journal last week, but, as shown, the flowers were scarcely so attractive in colour. Shown by the Hon. VICARY GIBBS.

Sweet Pea Elfrida Pearson.—This is a very large flower of rose-pink colour. There are generally four blooms on the spike, as shown, and the large, waved flowers frequently have double standards. Shown by Messrs. PEARSON & SONS, Lowdham.

Sweet Pea "Iris."—A very fine variety with large flowers, a good standard with waved outline, and pleasing tint, being an uncommon shade of salmon-pink; a slight cream shade proceeds mainly from the keel. Shown by Mr. THOS. BREADMORE.

Sweet Pea "Earl Spencer."—This variety is now pretty well known for its bright orange-coloured flowers. Excellent specimens were shown by Messrs. DOBBIE & Co.

Sweet Pea "Marian Cuthbertson."—This is a very beautiful pink variety. Shown by Messrs. DOBBIE & Co.

Sweet Pea "Mrs. F. A. Wellesley."—This variety was shown exceedingly strong, having long, very thick stems. The blooms have magnificent standards, and the variety will probably be much esteemed among the white sorts. Shown by F. H. WELLESLEY, Esq.

Orchid Committee.

Present: J. Gurney Fowler, Esq. (in the Chair), and Messrs. Jas. O'Brien (hon. Sec.), de B. Crawshay, Harry J. Veitch, R. Brooman-White, H. Little, R. G. Thwaites, F. J. Hanbury, J. Charlesworth, W. H. Hatcher, H. G. Alexander, A. Dye, W. H. White, H. A. Tracy, Gurney Wilson, Clive Cookson, C. J. Lucas, and Sir Jeremiah Colman, Bart.

Messrs. SANBER & SONS, St. Albans, were awarded a Silver Flora Medal for a very fine group, in which both species and hybrids were well represented, the most remarkable in the former class being their new *Oncidium Sanderae*, a new member of the small section including *O. Papilio*, and with very distinct botanical features. (See Awards.) The group, which contained excellent hybrid *Odontoglossums*, *Cattleyas*, *Lelio-Cattleyas*, and other showy Orchids, had two very fine examples of *Cattleya Rex*, with 10 flowers each. There were also *Notylia Barkeri*, *Cirrihopetalum Roxburghii*, the pretty little *Orchis monophylla*; *Cattleya Gaskelliana* Snowflake, with 12 white flowers; *Eria densiflora*; *Pescatorea Lehmannii*; a few select forms of *Dendrobium Phalenopsis*, *Brasso-Cattleya Pluto*, and other *Brasso-Cattleyas*, the cross between *B. Digbyana* and *Cattleya bicolor Grossii* being distinct.

Messrs. STUART LOW & Co., Bush Hill Park, Enfield, were awarded a Silver Flora Medal for a group, the centre of attraction in which was the unique *Cattleya O'Brieniana alba*, which secured a First-class Certificate. (See Awards.) The back of the group was composed of various species of *Oncidium*, *Cologyne Dayana*, *Epidendrums*, &c. In the body of the group, *Cattleya Gaskelliana*, including the clear white form, *C. Warscewiczii*, a few *C. maxima*, *C. Forbesii*, *C. Lueddmanniana striata*, and other *Cattleyas* were effective. Among others noted were a selection of *Masdevallias*, including *M. trochilus*, *M. muscosa*, *M. calva* and *M. infracta*.

Messrs. CHARLESWORTH & Co., Haywards Heath, staged a group, in which the *Cycnoches* were well represented, several of the plants having both male and female flowers. *C. maculatum* had a spike of nine of the ordinary male flowers, the basal one being apparently intermediate between the male and female forms, and larger than the others. Other plants showed the male and female blooms on separate plants.

FIG. 26.—HYBRID TEA ROSE "FREDA," EXHIBITED BY MESSRS. PAUL AND SON, CHESHUNT; COLOUR, ROSE WITH VIOLET SHADE. (Award of Merit, R.H.S., June 21.)

(gr. Mr. W. M. Webster), showed fine specimens of *Statice profusa*; *Kentia Edmoreana*, 10 feet by 12 feet; *Pteris Childsii*, 5 feet; and *Davallia dissecta elegans*, 2½ by 3 feet; a fine tall plant of *Dracaena Victoria*, and one of *Clerodendron Balfouriana* splendidly flowered and 10 feet high. (Silver-gilt Banksian Medal.)

AWARDS OF MERIT.

were recommended in the following cases:—

Astilla Arendii.—This name has been given to a race of hardy Astilbes (*Spineas*) raised by Mr. ARENDS, Ronsdorf, Germany, from crosses between *A. Davidii* and *A. Queen Alexandra*, *A. floribunda*, and others. In every case *A. Davidii* was the pollen parent, for it was found that when this species was crossed with other

nation. The flowers are a "Malmaison" shade of pink, and the petals are very smooth. It is a variety of much refinement.

Cosmos "Rose Queen."—This variety produces a great number of single flowers, which measure 3 inches or more in diameter; they are a most pleasing shade of mauve, with yellow centre. Shown by Messrs. DOBBIE & Co.

Fuchsia Sylvia.—This variety belongs to the same type as the old favourite known as "Miss Lucy Finnis." It has large, double flowers, with inflated, white corolla and brilliant red sepals. Fuchsias have been under a cloud in recent years, and very few awards have been made to them. It is said that this most effective variety is what is termed a good doer. From Messrs. JAS. VEITCH & SONS, LTD.

Two *Dendrobium Sanderæ*, a fine plant of *Chysis levis*, *Lælia monophylla*, and other rare species, including *Pescatorea lamellosa*, which secured an Award of Merit, were also shown.

Sir JEREMIAH COLMAN, Bart., V.M.H., Gatton Park (gr. Mr. Collier), staged a group in which the central figure was a grand plant of *Cattleya Rex*, with seven flowers on a spike. (See Awards.) Other specially noteworthy specimens were the rare *Javan Dendrobium arcuatum*, producing many short racemes of pretty, white, long-spurred flowers from the old pseudo-bulbs; *Ancistrochilus Thompsonii*, with a fine head of white and purple blooms; the new *Odontoglossum Queen of Gatton* (triumphans aureum \times perculum), a model flower, with pale-yellow ground colour, heavily blotched with dark purple; two fine scarlet *Odontioda Bradshawiæ*; *Dendrobium Arthur Ashworthi*; *Platychnis filiformis*; *Aeranthus grandiflorus*; *Pleurothallis stenophylla*; and *Xylobium leontoglossum*. In front of the group were cut flowers of varieties of *Sobralia Colmanii* of various shades of pale yellow.

Sir TREVOR LAWRENCE, Bart., K.C.V.O., Burford (gr. Mr. W. H. White), showed a fine plant of the singular *Masdevallia deorsu*, with eight yellowish flowers, spotted with dark purple; a well-flowered plant of *Calanthe japonica purpurea*; *Brasso-Cattleya Joan* (*B. nodosa grandiflora* \times *C. Warszewiczii*), with pretty, white flowers, the labellum and backs of the sepals spotted with rose-purple; and others. (See Awards.)

Messrs. J. & A. A. McBEAN, Cooksbridge, showed a fine plant of *Odontoglossum ardentissimum Doris*, with three-branched spike of white flowers heavily blotched with claret-purple.

R. G. THWAITES, Esq., Chessington, Christchurch Road, Streatham Hill (gr. Mr. Black), sent four plants of his very pretty *Odontioda Thwaitesii* (*O. Harryanum* \times *C. Vulcanica*), which is one of the most distinct in colour of all the *Odontiodas*, its various shades of rose-purple and lilac being very attractively arranged.

DE B. CRAWSHAY, Esq., Rosefield, Sevenoaks (gr. Mr. Stables), showed *Odontioda Senenacca* (*C. Noezliana* \times *O. Hunnewellianum*), an interesting cross, in which the influence of the firm texture and unfimbriated lip of *C. Noezliana* has succeeded in obliterating the very pronounced undulation and fimbriation in the lip of *O. Hunnewellianum*, the result in the progeny being an approach to some of the forms of *O. Bradshawiæ*. The pretty and well-formed flowers have a yellowish ground colour marked with orange-red over the greater part of their surface. The name is the old Saxon one for Sevenoaks, the place it was raised at.

A. HARRISON, Esq., Lyndhurst, Watford, showed a small selection of *Cypripediums* and a good plant of *Epidendrum falcatum* (*Parkinsonianum*).

H. S. GOODSON, Esq. (gr. Mr. G. E. Day), sent two plants of *Cattleya Rex*.

FRANCIS WELLESLEY, Esq., Westfield (gr. Mr. Hopkins), showed *Cattleya Gaskelliana Queen of the Earth*, a very fine white flower with the faintest trace of colour on the lip of the older flowers.

AWARDS.

FIRST-CLASS CERTIFICATES.

Cattleya Warszewiczii Low's variety, from Lieut.-Col. Sir GEORGE L. HOLFORD, K.C.V.O., Westonbirt.—A grand, dark variety of the *C. W. Sanderæ* type, in which the large, intensely rich crimson-purple lip shows only small yellowish spots on each side of the middle portion instead of the large, light-coloured patches seen in ordinary forms. The noble specimen shown had 14 flowers.

Cattleya O'Brieniana alba, from Messrs. STUART LOW & Co., Bush Hill Park.—A pure-white albino, the only colour in its broad-petalled, finely-formed flower being a slight sulphur-yellow tinge on the lip in front of the column. A white form of this pretty Orchid, which is commonly supposed to be a natural hybrid between *C. Loddigesii* and *C. Walkeriana*, but which has been imported in quantity in the typical rose-tinted form, comes as a surprise.

AWARDS OF MERIT.

Cattleya Artemis (Iris \times Gaskelliana), from Lieut.-Col. Sir GEORGE L. HOLFORD, K.C.V.O.—A very pretty hybrid of good size and fine substance. The sepals and petals are pink, the broad front of the lip purplish-crimson, with a

narrow, lavender-coloured margin, the central portion being orange colour fading to cream, white and extended to the side lobes.

Oncidium Sanderæ, from Messrs. SANDER & SONS, St. Albans.—Of the *O. Papilio* section, but with well-marked features. The scapes are near to typical *O. Papilio* and without the raised rings at the joints as seen in *O. Kramerianum*, which, however, it more nearly resembles in the flower, but is distinguished from both by the long beard-like glands on each side of the column. The dorsal sepal and petals are linear and erect, purplish at first, changing to sepia-brown; the broad lateral sepals are sharply decurved, light buttercup-yellow, with reddish markings, column velvety-purple above. Lip crimped and fringed, light yellow, with reddish markings inside the margin and on the side lobes.

Pescatorea lamellosa, from Messrs. CHARLES-WORTH & Co., Haywards Heath.—One of the finest of the *Pescatorea* section of *Zygopetalum*, and a very rare species. The flowers are nearest to *P. cerina*, and of the same yellowish-cream tint, but are easily distinguished by the thick, broad, ridged crest of the lip, which is striped with dark purple.

BOTANICAL CERTIFICATE.

Bulbophyllum Rhizophora, from Sir TREVOR LAWRENCE, Bart., K.C.V.O.—A dwarf species from tropical Africa, of tufted growth and bearing drooping sprays of singular brown and yellow flowers.

Liparis chulochila, from Sir TREVOR LAWRENCE.—A very pretty little species, with erect spikes of smallish pale-green flowers, having prominent orange-red labellums.

CULTURAL COMMENDATION.

To Mr. H. G. Alexander (Orchid grower to Lieut.-Col. Sir GEORGE L. HOLFORD, K.C.V.O.) for two magnificent plants of *Miltonia vexillaria Queen Alexandra*, the one with seven spikes with 36 flowers; the other 6 spikes with 29 flowers, the labellums being over 4 inches across.

To Mr. W. H. White (Orchid grower to Sir TREVOR LAWRENCE, Bart., K.C.V.O.) for a very fine plant of *Cypripedium W. R. Lee* "Burford variety," with four strong spikes bearing, together, 11 flowers.

Fruit and Vegetable Committee.

Present:—G. Bunyard, Esq. (Chairman); and Messrs. J. Cheal, W. Bates, J. Davis, J. Perkins, E. Beckett, W. Pope, G. Hobday, A. R. Allan, J. Vert, J. Jacques, G. Wythes, W. Poupart, and C. G. A. Nix.

Messrs. J. VEITCH & SONS, Chelsea, exhibited a magnificent collection of orchard-house trees in pots. There were well-fruited specimens of Peaches, Nectarines, Plums, Figs, and other subjects in various stages of development. Peach Peregrine was in most instances carrying ripe fruits; Nectarines were also nearly ripe in the case of the Pitmaston Orange, Early Rivers, and Cardinal varieties; the Figs were Castle Kennedy, Bourjassotte Grise, White Marseilles and Brown Turkey, the trees being laden with ripe fruits. This exhibit was one of the best of its kind we have seen.

Messrs. J. VEITCH & SONS also exhibited superior vegetables and salads, roots, &c. The samples of Quite Content, Prestige, Prodigy, Duke of Albany, and Maincrop Peas were excellent. The Cabbage Lettuces Green Globe Artichokes, Turnips, Broad Beans, Chelsea Imperial Cos Lettuce, Supreme Kidney Potato, Ellam's Early Cabbage and Pearl Cauliflower were all good samples. A Silver-gilt Knightian Medal was awarded for the vegetables and a Gold Medal for the fruit trees.

Messrs. G. BUNYARD & Co., Maidstone, showed a collection of Peaches, Plums, Nectarines, and Foster's Seedling Grape. The Peaches were Early York, Peregrine, and Earliest of All; the Plums Early Normandy and Early Orleans; the Nectarine was Cardinal. The fruit was mostly ripe and fit for consumption. (Silver-gilt Knightian Medal.)

THE CHURCH ARMY CITY GARDENS, a body which is offering help to the unemployed in London, showed vegetables cultivated on waste land in Westminster, quite close to the Hall. The produce included good Cabbages, Turnips, Carrots, Broad Beans, and one dish of Kidney Potatoes. (Bronze Banksian Medal.)

NATIONAL SWEET PEA.

THE TRIALS AT SUTTON.

THE most valuable work carried on by the National Sweet Pea Society is its trials, which are held at the Times Experimental Station, near Guildford, under the superintendence of Mr. Charles Foster. At the close of each year a circular is sent to every member of the Society, asking that varieties for trial be sent to Mr. Foster and a duplicate list sent to the secretary. Fifteen to twenty seeds of each variety are required. Each variety, on arrival, is given a number, and the name, not only of variety, but of the sender, is kept a secret until after the inspection has been made by the Floral Committee of the Society and their awards made.

The seeds, shortly after their arrival at the Experimental Station, are sown in pots and grown first under glass to note the germination. In March or April they are planted out in the ordinary way in short rows, one variety in a row, a stamped metal number being attached to the end of each row. The Floral Committee visited the trials and made their inspections during the first week of July. On the 14th inst. one hundred or so members of the Society visited the trials and were entertained to luncheon and tea by Lord Northcliffe, on whose estate the Times Experimental Station is situated. In his lordship's absence, Mr. Charles Foster presided, supported by Mr. N. N. Sherwood, the president of the Society for the current year. The company also enjoyed the opportunity of seeing the charming private gardens of Sutton Place, in which Lord and Lady Northcliffe take exceeding interest. Everyone was delighted, and Mr. J. Goatley, the head gardener, deserves praise for the way in which the gardens are maintained.

Altogether, there are 312 trial rows of Sweet Peas on the ground this season. About 200 of these are novelty trials, the rest being purity and comparative trials. The Floral Committee only granted one First-class Certificate and four Awards of Merit. The varieties were as follows:—

Stirling Stent (First-class Certificate and Silver Medal).—A most richly coloured flower of orange shade deeper than Earl Spencer. (From Mr. H. Agate, Havant.)

Mrs. Hugh Dickson (Award of Merit).—A fine, cream-pink flower with an excellent, free-blooming habit. (From Messrs. Dobbie & Co., Edinburgh.)

Masterpiece (Award of Merit).—This was raised by Mr. A. Malcolm, Duns, but has passed into Messrs. Dobbie & Co.'s hands. It is a first-rate lavender-shaded variety of fixed character.

Arthur Green (Award of Merit).—A purplish-maroon variety. It is distinct from all others, but the colour will not appeal to everybody. (From Messrs. Dobbie & Co.)

Cherry Bipe (Award of Merit).—As its name indicates, this flower is a bright cherry-red. A distinct and most attractive colour. (From Messrs. Gilbert & Son, Dyke, Lincs.)

VARIETIES NOT CERTIFIED.

So much for the certificated varieties. There are always numbers of new sorts which come quite close to certification standard, but fail to get it, chiefly for the reason of there being a lack of fixity in the stocks. To far-seeing men these sorts are often more interesting than those that win, because they possess great possibilities. Some of the following good things will show what is meant:—

Monroe Castle (Gerhold) is a fine flower, which might be described as a Dark Marquis.

Seedling Heliotrope (Dobbie).—True and distinct.

Heliotrope Self (Sydenham).—Might also be described as a dark Marquis or Tennant Spencer.

Rosy Pink (E. W. King).—Standards and wings broadly flushed with rose-pink.

Marjory Linzer (Breadmore).—Very fine; an improved Beatrice Spencer.

George Stark (Stark).—The Silver Medal Scarlet Spencer of two years ago. The best stock is very fine.

Red Star (Malcolm).—This is a fine red, but resembles George Stark.

Dazzler (Breadmore).—Bright orange-scarlet.

Edna Unwin (Unwin).—Bright and distinct, seems to be nearly a bicolor.

Helen Grosvenor (Aldersey).—Very fine, resembling *Helen Lewis*, but distinct from that variety.

Marchioness of Tweeddale (Bolton).—Quite up to Award of Merit standard; white, flushed with rose.

Mrs. W. J. Unwin (Unwin).—A remarkably bright and finely striped flower; stripes are St. George colour.

Marquis type (Dobbie).—This is a fine stock.

Coccinea ward (Hemus).

Cerise (Gilbert).

Nancy Perkin (Cantley).—A fine stock.

Dainty Spencer (Burpee).—A fine stock of Elsie Herbert.

Red maroon (Bolton).—A new colour.

Eric Harvey (Unwin).—Similar to *Marchioness of Tweeddale*. A fine stock.

OUTINGS AND DINNER.

The outings of the Sweet Pea Society to those who are interested in the flower are most educational and enjoyable.

The day following the outing to Guildford, the members went into the seed-growing district of Essex, and there visited the trial grounds of Messrs. Hurst and Son, where thousands of trials of Sweet and culinary Peas were seen, and where the members were most hospitably entertained by Mr. Sherwood, the principal of the firm, who happens this year to be president of the N.S.P.S.

A drive of three miles brought the party to Messrs. Dobbie's seed farm, where Sweet Peas are largely and well grown. The time here was all too short, as full opportunity was given to the party to inspect hundreds of new varieties in all stages of development.

The annual dinner took place on the evening of the first day of the show under the genial presidency of Mr. N. N. Sherwood, V.M.H., head of the wholesale seed firm of Messrs. Hurst & Son. Mr. Sherwood had on his right Mrs. Chas. H. Curtis and on his left Mrs. Horace J. Wright, and there were also present, among others, Dr. Boxall and Messrs. S. B. Dicks, W. Cuthbertson, R. Sydenham, H. Jones, H. Smith, H. J. Wright, T. Stevenson, J. Brunton, H. Shane, W. P. Wright, and C. H. Curtis. The proceedings were marked by the greatest enthusiasm.

SCOTTISH HORTICULTURAL.

JULY 5.—The monthly meeting of this society was held on this date at 5, St. Andrew Square, Edinburgh. Mr. Whytock, the president was in the chair, and there was an attendance of 90 members.

Mr. David W. Thomson, Edinburgh, read a paper on "Flower Gardening." In the first decades of the last century, said Mr. Thomson, when the flower garden had a site to itself, it generally consisted of unshapely beds cut out in the turf, and these were mostly filled with a miscellaneous assortment of shrubs and herbaceous and other plants, but now, with the improvement of existing species and the multiplication of beautiful varieties, highly artistic parterres were associated with most country seats. The work of the gardener, too, was now much more an art than it used to be, whatever might be said against the grouping together of plants of one colour, so as to form a mass, and thus make each bed a distinct picture. Blended together into one harmonious whole, this massing of individual colour in beds could lay claim to greater impressiveness than promiscuous mixing, but there were positions suitable to both systems, and there was a little reason why both should not add their distinctive charms to our gardens, as there was for playing the one off against the other. It had often been urged that the use of half-hardy plants in flower gardening involved a short-lived display, but there was abundant material for use even in winter, and many of our hardy plants, including bulbs and annuals, were among the most effective for that purpose, and were available to all. Surely it was possible to work into sub-tropical gardening a hardier class of plants resembling in grace and elegance those stove and other plants now used for the purpose. On the motion of Mr. McHattie, Mr. Thomson was cordially thanked for his interesting paper.

First-class Certificates were awarded by the adjudicating committee to *Gladolus* "Pink

Beauty," exhibited by Mr. P. Vos, Sassenheim, Haarlem; to Sweet Peas "Edrom Beauty" and Dobbie's "Sunproof Crimson," exhibited by Messrs. DOBBIE & Co., Edinburgh; and to Ox-eye Daisy "Early Meen," exhibited by Mr. F. BAILIE, Stenhouse, Liberton, Midlothian.

A Cultural Certificate was awarded to JAMES WOOD, Esq., Wallhouse, Bathgate (gr. Mr. F. Henderson), for a fine lot of *Odontoglossums* and *Cypripediums*, and to Messrs. JAMES GRIEVE & SONS, Edinburgh, for a plant of *Stanhoepa tigrina grandiflora*.

The other exhibits were: A large collection of the newer varieties of Sweet Peas from Messrs. DOBBIE & Co.; variegated *Cordyline australis* from Mr. J. D. JAMESON, Glen Tower Gardens, Hunter's Quay; *Nephrolepis Smithii* and *Cypripediums* from Messrs. JAMES GRIEVE & SONS, Edinburgh; Seedling Carnation ("Yule Tide" × "Churchwarden") from Mr. THOS. VALLANCE, Cardean Gardens, Meikle; Seedling *Antirrhinum* from Mr. D. W. THOMSON, Edinburgh; Ivy-leaved *Pelargoniums* "Countess Grey" and Red *Mme. Crousse* from Mr. JOHN DOWNIE, Edinburgh; *Hydrangea hortensis* "Avalanche" from Mr. A. PORTER, Davidson's Mains, Edinburgh; abnormal Foxgloves from Mr. ROBERTS, Dalkeith; Tomatos and Strawberries from the EDINBURGH DISTRESS COMMITTEE'S FARM, Muiriston; and British Orchids from Mrs. ALGIE, Toghee House, Mayo.

Four new members were elected. The paper for the meeting on August 2 will be on "The Cultivation of Peaches and Nectarines under Glass," by Mr. Thos. McPhail, Archerfield Gardens, Dirleton.

MANCHESTER AND NORTH OF ENGLAND ORCHID.

JUNE 23.—The meeting held on this date was the opening of the 1910-1911 session.

Col. J. RUTHERFORD, Blackburn (gr. Mr. Lupton), staged a group of plants which contained several choice *Cattleyas*. (Silver-gilt Medal.) *Cattleya Mendelii* var. *Duchess of York* and *Odontoglossum* × *amabile* var. "Rose Drop" received Awards of Merit.

A. WARBURTON, Esq., Haslingden (gr. Mr. Dalgleish), sent a few *Odontoglossums*, including *O. crispum* var. *Sultan of Zanzibar*, *O. c.* var. *Triumph*, *O. c.* var. *Queen of the North*.

R. ASHWORTH, Esq., Newchurch (gr. Mr. Gillett), staged a group of well-grown and showy plants. *Odontoglossum* × *Lambeauium* var. *corulescens* was awarded a First-class Certificate, and a Silver Medal was awarded to the group.

W. THOMPSON, Esq., Stone (gr. Mr. Stevens), was awarded a Silver Medal for a group of *Odontoglossums* and *Odontiodas*. *Odontoglossum* × *eximia* var. "Centenary" and *O. crispum* var. *White Swan* received Awards of Merit.

J. MCCARTNEY, Esq., Bolton (gr. Mr. Holmes), exhibited *Cattleya Mendelii* var. *General Botha*, to which an Award of Merit was voted.

R. LE DOUX, Esq., West Derby (gr. Mr. Fletcher), exhibited *Odontioda* × *Bradshawia* "Le Doux" var. and *Cattleya Mossie alba* "Le Doux" var.

Mr. A. K. WOOD, Glossop (gr. Mr. Gould), made a fine show of plants, including *Odontoglossums*, *Cattleyas* in great variety, *Vanda corulea* in fine form, and numerous other plants. A Cultural Certificate was awarded to a well-grown plant of *Odontoglossum hastilabium*, and an Award of Merit to *Phajus Sanderianus*.

Other exhibitors who were represented included Messrs. KEELING & SONS, E. V. LOW, J. BIRCHENALL, W. BOLTON, and F. SANDER & SONS.

GHENT HORTICULTURAL.

JULY 3.—At the monthly meeting of the *Chambre Syndicale des Horticulteurs Belges et Société Royale d'Agriculture et de Botanique de Gand*, held on the above date, the following awards were made to new plants:—

CERTIFICATE OF MERIT: This was awarded to *Laelio-Cattleya luminosa* *Munstre J. Renkon*, *Miltonia St. Andre*, *Cypripedium Maudiae*, and *Cypripedium Curtisii* var.—all from M. CH. DIETRICH; *Cattleya gigas* × *Cattleya Leopoldii*, from M. LE DR. BALLON; *Hydrangea hortensis* M. Emile Mouillère, shown by MM. DUBREZ FRÈRES; for cut flowers of *Iris Kamperi*, exhibited by M. A. GALLET and by MM. DERVAES FRÈRES; and *Gladolus Colvini rosea*, also from M. A. GALLET.

LEEDS GARDENERS' BENEFIT.

JULY 5.—The half-yearly meeting was held on the above date. Mr. Preece presided.

The half-yearly statement was submitted, showing an expenditure of £32 5s. 5d. for sick benefits.

In eight cases members suffering from prolonged sickness had special grants made from a fund which exists for that purpose. The total income for the half-year amounted to upwards of £120.

Twelve new members have joined during the half-year.

A deputation from the Federated Friendly Societies' Council was received inviting the Leeds Gardeners' Lodge to co-operate in the movement for the betterment of parliamentary legislation towards friendly societies.

GUILDFORD AND DISTRICT GARDENERS'.

JULY 13.—The summer show of this society was held at Brabourne Manor, Guildford, by permission of Lieut.-Col. J. A. C. Younger, on the above date. The vegetables, with the single exception of Onions, were of the finest quality; fruit was rather backward; but there was a profusion of flowers, including some magnificent Fuchsias, Carnations, and collections of Sweet Peas. There was a scarcity of Roses. In previous shows the spirit of competition had been entirely absent, there having been no judging and no distinction between the exhibits, and the committee, in deference to the wishes expressed, decided this year to award Certificates of Merit.

Lord NORTHCLIFFE, Sutton Place (gr. Mr. J. Goatley), contributed largely, including a collection of *Souvenir de la Malmaison* Carnations, a group of *Kalanchoe*, some excellent *Coleuses* and *Spiraeas*, also fine displays of Ferns, Sweet Peas and vegetables; among the latter Ailsa Craig Onions were the best in the show.

Mrs. RICHARDSON, of Weylea, Guildford (gr. Mr. P. Bullen), exhibited a remarkably good collection of vegetables.

One of the best collections of flowering plants in the show was that of Mr. F. F. SMALLPEICE, J.P., of Cross Lanes, Guildford (gr. Mr. W. F. Binfield).

A very effective display of plants and an exhibit of fruit came from Messrs. A. HART & SONS, of Guildford. They also exhibited some excellent fruit.

Other trade exhibitors were Messrs. W. CUTBUSH & SON, Highgate, and Mr. A. R. UPTON, of the Guildford Hardy Plant Nursery.

ELSTREE AND BOREHAM WOOD HORTICULTURAL.

JULY 15.—The second summer show of the above society was held by permission of Lord Aldenham in Aldenham Park on this date. The weather was beautifully fine, and visitors were again granted the privilege of viewing the private grounds and gardens. The show itself was a great success, due in a great measure to the honorary exhibitors.

The Hon. VICARY GIBBS (gr. Mr. E. Beckett, V.M.H.), who is president of the society, showed a magnificent exhibit of vegetables equal to the one he recently staged at the Holland House Show. A Gold Medal was awarded.

Messrs. W. CUTBUSH & SON, Highgate, were awarded a Gold Medal for a tastefully-arranged water-garden, which occupied one end of the tent, and a collection of Roses.

Mr. ENGELMANN, Saffron Walden was awarded a Silver Medal for an exhibit of Carnations, including the new variety *Carola*.

Silver Medals were also awarded to Messrs. EASTON BROS., Barnet, for Roses; to Mr. H. H. CRANE for *Niolas*; to Messrs. JARMAN & Co., Chard, for *Centauras* and Sweet Peas; to Messrs. NEWMAN, Watford, for a display of Sweet Peas; to Messrs. JAS. CARTER & Co. for *Streptocarpus* and other flowers; and to Messrs. GLEESON & Co., Watford, for herbaceous flowers.

W. A. STEPHEN, Esq. (gr. Mr. Greenfield), was awarded a Small Silver Medal for a group of *Gloxinias*.

The joint secretaries, Messrs. F. E. Eames and W. J. Pritchard, and the committee are to be congratulated upon the success of the show.

GLOUCESTERSHIRE ROSE AND SWEET PEA.

JULY 12.—The 22nd annual exhibition of the Gloucestershire Rose and Sweet Pea Society was held at the Spa Cricket Field, Gloucester, on this date, in beautiful weather. The season has been anything but a favourable one, especially so far as Roses are concerned. There was a slight decrease in the number of entries, confined mainly to the amateurs' section.

In the nurserymen's classes for Roses, Messrs. ALEX. DICKSON & SONS, LTD., Newtonwards, Ireland, repeated their successes at previous shows this year by taking the 1st prizes in the professional classes in which they entered. Amongst their novelties was a brilliant crimson hybrid tea variety, with an almost imperceptible tinge of yellow, named "Conway Jones" out of compliment to the celebrated Rose grower of Hucclecote. Other Roses exhibited by Messrs. ALEX. DICKSON & SONS not yet in commerce were Princess Mary, a fine tea variety of apricot and yellow shades; Lady Barham, a Rose of great dimensions, and with the substance of Her Majesty, but with a high, pointed centre; and Mabel Drew, a superb Rose of pale lemon colour. Messrs. DICKSON also showed good blooms of Mrs. Foley-Hobbs, Mrs. Curtis Harrison, Lady Ursula, Lady Helen Vincent, Charles J. Graham, and Mrs. George Preston.

In the amateur classes Mr. CONWAY JONES won most of the 1st prizes and the National Rose Society's Silver Medal for the best Rose exhibited by an amateur, the variety being Dean Hole. In the division open only to amateurs in Gloucestershire Mr. CHARLES HOLBROOK, of Hucclecote, secured a Silver Medal also with the variety Dean Hole. In the class for amateurs of the city of Gloucester, Mr. A. V. WRIGHT won a similar award with White Maman Cochet.

Mr. W. JARRETT THORPE, of Hucclecote, won the piece of plate offered by Messrs. Alex. Dickson & Sons for 18 varieties single trusses; Mr. W. H. PICKFORD, Gloucester, took the City of Gloucester Corporation plate offered for the best display of Roses. Messrs. A. MORTIMER and C. L. WALKER each won pieces of plate in the cottagers' classes.

The display of Sweet Peas which occupied a centre table extending the whole length of the spacious marquee was the finest ever seen in Gloucester, and occasioned the judges no little difficulty in fixing the awards. Mr. MEATH BAKER, of Harfield Court, won the N.S.P.S. Silver Medal for 12 distinct varieties. Among the newer varieties in this exhibit were Senator Spencer, Mrs. Townsend, Zarina and Aurora Spencer.

The exhibition, which was attended by the Mayor and Corporation of Gloucester, was formally opened by Lady Marling.

BECKENHAM HORTICULTURAL.

JULY 13.—The Croydon Road recreation grounds were again placed at the service of the society by the local council for the holding of the annual flower show, which took place on this date in beautiful weather. The attendance in the early stages of the show was not so large as usual, but, later, the number of visitors was well up to the average. There were no fewer than 15 groups of plants, these being accommodated in the largest tent, with the specimen stove and greenhouse plants. The best group of plants arranged for effect was shown by E. J. PRESTON, Esq., Kelsey Park (gr. Mr. M. Webster). Carnations formed an outstanding feature of his exhibit, and these were interspersed with Codiaums and other foliage plants, and completed by an edging of Caladiums argyrites. 2nd, W. POTTER, Esq., Elmside, Beckenham (gr. Mr. F. G. Cogger). A special 1st prize in this class was awarded to Mr. H. DUNNE, The Nurseries, Erith. In the class for a group of plants open to single-handed gardeners only, the 1st prize was won by A. W. OAKES, Esq., Knickwood, Shortlands (gr. Mr. W. Fane), who had some well-grown plants of Caladiums, Gloxinias, and Lilium auratum. The 2nd prize was won by C. E. FIRMIN, Esq., Langley Road, Beckenham (gr. Mr. J. Draper), whose group was a clever arrangement of miscellaneous flowers and plants.

In the class for three flowering greenhouse plants, Mr. POTTER excelled, one of his specimens, a plant of *Ixora Prince of Orange*, being adjudged

the best plant in the show, and, as such, received the Royal Horticultural Society's Medal. Three foliage stove or-greenhouse plants shown by Mr. WEBSTER, were easily first in that particular class. Mr. W. FANE showed the best four plants in the class for single-handed gardeners; whilst Mr. POTTER won in that for six miscellaneous plants. The best specimen plant in flower was *Clerodendron Balfouri*, shown by Mr. PRESTON, and the same winner secured the premier award for Fuchsias. Mr. G. SALE, Branxholme, showed finest Pelargoniums; whilst Mr. FANE excelled with Gloxinias. In the fruit classes, Mr. PRESTON was a prominent prize-winner.

DERBYSHIRE AGRICULTURAL AND HORTICULTURAL.

JULY 13, 14.—This society, which has existed for upwards of half a century, held its annual exhibition on these dates. The portion of the show devoted to horticulture included a large circular tent, and the interior presented a picture of floral beauty. The principal class was for a group of plants to fill a space of 300 superficial feet, the 1st prize being £20. There were three entrants, Mr. W. HASLAM, of Pilsley, Chesterfield, winning the 1st prize with a display of *Codiaums* interspersed with Orchids, artistically arranged with foliage plants. 2nd, Mr. W. A. HOLMES, Chesterfield; 3rd, Mr. W. VAUSE, Leamington Spa.

Another similar space was filled by Messrs. BARRON & SON, Borrowash, with a collection of Rose trees in pots not for competition, for which a Gold Medal was awarded.

Around the walls of the tent the space was filled with trade exhibits, and so made a perfect finish to the whole picture. Messrs. PROCTOR & SONS, Chesterfield, had a fine display of Roses in great variety. (Gold Medal.) Mr. W. SYDENHAM's collection of herbaceous flowers, staged in large bushes, presented a magnificent sight. Mr. W. PATTISON, of Shrewsbury, put up a very pretty bank of *Violas*. Mr. E. H. COLES, of Ashbourne, showed fine examples of Sweet Peas; and Messrs. T. BOTHERA & CO., of Burton Joyce, staged a miscellaneous collection of flowers.

A specially good display of Gloxinias was made by the Rev. H. BRACKTON, Sutton Hall (gr. Mr. A. Shambrook). It consisted of 300 plants, all furnished with massive heads of bloom. The same exhibitor was well ahead in the class for 18 Gloxinias.

EASTBOURNE FLOWER SHOW.

JULY 14, 15.—In connection with the Sussex County Agricultural Show a most successful horticultural exhibition was held on the above dates. The exhibition covered a considerable area of ground, and was held in a delightful spot about one mile from the station, adjoining the Downs and the links of Eastbourne Golf Club. Three large tents were not sufficient to accommodate the horticultural exhibits, several of them being arranged in the open. No money prizes were offered, but gold, silver and bronze medals were awarded.

One of the most meritorious, as well as the largest exhibit was shown by Mr. T. DURRANT YOUNG, Roselands Nurseries, Eastbourne, who displayed finely-grown Palms and a large number of chipped trees. (Gold Medal.)

Messrs. WM. PAUL & SON, Waltham Cross, had a very large exhibit of cut Roses, including the beautiful Juliet variety. (Gold Medal.)

Messrs. W. CUTBUSH & SON, Highgate, staged a large and splendidly-arranged group of Carnations. The flowers were very fine, especially blooms of Lady Coventry. (Gold Medal.)

Messrs. BAKERS, Wolverhampton, worthily gained one of the seven Gold Medals allotted for a model water-garden. The material used was of the best, and the formation generally most pleasing.

Mr. FRANK WOOLLARD, Brighton, gained a Gold Medal for a well-arranged collection of Roses.

Another attraction was a magnificent group of miscellaneous plants staged by Mr. E. T. SCOTT, of Eastbourne. This exhibit occupied the end of one of the large tents, the whole of the plants exhibiting excellent culture. (Gold Medal.)

Messrs. J. CHEAL & SON, Crawley, had a very

large exhibit in the open, consisting of pergolas and other designs for gardens. (Gold Medal.)

Silver Medals were awarded to his Grace the Duke of DEVONSHIRE for a well-arranged miscellaneous group of plants; to Lord WILLINGTON OF RALTON for a group of plants; to Mr. WILLIAM KNIGHT, Hailsham, for a large bank of tuberous-rooted Begonias; to C. DIMPLOCK, Esq., for a collection of Sweet Peas; to Mr. JAMES BOX, Lingfield, for collections of herbaceous flowers and Sweet Peas; to Messrs. JARMAN & CO., Chard, for a collection of cut flowers, including varieties of Centaureas; to Mr. RILEY SCOTT, Horsham, for a collection of hardy herbaceous flowers; to Messrs. H. B. MAY & SONS, Upper Edmonton, for a choice collection of exotic Ferns; to Messrs. G. & A. CLARK, LTD., Dover, for a large exhibit of hardy perennial flowers that included many choice subjects; to Messrs. STUART LOW & CO., Enfield, for a charming exhibit of Carnations and Roses; to Mr. FRANK LILLEY, Guernsey, for an extensive exhibit of hybrid Gladioli; to Messrs. KEIWAY & SON, Langport, for an exhibit of Delphiniums; to Mr. JOHN GORE, Alibon Nurseries, Polegate, and Messrs. H. G. WHITE & CO., Eastbourne, each for decorated tables of dessert fruit; to Messrs. YOUNG & CO., Cheltenham, for Carnations; to Messrs. JAMES & A. A. McBEAN, Cooksbridge, for a beautiful collection of choice Orchids; to Messrs. TOOGOOD & SONS, Southampton, for Sweet Peas, &c.; and to Mr. C. E. WATERS, of Balcombe, for Carnations.

Much of the success of the show was due to the energy and business-like methods of Mr. Rowland Burke, chairman of the special committee. Mr. Aust, chairman of the Eastbourne Horticultural Society, acted as hon. secretary, and he received valuable assistance from Mr. T. Durrant Young.

CARDIFF AND COUNTY HORTICULTURAL.

JULY 20, 21.—This society's 22nd annual show took place on the foregoing dates, and was held, as heretofore, in the Sadler Gardens, Cardiff. The entries, according to official information, were more numerous even than last year, when it was believed that high water mark had been reached. Although the weather was not so favourable as could have been desired, the show was, from the horticultural standpoint, a thorough success.

PLANTS AND CUT FLOWERS.

As usual, pot plants, shown either in groups or as specimens, formed a very attractive feature of the exhibition, and the competition in the various classes, although not keen, was fairly satisfactory. The highest money prize offered by the society was set apart for a group of miscellaneous plants in and out of bloom, staged in a space of 150 square feet, taste in arrangement and excellence of culture to be both taken into consideration by the judges. The successful competitor in this class was the firm of Messrs. JAMES CYRER & SONS, Cheltenham. The arrangement was bold and striking, and had as its centrepiece a fine specimen of *Kentia Belmoreana*. Among the principal plants used were *Lilium Harrisii*, *Humea elegans*, various *Ercas* and *Crotons*, *Verbena Miss Willmott*, and *Cocos Weddelliana*. H. OAKLEY, Esq., Cardiff (gr. Mr. W. E. Pearce), was 2nd. His group, together with that placed 3rd in order of merit, and shown by Lady HILL, Llandaff (gr. Mr. Macintyre), were fine examples of plant arrangement. *Liliums*, *Humeas*, *Crotons*, and pyramidal *Campanulas* were freely used in both collections.

For a group occupying a space of 50 square feet, Major-General LEF. DUNAS POWIS (gr. Mr. Hornor), was placed 1st. *Fraxinea racemosa*, *Statice Snowdon*, and *Crotons* were the striking features of this group. J. L. MORGAN, Esq., Llandaff (gr. Mr. G. Wall), was 2nd, and the Executors of the late JAMES HOWELL, Esq., Cardiff, 3rd.

One of the finest groups in the show was set up by the Marquis of BUTE (gr. Mr. H. Farmer), and, being a non-competitive exhibit, was awarded a Gold Medal.

In the class for three stove or greenhouse Ferns, the Executors of the late J. HOWELL, Esq., put up a fine specimen of each of the following species, and they were awarded the 1st prize:—*Gymnogramma lanceolata*, *Davallia bulbata*, and *Microlepia hirticristata*.

The entries in the Rose classes were numerous, and the competition very keen, and, considering the time of year, the quality of bloom was good. For a box of 12 distinct varieties of Roses, three blooms of each variety, Messrs. J. JEFFRIES & SONS, LTD., Cirencester, were awarded 1st place. Aimée Cochet, K. A. Victoria, Mildred Grant, Hugh Dickson, and Lyon were among the best blooms in this stand. Messrs. S. TRESSEDER & SON, Cardiff, were placed 2nd. Three of the best varieties staged in this lot were Lyon, Lady Ashdown, and Horace Vernet.

Mr. GEO. PRINCE, Longworth, Berks., carried off the 1st prize for 12 distinct varieties of Teas or Noisettes, three blooms of each. The outstanding blooms were Mme. H. Berger, Modera, Mrs. E. Mawley, and Comtesse de Nadaillac. Mr. H. DREW, Longworth, was 2nd; and THE KING'S ACRE NURSERIES, LTD., 3rd.

The 1st place for 4 distinct varieties, one bloom of each, was awarded to Mr. GEO. PRINCE. The varieties Lyon, C. J. Graham, Dean Hole, Bessie Brown, and Victor Hugo were among the most attractive shown in this class. Mr. HENRY DREW and Messrs. S. TRESSEDER & SON were 2nd and 3rd respectively.

With 12 blooms of Mildred Grant THE KING'S ACRE NURSERIES, LTD., secured the leading prize for 12 blooms of any one variety other than a Tea or Noisette, and the same firm were equally successful in carrying off the prize for 12 blooms of one variety of a Tea or Noisette. The variety shown was Mrs. Ed. Mawley.

The exhibits in the class for a collection of Roses set out with their own foliage and arranged for effect in a space 9 feet wide by 4 feet 6 inches deep, not to exceed 6 feet in height, were some of the most attractive in the whole show. Mr. GEO. PRINCE was a good 1st, his arrangement being tasteful and the quality of the flowers everything that could be desired. Blush Rambler, Crimson Rambler, Dorothy Perkins, and Hiawatha were used as an effective groundwork. The main features were made up of bunches of White Maman Cochet, Vicomtesse Folkestone, Pharisæer, Lyon, Mme. Constant Souper, and Mme. Melanie Souper. The 2nd and 3rd prizes were awarded to THE KING'S ACRE NURSERIES, LTD., and Messrs. S. TRESSEDER & SON respectively.

Mr. C. WALL, Bath, took the premier place for a collection of border Carnations and Picotees, shown with their own foliage and without artificial supports. Some beautiful flowers were noted in this exhibit, the most distinct being Sam Weller, Ashantee, Mary Hambro', Robin Hood, and Lord Roberts. Mr. W. J. GODFREY, Exmouth, took 2nd place with blooms little inferior to those shown by Mr. WALLS.

The stands of cut flowers in the herbaceous classes were exceedingly fine, and made a brilliant spectacle in the various tents in which they were set up. Mr. W. J. GODFREY secured the leading prize for a collection of hardy flowers arranged in a space of 15 feet by 4 feet. Violets were used very effectively as an edging for this group. Messrs. RICH & CO., Bath, carried off the 2nd award with a very fine collection of flowers, among which were good examples of *Chrysanthemum maximum* var. Mrs. C. Lothian Bell and Princess Henry and *Campanula trachelium* var. Isabel.

Sweet Peas were generally admitted to be the *pièce de résistance* of the show, and the exhibits were both numerous and of a very high standard of excellence. Those staged by Mr. T. JONES, of Rurdon, in the class for 13 distinct varieties were the admiration of everyone who beheld them. Every one of the varieties shown had exceedingly long and strong stems, and the size and colouring of the blooms were remarkable. Dazzler, Zarina, Mary Gerhold, Elsie Herbert, Audrey Crier, and Stirling Stent were among the most attractive varieties shown. VERNON HILL, Esq., Langford, Bristol, was placed 2nd, and Mr. W. J. GODFREY 3rd.

Miss BURGESS, Stow Park Avenue, Newport, took the 1st prize for a table arranged with Sweet Peas. Only one variety—Comtesse Spencer—was used, and the utility of the Sweet Pea for this purpose was well demonstrated.

FRUIT AND VEGETABLES.

The Fruit and Vegetable exhibits were not so remarkable as those in the flower classes, and the entries were by no means numerous.

G. A. CHES, Esq., M.P., Flag Bourton (gr. Mr. S. Wilkinson), with Muscat of Alexandria,

took the 1st prize for two bunches of a white Grape; and E. H. ERSWORTH, Esq., Llandough Castle, Cowbridge (gr. Mr. Gorman), with Buckland's Sweetwater, was placed 2nd.

D. C. LYSAGHT, Esq., Chepstow (gr. Mr. H. Perry), was awarded the 1st prize for two bunches of black Grapes, the variety shown being Madresfield Court.

The Marquis of NORTHAMPTON, K.G., Castle Ashby (gr. Mr. A. R. Searle), was the successful competitor in the class for a collection of vegetables consisting of nine distinct kinds.

TRADE EXHIBITS.

A Gold Medal was awarded to each of the following firms:—THE KING'S ACRE NURSERIES, LTD., for a collection of fruit trees in pots; Messrs. WEBB & SON, for collections of Sweet Peas and vegetables; Mr. H. ECKFORD, collection Sweet Peas; Messrs. YOUNG & CO., Cheltenham, for American Carnations; Mr. L. R. RUSSELL, Richmond, collection of Ivies; and Messrs. W. & H. EVANS, Cardiff, for rock plants.

Silver Medals were awarded to Messrs. J. C. WHEELER for Sweet Peas and Carnations; Messrs. STARK & SONS, Sweet Peas; Messrs. TOOGOOD & SONS, Sweet Peas; Messrs. JARMAN & CO., Roses; F. EAMES, Frome, hardy cut flowers; Messrs. W. J. GODFREY, Carnations; FRANK LILLEY,

THE LATE GEORGE TUBB.

Guernsey, Gladioli; Messrs. W. H. ELLISON, West-Bromwich, Ferns; Messrs. W. & H. EVANS, herbaceous plants; Messrs. CLIBRAN, Roses; Messrs. BLACKMORE & LANGDON, Bath, Carnations and Begonias; and Messrs. A. A. WALTERS & SON, Taunton, hardy herbaceous plants.

NOTES FROM A "FRENCH" GARDEN.

THE Cauliflowers planted on the cloche beds and in the open ground in April having been marketed, the beds have been dug and levelled, and Carrot "Bellot" has been sown broadcast. The seeds have been covered 1 inch deep with well-broken manure. Frequent but light waterings are given to hasten germination. This crop has always been remunerative when marketed in October, in the same manner as those grown on hot beds.

When the frames from the Melon beds become available for further use, they are set on a piece of open ground, which has been prepared previously, and another batch of Carrot, "Early Parisian," is sown broadcast early in August. This crop follows the Carrot "Bellot" at the end of October, and requires glass protection for 2 or 3 weeks immediately before they are ready for the market. The plants must be cultivated very thinly to prevent the foliage decaying during wet weather. Tomatoes in the open have been sprayed this week for the second time with "Strawsonite." All the plants will be stopped

by the 25th of this month at the leaf over the last made inflorescence, as the flowers appearing at a later date have only the remotest chance of producing ripe fruits. The ground occupied by Turnips and Carrots in the open in the spring has been prepared for a crop of Beans, "Little Nigra." The seeds are sown in 24 holes at equal distances, in a plot measuring 4 feet 3 inches by 13 feet (size of a frame), 6 to 8 seeds being placed in each hole. The frames will be placed on the ground early in September from the last Melon beds. This crop will be ready in October and November.

A first sowing of Spinach will be inserted early next week for autumn use. The winter batch will be sown a fortnight later.

The ground for the winter batch of Endives and Batavian Green must be prepared at an early date, so that they will be ready for planting between August 15 and 20. A sowing of Lettuces, "All the Year Round" or "Vauxhall Defiance," has been made this week, and the seedlings will be transplanted into frames 9 inches apart. The lights will be placed on the frames late in September. The crop must not be planted where the Lettuces will be pricked out in October or grown in the early spring, as it is liable to mildew. The Celery, "Chemin," sown in February and planted in the middle of May, at 9 inches apart, is now ready for blanching; this will be effected by spreading mats on the top. Owing to the close planting the blanching will not take more than 6 or 8 days. Before placing the mats the beds must be thoroughly soaked, in order that they may not require any more watering before marketing.

The Melon plants are now in full bearing. The ventilators must be left open a little at night to prevent the deposit of moisture on the fruits. The fruits must be turned often, especially the big specimens, or they will decay. Should the weather improve the lights may be removed entirely. *P. Aquatias.*

Obituary.

GEORGE TUBB.—We regret to record the death of Mr. George Tubb, in his 63rd year, at Minley Manor Gardens, Hampshire. Mr. Tubb has been gardener to three generations of the present owner's family, Laurence Currie, Esq., his period of service extending for upwards of 35 years. During his long service at Minley Manor many improvements and alterations were effected in the gardens. A description of these will be found in the *Gardeners' Chronicle* for December 12, 1891. Deceased was highly esteemed, and his presence will be missed by a large circle of friends. He was a prominent supporter of the Gardeners' Royal Benevolent Institution. The funeral took place on Monday, the 11th inst., at Cove Churchyard, in the presence of a large concourse of friends.

JOHN BENNETT CARRUTHERS.—As our pages are passing through the press, we receive news of the death of Mr. J. B. Carruthers, F.R.S.E., F.L.S., Assistant Director of Agriculture at Trinidad, and an occasional contributor to these pages. Deceased was the younger son of Mr. William Carruthers, F.R.S., late Keeper of the Botanical Department of the British Museum. He was 41 years of age, and, previous to taking up the appointment at Trinidad, he filled important positions in Ceylon and the Federated Malay States.

DEBATING SOCIETY.

STIRLING & DISTRICT HORTICULTURAL.—The members held their second outing of the season on July 9, when a visit was made to Blairdrummond, the seat of Colonel Home Drummond. The party were met by Mr. Blacklock, the gardener at Blairdrummond, who conducted them through the gardens and grounds.

GARDENING APPOINTMENTS.

Mr. H. ROBINSON, Outdoor Kitchen and Fruit Foreman at Leonardlee for the past 5 years, under Mr. W. A. COOK, as Gardener to Major K. R. BALFOUR, Kingston House, Dorchester, Dorset.

Mr. E. THAYER, recently Gardener to E. W. BARRON, Esq., Woodstown, Co. Waterford, and previously for 5 years General Foreman at Eastwell Park, Kent, as Gardener to BAILEY-HAWKINS, Esq., Stagenhoe Park, Welwyn, Herts.

MARKETS.

COVENT GARDEN, July 20.

We cannot accept any responsibility for the subjoined reports. They are furnished to us regularly every Wednesday, by the kindness of several of the principal salesmen, who are responsible for the quotations. It must be remembered that these quotations do not represent the prices on any particular day, but only the general averages for the week preceding the date of our report. The prices depend upon the quality of the samples, the way in which they are packed, the supply in the market, and the demand, and they may fluctuate, not only from day to day, but occasionally several times in one day.—Eds.]

Cut Flowers, &c.: Average Wholesale Prices.

Table listing various cut flowers and their prices, including items like Lily of the Valley, Marguerites, Poppies, and various carnations.

Cut Foliage, &c.: Average Wholesale Prices.

Table listing various cut foliage and their prices, including Galax leaves, Hardy foliage, Ivy-leaves, and various ferns.

Plants in Pots, &c.: Average Wholesale Prices.

Table listing various plants in pots and their prices, including Ficus elastica, Fuchsias, and various ferns.

REMARKS.—There has been a general decline in the demand for plants and flowers, except for a few special subjects, such as Odontoglossums, Cattleyas, and other choice Orchids, which are required for show purposes. Blooms of Lilium longiflorum are arriving in large quantities and their prices are depreciating. Lily of the Valley is a steady supply at 10s., and occasionally 15s., per dozen bunches. White Stocks have been a very ready sale as they have been the principal white flowers available for foundation work in floral designs. A. H., Covent Garden, July 20, 1910.

Fruit: Average Wholesale Prices.

Table listing various fruits and their prices, including Apples (Tasmanian), Grapes (English), Bananas, and various berries.

Vegetables: Average Wholesale Prices.

Table listing various vegetables and their prices, including Artichokes, Aubergines, Beans, and various cabbages.

REMARKS.—Black Currants are a short supply consequently their prices have risen considerably. Cherries are still expensive and poor in quality. English Grapes are a fair market. Some fine bunches of Madresfield Court are to be seen, and the demand is very good; this Grape generally finds a good market; Black Hambro' is more plentiful and cheaper. Home-grown scarlet-flesh Melons of good size would meet a good market. Peaches and Nectarines are a little cheaper, but the best-coloured fruits are meeting with a fair demand. Strawberries in pecks have finished, but some good samples are to be obtained in punnets. Raspberries are arriving in a wet condition and are much dearer. Tomatoes are cheaper. Green vegetables are generally plentiful. Trade on the whole is quiet.—E. H. K., Covent Garden, Wednesday, July 20, 1910.

New Potatoes.

Table listing new potato varieties and their prices, including Kents, Sharpe's Express, and Bedfords.

REMARKS.—Trade continues slow and prices are not good for the time of year. Edward J. Newborn, Covent Garden and St. Pancras, July 20, 1910.

THE WEATHER.

THE FOLLOWING SUMMARY RECORD of the weather throughout the British Islands, for the week ending July 16, is furnished from the Meteorological Office:—

GENERAL OBSERVATIONS.

The weather.—During the greater part of the week the weather was dry in all districts, but in the south and east of England the sky was often very cloudy. A little rain fell in several localities towards the end of the period, and on the evening or night of the 16th thunder-storms were experienced on some parts of our southern and south-eastern coasts.

The temperature was again below the average in all parts of England, except the north-west, the deficit amounting to about 3° in England E. and S.E. In Ireland and the north and west of Scotland it exceeded the normal—by more than 2° in Scotland W.—but in the east of Scotland the mean value was 2° F. below the average. The highest of the maximum were recorded at most stations about the middle of the week, and ranged from 61° in Scotland W. and England N.W., and 60° in Scotland E. to 73° in England E. and the English Channel. Maxima below 60° were very common in the north and east coasts, at North Shields there was no reading as high as 60°. The lowest of the minima were generally recorded early in the week. In Scotland L. (at Balmoral on the 14th) the thermometer fell to 31°, but in the other districts the minima ranged from 40° in Scotland N. and W. to 44° in England E. and Ireland S., and to 50° in the English Channel. The lowest grass readings were 23° at Balmoral, 33° at Sheffield and Newton Rigg, and 31° at Cratby and West Linton.

The rainfall.—Over a large portion of the Kingdom there was either no rain or less than 0.05 inch; in the south-east and south a few localities experienced about 0.5 inch with the thunderstorms noted above.

The bright sunshine was much above the average in Ireland, Scotland, and the north-west of England, and slightly above it in England S.W. and the Midland Counties; in the south, south-east and east of England, however, there was a great deficit. The percentage of the possible duration ranged from 74 in Ireland N., 69 in England N.W., and 61 in Scotland W. and Ireland S. to 30 in England S.E., 28 in England N.E., and to 25 in England E.

THE WEATHER IN WEST HERTS.

Week ending July 20.

After a cold week and the fourth in succession.—On the warmest day the temperature in the thermometer screen rose to 72°, which is only about 2° warmer than is reasonable, and on the coldest night the exposed thermometer registered a temperature within 4° of the freezing point—a very low reading for the middle of July. The ground is at the present time 2° colder than is reasonable, both at 1 and 2 feet deep. Rain fell to the depth of about a tenth of an inch on the 17th, but previous to that no rain had fallen for nine days. In the early part of the week a few drops of rain-water came through both the soil gauges, but since then there has been no percolation at all through either of them. The sun shone on an average for 5 1/2 hours a day, which is an hour a day short of the average duration at this period of the month. On one day the sun shone brightly for 1 1/2 hours, but on three others the amounts recorded were less than an hour a day. Calms and light airs have alone prevailed during the week, and the direction has been on all but one day some point between north and east. The mean amount of moisture in the air at 3 p.m. exceeded a seasonal quantity for that hour by as much as 15 per cent. E. M., "Rosebank," Berkhamsted, July 20, 1910.

A GREENGROVER'S PROFIT: C. M. You ask what profit should result on the sale of £20 worth of fruit and vegetables retailed at ordinary London prices? This is rather a difficult question to answer with any degree of accuracy, as so much depends upon circumstances. However, assuming that you get good value for your money and there is a ready demand for the produce, you should clear at the least £8 or £10 on your outlay, seeing that fruiters and greengrocers, as a rule, retail their goods at double the wholesale prices paid for same. There is much wastage in the handling of such perishable goods, and this loss must be made good from the profits on those which are actually sold.

ANTHRAXINUM AND IRIS KEMPERI: S. A. No trace of injury by fungi or insects can be found on any of the specimens. The injury is the result of unfavourable cultural conditions.

CALCEOLARIA AND PELARGONIUM: *J. P. B.* The disfigurement of which you complain as being similar to scalding, is probably caused by the flowers being sprayed with water directly before or during brilliant sunshine. There is nothing present that can be interpreted as an indication of disease.

CARNATION LEANDER: *G. F.* The black centre is caused by the fungus, *Ustilago antherarum*, which has developed in the anthers. This fungus is common in the wild *Lychnis*, and has probably passed from thence to the cultivated plants. In *Lychnis* the mycelium of the fungus is perennial in the root, and grows up with the plant each year, so that when a plant is once attacked by the disease it remains for life. Plants can only be infected during the seedling stage. Destroy the blooms, and do not propagate from plants showing the disease.

CARROTS: *E. C.* The maggots do not appear to be present in the roots forwarded, although evidences of the attack exist, and there is little doubt but that the pest is the maggot of the Carrot fly, *Psila rosæ*. The maggots have no legs, and are about $\frac{1}{4}$ inch long. When fully fed they go into the earth before entering the pupal stage. The flies are blackish-green, with ochre-coloured head and legs. They lay their eggs in the ground near to the Carrot roots, and it is generally noticed that the plants are mostly attacked by fly directly after they have been thinned. During this process the soil about the roots is loosened. The soil should be so treated before sowing that the plants will be capable of growing quickly and without check. Any thinning that is done should be carried out before the plants are 2 inches high, and it should be done in damp weather as carefully as possible. Following the process of thinning, a good watering should be afforded if the weather is dry, and a sprinkling of guano or other approved manure, the object being to cause the plants to grow quickly, and thus establish themselves again in the soil. As a preventive it has been found useful to rough-dig the ground at the beginning of winter, and sprinkle gas-lime over the surface until it is quite white; the lime is then "pointed" in about four inches deep. Vaporite might be mixed with the soil as an experiment.

CROQUET GROUND: *Jurville*. The particulars you require, together with plans, were given in the *Gardeners' Chronicle* for May 22, 1909, p. 336.

DISQUALIFICATION AT AN EXHIBITION: *W. B. G.* and *Doubtful*. The literal wording of the schedule would allow of two varieties of a single species being shown, as, for instance, two varieties of *Pyrethrum roseum* or *Chrysanthemum indicum*. It may be that the judges disqualified the *Hydrangea arborescens grandiflora* on the ground that this species is hardy, and, therefore, inadmissible in a class for 12 bunches of stove and greenhouse flowers. In this latter case there is something to be said for their decision.

EXAMINATIONS IN HORTICULTURE: *J. A. B.* Examinations in horticulture for journeymen gardeners are held periodically by the Royal Horticultural Society. You had better apply to the secretary of this Society at the Royal Horticultural Hall, Vincent Square, Westminster.

GOOSEBERRIES: *W. W., Holland*. The following dessert varieties may be recommended for the purpose you desire them:—Howard's Lancer (very free bearing, strong grower, excellent flavour), Lancashire Lad, Crown Bob, Whinham's Industry, Broom Girl, Gunner, Keepsake, Leveller, Plough Boy, Rifleman, Thumper, and White Lion.

INSECTS IN CUCUMBER FRAME: *J. P.* Vaporise the frame with one of the nicotine vaporising compounds. Place a little "Vaporite" here and there in the soil.

NAMES OF PLANTS: *T. B. B.* *Trifolium procumbens*. This plant will grow almost anywhere.—*E. F.* It is impossible to name the Ferns correctly unless you send better specimens.—*W. H. Christian*. 1, *Berberis vulgaris foliis purpureis*; 2, *Cotoneaster Simonsii*; 3, *Esculus flava*; 4, *Cryptomeria japonica*; 5, *Eschallonia macrantha*; 6, *Desfontainia spinesa*; 7, *Cryptomeria japonica elegans*; 8, *Cephalotaxus pedunculatus*.—*O. W. Wills*. *Crataegus tanacetifolia*.—*C. W.* 5, *Collinsia bicolor*.—*R. P. B.* *Egopodium podagraria* (Gout

Weed).—*J. E. J.* *Chrysanthemum leucanthemum* variety.—*A. M.* *Brachycome iberidifolia*. *J. U.* We cannot undertake to name varieties of Roses. Send them to some grower who has means of comparing them with a named collection.—*C. A.* *Centranthus ruber*.—*O. R. C.* 1, *Oncidium triquetrum*; 2, *O. pulchrum*; 3, *Aërides multiflorum*; 4, *Odontoglossum gloriosum*.—*R. H.* 1, *Blechnum occidentale*; 2, *Adiantum tenerum*; 3, *Lastrea varia*; 4, *Woodsia alpina*.—*E. E. K.* This is the common horse-tail (*Equisetum arvense*). It is a most difficult plant to eradicate, because it is impossible to pull out the roots, which break off very easily. A good remedy is to trench the ground and pick out every bit of root that can be found. We have seen an instance of a piece of ground being almost cleared of the weed by sowing it down with Barley and Clover. These crops had the effect of stifling much of the Horse Tail.

PEACH: *S. T. N.* The variety of Peach is Royal George. Thanks for sending good specimens, properly packed.

REFUSE FROM CANDLE MANUFACTURE: *W. L. S.* Bone-black, as received from the sugar refineries, contains the impurities gathered there, consisting chiefly of vegetable matter and moisture. It is somewhat variable in composition, containing from 32 to 36 per cent. of phosphoric acid, 38 per cent. of lime, and a small amount of nitrogen. Its decomposition in the soil is slow, and it is not now used to any great extent directly as a manure, because soluble phosphate can be produced more economically from mineral phosphates. After the bone-black has been used in the manufacture of candles, and has absorbed large quantities of fat, it becomes almost useless as a manure, the fat being decidedly injurious to all plant life. Wagner recommends the extraction of the fat by means of petroleum, but this is scarcely practicable for amateurs. Another plan is to burn the bone-black, which will destroy the fat, but leave the phosphoric acid and lime uninjured, when it can be used as manure at the rate of from 3 to 4 cwt. per acre. About five tons of farmyard or stable manure is recommended each year to a quarter acre of land; in your case, the soil being heavy and poor, the manure should be applied in the winter so as to be well incorporated with the soil before the spring sowing of crops.

ROSE LEAVES: *H. G., F. E. S. & Co., and Roder*. The leaves are disfigured with "black blotch," caused by the fungus *Antennaria rosea*. It is not a very destructive disease, but its presence is objectionable owing to the disfigurement the blotches cause to the foliage. It appears to be very common just now. Spray the plants at intervals of three days with 1 ounce of liver of sulphur in 2 gallons of water.

ROSE MARECHAL NIEL: *W. H. W., Sheffield*. The specimens are insufficient for us to determine the cause of the trouble.

SCUM ON PONDS: *R. G. C.* and *G. L.* The Bordeaux mixture may be sprayed on to the surface of the pond, repeating the operations after the elapse of several weeks if necessary. To commence, only use it at about half strength, so as not to injure the aquatic plants. Fish that may be in the water will suffer no injury, if the operation is carried out with care.

SEEDS OF HEATHER AND LING: *W. E.* The best time to sow seeds of Heather and Ling is in April or early in May. The seeds may be sown on prepared ground out of doors in the same manner as grass seed, except that no rolling is necessary afterwards. The ground should be moist without being wet, and be raked down as fine as possible. Care must be taken that every weed is cleared off the ground before sowing, as it will be some considerable time before the seedlings are large enough to be cleaned through. At the same time a few pans or boxes of seeds can be raised under glass to fill up any bare spaces that may occur. In two years a good crop of young plants can be raised.

SEEDSMEN IN NEW YORK: *J. M.* You may write to either of the following firms:—John Lewis Childs, Floral Park; Siebrecht & Son, New Rochelle and New York City, 569, Fifth Avenue; Peter Henderson & Co., 35, Cortlandt Street, New York; J. M. Thorburn, 33, Barclay Street; Ellwanger & Barry Nursery Co., Rochester.

SUITABILITY OF ESSEX SOIL TO THE GROWTH OF FRUIT-TREES: *Fruitsoil*. The soil prevailing in most of the agricultural districts in Essex is admirably adapted to the growth of fruit trees, being of a heavy, rather than light, loamy nature. If a proper quantity of stable or farmyard manure is added to it when preparing holes for the reception of the young trees, the land is well calculated to yield satisfactory crops of fruit. If you contemplate devoting the spare land referred to in your note, exclusively to the growth of Apples and Plums, a few Pears, then bush trees will be the most suitable and profitable form of tree to grow, inasmuch as they are less exposed than are standard trees to the wind; moreover, less labour is incurred in the gathering of the fruit in autumn. You should pay a visit to Orsett, near Grays, or Eastwood, near Southend-on-Sea, where you may see good examples of fruit-growing for profit on a fairly extensive scale. In addition to the established orchards others are now being formed in almost every parish where land is available for the purpose. The most profitable varieties of Apples to grow in the district are Warner's King, Lane's Prince Albert, Ecklinville Seedling, Bramley's Seedling, Stirling Castle, Newton Wonder, Peasgood's Nonesuch, Bismarck, Annie Elizabeth, Gascoyne's Scarlet, Lord Grosvenor, Lord Derby, Emperor Alexander, Cellini, Keswick, Codlin, Cox's Pomona, Beauty of Bath, Cox's Orange Pippin, King of the Pippins, and Worcester Pearmain. The following varieties of Plums are recommended for market culture: Victoria, Monarch, Pond's Seedling, Sultan, Goliath, Jefferson and Washington. Excellent market Pears include Williams's Ben Chretien, Clapp's Favourite, and Beurré d'Amanlis.

TOMATO: *W. J. W.* The fruits are affected with Tomato Black Rot, caused by the fungus *Macrosporium Tomato*. Remove all fruits that exhibit symptoms of disease, and burn them at once. Spray the plants occasionally with potassium sulphide, especially when they are setting their fruits. Open the ventilators and renew the air of the house whenever the weather is favourable, being careful also to avoid having too much moisture in the atmosphere. This fungus belongs to the same species that causes leaf-curl in Potatoes (*Macrosporium solani*), and cultivators should therefore be careful to avoid using soil taken from the Tomato house for cultivating Potatoes, or soil in which Potatoes have grown for the cultivation of Tomatoes.

WALLFLOWERS: *M. S.* It is unnecessary to pinch seedling Wallflowers for flowering next year. If you wish to pinch them, let the pinching be completed during the present month. The young plants should be pricked out from their seed-beds on to a well-prepared piece of ground in the open, allowing a distance of 15 inches between the rows and 12 inches from plant to plant. Make the ground very firm and apply a thorough watering after the planting is done. The plants should be ready for lifting again in autumn and transplanting to the positions where they will flower.

WOODLICE: *H. G.* Traps may be prepared by hollowing out pieces of Potato, Turnip, &c., and putting the pieces, hollow side downwards, in the haunts of this pest. If the baits are examined each morning it will generally be found that they contain woodlice, which should be destroyed and the baits replaced. Similar baits may be poisoned, if desired, by soaking them in Paris Green or white arsenic. There are also several effective proprietary remedies on the market. Steiner's "Vermin Paste" should be mixed with barley meal or middlings and put on pieces of glass, wood, or tin, and then placed in the haunts of the woodlice. This remedy has been found very effective by some of our correspondents.

THE NATURAL HISTORY OF CONIFERÆ.

CONIFERS are distinguished from other flowering plants growing in this country by the simplicity of their flowers and fruit; for the seeds are not lodged in any closed seed-chamber (ovary), though in some cases (e.g., Pines and Spruces) they may be concealed from view by means of the overlapping scales of the woody cones. But nearly all conifers also differ widely in habit from the majority of trees growing side by side with them in our gardens, parks, and woodlands, since they have small, narrow, stiff or leathery, evergreen leaves. To this rule there are exceptions in that the Monkey-puzzle (*Araucaria imbricata*) possesses broader leaves, while the Larch and trees belonging to three rarer genera have soft leaves that are shed each year. It is not only in cold-temperate Europe, Asia, and North America that forests of evergreen conifers occur, for they are also found in warm-temperate or even tropical lowland sites, and are represented even in arctic regions or at alpine heights by low bushes or isolated pygmy trees. We naturally ask the question, "Apart from conifers and their allies, where are evergreen trees found?" The answer is that broad-leaved, evergreen trees occur mainly in warm-temperate climates with winter rain and summer drought, such as prevail in Mediterranean

countries and California, also in tropical climates with very heavy annual rainfall that is scarcely or not at all interrupted by a dry season. The thousands of species of evergreen, broad-leaved trees of the equatorial forests are represented in England by only two—the Holly and the Box. Why, then, should evergreen conifers flourish and form forests in our cold-temperate climate? Why should they have evergreen leaves? And why should those leaves be narrow and stiff, instead of being broad and flexible?

To these questions various answers have been given from time to time.

On all hands, it has been admitted that the ancestors of all conifers had evergreen leaves. Evergreen conifers have merely retained characters handed down through endless generations. The Larch, Marsh Cypress (*Taxodium*), and *Pseudolarix*, which possess deciduous leaves, are the representatives that have adopted a new policy and a new habit.

Much more difficult to explain are the problems relating to the form and texture of the leaves, and linked with these is the question, "Why did not conifers follow the fashion prevailing in cold-temperate regions by becoming deciduous?"

One explanation put forward to account for the shapes of the conifer leaves was that, since the leaves are evergreen, conifers are especially liable to be overlaid with snow in winter. Such overloading endangers the life of the tree in two ways: First, directly, by causing the tree to be overturned; second, by causing breakage or rupture of the branches, and thus occasioning wounds through which many tree-destroying fungi gain entrance. There is one strong objection to this explanation, namely, that many kinds of conifers, though they live only in regions where snow occurs rarely or never, yet they possess foliage of the typically conifer type.

The stiff texture and the thick impermeable nature of the skin of the leaves were formerly interpreted as being devices by which the leaves derived protection against severe frosts. And, in support of this interpretation, it was pointed out that the Holly and Box trees, which retain their leaves during winter, have the same stiffness and the same thickness of skin. But against this explanation is the fact that many conifers with stiff and narrow leaves find their homes solely in places where the winter is mild and is possibly the season most favourable to the active working of the tree.

This plausible explanation links itself with the next theory, which explained the form and structure of the leaves on the ground that they serve to guard against a danger that is caused sometimes by cold and sometimes by other agencies—lack of available water. We do not thoroughly understand why plants die from cold. (Some interesting considerations on the question were offered in the columns of the *Gardeners' Chronicle* of January 8, 1910). It is often true that death from cold is in reality death from want of water. However cold the weather may be, evaporation can go on rapidly, as it often does in the arctic winter, so that a plant possessing leaves during winter is exposed to the danger of losing much water from their surfaces. But, during our cold winter, as the soil becomes colder and colder, the roots, deep and shallow alike, absorb water with increasing

difficulty and in decreasing quantities (though it is a mistake to suppose that the deep roots entirely cease to absorb). Consequently, if they are to avoid desiccation at this season, the trees must decrease their evaporation by throwing off the leaves that are the main vehicles by which the water is transpired, or they must possess leaves that transpire very slowly or not at all in winter. Hardy evergreen conifers possess leaves of the latter kind. Their "needles" are small, narrow, and usually relatively thick, so that each leaf presents only a small evaporating surface. Moreover, each leaf has a thick skin (epidermis and often hypodermis), whose thick walls form a nearly impermeable barrier to the outward passage of water, and are incidentally responsible for the stiffness of evergreen coniferous foliage. And even where there are openings (stomata) in the skin (epidermis) these are sunk below the level of the surface, and are thus withdrawn from the drying influence of air currents. Finally, in winter at least when the cold is severe the stomata are blocked more or less completely. Thus the Larch has soft, flexible foliage because its leaves are not compelled to withstand the drying influence of the winter. Similarly the deciduous kinds of Cherry and Oak have thinner leaves than the evergreen species, such as Cherry Laurel and Portugal Laurel, and Holm-oak. These facts now give us a clue to the stiffness of the foliage of the two broad-leaved evergreen British trees—the Box-tree and Holly.

Thus, in cold-temperate regions, the shedding of foliage is a device largely or exclusively designed to avert the danger of being parched to death. Here the danger arises, not through lack of moisture in the soil, but through the coldness of the latter and the consequent partial or complete inability of the roots to absorb the water that may be abundant. In tropical regions that are characterised by a markedly hot, dry season, the majority of trees shed their leaves, and probably rather with the same general object in view than to avoid the scorching sun. But, in this case, the danger of desiccation arises from the excessive rapidity of evaporation in the dry season, and from the scantiness of the amount of water present in the soil at that season. *Percy Groom, D.Sc.*

(To be continued.)

THE ROSARY.

CULTURAL NOTES FOR AUGUST.

THE Wichuraiana Roses are flowering splendidly. William Allen Richardson Noisette is also in wonderful form, and against a fence or on standards the flowers are very striking. The season on the whole, with the frequent showers, is favourable for budding, and there is nothing to be gained by delaying the completion of this work. The remaining stocks of the seedling and cutting briars can now be dealt with. The Manetti and De la Grifferie stocks can be left till the last; the buds should be inserted well down under the ground line. All Roses out of flower should be cut back two or three buds, not as I have seen done in some cases, the shoots merely half severed. The pillar and rambler varieties must be tied in as the growths lengthen to prevent them from being damaged by strong wind and autumn gales. I should have remarked before that it is not well to shorten the shoots of briar stock which have been budded, until there is a certainty of the bud having

"taken." If the ties are cutting into the bark, slacken them, as it is too early yet to remove them altogether.

A surface mulch of half-spent manure is invaluable for all Roses in dry, hot weather, as it lessens the need for watering. Now is a good time to increase desirable kinds by layering out-of-doors the shoots of dwarf Roses. The outer, best-matured shoots are the most suitable for the purpose. The soil should be well loosened and some sandy grit, leaf-mould and ballast mixed in at a depth of nearly 1 foot. Cut out a sloping trench 9 inches to 1 foot deep, make an incision 1 inch long half-way through the bottom of the shoot, and press it down carefully against the side of the trench, which will leave half the shoot exposed above ground. Fill in the trench and tread the ground quite firm, then apply a good soaking of water, well mulch the surface soil, and fix each layer upright to a stake to keep it in position.

Dwarf Roses which have been pegged down, should have the old wood cut away when they have ceased to flower, so as to encourage the growth of the long shoots proceeding from the middle of the plant, which furnish the flowering shoots for next year. Keep the ground well stirred with the hoe.

The Tea-scented and China Roses in pots that were forced and have been standing out-of-doors should now be overhauled, with a view to preparing them for removing indoors. Any that were potted in the spring will only require a good top-dressing of turfy loam, decayed manure and bone-dust, first removing the uppermost of the old soil. The drainage must be made efficient, and some pieces of charcoal, mixed with the crocks, will keep the soil sweet and the roots healthy. Any plants that require a shift into larger pots should have the old soil shaken from their roots and put into clean pots, using a few knobs of charcoal and Linch bones for drainage. The compost may consist of two-thirds fibrous loam, and one third rotten manure, leaf-mould and sharp sand. Pot firmly with a potting stick and place the plants outside until October, when they can be taken into a cool, light house.

If any of the plants are weak and stunted, it is best to return them to pots of the same size; they must not be over-potted. After one thorough good soaking, newly-potted plants should be kept rather drier at the root, but they may be given a light syringing overhead occasionally to assist root action.

Pot Roses which were propagated by grafts and cuttings during autumn and spring and plunged outside are now making splendid growths, and, having been well disbudded, are healthy and vigorous. They will be in grand condition later on for flowering in autumn and winter. *J. D. G.*

TREES AND SHRUBS.

CYTISUS MONSPESSULANUS.

This is a variety of Broom that is very little known. It is a tall-growing, vigorous plant from the south of Europe, and is hardier than might be supposed from its habitat. It will probably be found to succeed anywhere in the southern half of the kingdom, but would hardly be suitable for the midlands and north. Like all the other Brooms, it requires an open, sunny situation and a light, fairly dry soil. The comparatively stout stems are densely hairy and clothed with alternate, nearly sessile, trifoliate leaves, the individual leaflets being rather less than an inch long, and they are covered with short, fine hairs. The stems and leaves become nearly, or quite, glabrous in the second year. The golden-yellow flowers open in May, and are borne on short, axillary stems in clusters of four or five. They are followed by small pods from one inch to two inches long, which ripen freely, and yield plenty of good seed. The seed germinates readily and is the best and easiest method of propagation.

The species will probably attain a height of 10 feet or so with age, as some four-year-old plants we have at Bagshot have already attained a height of 5 feet.

CYTISUS NIGRICANS.

This is a native of the southern parts of Central Europe, being fairly abundant in Austria. It forms an upright bush from 2 feet to 3 feet in height, with slender, twiggy stems, terminated by upright spikes of yellow flowers in July and August. This Broom blooms at a time when out-door flowers are becoming scarce, and a clump has a fine effect. *C. nigricans* is easily grown, and thrives well in a dry, sunny spot. An annual cutting-back in spring keeps this plant in good condition and also conduces to good flowering. It is easily propagated by seeds, which are produced freely.

GENISTA ÆTHNENSIS.

This species is a native of the slopes of Mount Etna in Sicily. In a young state it is a thin, ungainly-looking plant, but looks at its best and blooms to perfection when it has attained a good height and size. When fully developed, it reaches a height of 12 feet or more, with thin, whip-like, arching or pendulous branches, bearing a few small, scattered leaves. The best place for this Broom is in a mixed shrubbery, where its bare, lower stems are hidden by other subjects, and its bright yellow flowers can be shown up by a dark background in July and August. Propagation should be by seeds.

GENISTA SAGITTALIS.

A DWARF, spreading plant, barely a foot high, and bearing short, terminal spikes of bright yellow flowers in June. The main stems spread horizontally, but the growths spring upright from them, so that the flowers are displayed to the best advantage. The stems are winged, each wing being terminated by an ovate-lanceolate leaf rather less than an inch long. The species is essentially one for the rockery, or a dry, sunny bank, which it soon covers if the plants are set out about 2 feet apart. It is easily raised from seed. *J. Clark, Bagshot, Surrey.*

INTERNATIONAL HORTICULTURAL EXHIBITION, 1912.

The following particulars have been issued by Mr. R. Hooper Pearson, hon. Press Secretary for the International Horticultural Exhibition, 1912:

The Executive Committee formed for the purpose of organising and holding a great International Horticultural Exhibition in London in the spring of 1912 is composed of the following members:—

Chairman, J. Gurney Fowler, Esq., J.P.; hon. treasurer, Sir Jeremiah Colman, Bart., J.P., V.M.H., and

E. Beckett, V.M.H.,	C. Harman Payne,
E. A. Bowles, M.A.,	R. Hooper Pearson,
W. A. Bilney, J.P.,	Sir Albert K. Rollit,
Wm. Cuthbertson, J.P.,	J.P., LL.D., D.C.L.,
C. R. Fielder,	Litt.D.
John Green,	T. A. H. Rivers,
Jas. Hudson, V.M.H.,	N. N. Sherwood,
F. J. Hanbury,	V.M.H.,
A. G. Jackman,	A. W. Sutton, V.M.H.,
A. Kingsmill,	A. Turner,
Henry B. May,	H. J. Vetch, V.M.H.,
C. G. A. Nix,	R. W. Wallace,
George Paul, V.M.H.,	Rev. W. Wilks, M.A.

The hon. sec. is Mr. Edward White (of Milner, Son & White), 7, Victoria Street, Westminster, S.W.

This committee is now holding frequent meetings and doing everything possible to push forward the necessary arrangements.

Appeals will shortly be distributed setting forth the privileges which the committee proposes to grant to subscribers and guarantors.

The exhibition will be held in May, and will

be open to the public on eight week days. It is proposed that the prices of admission shall vary between two guineas on the opening day, and one shilling on the later days of the exhibition. Although in no way responsible for the exhibition, the Royal Horticultural Society is extending its general approval to the scheme. This Society has not only agreed to forego the holding of the usual Temple Flower Show for that year, but it has also contributed a sum of £1,000 towards the International Exhibition, and in addition is prepared to assist generously in the formation of a guarantee fund.

An ideal site for the exhibition will probably be secured in the south-west of London.

A preliminary schedule will soon be ready for prospective exhibitors, as the Schedule Committee is meeting frequently and sitting long for the purpose of getting out an early edition.

This first edition will not contain the money prizes for each class; its main purpose will be to acquaint exhibitors in England, the Colonies, and foreign countries with the details of the classes included in this, the most embracing schedule of horticultural exhibits ever compiled in this country. The amount of prize money will very far exceed the sum awarded at the International Exhibition of 1866, when £1,600 was expended on prizes.

Arrangements are being made for establishing territorial committees in the counties, and the secretaries of these committees will shortly be appointed.

Already the committee has obtained the highest patronage for the International Show, including their Majesties the King and Queen and their Royal Highnesses the Duke of Connaught, Prince and Princess Christian, Princess Louise and others.

NOTICES OF BOOKS.

THE BOOK OF THE ROSE.

THE late Rev. Foster-Melliar was a Rosarian of the old school. He grew Roses because he loved them and loved to exhibit them, taking a pride in cups and medals and other prizes that he obtained as a result of his skill in growing these flowers. His book, the first edition of which was published in 1894, was written, as he told us, for enthusiasts, for those who made a regular hobby of Roses, for those who valued the individual flower of the Rose and whose idea was not the Rose for the garden, but the garden for the Rose. He believed that Rose-growing as a hobby was particularly adapted for gentlemen, and especially for country parsons.

But the exhibition qualities of a flower, be it a Rose or a Chrysanthemum, are not often those which gardeners value most; indeed, prize flowers, like prize pigs or prize poultry, are only obtainable as the result of much worry and hard work, to which the art of the dresser has also sometimes to be added. A tray of exhibition Roses is ugly in comparison with a well-flowered Rose bush on a lawn in June or July. For Roses are beautiful summer-flowering shrubs, and we are glad to see that this is now being generally recognised. The garden for the Rose certainly, but let the Rose display its real charms there and not as an individual flower pegged down on a tray.

The fourth edition of Mr. Foster-Melliar's book has been revised by the Rev. F. Page Roberts and Mr. H. E. Molyneux, who inform us in the preface that the book was originally written for the exhibitor, and, whilst they evidently are not in full sympathy with the author, they have thought it best to restrict their alterations and additions to footnotes, except the chapter on "Manners and Customs," and the lists of Roses.

Foster-Melliar loved the hybrid perpetuals because he knew comparatively little of the newer and, in many ways, far superior hybrid Teas. These Roses make the garden gay, not merely for

a week or two, but all the summer through, and often on until December and January.

The first chapter of this new edition is a memoir of the author, the rector of Sproughton, in Essex, in which capacity Mr. Foster-Melliar lived and grew his Roses for about 20 years. He died in November, 1904. The remaining chapters are pretty much as they were originally written, and, in looking through them, we were fired by the enthusiasm and filled with admiration for the great practical knowledge displayed by the author. History and Classification; Situation and Soil; Planting; Pruning; Propagation; Exhibiting, and Manners and Customs are each treated upon in the spirit of one who knows his subject and is in love with it. The lists or selections of sorts have been brought up to date by the editors. There is also a calendar of operations in the Rose garden. The illustrations are chiefly from photographs of representative Roses, and the frontispiece is a characteristic portrait of the author, who was, what he there appears to be, one of the most lovable of men. W.

THE BOOK OF THE FLOWER SHOW.*

THOSE who are acquainted with the series of gardening books, of which this is the latest, need not be told that the volumes are not of equal importance. *The Book of the Flower Show*, it may be remarked at once, if not the most important, is at least a notable addition to the list to which it has just been added. In some respects it were to be desired that the author had assumed a more authoritative tone than he has, and had been more definite in some things to which reference will be made later, because a book of this nature, if it is to have the fullest value, must have a precision that admits of no room for doubt on the part of the reader.

Full directions for compiling rules for flower shows, with examples obviously extracted from those of existing horticultural societies, are given, with warnings regarding the shoals that are most likely to wreck or damage the craft once it is launched. Mr. Curtis truly remarks that the moving spirit must always be the secretary, who has it in his power to stimulate enthusiasm for his society, or, on the contrary, to damp every bit of energy its members ever possessed. One could have wished that more had been written regarding the critical part of the subject, the duties of the judges, and also their powers in the matter of disqualifying which are sometimes carried beyond the necessity of the case. But this, perhaps, can best be judged by local circumstances. I have found it conducive to easy working, and at the same time to serve every good purpose, to request the judges to pass without notice any exhibit which clearly fails to conform to rule, or which may verge on the confines of fraud.

A large part of the present volume is occupied with a discussion of the exhibition points of flowers, fruits, and vegetables, with brief hints regarding the kind of thing not to stage. It is here, and particularly in the section devoted to flowers, that the author is less lucid, and too much given to generalise than the case demands. Definitions such as "good," "full," "large size," "great depth," and "shapely flowers" occur, and though, in a general way, people who are acquainted with the flowers to which these expressions refer may not go far astray in seeking for their meaning, it is obvious that they give no indication whatever of what is essential in the flowers. What, for instance, is "good size" in a China Aster or "great depth" in a quilled Aster! I should have liked, too, when the question of dressing flowers was approached, that it should have been squarely met. One cannot imagine a cultivator of scarcely any kind of garden-produce for exhibition who does not in some way or other manipulate it so as to make

it look more attractive than it would be were it left alone. It is possible to rebel against the superlative ordering of the petals of a Carnation by an accomplished master of the art of flower-dressing without deprecating the removal of petals which are disfiguring to a bloom; to be horrified by the taste that calmly produces a nicely formed African Marigold by the aid of a pair of scissors, without feeling qualms if the same flowers are rendered smooth by the extraction of aborted and misplaced florets. One might go a step further and remark that every cultivator "dresses" the object of his daily attention. The difficulty with the exhibitor is to find the point where legitimate dressing passes into that against which the ordinary mind recoils.

Mr. Curtis entertains very strong views on labelling—too strong, I should venture to assert, when its incompleteness would affect the results in judging. One can understand and sympathise with the spirit of a rule that would penalise by the reduction of prize money slackness in labelling, but that it should affect the proper placing of the produce on its merits would be absurd. In village shows, it is too much even to expect

FIG. 28.—HYMENOCALLIS HARRISIANA
FLOWERING IN CAMBRIDGE BOTANIC
GARDEN.

labelling, at least at the present stage of exhibiting.

Those interested will find in Mr. Curtis's book many hints and much information regarding everything connected with the subject of which it treats. It is illustrated, but not effectively. R. P. Brotherton.

HYMENOCALLIS HARRISIANA.

THE illustration in fig. 28 represents a distinct species of *Hymenocallis*, and the only one I know that can be grown out-of-doors in a border. In the Cambridge Botanic Garden, where the photograph was taken, it has been an ornamental plant for some years past, growing in a narrow border in one of the recesses between the houses. It forms a close tuft, and flowers early in July. The bulbs are globose, about 1½ inches in diameter; the leaves are oblanceolate, narrowing to the base but not petiolate, 2 feet long and about 2½ inches broad; the scape is about as long as the leaves, and bears an umbel of from 2-8 flowers, with two or three large, scarious spathe valves; the perianth tube is about 3 inches long, and is green for about ¾ inch of that length, then shading off to white; the segments are linear about 3 inches long; the staminal cup is funnel-shaped, comparatively small, ½ inch long, very plicate, about 3 inches in diameter at the throat, and with a small tooth between the filaments; the filaments are 1½ inches

long; the anthers slender and versatile, about ½ inch long.

The species is a native of Mexico, and I have two forms, one with a perfectly green leaf and the other with a leaf distinctly glaucous. The flowers are very ornamental when cut. The species is figured in *Botanical Magazine*, 1831, tab. 6562, from specimens received from Colonel Trevor Clarke and Mr. Elwes, but it was originally described by Dean Herbert from specimens imported about the year 1840 by T. Harris, of Kingsbury, after whom it was named. R. Irwin Lynch.

THE NEW LAND VALUATION.

THE preliminary steps for the official valuation of all land, as directed by the Finance Act, 1910, are now practically completed, and on August 1 forms will be sent out containing a list of questions which have to be answered by every person owning a piece of land however small. It is understood that no fewer than 3½ million forms have been printed, and owners of land have to return their forms duly filled in within 30 days, under a penalty of £50. Replying to a question upon this subject recently, the Chancellor of the Exchequer stated that he did not anticipate that the officials would strictly enforce the penalties in the case of those persons who might be away for their summer holiday during the month of August; but no actual pledge was given, and it would therefore be unwise to rely too confidently upon the indulgence of the Somerset House authorities.

UNIVERSAL VALUATION.

It does not appear to be fully understood by the general public that every piece of land is to be officially valued (as on April 30, 1909), irrespective of whether or not it may be exempt for the moment either from Increment Value Duty or Undeveloped Land Duty, or both these burdens; such is, nevertheless, the case. The effect of this valuation may be very far reaching, and, for this reason, great caution should be exercised in filling up the details required by the valuation forms. Practically, it will be necessary to deal with each individual case on its merits, the peculiarities of the Act being such as to render it impossible to lay down any fixed rules for general guidance.

SOME CONSIDERATIONS.

For instance, Increment Duty may be chargeable in respect of a piece of land, even though no claim for Undeveloped Land Duty arises. In such a case, the first impulse of the owner will probably be to press for as high a valuation as possible, so that, if the land should rise in value at some future date, the State's share of one-fifth of any such future increase may be kept down to the lowest possible figure. It does not necessarily follow, however, that such a course would ultimately prove advantageous to the owner, because, in the first place, the official valuation will probably prove the basis upon which the Death Duties are estimated (in addition to Increment Duty) in the event of the owner's death. Furthermore, it is understood that next year a strong effort will be made to levy all local rates on the capital value of the land instead of upon the annual value of the premises as hitherto, and a private Bill for this purpose, which may be officially adopted, has already been brought before Parliament.

An owner who is advanced in years might, therefore, consider it wise to run the risk of paying a large Increment Duty and to press for the valuation to be kept as low as possible, so that, in the event of his death, the burden of Death Duties might not bear too heavily upon his wife and children. Even, however, if he adopted that course he would still find himself confronted with the possibility of serious danger, as the Chancellor of the Exchequer has already suggested that the official land valuation might ultimately be made the basis of the price to be paid either by the State or by local authorities if they should require to purchase the land for the purposes of the community, or if the State should wish to buy up the land for the purpose of re-creating rural industries. It will be obvious,

**The Book of the Flower Show*. By Charles H. Curtis. (London: John Lane.) *Handbooks of Practical Gardening* Edited by Harry Roberts. Price 2s. 6d. net.

therefore, that those who have invested their savings in a piece of land, however small, cannot afford to answer with indifference the official questions which are about to be put to them.

A trader who carries on business as a limited company will be confronted with a somewhat different problem from that which faces a private individual. He will not be faced with the difficulty arising in connection with the Death Duties, as his Will would deal with shares in a limited company, and not with an "interest in land" within the meaning of the Act. He would, however, have to bear in mind that, in the year 1914, and in every subsequent 15th year, the land owned by his company will be valued afresh, and, in most instances, the State will claim one-fifth of any increase in value of the land since April 30, 1909, less the usual margin of 10 per cent. to cover expenses, possible fluctuations in price, &c. This, of course, is in addition to the universal valuation of "undeveloped land" to be made every five years.

A fresh set of considerations arises where the land is used for the purpose of agriculture or horticulture, especially if the land has any additional value by reason of its being either wholly or partially ripe for building purposes. In the case of horticultural land, a claim for Undeveloped Land Duty will usually arise, and, looking at the matter from this point of view, it might be wise to keep the official valuation as low as possible, having regard to the fact that the duty starts as from April 30, 1909, at one halfpenny in the pound on the capital or selling value of the land, and that this duty is not only payable every year, but will probably be increased in the near future. Here again, however, the owner of the land is confronted with the danger of having to pay a larger amount by way of Increment Duty, coupled with the additional risk of having his land taken from him compulsorily, either by the State or the local authority, at the low valuation in question. If the land is likely to be used for building in the near future, it will usually be wise to press for a high original valuation, as it will be cheaper to pay annually a tax of a halfpenny in the pound on the selling value of the land for a few years, rather than to pay 4s. in the pound on the increased value which will result from the land changing hands at building price.

SOME COMPLICATIONS.

Bearing in mind the above few examples of some of the factors to be considered, it will be seen that, even in the simplest cases, the official valuation forms will need careful study; but, in most instances, the question is likely to be complicated still further by other considerations. For instance, a nursery (or even a private garden) which has a frontage to a main road may, as regards the front portion at least, be almost worthless for the purpose of either horticulture or private enjoyment, owing to the excessive dust raised by passing traffic, or the application to the roads of special preparations, which, although very welcome to owners of motor-cars, are injurious to plant life. On the other hand, as the frontage to the road decreases in value for horticultural purposes, it may proportionately increase in value for building purposes, resulting in considerable liability for Increment Duty. It should, therefore, be borne in mind that an owner is entitled to demand that any portion of the land shall be separately valued. In some cases it may pay an owner to demand that the strip of land fronting the roadway shall be valued separately from the land in the rear, on the ground, for instance, that only a portion of the land is worth more for building purposes (or for the purpose of any other trade or business) than it is for agriculture or horticulture. Conversely, however, cases may arise where it would be unwise for an owner to split up the more valuable portions of his land from the less valuable, and where it would pay him better to demand that the land be valued as a whole, so that the increased value attributable to his building frontage may be spread over the whole of his holding. The result of this would be that the land at the rear would help to bear a proportion of the increasing value of the land at the front of the premises.

It will also have to be borne in mind that, although the valuation of the land is to be made now, the value which will be officially taken is not the value at the present moment, but the value as it stood over a year ago, namely, on

April 30, 1909, before the loss of confidence in the property market had arisen, and before a possible purchaser, in estimating the price to offer for a piece of land, would have had an opportunity of deducting from the amount of his offer the capitalised value of the increased taxation which he will have to bear in the future. Furthermore, if the land has been bought within the preceding 20 years at a higher price than its value on April 30, 1909, then that previous value will be substituted for the more recent value.

It may be suggested that, after all, the simplest plan will be for the owner to press for the true present value of the land to be estimated as nearly as possible, but, apart from the fact that every person is entitled to take every possible point in his favour which the law permits, and that any error may inflict irremediable loss in the near future, owners will find a very real difficulty in forming any idea of what the true present value may be. Be it remembered that, for the purpose of the pending valuation, all houses and buildings, and all fruit trees, fruit bushes, and growing produce are to be treated as if they were non-existent, and the cost of their assumed removal will be estimated. Various calculations have also to be made with regard to burdens in respect of tithe, improvement rate and other outgoings, the cost of making roads or sewers on the property, and capital expenditure made for the purposes of any business other than agriculture or horticulture, and so on. In addition, there is the difficulty that many clauses in the Act are admittedly ambiguous, and the Chancellor of the Exchequer has already declined to express an opinion upon certain questions of construction, on the ground that these will have to be decided by the courts of law. Until, therefore, these doubts have been removed by judicial decisions, it is impossible for an owner to foretell in what way he will be affected by some of the provisions of the Act.

GLASSHOUSES.

In this connection, it may be well to point out that, although liable for Increment Duty, land which is developed by building will not be chargeable with Undeveloped Land Duty. The Act says that, for this purpose, glasshouses are to be treated as buildings. Does this mean that only the few yards on which a greenhouse stands are to be treated as exempt, or is it intended that, if a reasonable number of greenhouses are in existence, then the whole nursery is to be exempt? If so, what is to be the minimum proportion of uncovered land? During the progress of the Bill in Parliament it was suggested in some quarters that, if one-fifth of the land were covered with glass, no claim for Undeveloped Land Duty should arise; but no such provision was inserted in the Act, and, apparently, the question will have to be fought out in the law courts.

THE VALUATION FORMS.

It should be carefully observed that the official valuation form is divided into two portions. The writer has already had an opportunity of seeing these forms, and it will be found that Part 1 contains a list of questions which the owner of the land is bound to answer; whereas Part 2 asks for additional particulars, which need not be furnished unless the owner desires to give them. The question marked "U," for instance, invites the owner to estimate the gross value, the full site value, the total value, and the assessable site value of his land. Having regard to the possibility of their answers being used against them in the future, most owners will probably consider it wiser to refrain from expressing any opinion in reply to the optional questions, especially as they would be called upon to give full particulars showing how the estimate has been arrived at. If the owner refrains from giving an estimate, his course will then be to await the provisional valuation, after which he will have 60 days in which to check and protest against the assessment if he think it desirable to do so in his own interests. The question marked "V," however, is one to which the owner must be careful to insert the answer "Yes," as this refers to his right to claim certain deductions from the estimated site value of his land. In this connection it should be borne in mind that delicate questions of calculation arise, as the value of the land, after stripping it (in imagination) of all timber, trees, and other growing produce, has to be taken into account,

and the cost of so stripping it has also to be estimated. These deductions may help considerably to reduce the amount of Undeveloped Land Duty payable. Furthermore, if deductions are now claimed now for the purpose of Increment Value Duty, they cannot afterwards be claimed when a demand for the duty arises in the future. At first sight it would look as though these deductions represent a common factor which, in the latter instance, it would, therefore, be immaterial to ignore; but this is not the case. For instance, a sum of, say, £50 might be deducted from the present value on account of capital expenditure in various directions; but it does not follow that, when a claim for duty arises in the future, the precise sum of £50 will again be deducted from the valuation. The owner will be entitled to deduct at the future date not merely the £50 in question, but all increase in value attributable to his original expenditure of £50, and, in years to come, the increased value of the land attributable to the original outlay of £50 might amount to £200, and so on in proportion.

POINTS SUMMED UP.

Summing up the position generally, it will be seen that the principal points to observe are as follow:—

First, in the case of a *high* initial valuation, there is the danger of—

(a) High Death Duties.

(b) High rates and taxes, if rating on capital site value is adopted hereafter.

(c) High Undeveloped Land Duty.

On the other hand, the risk of heavy Increment Duty is diminished.

Secondly, in the case of a *low* valuation, there is the danger of—

(a) High Increment Duty.

(b) Compulsory purchase for public purposes at under-value.

On the other hand, the claims in respect of Undeveloped Land Duty and Death Duties are diminished.

The principal points to be considered are:—(a) The age of the owner. (b) The possibility of sale or lease of the land for more than 14 years at an early date. (c) The present and future building value. (d) The present and future horticultural value. (e) The question of present exemption under the Act from either Increment Duty or Undeveloped Land Duty, the exemption in the case of these two burdens being by no means identical.

It is feared that the few points raised for consideration above are highly technical, and may prove wearisome reading; but perhaps enough has been said to warn those upon whom official valuation forms may be served of the extreme danger of committing themselves, without due care and consideration, to a present valuation of their property which will bind them for all time, and any error in which may prove seriously detrimental to them or their children in years to come.
H. M. V.

PLANT NOTES.

KALANCHOE FLAMMÆA.

SINCE this species was introduced several hybrid forms have been raised, but they do not, as decorative plants, equal *K. flammæa* itself. There can be no question that it is one of the finest plants of the last decade, and the numbers in which it is now to be met with well attest its present-day popularity. The comparatively simple cultural requirements of this *Kalanchoe*, combined with the uncommon, yet effective tint of its brightly-coloured blossoms, the length of time they remain fresh, and the succession which is kept up, are all points in its favour. In referring to it as one of the plants of the last decade, I have not overlooked the fact that it first flowered at Kew in 1897, from seed sent two years previously, but it was not till the year 1900 that Messrs. Veitch, into whose hands the stock passed first, distributed seed of it. Considering the vast expanse in Africa that has been opened up within the last few years, the really good plants obtained therefrom have not been numerous. *Kalanchoe flammæa* *Coleus thyrsoideus* are perhaps the best of them. W.

REPORT ON THE CONDITION OF THE OUT-DOOR FRUIT CROPS.

[FROM OUR OWN CORRESPONDENTS.]

THE WORDS "AVERAGE," "OVER," OR "UNDER," AS THE CASE MAY BE, INDICATE THE AMOUNT OF THE CROP, AND "GOOD," "VERY GOOD," OR "BAD," DENOTE THE QUALITY.

FULLER COMMENTS WILL BE GIVEN IN THE FOLLOWING NUMBERS. SEE ALSO LEADING ARTICLES ON PAGES 82.

EDITORIAL NOTICE.

ADVERTISEMENTS should be sent to the PUBLISHER, 41, Wellington Street, Covent Garden, W.C.

Special Notice to Correspondents.—The Editors do not undertake to pay for any contributions or illustrations, or to return unused communications or illustrations, unless by special arrangement. The Editors do not hold themselves responsible for any opinions expressed by their correspondents.

Letters for Publication, as well as specimens of plants for naming, should be addressed to the EDITORS, 41, Wellington Street, Covent Garden, London. Communications should be written on one side only of the paper, sent as early in the week as possible and duly signed by the writer. If desired, the signature will not be printed, but kept as a guarantee of good faith.

Local News.—Correspondents will greatly oblige by sending to the Editors early intelligence of local events likely to be of interest to our readers, or of any matters which it is desirable to bring under the notice of horticulturists.

Illustrations.—The Editors will be glad to receive and to select photographs or drawings, suitable for reproduction, of gardens, or of remarkable plants, flowers, trees, &c., but they cannot be responsible for loss or injury.

Newspapers.—Correspondents sending newspapers should be careful to mark the paragraphs they wish the Editors to see.

AVERAGE MEAN TEMPERATURE for the ensuing week deduced from observations during the last Fifty Years at Greenwich 62° F.

ACTUAL TEMPERATURES:—LONDON.—Wednesday, July 27 (6 P.M.): Max. 64; Min. 54°.

Gardener's Chronicle Office, 41, Wellington Street, Covent Garden, London.—Thursday, July 28 (10 A.M.): Bar. 29.9; Temp. 69°; Weather—Overcast.

PROVINCES.—Wednesday, July 27; Max. 62° Guildford; Min. 56° N.W. coast of Scotland.

In presenting our annual reports on the condition of the hardy fruit crops in the British Isles it has to be admitted that the prospects this season are distinctly unsatisfactory. This is so far the case that, in respect to the principal crops—Apples, Pears, Plums, and Cherries—the returns indicate such deficiencies as, happily, we have not experienced for some years. Concerning Apples, there are 226 returns, and, of these 180 describe the crops below the average, whilst in only five instances are there over-average crops. If the general yield were up to the average, it would be indicated by the number of returns of over-average crops equalling the number of under-average returns; therefore, some idea may be obtained of the deficiency by considering the proportion of 5 over-crops to 180 under-crops.

Again, our valued reporters are mainly the same who have contributed information on the subject for many years past, and have acquired a systematic method of estimating their crops; consequently, it is useful to compare their returns with those of last year, which may be seen in the summary printed on this page. It will be observed that, in respect to the Apple crop, there were 63 over-average reports last year and 81 under average; therefore, the proportion was as 63 to 81, instead of 5 to 180. The deficiency of Apples is so general that reports from the different portions of the country are nearly equal in their lack of promise. Scotland reports 1 above and 29 below the average; England 1 above the average and 131 below; Wales returns 12 reports, every one of which is under the average; whilst Ireland reports 2 above and 6 under the average. It is interesting to note that what little advantage one portion of these islands has over another belongs to Ireland. Another matter connected with the Apple crop may be mentioned in passing, namely, that a large proportion of the fruits that set have since fallen from causes not apparent; perfectly sound fruits have dropped in considerable numbers, just as might have been expected in a season of drought, but hardly in such weather as characterises the present season. This circumstance appears to indicate that the trees were not in a condition to bear satisfactory crops, even had the weather during May favoured a good set.

The Pear crop is equally disappointing, for there are only 7 returns of above average out of a total number of 222, whilst the number of under-average crops amount to 187. In this case also Ireland appears to fare best, for out of 14 returns there are only 6 which report crops below the average. In Scotland there is only 1 report above average, in England 2, and in Wales there is 1 average crop against 11 that are reported as deficient. Plums are only a shade better than Apples. Out of 221 returns, 56 report average crops or better, and 165 are under the average. Cherries, again, are distinctly scarce; there are 5 over-crops, as against 137 under the average, whilst the average crops number 71. Peaches and Nectarines were satisfactory last year, and, in not a few instances, fair crops were ripened even on standard trees in the warmer counties. This year the tale is different, although the returns are much more favourable than those in respect to the fruits already named. Of 154 returns, 68 are average, 68 below the average, and 18 over-average. Apricots are de-

ficient in all parts of the kingdom. The seven reporters from Ireland all state under-average crops, whilst in Scotland, England, and Wales the prospects are not very much better.

It is not until we turn to the small fruits (which include Raspberries, Currants, and Gooseberries) and Strawberries that the returns are satisfactory. In these cases the number of average and over-average crops greatly exceed the returns in which deficiencies are reported, but neither in the case of the former group nor in that of Strawberries are the returns so favourable as last year. There are no returns of over-average crops of Nuts, and the number of average crops is 35, against 87 below the average.

In the face of these figures there is no doubt but that the present season is remarkable for great scarcity of most hardy fruits, and the public will have to look to the Colonies and foreign countries for most of their supplies of Apples, Pears, and Plums.

In any attempt that is made to determine the causes of the deficiency, careful consideration must be given to the character of the autumn season last year, when the weather was certainly not of the best description for maturing the young shoots. But, when sufficient allowance has been made for that, it may still be the fact that the unusually bad weather experienced this season has been mainly responsible for the results.

In subsequent issues we shall print the remarks our correspondents have favoured us with upon this subject, for, as we have said in effect already, they are the remarks of practical fruit-growers, who have accustomed themselves to make careful observations and form intelligent deductions from the facts observed.

The Strawberry Season.

Though prices have been disappointing to growers during the last two or three seasons, there is no reduction in the supply of Strawberries forwarded to London and the other important towns of the kingdom. On the contrary, the figures of last year's crop greatly exceed those of any former season, and, when the returns for the current year are made up, it will probably be found that there has been a further increase. It appears that, in spite of a very much lower average price than growers were accustomed to receive a few years ago, Strawberries are still remunerative, though it is probable that a part of this season's crop has been sold at prices that left little or nothing for the producer. Fruit was sold during the third week

SUMMARY OF 1909 FOR COMPARISON.

Records.	Apples.	Pears.	Plums.	Cherries.	Peaches and Nectarines.	Apricots.	Small Fruits.	Strawberries.	Nuts.
Number of Records	(246)	(243)	(240)	(233)	(174)	(164)	(242)	(242)	(146)
Average	102	125	119	128	84	72	74	102	71
Over	63	21	44	76	75	47	157	119	22
Under	81	97	77	29	15	45	7	21	53

in June at the price of 6d. and 7½d. per gallon basket, which means about 1¼d. to 1½d. a pound.

The following table shows the growth of the Strawberry-growing business in the Southampton district—which is now the chief centre of the industry—during the past half-dozen seasons:—

		FRUIT	
		Tons.	Baskets.
1904	4,250	1,900,148
1905	3,400	1,500,000
1906	2,794	1,250,000
1907	4,705	2,100,118
1908	4,019	1,762,804
1909	6,585	2,948,195

These figures apply only to a single district, and it may be pointed out that this increase of production has not been equalled in other Strawberry-growing areas, although there has been an advance all round. In the West of England, for example, the business, though it is as nothing compared with that carried on in Hampshire, has more than quadrupled itself within the last three years, as the figures supplied in the returns amply testify. In the season of 1906 the Great Western Railway Company conveyed only 428 tons of Strawberries from the Saltash and Tavistock districts, and in the following year 433 tons. Last year, however, the figures for home-grown fruit had risen to 1,793 tons, and, at the same time, there has been a considerable advance in the Strawberry traffic from the Continent conveyed by this company. Strawberries from France, for which the season is naturally confined to the early part of the year, totalled 1,150 tons on the G.W.R. system.

It is said that growers are beginning to declare that Strawberry growing is not what it was, and are looking around them for the adoption of some measures that will bolster up the market. In these circumstances, the consumer may be able to make one or two useful suggestions. One of the grievances of the public is that, whilst they are reading in the papers every day that there is a glut of Strawberries and that the fruit is being sold at ruinously low rates, the prices in the shops are not correspondingly reduced. Even when the fruit is fetching no more than 2d a pound in Covent Garden, shopkeepers are charging three and four times that amount to their customers. This state of things is deplorable. It is easy to see that the retailer's risk in goods of this description is very great, but the margin between the wholesale and retail prices is too large. If the shopkeeper is asked why he charges 8d. or 9d. a pound for best Strawberries in punnets of one pound, when the fruit is being sold in the market at 1½d. to 3d. per pound, he states that the punnets he offers are the selected fruit from his purchases. He then proceeds to show the sort of sample that is left after he has removed the best, and it appears as though he has often a reasonable excuse for pursuing such methods. Most of his customers naturally want the best fruit, and, when he has given them that, he finds only too frequently that the remainder is unsaleable.

Then there is the old story of topping-up with the best fruit after having carefully hidden the inferior produce underneath. We do not suggest that this is quite so common a custom as it used to be, but it still prevails.

Has any grower ever tried rejecting all his small and misshapen berries and marketing only the very best under a registered brand? The foreigner does it with Apples and Oranges, but the system is scarcely known in this country, certainly not as regards Strawberries. The fruit might not at first fetch any better price, but as it became known among buyers that a particular brand could always be relied upon in every way, the proprietor would benefit, if not by better prices, at least by a sure market for his goods. The present practice of mixing "firsts" and "seconds" sometimes results in an anomalous state of things. One day lately the writer bought some Strawberries at a shop in the City at 8d. a pound by taking a 4½-pound basket, while loose Strawberries of better size but inferior in condition were being sold in the same shop at 10d. per pound. The latter, although sold as selected, had received an extra handling, but it seems that the general public thinks more of size than of good condition. The retailer, also, knowing that in selling a whole basket he was getting rid of fruit that would, so far as most of it was concerned, be of secondary value to him, was willing to let the basketful go at 2d. a pound cheaper. Of course, the quantity sold had something to do with the lower price charged, but, as the shopkeeper explained, it was the relief from the trouble of grading the fruit that was the chief inducement to him to sell an untouched basket at the lower rate.

It is to be regretted that some growers still keep to the old custom of marketing their fruit in peck baskets holding 10 or 12 pounds. If they could see the fruit when it is overhauled by the retailer, they would discover why prices are often bad for Strawberries packed in such fashion. A package of this size is much too large for Strawberries, the lower layers being often reduced, after a railway journey, to something very like pulp. The 4½ to 5 pounds basket, as used by the Southampton growers, is quite large enough for fruit that has to travel any distance.

This raises another question regarding the packing of Strawberries, for would not the fruit be more saleable if it could be put up in still smaller packages by the grower? It would be rather more trouble, but it is probable that the public would be more ready to buy two or three pounds at a time if they could get it in such quantities in the growers' original packages. When the outdoor Strawberries appear in the market—and it is those only that concern the general public—the purchaser must take his choice between the basket of four to five pounds (which is probably too big for him) and the punnet of one or two pounds put up by the retailer, and, consequently, subjected to a double handling.

This state of things might be improved upon if the grower could see his way to using packages of smaller size, and could take a leaf out of the Frenchman's book, and use the two-pound boxes in which we see the foreign fruit so neatly packed early in the season before the English crop is on the market? The carriage would not cost much, if any, more than the baskets do at present, for the inside boxes of a crate containing a couple of dozen packages could be made of very light material. The labour involved in putting up fruit in this fashion would, of course, be much heavier than at present, but if these packages were

marketed under a brand and only selected fruits were packed in them, it should only be a question of time before both the retailer and his customers preferred them to the fruit marketed in the ordinary fashion.

Unfortunately, directly there is a decline in price in any commodity, the tendency is to try and save in the cost of production, and it would probably be hard to persuade any grower at the present time to adopt a system of marketing that would involve him in greater expense than he is put to at present. But, from the public point of view, there is room for a better method of marketing Strawberries, and we commend the subject to the consideration of the more enterprising growers.

OUR SUPPLEMENTARY ILLUSTRATION.—

Among the pleasant memories which travellers on the Continent bring home with them are those of visits paid in the early morning to the market places where, under bright skies and amid delightful surroundings, buying and selling goes on with cheerful animation. Of such places the flower-market in Brussels is among the most interesting. It is held—as is shown in the Supplementary Illustration—in the "Grand Place," which is one of the finest mediæval squares in existence. The "Place" is surrounded by beautiful buildings, the chief among which is the Hôtel de Ville, recognisable by its façade ornamented by innumerable modern statues of the Dukes of BRABANT and other notabilities.

ROYAL HORTICULTURAL SOCIETY.—The next meeting of the Committees will take place on Tuesday, August 2, in the Vincent Square, Westminster. At the afternoon meeting of Fellows a lecture on "The Planning, Building and Planting of Small Rock-gardens" will be delivered by Mr. A. CLUTTON BROCK.

THE SALE OF POISONS.—We are informed that the defendant in the case of Pharmaceutical Society v. Pecover, which was heard in the City of London Court on June 21 last, has intimated that he will not appeal. It will be remembered that defendant was an assistant to HOBBIES, LTD., and judgment was given for the Society, but leave to appeal was given upon condition that the penalty and costs were paid into court. The proceedings arose in connection with the sale of XL-All fumigating compound. A report appeared on p. 455.

GLADIOLUS BRENCHLEYENSIS.—Regarding the introduction to commerce of this popular Gladiolus, Mr. GEORGE BUNYARD, of the Royal Nurseries, Maidstone, writes to say that he noticed a statement in a contemporary recently to the effect that enquiries have been made respecting the origin of Gladiolus brencleyensis at the village of Brenchley in Kent, but no particulars could be gleaned. Mr. BUNYARD therefore wrote as follows:—"In reference to your note as to origin of this Gladiolus, allow me to say that over 50 years back, my father purchased bulbs from the raiser, a Mr. HOOKER, of Brenchley, Kent, who raised it from Gandavensis. I can well recollect selling them at 2s. 6d. each. We raised a big stock the same year. Mr. YOULL, of Yarmouth, called on his round, and we sold him a quantity, which, in his sandy soil, soon enabled him to flood the country with it." Mr. BUNYARD now informs us that he believes that Mr. HOOKER was once a nurseryman. Mr. BUNYARD knows nothing about Mr. YOULL's foreman, as mentioned in our note upon the newly established American Gladiolus Society (see p. 45), but he well recalls Mr. YOULL himself, a cheery, short and thickset man. Gladiolus brencleyensis, writes Mr. BUNYARD, is still one of the most reliable sorts for massing, being less liable to disease,

FLORISTS AND THE FACTORY ACTS.—In the course of an important speech in the House of Commons on July 20 (Home Office Vote, Factory Inspection), Sir CHARLES DILKE raised the question of the position of florists with respect to the Factory Acts. In the debate, which arose out of this speech, Sir J. D. REES and Mr. MILDMAY stated that, if the Factory Acts were rigidly enforced in the case of florists, numbers of English women and girls would lose employment and their places would be taken by alien men. Mr. MASTERMAN, speaking on behalf of the Home Office, made a reply from the *Times* report of which we make the following extract:—The question of the florists had been raised by the hon. member for the Montgomery Boroughs and by his right hon. friend. He was amazed at the statements made by his hon. friend, who, in a question the other day, suggested that there

in florists' workshops beyond the normal working hours was entirely a local question connected with the demands in the West-end of London. The reports from the other parts of the country show that no such necessity for the working of long hours existed. There was no east-iron and no inelastic system. In florists' workshops women and girls could work from 6 a.m. to 6 p.m., from 7 a.m. to 7 p.m., or from 8 a.m. to 8 p.m., with two hours overtime, during five weeks in the year by merely sending a notice to the factory inspector before 8 o'clock on the same day on which it was intended to work overtime. While accepting and agreeing with the decision of Judge RYEGG, he pointed out that last year they had gone thoroughly through the various florists' workshops that might be affected. They found that the number was exceedingly small. The total number of

CULTIVATION OF VACANT LAND.—On the 21st inst. Lord CARRINGTON, President of the Board of Agriculture, accompanied by Mr. RICHARD WINFREY, M.P., and Mr. E. J. CHENEY, Small Holdings Commissioner, conducted by Mr. JOSEPH FEIS, visited the grounds held by the Vacant Land Cultivation Society from the Gas, Light & Coke Co., at West Ham. Over an hour was spent in the inspection of the well-cropped plots, of which there are 266 on an area of 33 acres, and the visitors expressed much satisfaction with the results obtained by the men. Lord CARRINGTON closely questioned several of the plot-holders with regard to the value of their produce, used or sold, and the information elicited indicated an average of £3 to £10 per plot of 20 square rods. In every case especial value was attached to the supplies of fresh vegetables for home use, the men, wives and children thus benefited numbering over 1,200. The ground lent by the Gas, Light & Coke Co. was formerly used for market gardens. Mr. R. L. CASTLE, Superintendent, states that the occupations of the plot-holders are as follows:—General labourers, 126; dock labourers, 50; coal porters, 23; various, 67. The produce is chiefly consumed in the homes of the men, but some is sold retail.

FIG. 29.—THE SILK-COTTON TREE (BOMBAX SP.) IN NIGERIA.

were thousands of honest British working women being thrown out of employment, and whose places were being taken by aliens under the stern, east-iron regulations dealing with the florists. If a hundredth part of his hon. friend's accusation were true there would be assuredly a case for consideration on the part of the Home Office, but really there was no justification for the allegation as revealed by the facts. This year a Home Office inspector had reported that before the visits of inspection women and young persons worked from 5 a.m. to 10 p.m., that there was no half-holiday, and no proper meal times were recognized. One young person, 15 years of age, had been employed 31½ hours, with 2½ hours for rest, and short breaks for food. The House had a right to look upon the breakdown of that system as an affirmation of freedom in England. The question of women working

women who might be affected was 32. According to an inspection made this year, to see what the result had been, it was found that there were no cases of women being dismissed as the result of the order. They found one case given of a man having been taken on as a new hand, not an Englishman; and another case of a boy being taken on as a new hand, also not an Englishman. Thus the thousands of aliens of his hon. friend resolved themselves into 1½ aliens. The Government were asked to allow 100 days of work at florists from 8 a.m. to 10 p.m., and 30 days from 6 to 10, representing a 14 and 16-hour day. There was nothing like this in our factory legislation. If, and when, evidence could be submitted showing a hardship connected with the work the Home Secretary would always exercise an open mind on the subject; but as the facts were at present, he had no intention to relax the system.

PLANTS OF SOUTHERN NIGERIA.

At a recent meeting of the Linnean Society, Mr. P. A. Talbot exhibited a series of coloured drawings by Mrs. Talbot of plants from Southern Nigeria, and displayed a map and photographs of the scenery. He described the country as very hilly and densely wooded.

The photographs were of the Kwa River, and gave some idea of the beauty and density of the vegetation (see fig. 30), but none of the glory of colouring or variety of the multitude of flowers. Right down to the water's edge grow giant Arums, green on the outer sheath, but cream splashed with purple within. Behind these spring trees of every shape and tint, from Mimosas, with their delicate mauve or cream-coloured flowers and feathery foliage, to the huge trumpet-shaped flowers of *Gardenia physophylla* and the heavily-scented, purple-splashed blooms of *G. Kalbreyeri*, or the great *Berlinia*, the white flowers of which shine with a pearl-like lustre from amid its dim, dark leaves.

About this river lies the boundary between the sedimentary deposits below and the crystalline rocks above. The line of demarcation runs along this parallel to the Akwa Yafe, on the German border and the Calabar River on the other side. By far the greater part of the district, therefore, is composed of metamorphic rocks, in which gneiss predominates.

One of the most striking features in these ancient forests is the hurry shown by all trees to reach the light above the thick undergrowth.

Perhaps the tallest of all the bush giants are the Silk-cotton trees. It is difficult to get a good photograph of these, owing to the density of the surrounding bush, which would have to be cleared for a great way before a picture could be taken. The photograph (fig. 29) is of a comparatively poor specimen, which stood on the edge of a clearing. It is only about 150 feet high. The man standing at the base was the tallest carrier available, a man well over 6 feet. These trees are often 200 to 250 feet high, and have a girth of over 80 feet.

Another photograph (not reproduced) showed the source of the Calabar River. It was on the slope of a hill near by that a *Napoleon* was discovered, which is not only a new species, but which shows an inflorescence hitherto unknown in this interesting genus.

Four new *Napoleonas* have been brought home—thus adding half as many again to those already known. The second, with the consent of the courteous authorities at the Natural History Museum, has been named after Mr. Talbot's friend and former leader, Boyd Alexander, who was murdered on April 2 in Central Africa.

Upwards of 50 specimens of coniferous trees were discovered in the district. Detailed drawings of all of these were made, but, unfortunately, many of the actual specimens were ruined by climatic conditions or lost in transit. This number only represents a small proportion of those to be found. Mr. Talbot hopes to bring back at least double the number from his next tour.

Of the *Balanophoraceæ*, five species have been brought home. The *Gardenias* of the district are specially striking in the size and beauty of their flowers. The fruits of most of them afford excellent black dyes, some of which are at present being tested at the Imperial Institute, as is also a new fibre, made from an epiphytic *Arum*, which was forwarded with them.

Two kinds of *Geasters* were found in the district. These are the first of this genus discovered in Africa. Altogether over a thousand drawings were made in the course of the year.

The Week's Work.

PLANTS UNDER GLASS.

By JOHN DONOCHUE, Gardener to JOSEPH PICKERSGILL, Esq., Bardon Hill, Weetwood, Yorkshire.

Dipladenia.—Where cut flowers are in demand for decorative purposes, *Dipladenias* are very serviceable. As climbing plants for cultivation in the stove, they will continue flowering from three to four months. If there is not sufficient space for the culture of specimen plants, a batch may be raised to supply blooms in spring by inserting cuttings at the present time. When roots have formed, the plants may be potted off singly into small 60-sized pots, and be placed near to the glass, keeping them growing steadily throughout the autumn. They should be repotted as the small pots become filled with roots. The most suitable compost is one consisting of fibrous peat two parts, loam with the fine particles shaken out one part, and the remaining part made up of coarse Bedfordshire sand, well-decayed sheep manure, and a small quantity of broken charcoal. *Dipladenias* may be trained upon the usual balloon trellis, but under such treatment they do not always succeed so well as when cultivated as roof climbers. During the flowering season, when the long trails of flowering shoots are allowed to hang loosely from the roof of the plant stove, *Dipladenias* present a beautiful floral picture.

Ixora.—These plants revel in an abundance of heat and moisture, which conditions indeed appear to be essential to their successful culture. Plants may be raised from cuttings rooted at any time of the year, but the present season is very suitable for raising batches of plants to flower early next summer. Select the strongest cuttings from half-ripened shoots, and place them around the edges of small 60-sized pots, 6 to 14 in a pot, and plunge the receptacle up to the rims in a hot-bed having a heat of 70° to 80°. If the propagating case is kept closed for a few weeks, the cuttings will form roots quickly, and they may afterwards be gradually hardened to the air and light. For a potting compost, during the early stages, peat and sand in equal parts are suitable, but when the plants are ready for repotting into 4-inch pots add a small quantity of the best yellow loam. The *Ixora* always has a tendency to flower in its early stages of growth; but early flowers, however, should be removed, and the plants kept growing until a fair stage of development is attained. After that stage, they may be brought into flower in successional batches from May until late in the autumn. When young plants are desired on the single stem for decorative purposes, *Ixora Duffii* is the best variety for the purpose. It forms trusses of flower of immense size. As *Ixoras* are very subject to attacks of scale and mealy bug, the plants should be syringed at regular intervals with an insecticide, and sponged occasionally if the best results are desired.

Herbaceous Calceolarias.—These will now be ready for potting off singly into small 60's, using a compost consisting of loam, leaf-mould and sand in equal parts. They should be carefully shaded from sudden outbursts of sunshine, and kept moist by an occasional dewing over with a syringe.

Cineraria.—*Cinerarias* require similar treatment to the *Calceolarias*. Both batches of plants must be kept near to the glass to ensure sturdy growth.

THE ORCHID HOUSES.

By W. H. WHITE, Orchid Grower to SIR TREVOR LAWRENCE, Bart., Burford, Surrey.

Epidendrum.—Many of the species of this extensive genus are of interest only to the botanist, but other species and their hybrids deserve general cultivation. When strongly-grown, they produce large panicles of brilliantly-coloured flowers that open in succession for five or six months and are extremely useful for table or other floral decorations. Among the brightly-coloured sorts are the well-known *E. radicans*

very light positions either in the *Cattleya* or intermediate houses. They should be placed together, so that they may be syringed overhead throughout the period of growth. The materials used for repotting should consist of one-fourth each of *Osmunda* fibre and *Polypodium* fibre, the other half being fresh green *Sphagnum*-moss. Cut these materials up moderately fine, and add plenty of small crocks to keep the compost in a porous condition. Other *Epidendrums* that are well worth growing and which thrive in a similar temperature are *E. prismatocarpum*, *E. fragrans*, *E. atropurpureum* (*macrochilum*) and its rare variety *album*; *E. floribundum*, *E. syringothyrsis*, *E. Cooperianum*, *E. odoratissimum*, *E. sceptrum*, *E. aurantiacum* with orange-coloured blossoms; *E. Pseudepidendrum*, which has green sepals and petals with bright orange-scarlet lip, and such hybrids as *Epi-Cattleya Nebo*, *E.-C. matutina*, *E.-C. radiata*-*Bowringiana*, *E.-C. Mrs. Jas. O'Brien*, and *E.-C. Liliane*. These and other similar plants may also be repotted as soon as growth begins. The distinct *Epidendrum erubescens* grows

FIG. 30.—PANDANUS IN SOUTHERN NIGERIA, SHOWING ADVENTITIOUS ROOTS.

(See p. 84.)

(rhizophorum). *E. radicans* var. *Blethleyense*, *E. Schomburgkii*, *E. fulgens*, *E. cinnabarinum*, *E. Ibaquense*, *E. arachnoides*, *E. crassifolium*, *E. pristes*, *E. Ellisii*, *E. evectum*, *E. paniculatum*, *E. xanthinum* (bright yellow), and the distinct hybrids *E. Boundii*, *E. Dellense*, *E. O'Brienianum*, *E. elongatum*, and *E. radiocvitellium*. Those which are of semi-scandent habit like *E. radicans* and *E. Boundii* should be trained to some kind of support; for instance, they grow very well when tied up against a wall or pillar, the shoots being tied to neat wires or a wooden trellis, while some cultivators prefer to grow the stems singly in small pots, using ordinary garden sticks for their support. The plants of this section produce aerial roots from their stems, and frequent syringings overhead favour their growth. Now that most of these plants have passed their flowering stage, and the old shoots have grown very long, those stems with young shoots on them may be cut down to about 2 feet in length, and be repotted or replanted. These *Epidendrums* thrive well in

best when fastened to a teak-wood raft covered with living *Sphagnum*-moss, and suspended in a perpendicular position near to the roof-glass. Such varieties as *E. Wallisii*, *E. Endresii*, *E. Endresio-Wallisii*, *E. Clarissa*, *E. elegantulum*, and *E. vitellium majus* do best when subjected to cool-house treatment during the summer months, and, in winter, in a cool position in the intermediate house. These *Epidendrums* should be supplied with plenty of water at the root whilst making their growth, and, as the last-named varieties are frequently attacked by red-spider, it is advisable to wipe the leaves and stems frequently with some weak insecticide. The white-flowered *E. (Diacrium) bicornutum* and a smaller-flowered species, *E. indivisum*, which is often imported and mistaken for the former species, require a higher temperature, the most suitable position being close to the roof-glass on the lighter side of the East India house. Established plants, whilst at rest, need but very little water to keep them plump, but, when growing, they need copious applications whenever the

soil appears to be dry. At this season, the plants will begin to grow, and, as the numerous young roots push out from the new growth, fresh rooting material should be afforded to the plants in need of it. Plants now imported should be suspended in shallow pans, with only broken crocks and a pseudo-bulb here and there tied to the wire of the pan to keep them steady. Pour plenty of water through the crocks every day, and, when growth commences, raise the base of the plant just above the rim of the pan, and surface the crocks with the usual compost, pressing it down rather firmly. The rare *E. nemorale* should receive the same treatment. *E. prismatocarpum*, being now at rest, should be kept comparatively dry at the root, but not so dry as to cause the pseudo-bulbs to shrivel. Place the plant in a light, cool position in the intermediate house. *Epi-Laelia*, or *Dia-Laelia Veitchii*, should be grown in the Cattleya house.

THE KITCHEN GARDEN.

By JOHN DUNN, Kitchen Garden Foreman,
Royal Gardens, Windsor.

Turnips.—A good breadth of Turnips should be sown now for use during late autumn and winter. A sandy soil that was manured for some previous crop will be suitable for this sowing. If the ground is dry the drills should be thoroughly soaked with water on the afternoon previous to sowing the seed. This is much better than watering the bed after the seed has been sown. When the young plants can be seen above the ground constant attention must be given to dusting them with sifted wood-ashes or lime in the early morning while the dew is still upon the plants. Keep the Dutch hoe at work between the rows, or Turnip fly may prove troublesome. This is the most important sowing of Turnips in the whole year, as the winter supply depends upon it. When the plants are large enough to handle they should be thinned to 10 inches from plant to plant, as good roots will form much quicker if given plenty of room between the plants. Red Globe, Green Top Stone, and Golden Ball are good varieties for furnishing a winter supply. A sowing of Golden Ball may be made a week later to stand the winter in the open and yield supplies during the spring.

Parsley.—The Parsley sown in June should now be ready for pricking into cold frames or other sheltered places where a covering can be applied in rough weather during winter. If there are no unheated pits available a plantation may be made at the foot of a south wall. The soil for this purpose should be made moderately firm before planting takes place. In pits, 12 inches may be allowed between the rows, and 6 inches from plant to plant. The soil between the rows must be kept stirred by a Dutch hoe. Where a daily supply is necessary this is the best way to secure it during winter.

Coleworts.—Continue to plant Coleworts for use during autumn. If the ground is dry the drills should be well saturated with water previous to planting. Coleworts should be allowed 15 inches between the rows and 1 foot from plant to plant. As soon as they have commenced to root the ground should be broken between the rows with a draw hoe or the point of a digging fork. Rosette is the best variety for autumn use, but to stand the winter Hardy Green or Drumhead Colewort are the most reliable varieties.

Canflowers.—Plants that are expected to "turn in" next month should receive liberal supplies of manure water. If allowed to become too dry at the root, premature bolting is almost sure to take place. There are few crops that require more liberal treatment than summer Canflowers, therefore every attention should be given them so that they may grow from start to finish without a check, especially those planted a month ago and intended for use during August and September. If white fly should make its appearance, apply a liberal dusting of soot while the dew is on the leaves early in the morning. A plantation of the variety Autumn Giant may still be made for late autumn use; these plants should receive a plentiful supply of water to settle the soil amongst the roots as soon as planted.

French Beans.—These must now be planted in cold frames for furnishing a supply in autumn. It is not safe to trust to outdoor crops after the middle of September, and few crops will be more valuable than a pit of French Beans after the first autumn frosts. Canadian Wonder is one of

the best varieties for this purpose and should be planted in rows 20 inches apart. The lights should be left off the pit until frosts are likely to occur. French Beans should be kept closely picked whether required for use or not, or the plants soon become exhausted. Occasional waterings of liquid manure prolong their season of bearing.

FRUITS UNDER GLASS.

By B. GOODACRE, Gardener to Sir ERNEST CASSEL,
G.C.B., Monlon Paddocks, Newmarket.

Early Vines and Peaches.—The vines intended for early forcing will now be ripening their wood. Keep a dry atmosphere with plenty of ventilation, and give only sufficient water to preserve the roots in a healthy condition. Peach trees will require careful attention in this respect or dropping of the buds may result later on. Endeavour to keep the foliage clean and healthy until the leaves are fully matured and ready to fall off. As frequent syringings are not conducive to the ripening of the wood, the trees may be sprayed with some safe insecticide as a preventive of insect pests. If any of the vines are infested with mealy-bug they may now be cleansed with a mixture of soft soap and paraffin. Use a wineglassful of the oil and 4 ounces of soap to each large bucket of water. Dissolve the soap in boiling water, and add enough warm water to make up the required quantity. During the process of spraying, return every second syringeful to the bucket, to prevent any oil floating on the top of the water. This mixture should be used whilst it is still warm, and it should be applied forcibly with a syringe, taking care to work it into the crevices of the bark and into the joints of the trellis and woodwork. The work can be done more thoroughly if one person arranges the foliage whilst another uses the syringe. A little short manure or rough leaf-mould spread on the border will absorb any excessive drip. This treatment may be repeated after the lapse of two or three weeks if necessary.

Young Vines.—Vines raised from eyes early in the year may now be exposed to full sunshine and free ventilation. Keep the roots moderately dry. If watering is carefully attended to, the plants will not make much more lateral growth. A little heat should be kept in the water pipes during dull weather to promote a buoyant atmosphere and help to ripen the wood. Vaporise the house occasionally with the sulphur vaporiser as a preventive of mildew. Keep a sharp look-out for thrips and red spider, which are apt to thrive in the dry atmosphere, and take prompt measures for their destruction.

Late Vines.—Continue to apply liquid and artificial manures to the borders as often as necessary. The Grapes swell considerably during the colouring period, and derive much benefit from such applications of manure. Maintain a moist, genial atmosphere with free ventilation whenever the weather is suitable. Keep a little heat in the water pipes during cold weather to prevent a cold, stagnant atmosphere.

Strawberries.—The earliest layers in small pots being now well rooted, they may be detached from the parent plants. Place the small pots containing the layers closely together on a hard ash bottom in a partly-shaded position. The pots and soil should be in readiness, in order that the layers may be moved into the fruiting pots without delay. It is important to have this potting done early, so as to get large, well-ripened crowns before winter.

THE FLOWER GARDEN.

By E. BECKETT, Gardener to the Hon. VICARY GIBBS,
Aldenham House, Hertfordshire.

Propagation.—The end of July or the beginning of August is perhaps the most suitable time for inserting cuttings of many of the choicer shrubs, as the growth is sufficiently ripened and not unduly hard. At this time of the year the atmosphere of the frames may be kept humid with frequent syringings to promote a speedy root-action. It is surprising what a number of species may be raised in this manner if care and attention are given to airing and damping. An excellent method of striking cuttings is by the system known as the hot frame system. The cuttings are inserted in rows in a bed of silver sand and the frame kept perfectly close and no shading given at any time of the day, but fre-

quent syringings must be given when the sun is powerful or much damage will result. When rooted, the plants may be potted up singly and placed in cold frames, which should be kept close until the plants have recovered from the shift, when they may be plunged in such cold frames as can be protected during the winter months. In the event of a hard winter, it is quite possible that stocks of various subjects in the open ground may suffer or be killed outright, whereas by this method of procedure the young stock may be placed out-of-doors next spring when severe weather is past. Other plants of a sub-shrubby nature now making growth may be treated in a similar manner.

Seed saving.—Plantings from which it is intended to save seed must be carefully watched after the flowering period is over, and when approaching ripeness the stalks should be cut. This operation should always be performed when they are in a dry state. The best way to keep the seeds, if they are not required for immediate sowing, is to place the seed-vessels head downwards in paper bags, tied at the top, and placed in a dry position to thoroughly dry and ripen. Label the bag, when the seeds are placed in it, to avoid mistakes. The seed may be cleaned at a later date, when there is less pressure of work.

The shrubby Hypericums.—These will thrive practically anywhere, and are now making a bright display with their yellow flowers. Propagation is easily effected by division of the roots in winter, or any of the species may be raised from seeds. *H. calycinum*, the St. John Wort, is perhaps the best of all plants to provide a good carpet under trees. Others, varying in height up to 4 feet, are *H. Androsæum*, *H. Ascyron*, *H. galioides*, *H. hircinum*, *H. Hookerianum*, *H. inodorum*, *H. kalmianum*, *H. Moserianum* and *H. patulum*.

Seasonable work.—The Rose garden will need much attention to keep it attractive. Many of the plants have developed their flowers, and if the strongest growths are now pruned to about the same length as the normal shoots, the uppermost buds will then break and produce a good supply of late Roses. Continue to remove all decaying flowers and, if any are required for Rose bowls, care should be taken to preserve them in a clean and dry state. Climbing Roses, on poles, pergolas, &c., will be much benefited by the removal of the old flowering wood as soon as the flowering is past. Half-hardy climbers of rampant growth will need attention and occasional tying and training of their growths to ensure even development. The lawns have not this season suffered any ill effects from drought, and the use of the mower has been in frequent request. Worm casts are troublesome, but a thorough good brushing and rolling is the best treatment. Sweet Peas are continuing to flower well, and still making vigorous growth. Continue to remove all seed pods as they form, and stop the leading growths to encourage laterals. Strong-growing perennials, especially those growing close to fruit trees, should be soaked from time to time. *Verbascum olympicum* is a very valuable plant for the borders and the wild garden. It has large, handsome foliage and branching spikes of yellow flowers, which remain effective for some considerable time.

THE HARDY FRUIT GARDEN.

By A. R. SEARLE, Gardener to the Marquis of NORTHAMPTON, Castle Ashby, Northamptonshire.

Black Currants.—When the crop has been cleared from the bushes, give the branches a good thinning out in order to encourage the young growths from the base. If the bushes are thinned now, these young shoots will ripen much better and earlier than if left unthinned until autumn. All prunings should be taken to the rubbish heap and burnt, in order to destroy any insect pests that may be on them. Where the bushes are badly infested with the bud mite (*Phytoptus ribes*), it is best to have them grubbed up and burnt, and a fresh site should be selected some distance from the old one for a new plantation. When planting time arrives endeavour to procure young bushes from a clean and healthy stock and treat them liberally. The new site should be double dug and have plenty of well-decayed manure worked in as the digging proceeds; this should be done several weeks before the planting takes place to enable the soil to settle. It is not a good plan to plant Black Currants in large

quantities together; they should be dotted about if possible amongst Gooseberries and other bush fruits, or planted in single rows. The two best varieties grown here are Boskoop Giant and Carter's Champion.

Budding.—During the early part of August is a good time for budding Cherry, Peach, Nectarine and Plum trees. Where the branches of these trees have become bare, and it is desired to have them refurbished, this can be easily done by inserting buds of the desired variety on the old branches. The method of budding is similar to that practised for Roses. The work should be performed carefully during dull weather, and should not be set in immediately after the operation, those parts of the branches containing the buds should be shaded from bright sunshine. Plump buds should be selected from half-ripened wood. Make the incision at the point desired in the shape of the letter T. Lift the bark carefully and insert the bud without causing it any damage. Bind it with raffia in the usual way, just sufficiently tight to exclude air and wet. The buds should remain dormant during the winter, but in the spring they will burst into growth with the other parts of the tree. I have seen aged trees which were naked towards the centres become entirely refurbished and produce good crops of fruit the second season after being budded in this manner.

General remarks.—Push on with the work of summer pruning, as this should shortly be brought to a close. Thin out the young growths upon Fig trees, leaving sufficient only to cover the allotted space thinly; train the new shoots that are required for extension, and rub off the superfluous growths. Expose the fruits as much as possible to the sun, or they will fail to develop good flavour.

HOME CORRESPONDENCE.

(The Editors do not hold themselves responsible for the opinions expressed by correspondents.)

CATLEYA MENDELII "STUART LOW."—I notice in your issue of July 16, p. 34, you refer to *Catleya Bluntei* in connection with *Catleya Mendelii* "Stuart Low." It would be interesting to know whether a plant of this rare variety is still in existence. Perhaps some reader of the *Gardeners' Chronicle* can afford information on this matter. *Laurence J. Cook.*

HISTORIC FLOWER SHOW SCHEDULE.—At the Teddington and Hampton Wick Horticultural Society's show, held on the 15th inst., Mr. P. M. McKie, one of the members of the committee, had in his possession a copy of a schedule issued by the Teddington Royal Horticultural Society, under the immediate patronage of the Dowager Queen Adelaide in 1845, when the society had for its president the Right Honorable the Earl Howe. The interesting document consisted of two pages. The exhibition took place in September, therefore Dahlias were a leading feature. Prominence was given to a class for "50 dissimilar blooms of Dahlias," and to "24 cut Roses," a rather unusual thing for September I imagine, in those days. With flower shows so frequent now in town and village, it would doubtless be of interest to know the date of the first recorded show in England. One writer in the *Floricultural Cabinet*, of 1839, describes himself as an exhibitor of Carnations for upward of 20 years. *J.*

THE LABOUR PROBLEM.—I should like to endorse all Mr. Pearson has written in his excellent letter on p. 37 on this question. There is no doubt the profits of the nurseryman and market gardener are rapidly dwindling, and, as the wages fund depends upon the profits, both the master and the workman must suffer. The whole object of our law-makers is to benefit the consumer only, and, if this insane policy continues, the producer in this country will cease to exist. This may take some time, as the British are a dogged race and will die hard. A friend near me, who sometimes assumes the mantle of the prophet, says in the future there will only be three classes in this country, viz., officials, who are in excess so alarmingly, pensioners, and paupers,

and that the cultivators of the soil, which ought to be the mainstay of the country, will be found under the last category. *E. Hobday, Cavendish Park Nursery, Cambridge.*

—We have had the editorial statement (p. 6) that "in few trades are the hours so long as in gardening, and in no trade is the remuneration so low." Mr. C. E. Pearson, speaking on behalf of nurserymen, says (p. 37), they would "be only too pleased to give their staff a higher remuneration if only the conditions of the trade would allow it." The nurseryman who sits waiting for Protection to come and make things better for him is lost, and the nursery hand who accepts this as an excuse for low wages and long hours is also lost. The nursery trade appears to be at least as prosperous in this country as it ever was. There are as many making fortunes at it as there are at any trade with which it may be reasonably compared, notwithstanding cheap French Roses, Belgian Grapes, Dutch bulbs and the assessors of taxes. I was once one of a large gang of trained young men who were paid 15s. for a 62 hours week by a nurseryman who made a big fortune. A better excuse than that offered by Mr. Pearson for low pay and long hours in nurseries and gardens generally is that plenty of men are to be had on the present terms. To use Mr. Pearson's boots as an illustration, if he can get them at 10s. 6d. why should he pay 21s. The Editor tells him he would find the higher-priced boots the cheaper in the end and more becoming, to which he replies, appearances notwithstanding, I cannot afford to pay more, at any rate until Protection comes. For my part, I think it is hopeless to ask employers to take the first step in this matter. In what calling have they ever done anything for the workers until they were forced? The shortage of men in America, referred to in the editorial article, is not likely to be experienced here. The tendency of wages to a minimum is certain where there are three men for two jobs, unless the men agree on a fixed price for their services, below which they will not go. This can only be done by following the example of workers in other industries, and forming a strong union of gardeners. Nurserymen and other employers will, of course, protest, but if we set to work in a business-like, earnest way, things will adjust themselves, as they have done in other industries, where the hours and wages of the employees have been improved 50 or 100 per cent., and generally to the advantage of the industry and the employer. Mr. Pearson's old catalogue prices prove nothing except that plants, like bread and tea, used to be dearer. But surely what we want is to see a condition of things that will make nursery stock cheaper still (much of it is far too dear at present), and this is to be brought about by skilled management and the employment of trained men paid fair wages and working a reasonable day. *W. W.*

—Your recent leading article (July 2) on this subject was very opportune, and it is well that attention should be drawn to the fact that "in few trades are the hours so long as in gardening, and in no trade is the remuneration so low." Is not the present unsatisfactory state of the nursery trade quite as much due to home competition and the cutting of prices among British firms as to any foreign competition such as suggested by Mr. Chas. E. Pearson? Notwithstanding the fact that some people, and particularly women, already grumble at having to pay 6d. for a good hardy plant, cannot an understanding be arrived at among nurserymen to raise the price of goods and thus put the business on a surer footing? They should then be better able to command more skilled labour, and young men would not so quickly enter trades where the pay and the conditions (except in regard to health) are better than is frequently the case with gardeners. Mr. C. E. Pearson fears "the new land taxes will hit the nursery trade harder than any other section of land-owners, owing to

their premises being usually situated in suburban districts." Like numerous other persons, your correspondent does not seem to realise that the small holder, occupying a holding not exceeding 50 acres or £50 in annual value, is specially exempted from any increment value duty, whether on agricultural or building values. This is how "agriculture" is defined under the new Act:—"The expression 'agriculture' includes the use of land as meadow or pasture land or woodland, or for market gardens, nursery grounds, or allotments, and the expression 'agricultural land' shall be construed accordingly." (Clause 27.) Having had some very varied experience as a rating surveyor, I also take exception to Mr. Pearson's complaint that "These hardships are accentuated by the fact that assessment committees always assess nursery land at double or treble its value." *H. Stuart Thompson.*

IRIS TINGITANA.—As Mr. Basil Levett says on p. 38, flowering bulbs of *Iris tingitana* break up into numerous small bulblets after flowering, but that is no reason why this *Iris* should not be grown extensively. Of course, if one only has the bulbs that flower, some years must elapse before the bulblets become large enough to flower again, but *Iris tingitana* should be treated in the same manner as *Lilium giganteum*, also referred to by Mr. Levett. An assortment of bulbs of different sizes should be procured. Some of these in both cases will probably flower the first year, but the others will grow on and will bloom in later seasons. As I described in my article on p. 16, all my large bulbs, which I depended on to flower, rotted off because they had been unintentionally covered with about a foot of soil, but 35 of a large colony of smaller bulbs, which were planted in another garden bloomed, though I had not expected them to flower for another year. It was these that were represented in the illustration. If a hundred bulbs of different sizes are obtained, some will come into flower every year, and no season should pass without this glorious *Iris* being in blossom. *Wyndham Fitzherbert.*

OXLIP.—It seems not improbable that Mr. Nicholson's objective and mine are different. I do not dispute the right of the botanists' *Primula elatior* to the word "elatior." My objection is to its usurpation of the old English designation of Oxlip, which belongs to the natural hybrid between the Primrose and Cowslip. If anyone has doubts regarding the bona fides of the Oxlip of the old writers, they ought to be dispelled by the unanimous agreement of a later group—the Rev. John Lightfoot, who has the Primrose, Cowslip and (hybrid) Oxlip as varieties of one species; Sir J. E. Smith, Dr. Hooker and their followers, who indisputably regard the hybrid as the true and only Oxlip. Darwin's may be cited as the greatest name among the moderns. In *Forms of Flowers*, he remarks, "The common Oxlip (not the *elatior* of Jacq.) is found almost everywhere in England where both Cowslips and Primroses grow;" and "Primula *elatior*, Jacq., or the Bardfield Oxlip, is found in England in only two or three of the eastern counties." At the Primula Conference in 1886, the late Dr. Hogg exhibited "The Bardfield Oxlip and Common Oxlip with seedlings," and in the collection from Kew were "a few forms of Oxlip, some of which were very curious." Were these "very curious" forms the offspring of Darwin's and Hogg's "Bardfield Oxlip" or of the "common"? And now may I point out that the fact of the Oxlip being known by other names, and as a Cowslip, and that other plants may have been called Oxlip is outside the question? The same can be said of the Cowslip, and of, perhaps, all very common or attractive "weeds." When on a visit in spring, a lady took me to see a mass of Wood Anemones, of which she remarked, "In Derbyshire we call them Ladysmocks." But that does not invalidate the right of *Cardamine pratensis* to the name as being peculiarly its own. On referring

to the late Mr. Leo. Grindon's *Shakespeare Flora*, and to Canon Ellacombe's *Plant Lore of Shakespeare* (all the editions), I find both authorities agree that the poet's Oxlip is the hybrid, *P. elatior* continues to be called Bardfield Oxlip by some folks, and were that the rule, there would be no confusion. *R. P. Brotherton.*

INCARVILLEA GRANDIFLORA.—Everyone knows that this showy plant opens its flower on quite short footstalks, which, after fertilisation, commence to lengthen until they are, as you will see from those sent, 20 inches high. Why does it do this? *T. Smith, Newry.*

SWEET WILLIAM PINK.—I appreciate the remarks of your correspondent Mr. Brotherton on my note on Sweet William Pink (see p. 64). I shall send him a complete specimen of flower and foliage as soon as my plants recover from the effect of recent rains. He will then be able to make a comparison, and will probably come to my opinion, that the plant I had described is not a form of *Dianthus barbatus* at all, it having the general appearance of a cross between *D. barbatus* and *D. chinensis*. Unless desired further, I need not repeat the offer of specimens to Messrs. Forbes, having sent a fully-grown plant some time ago to the late Mr. John Forbes, who replied at the time, as well as by subsequent conversation, that he had only seen the plant once before, and could not give any account of it, and I expect his son, Mr. Archibald Forbes, may still have the plant, as he was acquainted with the subject. Had my plant been common in Scottish gardens, those eminent specialists in Pinks would have recognised it at once. Last year I sent a specimen to Kew, and was favoured with a reply from the Director that it was one of the numerous varieties of *D. Caryophyllus*; however vague that may appear, I believe it is consistent with the rules of the Royal Botanic Gardens not to pay much attention to horticultural variations. It will be of much interest to have Mr. Brotherton's opinion later. *Dianthus chinensis* was first cultivated before 1713 by Mr. Thomas Fairchild (vide Aiton). He was a commercial gardener at Hoxton, and died in 1729, leaving funds for an annual sermon, which is still preached; the first two were published, and I succeeded a short time ago in procuring, for a small sum, for the present vicar, these eloquent orations on nature. Mr. Brotherton repudiates my statement that "Sweet John" and "Fairchild's Mule" are the same. If he will be good enough to refer to Miller's *Gard. Diet.*, 1743, vol. i., under *Caryophyllus*, he may read, "The double rose coloured Sweet John or Fairchild's Mule." Seeing that Aiton, in *Index Kewensis*, 1812, associates *D. chinensis* with Fairchild, I conclude that the Sweet William Pink was the result of a cross of the two species aforementioned, as it bears a much greater affinity to such a parentage than the well-known Mule Pinks with narrow Carnation-like foliage and without the glaucous colouring. These common Mule Pinks were first raised at Angers, by M. Flon, from a supposed natural sport or crossing of *D. Caryophyllus* and *D. chinensis*, and contained in numerous varieties by Paré, Bonnet, and others. *D. Napoleon III.* is believed to be from the same origin. That numerous section is known in France as *D. semperflorens*, or *Éillet Flon*, and in the English trade as *D. multiflorus hybridus*. Mr. Douglas has some very interesting Mule Pinks from recent crossing. The seed of Brown's Mule Pink was in the trade in the early 'seventies, it probably originated at Slough, but I never succeeded in getting it to grow, and cannot describe it. *J. Morrison.*

PHILADELPHUS.—Mr. Beckett in his interesting note on flowering shrubs (see p. 39) leaves out *Philadelphus Yokohama* (Satsuma), the best of the lot. There are specimens here over 15 feet high, drooping from the summit to the ground, masses of snowy beauty. I send a few sprays. *P. Smith.*

ORIGIN OF THE DOUBLE PRIMROSE.—The dropping of a line or two in my communication on this subject at p. 38 makes my reference to *Primula auricula-flora*, so-called, difficult to understand. What I wrote was, this Crimson Primrose was thym-eyed, and that I used its pollen on a large, pin-eyed, single Primrose to create a strain of garden Primroses. *J. Dean.*

SOCIETIES.

ROYAL HORTICULTURAL Scientific Committee.

JULY 19.—*Present*: Mr. E. A. Bowles, M.A., F.E.S., F.L.S. (in the Chair); Messrs. J. T. Bennett-Poe, M.A., E. M. Holmes, F.L.S., W. Hales, J. Fraser, F.L.S., A. Worsley, J. Douglas, V.M.H., W. Fawcett, F.L.S., and F. J. Chittenden, F.L.S. (hon. sec.).

Saxifraga tellimoides.—Mr. FRASER showed a plant of *S. tellimoides* and commented upon its peculiarities. It is a native of Japan, and has affinities with the American *S. peltata* and with *S. Jamesii*, which is also American, but it agrees with none of the recognised sections completely. It is perhaps nearest the section *Isomeria*, but differs in the peltate leaves. This species was discovered by Maries in 1880, first flowered in this country in 1885, fertile seed being produced in 1892. It was put into commerce by Messrs. Vilmorin in 1897.

Seminal variation in Campanula lactiflora.—Mr. BOWLES showed seedlings of *Campanula lactiflora* having abnormally narrow leaves and very narrow petals, the corolla being cut almost to the base. One had blue flowers, and had been derived from a blue-flowering plant; the other bore white flowers, and had occurred near a clump of the white form. The variation was in the same direction as that seen in the variety of *C. rotundifolia*, known as *soldanelloides*.

Spiraea Aruncus.—Mr. BOWLES also showed a specimen of *Spiraea Aruncus*, bearing both staminate and hermaphrodite flowers. Up to the present only the staminate form had been known in his garden.

NOTTINGHAM HORTICULTURAL AND BOTANICAL.

JULY 19.—An interesting feature at this exhibition was the magnificent display of *Souvenir de la Malmaison* and other varieties of Carnation shown by Mr. ALLEN TATHAM, Nottingham, an amateur. For a bright and attractive group of plants bearing large flowers of exquisite quality, he was awarded a special Gold Medal. The beautiful arrangement of the group reflected great credit on the exhibitor. For another group of "Malmaisons" he was awarded a 1st prize and he gained three other prizes for cut blooms.

The best group of miscellaneous plants arranged in spaces not exceeding 200 superficial feet was exhibited by Mr. W. HASLAM, Chesterfield; Mr. W. A. HOLMES, Chesterfield, being 2nd, and Mr. W. VAUSE, Leamington, 3rd.

In the class for smaller groups, Mr. W. A. HOLMES won the 1st prize and Mr. VAUSE the 2nd prize.

The best stove and greenhouse plants were shown by Mr. W. VAUSE, and the best specimen of a stove foliage plant by Mr. W. VAUSE, who had also the best greenhouse plant. Messrs. MANSSELL & HATCHER, of Rawdon, Yorkshire, won the 1st prize for a collection of Orchids, and Messrs. T. WROTHERA & Co., Burton Joyce, a 1st prize for a display of Roses arranged on a table. The best collection of 24 Rose blooms, distinct varieties, was shown by Mr. J. LEAK, Beeston, and the best collection of 12 blooms by Mr. W. LOWE. There were fine collections of Sweet Peas, Carnations, Liliiums, Fuchsias, Gloxinias, Pelargoniums, Begonias, Caladiums, Ferns, Dracaenas, and a considerable number of florists' arrangements of bouquets, button-holes, &c. Altogether the show, which was held in the beautiful grounds known as the Arboretum, was a distinct success, and the hon. sec. Mr. C. J. Mee is to be congratulated upon the result.

FORESTRY AT THE HIGHLAND SOCIETY'S SHOW.

JULY 19, 20.—In connection with the Dumfries Show of the Highland Agricultural Society, on July 19, 20, 21 and 22, a valuable section devoted to forestry was arranged by the Royal Scottish Arboricultural Society, this being more interesting than any made by the society at previous shows. From the Royal Scottish Arboricultural Society came a large collection of sections of the timber of British-grown trees and

shrubs, together with about 100 photo-micrographic slides of plant tissue. The GLASGOW AND WEST OF SCOTLAND COLLEGE OF AGRICULTURE sent a collection of forestry implements and instruments, together with timber and other specimens. Sir JOHN STIRLING MAXWELL, Bart., President of the Royal Scottish Arboricultural Society, exhibited notched Spruce planted on inverted turf to show the advantages of the method adopted by him on his estates; and other exhibits of considerable value were shown by his Grace the Duke of Buccleugh from his local estates; from the Rt. Hon. Sir HERBERT MAXWELL, Monreith (forester Mr. T. Sharpe); Earl of MANSFIELD, Comblongon (forester Mr. W. H. Whillans); E. J. BROOK, Esq., Hoddam (forester Mr. W. H. Cowan); and Major J. F. CARRUTHERS, of Dormont.

In the Competitive Section the entries were, as a rule, good, and the exhibits included several from the Duke of ABERCORN; the Duke of BUCCLEUGH; the Duke of ROXBURGHE; the Marquis of GRAHAM; the Earl of MANSFIELD; Mr. G. F. BARBOUR, of Borskirch; Mr. J. E. KEIR, of Harviestoun Castle; Mr. W. J. HERRIES MAXWELL, of Munches; Mr. YOUNGER, of Benmore; and several foresters, including Mr. R. COWAN, Hoddam; Mr. A. LOWE, Lockerbie House; and Mr. W. H. WHILLANS, Comblongon.

The whole section interested the public, and showed the advance made in the study of forestry in Scotland in recent years.

BIRMINGHAM BOTANICAL AND HORTICULTURAL.

JULY 20.—Owing to the wet weather on the above date, the number of visitors at the annual Rose and midsummer flower show, held at the Botanical Gardens, Edgbaston, was below the average. Roses and Sweet Peas were well shown. During the afternoon a party of gardeners from Bath, who were visiting Birmingham, spent about two hours in the show and gardens.

Messrs. BASTOCK & SON, Woodbridge Road, Moseley, showed about 40 varieties of Violas in vases over a bed of moss. The effect was pleasing. A few of the best varieties were Peace, Ada Anderson, Moseley Perfection, Willie Farmer, Jeannie Houston, Moseley Purple, and Mrs. Chichester. (Bronze Medal.)

Mr. FRANK LILEY, St. Peter's, Guernsey, had a nicely-arranged group of early-flowering Gladioli in tall stands and vases of various sizes. The varieties named Fairy Queen, Crimson Queen, General Scott, and formosissimus were much admired. (Bronze Medal.)

From THE LAPWORTH NURSERIES, Hockley Heath, came 26 varieties of Sweet Peas. (Bronze Medal.)

Mr. A. R. BROWN, Wychall Lane, King's Norton, had a group of Roses in tall stands, vases, and boxes. (Bronze Medal.)

The largest and most effective exhibit came from Messrs. GUNN & SONS, Olton, Birmingham, whose display of Roses comprised about a hundred popular and little-known varieties, arranged in bold stands, circular baskets, vases, &c. The various sections were represented, but the Teas, Hybrid Teas, Hybrid Perpetuals, and Rambler Roses were shown in the greatest numbers. The following varieties were exhibited in excellent condition:—Monsieur Paul Leda, Hon. Ina Bingham, Le Progrès, Lyon Rose (extra good), White Killarney, Pharisæer, Königin Carola, Princess Marie Mertschersky, Richmond, Mrs. Theodore Roosevelt, Frau Karl Druschki, and Mme. Melanie Supt. On the orchestra at the end of the hall Messrs. GUNN had a collection of Phloxes, in which several new varieties were well shown. (Gold Medal.)

Mr. C. H. HERRERT, Hazelwood Road, Acock's Green, had a well-arranged group of hardy flowers, consisting principally of Delphiniums, Gageas, Pinks, Gaillardias, Iceland Poppies, and Alstromerias. (Silver Medal.)

Messrs. BAKERS, Wolverhampton, showed an extensive collection of Sweet Peas in splendid condition. Two large Cork arches and three tall Bamboo stands, each decorated with large, substantial flowers, formed a pleasing background. Varieties of outstanding merit were Lord Nelson, Gladys Unwin, Helen Pierce, Constance Oliver, Etta Dyke, Othello Spencer, Mrs. Charles Mauder, Earl Spencer, Mrs. Charles

Foster, John Ingman, G. W. Kerr, The Marquis, and Catherine Macgowan. (Silver-gilt Medal.)

Messrs. ROBERT SYDENHAM, LTD., Tenby Street, Birmingham, showed good-quality Sweet Peas, beautifully arranged in rustic stands. (Bronze Medal.)

Mr. H. N. ELLISON, West Bromwich, contributed a collection of well-grown Ferns, consisting of varieties of Nephrolepis, Adiantums, Gymnogrammas, Lastreas, Davallias, Pteris, and Selaginellas. (Silver Medal.)

W. P. WILLCOX, Esq., Park Hill, Moseley (gr. Mr. A. Hartwell), sent a group of Gloxinias and double and single Begonias, interspersed with bright-foliaged plants.

In the classes provided for Roses, Sweet Peas, hardy herbaceous flowers, &c., the undermentioned exhibitors were the principal prize-winners:—Mr. F. JEFFERSON, Lapworth; Mr. E. DEARIN, Hay Hall, Hay Mills; Mr. J. W. MEE, Harborne; Mr. F. W. BLOOD, Edgbaston; Mr. W. P. WILLCOX, Moseley; and Mr. H. ANDERSON, Shirley.

AWARD OF MERIT.

Viola Mosley Perfection.—A strong-growing variety, with large, flat, deep-yellow flowers. Shown by Messrs. BASTOCK & SON, Moseley.

RAYLEIGH AND DISTRICT HORTICULTURAL.

JULY 20.—This society held its ninth annual show on the above date, and, as regards the number and quality of the exhibits, it may be regarded as satisfactory, but the weather in the afternoon was unfavourable. The amateurs' and cottagers' classes were well filled, the exhibits being for the most part of good quality and staged to advantage. Messrs. E. BOYES, W. DODD, C. J. BARNARD, W. A. VOSS, Miss FRANCIS and Mrs. VICKERS were the most successful exhibitors in the amateur classes, and Messrs. G. WOOD, B. G. CHIPINGTON, and W. DENYER in the cottagers' classes. In the classes open to gentlemen's gardeners, JAMES TABOR, Esq., J.P., The Lawn, Rochford (gr. Mr. J. Burle), and Mrs. MILLAR, Leigh-on-Sea (gr. Mr. A. Epps), were the most successful competitors, taking four 1st and two 2nd prizes each. In the open classes, Mr. BURLE was the most successful exhibitor, winning the 1st prize for a capitally-arranged group of miscellaneous plants, 1st prize for a collection of fruit, and a silver award for a collection of vegetables. Mr. E. JACKSON, of Rochford, was 1st for 18 H.P. and H.T. Roses (distinct varieties) and for 12 Tea Roses (distinct); Mr. EPPS won the 1st prize for hardy flowers, and Mr. W. A. VOSS was 1st for six tuberous-rooted Begonias, staging well-grown and capitally flowered plants of good varieties.

In the ladies' classes (table decorations), &c., Miss A. M. BARNARD, Miss EPPS, Miss BLYTH, Miss BARNES, and Miss CORK won the chief prizes. Miss BARNARD'S 1st prize dinner-table arrangement consisted of Sweet Sultan (*Centaurea rosea*) and *Gypsophila elegans grandiflora alba*, with a few sprays of Fern placed on the white ground round the individual glass stands.

NON-COMPETITIVE EXHIBITS.

These were contributed by Mr. HAROLD BROWN, Clomence Hall Nursery, Hawkwell, near Rochford; Mr. WALTER ESLEA, Danecroft Rosary, Eastwood, near Southend-on-Sea; and Mr. RUSSELL, The Essex Nurseries, Brentwood. Mr. BROWN'S exhibit consisted of choice Roses, which were shown well by this exhibitor, and by Mr. ESLEA, who had also a fine exhibit of hardy flowers; Mr. RUSSELL'S exhibit consisted mainly of hardy flowers.

YORKSHIRE SWEET PEA.

JULY 20, 21.—The second annual show of this promising society was held at Beverley. In spite of the recent trying weather experienced in the northern counties the entries were equal to those of the previous year, whilst the quality of the blooms and the staging of them showed a marked improvement. The general arrangements of the show reflected great credit on the secretary, Mr. H. G. Sumpner.

It is proposed another year to hold the show in Hull or some such large centre should a committee be forthcoming.

The Silver Cup presented by A. Stanley Wilson, Esq., M.P., for 18 varieties, distinct (open to all), was won by W. B. GAUTRY, Esq., who had some very fine flowers of Audrey Crier, Etta Dyke, Princess Victoria, Frank Dolby, Sycira Lee, John Ingman, Marquis, Althorp Cream, Countess Spencer, Asta Ohn, Evelyn Hemus, Helen Lewis, Apple Blossom, Spencer, Black Knight, "Maiden's Blush," Imp, Prince of Wales, Marie Corelli, and Sybil Eckford.

H. SHERNBORNE, Esq., Howden, won the 2nd prize with a good lot of flowers.

The Open Class for 12 bunches, distinct, was won by G. COTTAM, Esq., Cottingham.

One of the features of the show was the open classes for single bunches.

For the best bunch of White Mr. M. STATHER, Cottingham, took 1st place with a grand vase of Nora Unwin; the best bunch of a Picotee-edged variety was Evelyn Hemus shown by Dr. ROY APPLETON; the best bluish, Constance Oliver, shown by G. COTTAM; the best striped, flaked, or marbled variety was Yankee; the best pink shade, Bolton's Pink; the best lavender, Frank Dolby; the best scarlet, Geo. Stark; the best rose or carmine, John Ingman; the best maroon, Douglas Unwin; the best buff, Clara Curtis; mauve or heliotrope, Marquis; the best orange, Helen Lewis; the best bi-color, A. Ireland.

The class for six varieties did not bring forth much competition, but the Silver Cup was deservedly gained by Dr. ROY APPLETON; with splendid blooms of John Ingman, Princess Victoria, Maroon Paradise, Zero, Lavender George Herbert, and Elsie Herbert.

The Certificate of Merit, awarded by the National Sweet Pea Society, was given to a vase of Castlethorpe Beauty (said to be an improved Mrs. H. Sykes), shown by W. B. GAUTRY, Esq., Brigg.

The Silver Medal of the National Sweet Pea Society offered for the best vase in the Amateurs' Section was won by Mr. J. S. HARPER, York, with Elsie Herbert.

The handsome Silver Gilt Medal, presented by Messrs. Dobbie & Co. for the most successful exhibitor, was won by Mr. STATHER, Cottingham.

NON-COMPETITIVE EXHIBITS.

Dr. ROY APPLETON showed Gloxinias, Begonias, &c.; Mr. FRANK GOULDING, Beverley, Border Carnations; Mr. J. R. LANE, Roses and Violas; Messrs. DOBBIE & Co., Edinburgh, a collection of Sweet Peas; Sunproof Crimson, Edrom Beauty, and Mrs. Hugh Dickson received First-class Certificates, and Messrs. DOBBIE received a Medal for the best trade exhibit. Messrs. E. P. DIXON & SONS showed a neatly-arranged exhibit of Carnations, early-flowering Gladioli, foliage plants, and some floral decorations.

LIVERPOOL HORTICULTURAL.

JULY 20, 21.—The Rose and Sweet Pea show was held at the Corn Exchange, the Sweet Peas being excellent and the Roses, although showing the effects of bad weather, were an improvement upon the empty benches of last year. Hardy flowers were shown well.

SWEET PEAS.

For twenty distinct varieties Dr. G. E. PHILLIPS, Malpas (gr. Mr. W. Davies) won the 1st prize with an excellent assortment, including Asta Oha, Dazzle, Tom Bolton, Nancy Perkin, &c.; GEO. H. F. ROBERTSON, Esq. (gr. Mr. E. Jones), Gresford, was 2nd.

For twelve distinct varieties Geo. H. F. ROBERTSON, Esq., led, having good flowers of Othello, King of the Blues, &c.; P. H. ASHWORTH, Esq. (gr. Mr. W. H. Shoni), Gresford, was 2nd.

The best collection of twelve varieties with waved standards was shown by Dr. G. E. PHILLIPS, who had the varieties Dazzler, Mrs. Hugh Dickson, and others. The best bunch of Sutton's Queen was shown by Mr. ROBERTSON.

In the Amateurs' Section the best twelve varieties came from Mr. W. BINDLOSS, Formby.

ROSES.

In the competition for the best collection of 18 Hybrid Teas, G. H. F. ROBERTSON, Esq., won the 1st prize, and he had fine blooms of Caroline Testout, Mildred Grant, Killarney, &c. Mr.

ROBERTSON had also the best collection of 18 blooms.

For twelve blooms, distinct, A. E. GUNSON, Freshfield, was the most successful exhibitor.

Mr. ROBERTSON had the best collection of six blooms.

In the Amateurs' Section Mr. C. HACKING won the 1st prize for twelve blooms, and Mr. H. BROWNHILL for six blooms.

CARNATIONS.

The best exhibit of six Carnations or Picotees, three blooms of each, came from PERCY CORNELIUS, Esq.; he had good blooms of Hesperia, and Agnes Sorrel; 2nd CHAS. ALCOCK, Esq. (gr. Mr. C. Russell); the best collection of twelve blooms, distinct, was shown by PERCY CORNELIUS, Esq.

NON-COMPETITIVE EXHIBITS.

Gold Medals were awarded to Messrs. BREADMORE, Winchester, and H. MIDDLEHURST, Liverpool for Sweet Peas; ALEX. DICKSON & SONS, Newtownards, W. ROWLANDS, Wavertree, and R. MANSON, Gateacre, for Roses; W. CONWAY & SONS, Halifax, and DICKSONS, Chester, for herbaceous cut flowers; R. P. KER & SONS, Liverpool, plants, fruits, and vegetables; W. L. PATTISON, Shrewsbury, Pansies and Violas; and Messrs. YOUNG, West Derby, for Carnations. Silver Medals were awarded to Messrs. THOS. DAVIES & Co., and BEES, LTD., Liverpool, for cut flowers.

DUNFERMLINE.

JULY 21, 22.—Why is this show rapidly becoming one of the best shows in Scotland? It is held by the Carnegie Dunfermline Trust, and besides having plenty of money behind it, it has also plenty of enthusiasm, concentrated largely in the personality of the convener and secretary of the Trust's horticultural committee, Mr. John Hynd. Three popular classes of flowers are very specially encouraged—Roses, Sweet Peas and Pansies. In fact, the Pansy competitions are now the most important in this country. To give some idea of the display, we print below the number of entries in the leading classes.

ROSES (open to all).

The Carnegie Championship prize for 72 cut Roses, single blooms, not fewer than 56 distinct varieties (3 entries).—1 (£10), HUGH DICKSON, Belfast; 2 (£7 13s.), R. HARKNESS & Co., Hitchin; 3 (£5), D. & W. CROLL, Dundee; 4, (£2 10s.), ROBERT FERGUSON, Brucefield, Dunfermline.

Thirty-six cut Roses, single blooms, not fewer than 18 distinct varieties (9 entries).—1 (£4 10s.), HUGH DICKSON; 2 (£3), R. HARKNESS & Co.; 3 (£2), D. & W. CROLL.

Twenty-four cut Roses, single blooms, distinct varieties (10 entries).—1, HUGH DICKSON; 2, D. & W. CROLL; 3, R. HARKNESS & Co., 4, W. FERGUSON.

Twenty-four cut Roses, eight sorts, three blooms of each (8 entries).—1 (£3), HUGH DICKSON; 2 (£2), R. HARKNESS & Co.; 3, D. & W. CROLL; 4, W. FERGUSON.

Twenty-four cut Roses, single blooms, Tea or Noisette, not fewer than 12 distinct varieties (9 entries).—1 (£3), HUGH DICKSON; 2, D. & W. CROLL; 3, SMITH & MELDRUM, Forfar; 4, R. HARKNESS & Co.

Display of Roses, space not to exceed 12 feet by 6 feet; Rose foliage only allowed for decoration.—1 (£7), W. FERGUSON; 2 (£5), R. FERGUSON.

Fifteen vases, distinct varieties, garden or decorative Roses, not fewer than three trusses of each; to be arranged on three tiers.—1, R. FERGUSON; 2, W. FERGUSON; 3, J. FAIRLEY & Co.

PANSIES AND VIOLAS (open to all).

Forty-eight blooms Fancy Pansies, distinct varieties (10 entries).—1, CHARLES KAY, Mill Farm, Gargunnoch; 2, ANDREW FRATER, Linlithgow; 3, CHARLES COCKBURN, Pencaitland; 4, JAMES PAUL, Killearn.

Twenty-four blooms Fancy Pansies, distinct varieties (16 entries).—1, JAMES PAUL; 2, CHARLES KAY; 3, ROBERT DUNSIER, Avonbridge; 4, ANDREW FRATER.

Twenty-four blooms Show Pansies, distinct varieties (14 entries).—1, ANDREW FRATER; 2,

MATTHEW WALLACE; 3, JAMES PAUL; 4, JAMES SMELLIE, Busby.

Twenty-four blooms Violas, distinct varieties (18 entries).—1, ROBERT DUNSIRE; 2, ANDREW FRATER; 3, MATTHEW MILLIGAN, Wishaw; 4, JAMES PAUL.

Gardeners and amateurs.—Twelve Fancy Pansies, distinct varieties (31 entries).—1, ANDREW FRATER; 2, CHARLES KAY; 3, ROBERT HUNTER, East Kilbride; 4, JOHN McLAUGHLAN, Gargunnoch.

Twelve Show Pansies, distinct varieties (22 entries).—1, ANDREW FRATER; 2, JOHN HENDERSON, Fauldhouse; 3, MATTHEW WALLACE; 4, JOHN DOUGLAS, Uphall.

Twelve blooms Violas, distinct varieties (33 entries).—1, JOHN DOUGLAS; 2, ANDREW FRATER; 3, ROBERT DUNSMORE; 4, ROBERT HUNTER.

Good prizes were also given for Sweet Peas, herbaceous flowers and Carnations. Messrs. DOBIE & Co., Edinburgh, were awarded a Gold Medal for a fine stand of Sweet Peas and Pansies, and Mr. WM. ANGUS, Penicuik, a Silver Medal for a table of Carnations.

DURHAM, NORTHUMBERLAND AND NEWCASTLE-ON-TYNE BOTANICAL AND HORTICULTURAL.

JULY 20, 21.—This show was held on these dates at Newcastle. Unfortunately, the recent strike of railway servants prevented a number of exhibits reaching their destination, but, nevertheless, the general quality was very high. The groups arranged for effect on spaces 25 feet by 12 feet brought four competitors. Mr. A. E. BAMBRIDGE, Lynwood, Jesmond, Newcastle-on-Tyne (gr. Mr. T. Bell), easily won the 1st prize for a group containing Codiaums (Crotons) in excellent condition, whilst the arrangement of the Orchids and other flowering plants was very effective. Mr. H. H. HILLIER, Green Park Gardens, Darlington, was 2nd. In Mr. HILLIER's group Roses and flowering plants were prominent features, but the general arrangement was thin. Messrs. CARNEGIE & Co., Newcastle, were placed 3rd, and Mr. G. W. PINKNEY, Brookfield Gardens, Stockton-on-Tees, 4th.

In Class 2, for six plants in bloom, the pitman showed their plants in fine condition. Mr. J. ELLISON, Cramlington, Northumberland, was awarded the 1st prize. In the back row was a fine specimen of *Clerodendron Balfourii* 5 feet in diameter, profusely flowered, the other plants being *Clerodendron fallax*, *Dipladenia amabilis*, *Allamanda Hendersonii*, *Anthurium Scherzerianum*, and another. Messrs. R. ARTHUR & J. HARRISON were 2nd, and they showed finely-flowered plants of *Stephanotis*, *Stative*, and *Bougainvillea*, amongst others.

In the class for four plants in bloom, Mr. ELLISON was again 1st. *Clerodendron fallax* and *Allamanda* were especially fine. Messrs. ARTHUR & HARRISON were 2nd.

For a group of Carnations, Mr. W. LAWRENSON, Newcastle, was 1st, with a neatly-arranged group. Mr. D. MARSHALL, Yarm, being 2nd.

For six table plants, Mr. T. BELL was 1st, Mr. H. H. HILLIER 2nd, and Messrs. ARTHUR & HARRISON 3rd.

The best exhibit of four tuberous-rooted Begonias was shown by G. LYALL, Esq., Binton (gr. Mr. E. Brough), who was awarded the 1st prize.

In Class 7, for 48 Roses, distinct, Mr. HUGH DICKSON, Bellast, beat all competitors, the varieties Lyon, Mrs. Miles Kennedy, Mildred Grant, J. B. Clark, and Dean Hole being especially fine. Messrs. G. GIBSON & Co., Bedale, were 2nd.

In the class for 24 Roses, in 12 distinct varieties, Mr. HUGH DICKSON was 1st, and WALTER LAVEY, Esq., Gosforth, 2nd.

Mr. HUGH DICKSON was also 1st for 12 distinct varieties, and Messrs. GIBSON & Co. 2nd.

For 12 Roses of any variety, Mr. HUGH DICKSON was 1st, with fine flowers of the variety Mrs. E. Mawley. Mr. PARK, Askew Mill, was 2nd, with Mrs. J. Laing.

For 18 bunches of Sweet Peas, the Right Hon. Sir G. O. TREVELYAN, Bart., Wallington Hall, Cambo, Northumberland (gr. Mr. E. Keith), was 1st, with a grand stand, in which the colours were finely blended. Tom Bolton, J. Ingman, St George, Mrs. H. Sykes, Queen Alexandra, and Elsie Herbert being especially fine. Mr. T. BELL, Whitley Bay, was 2nd, and Messrs. LONGSTER & SONS 3rd.

For three bunches, Mr. KEITH was again 1st, and Mr. JARVIS, Northallerton, 2nd.

For 12 bunches of hardy flowers, Messrs. HARNNESS & SONS, Bedale, were 1st, Messrs. GIBSON & Co. 2nd, and Messrs. LONGSTER & SONS 3rd.

For a collection of Carnations, Mr. W. LAWRENSON was deservedly awarded the 1st prize, being the only exhibitor.

In the classes for eight dishes of fruit, J. E. HATHAWAY, Esq., Baldersby Park (gr. Mr. J. Brennan), was awarded the 1st prize. The Muscat of Alexandria and Black Hamburgh Grapes were excellent, and Royal George Peach and Brown Turkey Figs were the best of the other dishes shown. 2nd, the Right Hon. Lady BEAUMONT, Carlton Towers, Yorkshire (gr. Mr. Nicholls).

In the open class for four dishes of fruit, Mr. HATHAWAY was 1st and Mr. NICHOLLS 2nd.

For a dinner table arranged with flowers and fruit for effect, Mr. G. E. HILLIER was 1st, and Mrs. BATTENBY, Blayton, 2nd.

The best exhibit of bunches of Grapes was shown by Lady BEAUMONT, the varieties including Madresfield Court and Muscat of Alexandria. 2nd, H. B. WATSON, Esq. (gr. Mr. W. Ferguson).

For two bunches of white Grapes, Mr. T. BELL was 1st, with Buckland Sweetwater.

For two bunches of Black Hamburgh, Mr. G. SHOTTON was 1st, and EARL GREY, Howick (gr. Mr. W. Lambert), 2nd.

For two bunches of black Grapes, any other variety, Mr. J. R. GARDINER won the 1st prize with finely-finished fruits of Madresfield Court.

In the competition for Messrs. Webb & Son's prizes for the best collection of Vegetables, Mr. T. H. BOLTON, Powderham Castle Gardens, Devon, was 1st, and Mr. E. KEITH 2nd.

For Messrs. Sutton & Son's prizes for Vegetables, Mr. T. H. BOLTON was again 1st, and Mr. NICHOLLS 2nd.

Among the non-competitive exhibits Messrs. SUTTON & SONS had a grand display of flowers, fruit and vegetables. (Gold Medal.) Mr. JOHN FORBES, Howick, made a grand display of Phloxes, Delphiniums, Pentstemons, Violas, and Carnations. (Gold Medal.) Messrs. STUART & MEIN, Kelso, exhibited perpetual-flowering Carnations, and herbaceous and Alpine plants in variety. Mr. F. J. BELL, Whitley, had a fine display of Violas, Sweet Peas, &c. Messrs. G. GIBSON & SONS, Bedale, showed hardy flowers, Roses, &c. The TYNESIDE SEED STORES, Newcastle, had a choice collection of tuberous-rooted Begonias. Messrs. MITCHELL & Co., Alnwick, showed Conifers, Acers, and hardy flowers in variety. Mr. W. LAWRENSON, Newcastle, had a fine display of Ferns, pot Roses, Pelargoniums, and hardy cut flowers. (Gold Medal.) Messrs. J. THOMPSON & SONS, Forest Hall, showed Roses, Pelargoniums, Ferns, &c. Mr. H. INNS, Croft Spa, Darlington, had a fine group of Orchids, arranged with Caladiums and Ferns. Messrs. ORB BROS., North Shields, had a miscellaneous display of Ferns, Palms, foliage and flowering plants. Mr. O. R. LAMB, Gosforth, showed Bays and other foliage plants.

NATIONAL CARNATION. (SOUTHERN SECTION.)

JULY 26.—The thirty-fourth exhibition of this Society was held in the Royal Horticultural Hall, Westminster, and, despite the untoward season, it was a very fine show. The competition was good in most of the small classes, but in the first division it was merely a duel between two exhibitors. For future shows, it should be pointed out that a few tall Palms for the table would greatly improve the general effect.

In the class for eighteen dressed blooms, Flakes and Bizarres, there were two competitors, Mr. JAS. DOUGLAS, Great Bookham, winning the 1st prize with a fine, even display. The varieties were J. D. Herschell, Meteor, Admiral Curzon, Recorder, Sportsman, Sarah Payne, Geo. Melville, Peter Pan, Arthur, Rowena, Master Fred, Torchlight, J. S. Hedderley, and Gordon Lewis. Mr. CHAS. BLICK, the Warren Nurseries, Hayes, was 2nd. The best of his flowers were Deauston, Cleopatra, Emigrant, Opella, Claude Lorraine, and Hestra.

For 18 Selfs in not fewer than twelve varieties, Mr. JAS. DOUGLAS was awarded the 1st prize for a beautiful stand. The varieties employed were Daffodil, Caruso, Kate Nickleby, Cardinal, Bob

Acres, Queenie, Ruby, Mrs. R. Gorton, Mrs. Parton, Mrs. Henwood, and Mrs. G. Jones. Mr. CHAS. BLICK followed with a stand of larger flowers, but they were not dressed quite so well. His best blooms were Maharajah, Elizabeth Schifner, Lady Bury, John Knox, Attraction, and Black Douglas.

The class for eighteen Fancy varieties contained two very fine exhibits, Mr. CHAS. BLICK turning the tables on Mr. JAS. DOUGLAS by winning the 1st prize. His varieties were Donald McDonald (very fine), The Marquis, Vandeyk, Dauntless, Skirmisher, San Remo, Bombardier, Pasquin, Prince Albert, Leslie, Lieut. Shackleton, Arabella Stuart, Outlaw, Medusa, Prince Arthur, Victory, and R. Morton. In Mr. DOUGLAS's stand the finest flowers were Mrs. Penton, Cassiope, Dido, Linkman, and Queen Eleanor.

There were but two competitors for 18 white-ground Picotees, Mr. J. DOUGLAS again winning the 1st prize, with beautiful examples of J. Smith, Amelia, Miss Cartwright, Mrs. Twist, Lena, Ganymede, Harry Kenyon, Amy Robsart, Thomas William, Brunette, Fortrose, Mrs. Sharp, Favourite, Little Phil, and Clementine. Mr. BLICK followed with the following varieties as his best flowers, Lucrece, Bobby, Patty Oliver, Lucy Labouchere, and Free Lance.

The yellow-ground Picotees were exceedingly good, and Mr. JAS. DOUGLAS was again the best exhibitor, with such varieties as Margaret Lemon, Onward, Her Majesty, Ophir, Cymbeline, Togo, Lady Freemantle, Exquisite, Lady Galton, Styx, Archie Brown, and Goblin. Mr. CHAS. BLICK, who followed, had good examples of Mark Twain, Amy Charles, Daisy Boston, Her Majesty, and F. W. Goodfellow.

The flowers in the undressed division, which were displayed in vases, were certainly more effective than those on the boards.

For six vases, three blooms of each variety, Mr. JAS. DOUGLAS won the 1st prize for well-displayed flowers of Mrs. R. Berkeley, Agnes Sorrel, Daffodil, Mrs. T. E. Henwood, Mrs. Griffiths Jones, and a scarlet seedling. Mr. CHAS. BLICK was 2nd with good examples of Lady Bury, Maharajah, and Miss Willmott.

In the class for six vases of Fancy varieties Mr. DOUGLAS repeated his former successes with very fine flowers. His varieties were Alice Byron Stuart, Gloriosa, Mrs. Penton, Liberté, Lord Steyne, and Queen Eleanor; Mr. CHAS. BLICK was 2nd.

The yellow-ground Picotees still found Mr. J. DOUGLAS in the front; he staged good vases of Margaret Lemon, Ophir, Onward, and Santa Claus. In Mr. C. BLICK's vases were noted Lady Godiva, John Ruskin, and Her Majesty.

For 12 varieties, to include Selfs, Fancies, and yellow-ground Picotees, Mr. JAS. DOUGLAS led off with a fine display. The varieties were Kate Nickleby, Margaret Lemon, Renown, Onward, Mrs. R. Berkeley, Alice Byron Stuart, Ruby, Togo, Lord Steyne, Gloriosa, Daffodil, and Liberté. Mr. CHAS. BLICK was a capital 2nd, with R. Morton, Victory, Vandeyk, and Dauntless as his best flowers.

The competition in the second division was considerable. For 12 Bizarres and Flakes, Mr. H. R. TAYLOR, Cheam, Surrey, was most successful, his flowers being well-grown and well-dressed specimens. The varieties were Bedouin, Gordon Lewis, G. Moreland, Torchlight, Merton Trio, J. S. Hedderley, Geo. Melville, and two seedlings. Messrs. PHILLIPS & TAYLOR, Bracknell, were 2nd, with good examples of J. S. Hedderley, Isolda, Hall Caine, and Gordon Lewis.

In a similar class for Selfs, Mr. H. R. TAYLOR won the 1st prize with excellent flowers of Caruso, Splendour, Snowflight, Luda Malta, Cardinal, W. G. Parton, Carabas, Maud Allan, and Mrs. Eric Hambro. The 2nd prize went to Mr. H. MATHIAS, Stubbington, who had good flowers of Carabas, Cain, Snowball, and Daffodil. Messrs. PHILLIPS & TAYLOR were 3rd.

In the Fancy varieties, Mr. H. MATHIAS won the 1st prize, the varieties employed being Linkman, Liberté, Hecla, Daniel O'Connor, Devonian, Father O'Flynn, and Mair. Mr. C. WALL, Bath, was 2nd, with fine flowers of Ino Sbright, Hercules, and Lord Steyne. Mr. W. SYDENHAM, Melbourne, was a good 3rd.

For 12 white-ground Picotees, Mr. H. R. TAYLOR led off, with Queen of Spain, Dora Bright, Little Phil, and Mrs. Sharp as the best examples. Mr. W. SYDENHAM was 2nd, with examples of Mrs. W. Twist, Blink Bonny, Miss

E. Cartwright, and Ganymede. Mr. H. MATHIAS was 3rd.

The competition for 12 yellow ground varieties was good, Mr. H. MATHIAS winning the 1st prize with Goblin, Togo, Gloria, Lady Constance, and Lady Halford. Mr. W. SYDENHAM was 2nd, and Mr. C. WALL occupied the 3rd position. The undressed flowers were arranged in vases. For four varieties, three blooms of each, in the Self section, Mr. H. R. TAYLOR staged some fine flowers. His varieties were Sultan, Cardinal, Miss Willmott, and Lady Walton. Mr. H. MATHIAS was 2nd, and Mr. R. MORTON, Woodside Park, 3rd. There were nine entrants. In a similar class for Fancies, the competition was again good, Mr. R. MORTON winning the 1st prize for well-displayed vases of Lord Steyne, Erl King, R. Buchanan, and Richness. Mr. G. R. TAYLOR was 2nd, with R. Buchanan and Carnival in good form, while Messrs. PHILLIPS & TAYLOR were 3rd.

The yellow-ground Picotees were not so strongly represented. Mr. H. R. TAYLOR was awarded the 1st prize. He had vases of Ophir, Santa Claus, Onward, and Lady Halford, while the other prizes went to Messrs. H. MATHIAS and W. SYDENHAM in the order named.

In the class for nine vases of Sells, Fancies and yellow-ground Picotees, Mr. H. R. TAYLOR secured the 1st prize with fine vases of Lord Steyne, Anne Hathaway, Miss Willmott, Ophir, R. Buchanan, Mrs. E. Hambro, Solomon, and Onward. Mr. H. MATHIAS was a capital 2nd, having good, clear flowers of Libra, Daffodil, Pasquin, and Sam Weller. Mr. R. MORTON was 3rd.

In the third division, Mr. G. D. FORD, Acecks Green, was 1st for six dressed flowers of Flakes and Bizarres, with the following varieties: C. H. Herbert, Sportsman, Meteor, R. G. Rudd, Master Fred, and Ophelia. Mr. C. LINZEE, Arlesford, was 2nd.

For six Sells, Mr. G. D. FORD won the 1st prize with bright, clean flowers, Mr. C. ALCOCK, Liverpool, being 2nd. In the class for six Fancies, Mr. C. LINZEE was 1st with good examples of Pasquin, Sam Weller, Linkman, and Orlando; Messrs. C. ALCOCK and G. D. FORD were 2nd and 3rd respectively.

SINGLE VARIETIES.

For a pink or rose-coloured Self, Mr. C. ALCOCK was 1st with a fine vase of Lady Hermoine; Mr. E. J. PRICE, Bournville, being 2nd with Camilla. The best white Self was shown by Mr. C. ALCOCK in Sir Galahad. In the darker varieties, Mr. E. J. PRICE won 1st honours with Ashantee, whilst Mr. C. A. LINZEE was 1st in the yellow class with Daffodil. The scarlet varieties were very effective, Mr. C. A. LINZEE being awarded the 1st prize for a fine vase of Brigadier. The yellow-ground Fancy varieties proved an extra strong class, Mr. C. ALCOCK won the 1st prize with Lord Steyne; Mr. JAS. FAIRLIE was 2nd with R. Buchanan. The class for Fancies, other than yellow-grounds, was awarded Mr. C. A. LINZEE for Ino Sebright, while Mr. W. FAIRLIE followed with Millie. Mr. C. ALCOCK won the 1st prize for Sells, showing Duchess of Wellington.

The "Martin Smith" Cup class for 12 varieties, three blooms of each, staged in vases, proved a most attractive class. Mr. H. R. TAYLOR, however, secured the coveted award with excellent examples of Lord Sefton, Ophir, Duchess of Wellington, Cardinal, R. Buchanan, Sultan, Miss Willmott, Snowflight, Maud Allan, Carnival, Togo, and Erl King; Mr. R. MORTON followed with good, clean vases of Lord Steyne, Daffodil, Cardinal, and Togo.

The open classes for a vase of nine blooms of one variety in the various sections produced a splendid display, and Mr. DOUGLAS won all but one class. The best pink or rose Self was Miss Willmott; the best yellow variety, Daffodil; red or maroon Self, Agnes Sorrel; white, T. E. Henwood; scarlet, Cardinal; terra-cotta shades, Mrs. Griffiths Jones, and yellow-ground Fancy, Pasquin. The class for a yellow-ground Picotee was won by Mr. H. R. TAYLOR with Ophir.

TABLE DECORATIONS.

There were only two exhibits of table decorations. Mr. A. ROBINSON, Carshalton, won the 1st prize with a delicate arrangement of yellow Carnations, while Mr. E. J. PRICE won the 2nd prize with an arrangement of pink varieties, with delicately-arranged foliage.

PREMIER FLOWERS.

The premier flowers in the dressed section were yellow-ground Picotee John Ruskin, from Mr. C. C. WALL; heavy-edged yellow-ground Picotee Her Majesty, from Mr. CHAS. BLICK; light-edged, white-ground Picotee, Thomas William, from Mr. H. R. TAYLOR; heavy-edged white-ground Picotee Seedling 200, from Mr. H. R. TAYLOR; Fancy variety Leslie, from Mr. CHAS. BLICK; Self variety Maud Allan, from Mr. H. R. TAYLOR; Flake, Torchlight, from Mr. H. R. TAYLOR; Bizarre, Master Fred, from Mr. D. WALKER. The premier undressed flowers were light-edged yellow-ground Picotee John Ruskin, from Mr. CHAS. BLICK; heavy-edged yellow-ground Picotee Her Majesty, from Mr. CHAS. BLICK; Fancy variety R. Morton, from Mr. C. BLICK; and Self variety Daffodil, from Mr. JAS. DOUGLAS.

The "Cartwright" Challenge Cup was awarded for the third time to Mr. JAS DOUGLAS; while the "Martin Smith" Challenge Cup was secured by Mr. H. R. TAYLOR.

The Divisional cups for the highest aggregate number of points were awarded to Mr. JAS. DOUGLAS, in Division I., and Mr. H. R. TAYLOR in Division II. A third cup was received by Mr. ALCOCK, while the fourth went to Mr. J. H. LINNINGTON.

HONORARY EXHIBITS

Messrs. W. CUTBUSH & SON, Highgate, arranged a fine group of Carnations in tall vases, with Palms, Bamboos, and appropriate foliage; Mr. CHAS. TURNER, Slough, had an effective group of border varieties in pots, bedded with Pteris Ferns; Messrs. J. PEED & SON, West Norwood, also arranged a group of Carnations; Messrs. S. LOW & CO., Bush Hill Park, had a large exhibit of Roses; while Messrs. G. & A. CLARK, Dover, staged a table of hardy flowers; as did also Messrs. BARR & SONS, Covent Garden, their collection of Phloxes being very fine. From Messrs. H. B. MAY & SONS, Upper Edmon-ton, came a fine exhibit of Ferns and Campanulas. Messrs. PHILLIPS & TAYLOR occupied a table with Carnations, hardy flowers, and some attractive Nymphaeas.

LAW NOTE.

HERBERT STANLEY.

THE Official Receiver for the Edmonton district has issued particulars with respect to the failure of Herbert Stanley, formerly known as Herbert Stanley Mobbs, of 15, Palmerston Crescent, Bowes Park, Middlesex, lately residing at Salcombe, Bowes Road, Palmer's Green, Middlesex, Orchid importer, from which it appears that the debtor has filed a statement of affairs showing unsecured liabilities amounting to £5,902 6s. 6d. and assets nil. The debtor alleges his failure to have been caused through agreeing to pay too much for the business in 1896, want of liquid capital, excessive interest and protracted ill-health of my former partner, Ashton, and loss of Orchids in Civil War in Columbia.

The report and observations of the official receiver are to the following effect:—The debtor, aged 41, who has been adjudged bankrupt, states that he commenced business on June 1, 1896, in partnership with another person, under the style of Stanley Mobbs and Ashton, without capital, taking over the assets and liabilities of the business as a going concern, and agreeing to pay £3,350 for the business and £675 for the goodwill. The debtor states that these sums were considerably in excess of the value, and the purchase money was not to be called in for 7 or 14 years, provided interest was paid on same.

The debtor states that about eight years prior to the receiving order, another person joined the partnership, and about five years ago his original partner retired, and the debtor took over his share of the assets and liabilities. The partnership was dissolved on April 15, 1909, and an account and valuation were taken, and his partner took over the assets and liabilities, and there was a balance found due to him from the debtor of £1,608 19s. In December, 1902, the debtor executed a settlement on his marriage, under which he settled a policy for £500 and his household furniture, and he undertook to spend £300 further on furniture, and to effect and settle a further policy for £500.

The unsecured liabilities include £1,608 19s.,

being the amount due to his late partner, mentioned above, the balance is in respect of the balance of the purchase money of the business in 1896.

The books of account stated to have been kept, comprise cash book, bought and sold ledgers, journal and day book. The debtor states that the balance-sheets were made out and the books audited annually and stock taken, and up to 1909 he valued the stock at cost or under, and in 1909 the stock was valued by experts at about 30 per cent. of the debtor's valuation.

The debtor states that he became aware he had not sufficient property to pay his debts in full on April 15, 1909.

DEBATING SOCIETIES.

WATFORD AMATEURS AND GARDENERS'.

—The 17th annual meeting of this society was held at St. Andrew's School on July 8. Herbert Rogers, Esq., presided, and there was a good attendance. A paper was read on "Flowering and Ornamental Shrubs" by Mr. C. Jones, and one on "Mushrooms" by Mr. A. Clements. A discussion of half an hour's duration followed each paper. Mr. Clements' paper was made doubly interesting by a number of lantern slides being thrown on the screen by Mr. Frank Newman illustrating Mushrooms at different stages of their growth. These slides were specially made for Mr. Clements, who afterwards presented them to the society. On the following afternoon a large number of the members visited the Watford Nurseries on the invitation of Mr. Henry Newman, the society's secretary.

READING GARDENERS' ASSOCIATION.

—The annual excursion of this association took place on the 14th inst., when the Japan-British Exhibition at the "White City," Shepherd's Bush, was visited. It had been earnestly hoped that this year the society might visit the Royal Gardens at Windsor, and negotiations with that end in view were in progress when the lamented death of his late Majesty King Edward took place, and all thought of the projected excursion was abandoned. The committee had then somewhat hurriedly to fix on a venue and the Japan-British Exhibition was selected. Arrangements were made with the G. W. R. Co. whereby reserved coaches were attached to a special train to Uxbridge Road, which left Reading at 10.35 a.m. The party numbered 150, including ladies. The Japanese Gardens came in for considerable attention, the scenic railway, the flip-flap and other frivolities were not overlooked, while the music discoursed by the bands was a source of enjoyment to every one. By arrangement with the railway company the members were allowed to return at any time in the evening, but most of the party remained to see the display of fireworks, returning by the special train from Paddington at 11.30 p.m., Reading being reached at 12.25.

REDHILL, REIGATE AND DISTRICT GARDENERS'.

—By kind permission of the Rev. Bridges, M.A., the members paid a visit to the gardens of Worth Rectory, on July 14. Journeying by brake and cycle, the party reached Worth about 6 p.m. They were met at the gate of the rectory by the Rev. Bridges and his gardener (Mr. C. Daisley). Roses in endless variety were to be seen in the gardens. No matter where the party looked, Roses appeared to be plentiful. Some of the most notable varieties included American Pillar, Deboutante, and Elaine. The Sweet Peas excited much admiration. The varieties, Dorothy Tennant, Constance Oliver, Lord Nelson, and Douglas Unwin were charming. In the flower borders the Sweet William, Irises, Spireas, Delphiniums, Dahlias, and other flowers were of great interest. Other features of interest were the Liburnum walk, the Dingle, the lakes, and the ornamental terraces. Owing to a Rose fête that was in progress, the rectory gardens were illuminated in the evening.

GARDENING APPOINTMENTS.

Correspondents are requested to write the names of persons and places as legibly as possible. No charge is made for these announcements, but if a small contribution is sent, to be placed in our collecting box for the Gardeners' Orphan Fund, it will be thankfully received, and an acknowledgment made in these columns.

- Mr. F. W. SIBTHORPE, for the past 43 years Gardener to the late P. FALCON, Esq., of Owles Hall, near Enfield, Herts., as Gardener to R. W. BHOIRNE, Esq., Manor House, Bishopstoke, near Eastleigh, Hants.
- Mr. W. PARRY, previously General Foreman in the gardens at Norwood, Alton, as Gardener to A. McONIE, Esq., Ballochneuk, Buchlyvie, Stirlingshire.
- Mr. W. STURGES, for the past 2 years at Stagenhoe Park, Welwyn, Herts., as Gardener to Lady FITZWILLIAM, Eastcliffe, Embridge, Isle of Wight.
- Mr. W. V. WALL, until recently Gardener to A. HUGHES, Esq., Packwood Grange, Knowle, near Birmingham, as Gardener to JAMES BOOTH, Esq., J.P., Alton, near Claverdon, near Warwick.
- Mr. ALFRED BRISTOW, for the past 7 years Gardener at Worcester Court, Worcester Park, Surrey, as Gardener to The Rt. Hon. Sir HENRY ROSCOE, Windsor Lodge, West Horsley, Surrey. (Thanks for 2 for R.G.S.F. Box.—EDS.)
- Mr. J. W. SIMONS, late Gardener to Colonel CHAMBER DE CRESPIGNY, Burton Latimer Hall, as Gardener to F. WRIGHT, Esq., Petherton House, Rockingham Road, Kettering.
- Mr. H. REYNOLDS, for the past year and 8 months Gardener at Shadwell Court, Theobald, Norfolk, as Gardener to R. F. ROXBOROUGH, Esq., Gladstone Hall, Shipton-Craven, Yorks.
- Mr. R. SMITH, for 4 years Gardener to Colonel HARRY ED, Down Place, Windsor, as Gardener to Earl BATHURST FRANKS, Daffodil, Kent

Obituary.

FERDINAND KEGELJAN.—We have just received news of the death of Ferdinand Kegeljan, president of the Royal Horticultural Society of Namur (Belgium), on the 24th inst., at the age of 88. Deceased was a much-respected philanthropist, and he took a prominent part in Belgian horticultural affairs, being celebrated for his culture of Gloxinias. He was a honorary member of the Royal Horticultural Society.

Editors and Publisher.—Our Correspondents would obviate delay in obtaining answers to their communications, and save us much time and trouble, if they would kindly observe the notice printed weekly to the effect that all letters relating to financial matters and to advertisements should be addressed to the *Publisher*; and that all communications intended for publication, or referring to the Literary department, and all plants to be named, should be directed to the *Editors*. The two departments, Publishing and Editorial, are distinct, and much unnecessary delay and confusion arise when letters are misdirected.

*** *The Editors will be glad to receive, for consideration, large photographs of horticultural subjects, suitable for reproduction as Supplementary Illustrations in this Journal.*

APPLE STEM: *F. B.* The stem was not bitten through by the insect, but broken by other means.

BEECH COCCUS: *J. L.* See answer to *W. J.* on p. 396 in the issue for June 11 last.

CLEMATIS: *J. S.* Your informant is quite right in stating that Clematis plants growing against buildings die occasionally from lack of sufficient moisture at the roots. Just as in the case of fruit trees, Clematis, Ampelopsis, Ivies, and other sorts of wall plants do not benefit from the rains to the extent plants do which are growing in the open. At the same time this cause may not account for the death of your plants. It is impossible to say what has caused the trouble in your particular case unless specimens are sent for examination.—*Correspondent.* The Clematis leaves arrived very dry and in a bad condition. There were no eggs on them, but a quantity of caterpillar excrement. The caterpillars had either all escaped, or been crushed in the post, and only one was available for examination. Assuming that they were all the same, the trouble is due to small, just-hatched larvae of the magpie moth (*Abraxas grossulariata*). We should like to see some fresh material, which should be picked in such a way that it will not dry.

CORRECTION.—On p. 58, for *Campanula Porter-schlagiana* read *C. Portenschlagiana*.

DISEASE ON FRUIT TREES: *T. C.* The injury is caused by *Phyllosticta prunicola*. Nothing can be done except to remove diseased portions. Spray the trees next spring with the Bordeaux mixture, using it at half strength.

FRENCH BEAN: *Cymro., Carmarthen.* French and Runner Beans frequently shed their flowers through a check arising from drought at the roots, especially in periods of hot weather. The weather has not been excessively hot lately, but, at the same time, various local conditions may cause the soil to be dryer than is beneficial to the roots. If this is the case, you might apply a good watering, and then place a mulch of half-decomposed manure and leaves over the soil between the rows. There is nothing in the specimens themselves to explain why the flowers should fail to set.

GRAPES: *R. W.* The black Grapes do not at present show signs of disease, but they appear to have ripened, and then to be keeping badly. In such cases as this we should expect to find that the plants have been overcropped or that they are impoverished, owing to unsuitable conditions, or lack of food at the roots. The green berries are affected with Grape rot, caused by the fungus *Gloeosporium ampelophagum*. As a remedial measure you may dust the fruits and leaves with flowers of sulphur at intervals

of ten days or so as long as the disease appears to be spreading. A small quantity of quicklime should be mixed with the sulphur on the second application, and the quantity of lime should be increased on every successive occasion until the proportions of lime and sulphur are nearly equal, but always keeping just a little more sulphur than lime. Before applying sulphur, you should remove any leaves, shoots and fruit showing signs of disease, taking care to destroy them by burning. In winter the branches should be washed thoroughly with a solution of sulphate of iron.

JAPANESE GARDENING: *A. L.* We do not know a book in the English language which deals exclusively with this subject, though articles appear from time to time in the press, including our own columns. A list of plants suitable for this form of gardening is given in the *Journal of the Royal Horticultural Society*, vol. xxxii., p. 1; see also the same journal, vol. xxxi., pp. 12, 18.

LILIIUM CANDIDUM: *R. B.* The plant is attacked by the common Lily disease, *Botrytis cinerea*, a disease which it is next to impossible to cure. As the Lilies in other parts of the garden are unattacked, you will do well to dig up and destroy those few which show the disease. In addition to this, you should take the soil in which the roots have permeated and sterilise it by placing it on a smouldering fire. Remedial measures sometimes applied with a certain amount of success include the spraying of the plants early in spring with a weak solution of potassium sulphide and dusting them with flowers of sulphur.

MAGNOLIA: *A. B.*—The Magnolia is *M. Watsonii*, and the other specimen is *Neillia opulifolia* var. *lutea*.

MILDEW ON GRAPES: *Vitis.* To prevent mildew from attacking your Grapes, dust the surface of the leaves with flowers of sulphur, using a distributor (which you can obtain from any horticultural sundriesman) for this purpose. Keep a sharp look-out for its appearance on the bunches, and apply the sulphur to the affected parts as soon as it appears. The sulphur can be removed later when the Grapes are colouring by syringing with rain-water. There is no danger of the mildew spreading after the Grapes commence to colour. The greatest care must be used in ventilating the structure until the fruits are ripe, especially during cold, stormy weather. If the border is wet and clammy, lightly fork up the surface soil and do not walk on it more than is necessary.

NAMES OF FRUITS: *Ex H.* The fruits arrived in a smashed condition, owing to the use of a cardboard box for packing.

NAMES OF PLANTS: *H. H., Hutton, and J. W.* Will you please send fresh specimens, packing them as carefully as possible.—*W. J. B.* 1, *Achillea Eupatorium*; 2, *Thalictrum flavum*; 3, *Centaurea macrocephala*; 4, *Spiraea filipendula* fl. pl.; 5, *Eupatorium Weinmannianum*; 6, *Heuchera sanguinea*; 7, not recognised, send when in flower.—*W.* 1, *Polygonum bistorta*; 2, shrivelled beyond recognition; 3, *Beris sempervirens*; 4, *Fagus sylvatica heterophylla* (syn. *F. s. asplenifolia*); 5, *Gaultheria Shallon*; 6, *Campanula Balcanica*.—*H. B.* 1, *Retinospora plumosa aurea*; 2, *Cupressus Lawsoniana*; 3, *Kernia japonica* fl. pl.; 4 and 5, shrivelled beyond recognition; 6, *Enonymus radicans variegata*.—*T. J. H.* *Pyrus pinnatifida*.—*P. E. N.* *Epidendrum cochlearatum*. The red disfiguration of the leaves is caused by thrips. Sponge the leaves occasionally with soapy water.—*S. C.* *Lilium chalcedonicum*.—*D. M.* 1, *Cymbidium ensifolium*; 2, *Dendrobium cretaceum*; 3, *Masdevallia corniculata*; 4, *Dendrobium tortile*; 5, *Oncidium varicosum*.—*Hampstead.* *Oncidium Schlimii*.—*J. P., Carlisle.* *Euchsia procumbens*.—*H. B.* 1, *Catantopus macrocarpum*; 2, *Polygynis muscifera*; 3, *Gongora cassidea*; 4, *Adiantum*.—*W. G. B.* The scarlet flower is *Lobelia cardinalis* and the other *Hipeastrum* (*Amaryllis*) *equestre*.—*J. G.* 1, *Spiraea Bumalda*; 2, *S. Douglasii*; 3, *S. arifolia*; 4, *Lycocystis formosa*; 5, Shrub, send when in flower; 6, *Doutzia crenata* fl. pl.—*H. Roberts.* 1, *Cotyledon umbilicus*; 2, *Valeriana officinalis*; 3, *Cochorium luteum*; 4, *Stachys betonica*; 5, *Galium saxatile*.—*H. Gandy.* The Thistle is *Silybum Marianum*.

NECTARINE: *D. W. G. H.* The fruits of the Nectarine and Peach sometimes crack owing to greatly fluctuating cultural conditions. In order to prevent the trouble, you should endeavour to keep the roots in an even condition of moisture and regulate the atmosphere in regard to temperature and moisture, in such a manner that violent fluctuations will be avoided.

OAK: *W. E.* Old trees as frequently fail from lack of nourishment as from old age, therefore your proposal to loosen the surface soil and apply a good mulching with occasional waterings of liquid manure is perfectly sound practice, and may have the desired effect. If you turn to the last issue, you will see that your question respecting Heather and Ling has been answered.

PEA: *C. A.* There is no specific disease present; the recent bad weather may be responsible for the failure.

PEACH: *A. B.* The fruits show signs of ordinary Peach mildew. Dust the leaves with flowers of sulphur whilst damp. Let the water pipes be dusted with sulphur when they are made very hot in the evening following a dull day, closing the house for an hour or two afterwards. Take care that the roots are not allowed to suffer from drought, but, at the same time, see that the atmosphere is not kept excessively damp.

PEACH TREE: *W. E. Poole.* There is no disease present on the branches. Probably the root is in some way affected.

PEARS EXHIBITED AT A SHOW: *E. C.* It is not possible for us to give you the information in the absence of further particulars. Can you not apply to the Mr. G. Longhurst mentioned in your letter? This would appear to be the proper way of getting the information required.

SEEDS FROM INDIA: *A. S. E.* Seeds not recognised. Sow some in a greenhouse and send us specimens of the plants when in bloom.

SWEET PEAS: *H. C.* The seedling varieties are not without merit. The purple one, having an especially fine standard, appears to be equal to any existing variety of its colour. In order to determine this, however, better specimens would be required for comparison with others. You would do well to exhibit them before the Royal Horticultural Society's Floral Committee or send the varieties for trial by the National Sweet Pea Society next season, when the relative merits of any seedlings you may have may be determined accurately.

SWEET WILLIAM: *T. H.* The injury is not due to either a fungus or insect.

TOBACCO LEAVES FOR FUMIGATING PURPOSES: *Nicotine.* If you wish to use home-grown tobacco leaves for fumigating plant houses, you should allow the leaves to develop to their full size, then cut them and suspend them in the sun to dry. Beyond drying them thoroughly no other preparation is required, except cutting them into coarse shreds.

TOMATO FOLIAGE: *J. H. B. and C. C.* The leaves are affected with Tomato-leaf rust (*Cladosporium fulvum*). If the fruits are still young and green spray the plants with the Bordeaux mixture. If they are nearly ripe, remove any rusted leaves or plants, and spray the remaining ones with the potassium sulphide solution, using 1 ounce of potassium sulphide to 2½ gallons of water. Dissolve the potassium sulphide (or liver of sulphur as it is called) in a quart of hot water, then make it up to 2½ gallons by adding cold water. The white paint should be protected as this spray would discolor it.

VINE LEAVES: *T. E.* Your leaves are affected with sapwarts. These are caused by excess of moisture in the air. Ventilate the house more freely, especially in the morning.

Communications Received.—*J. Comber* (your letter has been forwarded).—*S. F. & S.*—*E. T. H. S.*—*E. W. and Sons*.—*G. V. I.*—*W. S.*—*C. T.*—*W. C.*—*Royal Meteorological Society*.—*H. M.*—*B. ADVANCING FRUIT SEASON.

THE FINANCIAL OUTLOOK.

MANY remarks upon the circumstances noticeable in market fruit orchards have been made in previous articles; but more are needed to bring the subject up-to-date. The returns published in this journal last week show how general the failure in nearly all kinds of fruit is throughout the United Kingdom, and, if they had been mainly from market growers, instead of from gentlemen's gardeners, it is probable that they would have been even more unfavourable than they are, because the crops in highly-cultivated gardens and private orchards are better than those in larger plantations.

It is to be feared that the year will prove one of heavy financial loss to many market growers, if not actually ruinous to a considerable number of them. Prices, even when higher than usual, are seldom high enough to make up for so great a deficiency. Gooseberries sold well throughout the season, and, it is possible that the prices made up for the lack in quantity in cases where three-fourths of an average quantity were obtained; but Black Currants, in consequence of foreign competition, made but little more than ordinary prices until the last week or two of the

season, when very few growers had any left. As for Cherries, high as were their prices, these did not give any near approach to compensation for the extreme shortness of the crop. Strawberries and Raspberries do not come into the category of short crops, and possibly the returns from them were moderately remunerative, although the coldness of the weather told against good markets for the former fruit especially.

It is in relation to Plums and Apples that the financial outlook is most serious, for Cherries and Pears, although even more deficient, are not grown nearly so extensively.

The earliest consignments of Rivers' Early Prolific Plums realised good prices; but there was a speedy fall, in consequence of supplies from the Continent. Some idea of the volume of these competing supplies may be gained from the statement of my salesman in a southern seaside market to the effect that they had received 600 half-sieves of Orleans Plums from the Seine Valley in the latter half of the last week of July, just when my Prolifics were being marketed.

Early Apples have not started well, considering the shortness of the crop, from 2s. 6d. to 3s. 6d. per half-sieve having been the prices for "firsts" of cooking varieties in the last week of July. The fruit keeps on dropping from the trees that are bearing, a wind of quite moderate force being sufficient to strew the ground with Apples of various sizes. As stated last month (see p. 17), Apples have a very slight hold upon the trees this season, and any approach to a gale, now that the fruit is heavy, would glut the markets with windfalls.

SIZE OF FRUIT.

Plums are of a good size, as such a thin crop should be; but many varieties of Apples have a hide-bound appearance, and are not swelling properly. The early kinds in the markets have been small, as a rule. Early Julyan, particularly, matured too soon, which is a curious result in a wet and sunless season. Probably the coldness of the soil has prevented the flow of sap from being normal, in spite of the abundance of moisture. Or it may be that the explanation of the bad setting and dropping which appears to be most in favour with growers applies also to the size of the fruit. This is that the fruit-buds which fruited this year were not properly matured in the wet and cold autumn of 1909, and, therefore, have failed to sustain the fruit well. Worcester Pearmain and Stirling Castle, which have about three-quarter crops in my oldest plantation, are among the varieties which have a hide-bound appearance, while Lane's Prince Albert seems likely to be much smaller than usual, and Beauty of Bath bears small fruits where they are at all thick on the trees. Lady Sudeley, Potts's Seedling, Queen, Domino, Warner's King and Bramley's Seedling are bearing fruits of fair size; but there is not many on the last-named variety.

APPLE SCAB.

As was to be expected in a wet season, scab is bad on trees that have not been sprayed two or three times with the Bordeaux mixture. Irish Peach and Duchess of Oldenberg are so badly marked and cracked by scab in my orchards that they will be worth very little to sell. Having Gooseberries under them, they

missed a timely spraying given to most other kinds, and, after the Gooseberries were picked, the operation was too late to do much good to the fruit. Many other varieties, even those which were sprayed at the proper times, are marked with scab, but not cracked. Cox's Orange Pippin is not scabby, but is much russeted, perhaps in consequence of the spraying. By the way, I have clear evidence this season of the spotting of the leaves of this variety by spraying with Bordeaux mixture, as three trees left unsprayed are exempt from the spotting. There is no defoliation worth notice at present, but the spotted leaves are deteriorated in vigour, and will certainly drop prematurely. After this season I shall refrain from spraying this variety with the Bordeaux mixture when it is in leaf, but shall do all that can be done to keep the disease from developing on the wood. Possibly dilute lime and sulphur wash will be tried on the foliage next season. In other cases the benefit of systematically spraying with Bordeaux mixture during three seasons is obvious and considerable. Some trees of Dumelow's Seedling (Wellington) and Bismarck that were badly affected with scab three years ago are now almost clear of the malady.

UNDESIRABLE APPLES.

There are some varieties of Apples which, though commonly grown, should never be recommended for market plantations, although they do better on some soils than on others. Three varieties, covering over an acre of my land, are to be dug up in the autumn, after a trial of ten years, and two others are to be allowed only another year to determine whether liberal manuring last year and this year will improve them sufficiently to render their retention desirable. King of the Pippins sells well, and it does not concern the market grower that it is hardly worth eating. But what does concern him is that it is inveterately liable to canker. Potts's Seedling, a very fine cooking Apple, is equally bad in this respect. Stirling Castle is only fit for gardens where trees of an extremely dwarf habit of growth are desired. Nothing short of profuse and frequent manuring or resolute thinning of the fruit can prevent it from "cropping itself to death" in a few years. Besides, it is badly subject to canker. Duchess of Oldenberg is not big enough for a culinary Apple, and is not worth eating for dessert. Moreover, it has a persistently inward habit of growth, and does its best to grow like a Lombardy Poplar. Again, it is badly liable to scab, and yet dislikes the remedial spraying. I have it in two beds of different classes of soil, and it does not flourish in either. It has a tendency to make long and slender shoots, and for that reason, as well as on account of its inward habit of growth, it needs severe thinning and hard pruning to buds pointing outwards until it is well furnished with branches. But it is not worth the trouble, as there is the choice of scores of better market varieties. Irish Peach is the last that needs to be mentioned as not worth planting for market purposes. It is a nice early Apple, but is too shy a bearer, and its habit of fruiting mainly on the ends of shoots of a straggling and pendant growth causes it to take up more space than it pays for.

SUMMER PRUNING.

When time allows I get on with the summer pruning of Apple trees four and five years from the planting. Old and big trees have to

do without the operation, and they need it much less than young trees, because, after they have got into the fruiting habit, they make fewer shoots to crowd their interior parts. I believe in the advantage of summer pruning for the purpose of letting sunshine into all parts of a tree, but I have no faith in the prevailing theory as to its effect upon the formation of fruit buds through the stopping of laterals. That is to say, my opinion is that summer pruning tends to promote the development and ripening of fruit buds by letting sunshine into the interior parts of a tree, but that, apart from this advantage, it tells against such development. The theory is that, by shortening a lateral, the energies of the tree are increasingly directed to the development of the lower buds into fruit buds. This seems to me contrary to the natural course of events.

fruit buds. Further, many laterals need to be cut off close to the main shoots, to give sunshine access to those left and to the main shoots. For these reasons I am convinced that summer pruning pays, although it involves a great deal of work. *A Southern Grower.*

THE ALPINE GARDEN.

THE ALPINE HOUSE AT KEW.

In an article by Mr. Wyndham Fitzherbert in your number of June 25, he refers to the beauty of the plants growing in the Alpine House at Kew during May. It has often been a cause of wonder to me why more people do not take up this branch of gardening, for its simplicity and inexpensiveness should appeal to all, and I fully endorse Mr. Wyndham Fitzherbert's description of the Alpine House being "one of the most

Close to the glasshouse are a number of cold frames. Here the little plants are grown, first of all, in pots plunged in earth in these frames, and, as each plant comes into bud, it is taken into the Alpine house until its flowering period is over. It is not, of course, within the means of everyone to possess a range of frames such as may be seen at Kew, and many of us would, therefore, have to grow some or all of our plants in our glasshouse for some time previous to their flowering. The Alpine House itself is a span-roofed one, and measures, roughly speaking, 45 feet by 10 feet. There is a narrow path in the centre, with stages on either side. The staging is about 3 feet 4 inches wide, and appears to be made of slabs of slate supported by a framework of iron and wood. On the slates is spread a bed of cinders, on which stand the pots of plants in an informal manner. The roof is constructed so that air may be admitted, and there are also roller blinds to give shade in hot weather.

The pots are worthy of notice, as they are

FIG. 37.—VIEW IN THE ALPINE HOUSE AT KEW.

The adage, "Growth follows the knife," applies to a lateral just as much as to a main shoot, and anything which promotes wood growth delays fruiting. It is desirable to delay the fruiting stage until a tree is well furnished with branches, and to give time for the branches to become sturdy before they are called upon to bear a great weight of fruit. But if a main shoot is left entire, it is much more likely to form fruit buds all along its length than a cut shoot is to form them on the portion left. The case of a lateral is similar, provided that it is exposed to the sunshine. But it is not desirable that a lateral should fruit along its uncut length, and, therefore, its pruning is beneficial. Moreover, if interior laterals are left to grow until the late part of the autumn or the winter, they shade not only each other, but also portions of the main shoots, and thus prevent the development of

pleasing and instructive spots at Kew." Perhaps a short description of this house, and of a visit I paid to it early in March may be of use to those who possess a small or large glasshouse, and who do not realise that it may be kept gay and bright all the year round without the use of any kind of heating apparatus.

As I opened the door my eyes were greeted with a blaze of colour, and a second glance told me that I was in the sheltered home of the hardiest and sturdiest class of plants, whose natural habitat would be the colder and more rigorous parts of the world. It was evident they appreciated the protection afforded to them, and were flowering profusely. Most of them were quite capable of growing and blooming out-of-doors; but in this Alpine House they flower a few weeks earlier, and their blossoms are produced in greater perfection than if they had to put up with inclement weather.

Briefly described, the system in force at Kew is as follows:—

almost of the same width top and bottom, and mostly of the following measurements:—Diameter at top, $7\frac{1}{4}$ inches; diameter at bottom, 5 inches; height, $4\frac{3}{4}$ inches.

The soils used vary according to the needs of each plant. Some have chopped sea-shells mixed in, and some are composed largely of peat and silver-sand. Others have chippings of limestone and sandstone, or, perhaps, granite on the surface of the soil; while others, again, present a rockery in miniature, and the little plants appear to actually grow on small lumps of sandstone or granite.

There were, I should say, some 300 pots and about 20 different species of plants at the time of my visit. I will briefly describe a few of them. To those who contemplate taking up the idea for themselves, I would recommend a book called *The Unheated Greenhouse*, by K. L. Davidson, which describes how to keep such a house filled with bloom all the year round.

A large number of the plants blooming at K

were of the Saxifrage family, notably *S. Rocheliana* and *S. Ferdinandi Coburgii*, both of encrusted habit, and studded with white flowers in the former and yellow flowers in the latter species. *S. oppositifolia* was there in several shades of colour, and *S. apiculata*, with numerous pale-yellow flowers. *S. Boydii* and *S. Paulinae* were both out, and so was *S. Salomonii*, bearing white blossoms about 2 inches high. *S. Grisebachii* looked healthy, and its curious drooping stems and crimson flowers had a distinct and pleasing appearance. A somewhat rare plant was present in *Epigea repens*, of creeping, shrubby nature, and small, white flowers; while better known species were *Scilla bifolia* and *S. siberica*, *Chionodoxa luciliæ*, *Puschkinia scilloides*, and *Bulbocodium vernum*. *Arabis alpina*, though common, is a pretty plant; while *Gagea lutea* may be uncommon, but is certainly not pretty! Plenty of colour was provided by the Tulips,

many pots were grown of *P. verticillata*, with its mealy leaves and whorls of bright yellow flowers. Other noticeable Primulas were *P. Fortunei*, *P. marginata*, *P. megasefolia*, and *P. denticulata*, all bearing blossoms of varying shades of lilac and mauve, and having mealy stems and leaves. Both the type and the white variety of *Cyclamen coum* were in bloom, and so also was that lovely little *Hyacinth azureus*, and its near ally, *Muscari atlanticum*, one of the so-called "Grape Hyacinths." *Adonis amurensis* was over, and *Iris sindjarensis* was nearly so. There were three species of *Erythronium* out, *E. Hartwegii*, *E. citrinum*, and *E. robustum*, their colours being respectively yellowish-green, pale cream, and bright yellow. I also noted *Fritillaria aurea* for its handsome yellow flowers, chequered brown, and *Ornithogalum Hans Kneekii*, for its emons, white blossoms striped with green. Other plants in bloom were *Draba rigida*, *Iberis gibralt-*

THE NATURAL HISTORY OF CONIFERÆ.

(Continued from p. 73.)

The facts already recounted satisfactorily explain how conifers are able to retain their foliage and yet withstand the rigours of our frosty winter; but they do not tell us why conifers have not adopted the annual leaf-shedding habit that appears to represent the true spirit of vegetation thriving in regions where there is a season of the year during which water is not adequately available. It might be suggested that the evergreen habit has become so deeply ingrained in conifers that it was impossible for them to overcome this hereditary trait. Such a suggestion is not justified, inasmuch as the Larch and several other kinds of conifers have actually acquired the deciduous habit.

The question arises, then, "Is not, after all,

FIG. 32.—IRIS FLAVESCENS IN THE ROYAL BOTANIC GARDENS, KEW, IN JUNE.

(Photograph by W. J. Vasey.)

especially by *Tulipa Kaufmanniana* and its variety *aurea*, both opening their flowers flat, and being of most brilliant shades of yellow and gold. *T. suaveolens* had large, scarlet blossoms, *T. pulchella* small, cherry-crimson flowers; while *T. Leichtlinii* had lovely white, cherry-coloured flowers on long, drooping stems. *T. Clusiana* was only in bud.

Narcissi of various kinds were much in evidence. *N. obvallaris*, *N. minor*, and *N. bulbocodium* had yellow flowers; so also had *N. cyclamineus*, with its elegantly-reflexing perianth petals. *N. triandrus* was also there, and its beautiful, white flowers were both dainty and striking in appearance.

Heloniopsis japonica was blooming freely, so also were the *Anemones hepatica*, *blanda*, and *hortensis*. *Crocus versicolor* var. *violaceus* struck me as being very pretty, with sturdy, little, white flowers, striped outside with plum colour. I saw a great many different species of Primula, and

tarica, *Corydalis bulbosa*, *Theaspi densiflorum*, *Morisia hypogea*, *Achillea Halleri*, and *Shortia uniflora*. *M. E. Stebbing.*

IRIS FLAVESCENS.

The illustration in fig. 32 represents a large bed of this pretty, pale-yellow Iris in the Royal Botanic Gardens, Kew. Mr. J. G. Baker, in his *Iridææ*, places *Iris sulphurea*, K. Koch, and *Iris imbricata*, Lindl., under this species, and describes the habitats as Bosnia and the Caucasus and Armenia. It is classed amongst the tall, bearded, flag Irises, and is closely allied to *Iris germanica*. Like those of many other members of this group, the flowers are sweetly scented; they are produced in May. Of a deeper shade of colour, but not quite so pleasing nor so free in flowering, is the form known as *I. flavescens* var. *leucantha*. These Irises prefer a rather dry and sunny position, and good, heavy but not too highly manured soil.

the coniferous type of leaf quite as well suited to our climate as the leaf shedding mechanism of ordinary broad-leaved trees?"

When we call to mind the distribution of conifers in Northern Europe, and the various facts gleaned by foresters as to the growth of conifers, we are apt to jump to the conclusion that conifers are inferior to broad-leaved deciduous trees in their power of maintaining themselves in the struggle for existence. We find coniferous forests occupying less favoured sites—often nearer arctic latitudes and alpine altitudes—and we know that in our latitudes conifers can be grown successfully (from an economic point of view) on soils too poor for the profitable cultivation of broad leaved trees, such as the Oak and the Ash. Yet even these facts convince us that conifers have considerable powers of growth on soils and climates that are more or less unfavourable, and they also prove that the conifer is by no means an unsuccessful type of

plant. But, on favourable sites, it is not always the conifer that is defeated by its broad-leaved, leaf-shedding rival. For, in Germany, cases are known in which the Spruce or Silver Fir defeats such a redoubtable warrior as the Beech, which is wont to overthrow many other broad-leaved species of trees, including the Oak, largely by means of the lethal shade that it casts and in virtue of its own power of enduring shade. Where the Spruce and the Beech battle, sometimes the Spruce forest advances, driving the Beech forest before it and exterminating the vanguard trees of the latter.

The efficiency of the coniferous apparatus is also demonstrated by the wide range of distribution of a single genus, such as *Pinus*. True Pines form low scrub in the icy and snowy climate of arctic and alpine sites; they give rise to vast forests in cold-temperate and warm-temperate lowlands, and even occasionally do so in sweltering tropical climates. They grow on soils

question? If the matter is one of water-supply and water-expenditure, and, in particular, if it is necessary for the individual leaf to present a small evaporating surface, which is also specially protected from rapid outward passage of water, there are three possible causes:—

(i.) The roots may be able to absorb only slowly, so that the supply of water to the tree is relatively small.

(ii.) The stem may be incapable of conducting water upwards with rapidity, so that the supply of water to the leaves is relatively small.

(iii.) The aggregate leaf-surface of the whole tree may be so great (notwithstanding the small size of the single leaf) that there would be an excessive loss of water unless unusual provisions were made to check the loss from each leaf.

In connection with the first suggested cause, it may be admitted at once that conifer roots generally seem to absorb water slowly and to be incapable of setting up anything more than a slight

"tracheids." Water travelling up the cavities of these is exposed to greater resistance than when moving up longer and wider wood-vessels. Hence we might imagine that sap could not ascend in coniferous wood at a sufficient pace to balance the loss of water due to transpiration from more delicate, deciduous foliage. But, in following this train of thought, we are apt to forget the existence of the Larch, which proves the direct opposite. Moreover, I have found that water can and does ascend the Larch stem rapidly—probably quite as rapidly as it usually travels up the Beech. Thus the structure of the wood of the conifer forms no insuperable barrier to the assumption of a deciduous habit and the acquisition of delicate leaf-structure.

There is, therefore, no reason to believe that the supply of water to the leaves is necessarily inadequate to such a change of habit.

But when we consider the question of expenditure of water by the conifer, we encounter a fact for which we may have been unprepared. Though the surface exposed by the single conifer leaf is very small when compared with that of an Oak or any ordinary broad-leaved tree, yet the number of leaves on the ordinary conifer is so great, that the aggregate surface of the whole foliage is apt to be far greater than that of an equal-aged or equal-sized, broad-leaved, deciduous tree.

Now, the amount of water evaporated by a tree depends not only on the size of the individual leaf surface, but also upon the number of leaves. Hence it should not surprise us that a number of coniferous species expend and require quite as much water as a broad-leaved tree of the same size or age. Such kinds of conifers, taken to dry places, grow feebly or die. If the size of the individual leaves of the conifer were to be greatly increased, or the skin (epidermis) of the leaf were to become more pervious to water, the loss of water by evaporation would tend to be greatly increased—and the tree would be threatened with death from desiccation. Hence the small size and peculiar structure of the conifer leaves may be correlated with the great number of the leaves on the plant. Having thus acquired leaves of this structure in past ages, possibly under climates utterly different from those in which they now live, conifers were enabled to persist in cold-temperate climates for the reasons given earlier in this article. It is obvious that were the conifers to produce fewer leaves, they would decrease their power of producing food-material, and, consequently, would suffer in growth and productiveness. But why they have not in the past adopted the policy of having fewer and larger leaves we cannot say. *Perry Groom, D.Sc.*

FIG. 33.—*CAMPANULA PUSILLA ALBA*.

varying from dry sand and sour heath to soaking bog. Even one and the same species of conifer may exist on very diverse soils, in very varied habitats, and in very diverse climates: such is true of the Scots Pine, and even more so of the common Juniper, which extends from the frigid Arctic zone to nearly sea-level in warm Mediterranean countries, and from dry, scorching sand-dunes to misty, shaded forests.

Nevertheless, it cannot be denied that broad-leaved, deciduous trees preponderate in favoured situations in our climate, and seem here to have largely ousted conifers. Hence once more the question arises as to why conifers have not adopted the broad and less stiff foliage of deciduous dicotyledons. Is there any structural or architectural feature in the conifer that renders it essential for the individual leaf to be small and so constructed as to transpire slowly? Or is there any peculiarity in the working of the coniferous machinery that renders the change in the type of the foliage more or less out of the

amount of root-pressure. Yet, despite this, the Larch shows that the difficulty of obtaining water is not so great as to debar the possession, on the part of a conifer, of a vast number of rapidly-transpiring, deciduous, and soft leaves. (It would be interesting to have some particulars concerning the rate of absorption of water by the Larch.) Moreover, the slow rate of absorption, and the poverty or lack of root-hairs on the roots of conifers might quite as well be the effect, not the cause, of the slow transpiration; for other slowly-transpiring plants (including certain monocotyledons and dicotyledons) often have no root-hairs.

As regards the rate of the conduction of water from the supplying roots to the expending leaves, we know that in conifers the wood, which conveys the water up the stem, differs from that of broad-leaved trees in lacking the long, relatively-wide, open tubes known as "wood vessels." Coniferous wood is mainly constituted of short, very narrow, closed, tapering tubes termed

CAMPANULA PUSILLA ALBA.

THIS *Campanula* is found throughout the chain of the Alps in calcareous regions on the Jura, the Pyrenees, the Cevennes, the Vosges, the Sudetic range, and the Carpathians, living in the natural debris, stone slides and glacial moraines at an altitude of from 1,000 to 6,000 feet. It was first introduced into this country in 1821. In Nicholson's *Dictionary of Gardening*, *Campanula caespitosa* and *C. pusilla* are given as two distinct plants, but in practice it is almost impossible to find any difference between them. Their dissimilarities, if any, are so minute as to have no importance in horticulture. Possibly, *C. pusilla* is less stoloniferous in character than *C. caespitosa*. The plant is the commonest, as well as one of the loveliest of all the small-growing *Campanulas*, thriving in sunny or shady places among rocks or on level ground, though it flowers best in full sunshine. It is the prettiest of the rock *Campanulas*, and flowers from June until October, and may be used indiscriminately in edgings, carpets or the rock-garden, and is pretty

in pans and pots. The plant rejoices in a calcareous compost, so that limestone chips should be added in quantity to the loam in which it is grown. The soil should be heavy, as the plants do not flower freely in light soil. It is very close and erect in growth, rarely forming flower-stems over 5 inches in height. The lanceolate leaves are light green and are carried on thin, wiry stems. The stem rises from a rosette of closely-pressed leaves surrounded by a number of leafy branches, and the flowers, which are of half ball-shaped, drooping, campanulate form, are of a fine blue colour slightly inclining to lilac. The pure-white variety is even more charming, and has a freer habit than the type. Of this there are two forms, one almost entirely disappearing in the winter, while the other is evergreen and keeps the ground carpeted during the dark days of the year with emerald foliage. *C. pusilla alba* is sometimes grown under the name of *C. Bocconii alba*. Both the type and the white variety are easily increased by division or seed.

Campanula alpina is growing very close to the plant figured, but it is not shown in the illustration. *C. alpina* is rare in cultivation, but it is very beautiful, and is closely allied to *C. barbata*. It forms a small, dense tuft of narrow, grey, downy leaves, and sends up a flower spike

REMARKS ON THE CONDITION OF THE FRUIT CROPS,

(See Tables and Summaries, ante, pp. 77-82.)
O. SCOTLAND, N.

SUTHERLANDSHIRE.—Small fruits and Strawberries are average crops, but Apples, Pears, Plums, and Cherries are considerably below an average quantity. In this late district it is too early in the season to say much as to the quality of the fruits. The soil here is a good, free, black, sandy loam, resting on water worn gravel and sand. The gardens are sheltered on the N., N.E., and N.W. by hills, rising ground, and woods. Easterly winds in spring are sometimes troublesome, and in some years these cold winds continue well into June. *D. McVillo, Dunrobin Gardens, Sutherland.*

1. SCOTLAND, E.

ABERDEENSHIRE.—Apples, Pears, Plums, Cherries, Gooseberries, and Black Currants are all very light crops. Strawberries are equal to the average; whilst Raspberries are a very heavy crop, these fruits looking exceptionally well. Our soil is a loam of medium quality, resting on a pan. *James Grant, Rothiebarrow Gardens.*

BANFFSHIRE.—With the exception of Apricots, Peaches, and small fruits, all other kinds are

moist that many of the blossoms rotted. Early Strawberries were a fair crop, but there is much mildew on the foliage, while the main and later crops have suffered much from lack of rain; added to which the crippled condition of the plants consequent on an exceptionally severe winter was enough of itself to make hopeless the expectation of much fruit. The fruit trees generally are healthy, the foliage being clean. *R. P. Brotherston, Tynningham.*

KINCARDINESHIRE.—Appearances are exceedingly unpromising, and I anticipate the worst season we have had here for years. The trouble is partly owing to unripened wood, and also to the continuous frosts when the trees were in blossom. The soil here is of a light, sandy nature, on a subsoil of sludge and cold pan. *John M. Brown, Blackhall Castle Gardens, Banchoy.*

MIDLOTHIAN.—We experienced a very low temperature at the time Pears were setting, and this caused most of them to drop. The same conditions prevailed when the Cherries were in flower, and they also set badly. *W. G. Pirie, Dalhousie Castle Gardens.*

—Most varieties of Apple, Pear, Plum and Cherry trees showed an unusual quantity of blossom. Varieties that bear well most years have a poor crop, and many good, reliable varieties have no fruits. Small fruits, however, are more than usually abundant. The soil is light, with a subsoil of gravel. *James Whytock, Dalkeith Gardens.*

PEEBLES SHIRE.—The cold, wet and sunless weather of last year, and the subsequent hard winter caused great damage, both amongst fruit trees and the smaller fruit bushes. Apples, Pears and Cherries blossomed freely, but set fruits sparingly, which I attribute to weakness in the flowers themselves. The older beds of Strawberries suffered damage, but the younger plantations escaped. A great number of the buds of Raspberries either remained dormant or grew weakly, hence this crop is smaller than usual. Black Currants are not giving such a large crop as the amount of blossom promised, but Red and White Currants and Gooseberries are very plentiful. The soil here is of a light, sandy loam, overlying a bed of gravel and sand. *Geo. Haig, Garrald House Gardens, Dolphinton.*

6. SCOTLAND, W.

AYRSHIRE.—All hardy fruits in this garden are under an average quantity, excepting the Plums on walls and the small fruits. The May frosts destroyed the bloom. The garden is in a low situation, and the subsoil is cold. *W. Priest, Eglinton Gardens.*

—Hardy fruits are not so plentiful here this season as usual, but the quality is good. Strawberries were well flavoured, although rain fell almost every day whilst they were ripening. Frosts were not so prevalent in May this season, and the result is that fruit trees and bushes are in a more healthy condition than they have been for years past. The soil is of a rather light nature, resting on a gravel subsoil. *D. Buchanan, Burygang Gardens, Dalry.*

DELVRIESSHIRE.—All stone fruits, that is to say, Apricots, Plums, and Cherries are scarce. Peaches and Nectarines are not grown outside here. Apples are an average crop in the case of Codlin varieties, Lord Suffield and Bramley's seedling. Strawberries and small fruits are equal to the average. *John Urquhart, Hoddon Castle Gardens, Ecclefechan.*

—Small fruits do remarkably well in these gardens. Black Currants growing to a large size. Late Gooseberries grow much larger than early Gooseberries. Strawberries do extra well here for a couple of seasons, but older plants furnish very small fruits. We plant half the Strawberry beds afresh each season, and this system furnishes us with fine fruits. The soil is a thin, light loam, on a gravel bottom. Fenching serves to deepen it and lower the water table. *James McDonald, Dryfeholm, Lockhart.*

2. ENGLAND, N.E.

YORKSHIRE.—Fruit trees in this district looked promising early in spring; no frost of any great severity was registered during the time the trees were in bloom, and a good

FIG. 34.—ROSE "CAROLINE TESTOUT," FLOWERING ON PLANTS RAISED FROM CUTTINGS.

[Photograph by C. Turner.]

rather over 6 inches in height bearing drooping bells of a deep purple-blue tint, in May and June. The plant appreciates rich soil, and should be given a compost of leaf-mould and fibrous loam in equal proportions mixed with an abundance of limestone chips. It often proves a difficult subject to grow, and in some gardens it dies after flowering. *Wyndham Fitzherbert.*

ROSE "CAROLINE TESTOUT."

THE illustration in fig. 34 shows a bed of this popular Hybrid Tea Rose composed of plants growing on their own roots. Mr. C. Turner, of Highgate, London, N., who supplied the photograph, informs us that the plants were rooted from cuttings in the autumn of 1906. The cuttings were planted in October, in the open ground in the kitchen garden, where they were permitted to remain until the following autumn. The propagation of Roses from cuttings and layers is probably as old as Rose-culture itself, but we have so many questions addressed to us on the subject that it may be questioned if the practice is employed at the present day so often as it might be. The illustration may, therefore, serve to remind amateurs that there are other ways of propagating Roses than by budding and grafting.

deficient. The only varieties of Apples carrying a full crop are Bramley's Seedling, Warner's King, and Lord Suffield. Of Plums, there are good crops of Victoria and Mitchelson's; and of Cherries, Emperor Francis, a sort that seldom fails, is satisfactory. The soil in these gardens is a black, sandy loam, resting on a gravel subsoil, which seems to suit all kinds of fruit trees. *Chas. Webster, Gordon Castle, Forcubers.*

—Small fruits, including Black and Red Currants, are satisfactory, and the crops are looking well. Raspberries also promise to be good. Strawberries are satisfactory, although they were somewhat spoiled by a hailstorm on June 22. Victoria Plums are good, but the varieties King's, Jefferson, Monarch, and River's Early Prolific are not so plentiful as last season. *George Edwards, Ballindalloch.*

BERWICKSHIRE.—Apple trees developed plenty of blossom, but the fruits did not set, and, in common with all the trees here, suffered from drought on our light, gravelly soil. *James R. Rolpath, Duns Castle Gardens, Duns.*

EAST LoTHIAN.—This is one of the worst fruit seasons on record. There was very little blossom on Plum and Pear trees, and consequently there is little fruit. Apples and small fruits flowered profusely, but the weather at the critical period for setting was so continuously

fruit year was anticipated. But east winds brought blight in their train, with the result that most of the fruits dropped. Apples and Plums are very scarce, and Pears even fewer. Small fruits were plentiful and good, but all crops suffered severely, and in many cases were completely ruined by hailstorms on June 30 and July 1. The early spring was wet and cold, followed by very dry weather, and these conditions had a serious effect on vegetation generally. Our soil is a light loam, resting on a subsoil of chalk. *F. Jordan, Warter Priory, York.*

— There was a moderate show of blossom on Apple and Pear trees, but the fruits did not set owing to the cold weather which prevailed early in April. Royal Sovereign Strawberry promised to give good returns, but the crop was ruined by the heavy rains which occurred after June 22. For a month previous to that date we had only had .59 inches of rainfall, whereas after that date 2.70 inches fell in ten days. What is needed for crops on our hungry, sandy land on sandstone rock are alternate rains and sunshine. Givon's Late Prolific Strawberry is bearing well. *J. G. Wilson, Cherl Park Gardens, Wakefield.*

— The fruit crops in this district are very poor, with the exception of small fruits. The dull, damp weather at the time the Apple and Pear trees blossomed had a disastrous effect on the crops, scores of trees that were laden with blossom in many cases have set no fruits. But what fruit there is promises to be of fine quality. Royal Sovereign, Bedford Champion, and Givon's Late Prolific Strawberries having been very fine. Nuts of all descriptions have failed in nearly all cases. *Jas. E. Hathaway, Baldersby Park, Thirsk.*

— This is one of the worst fruit seasons I have known. The Apple crop is almost a complete failure, and Pears are very poor. Plums are an average crop, but Gooseberries are very deficient. Red and Black Currants are an average crop. Raspberries are plentiful, and Strawberries have been very good. *A. E. Sutton, Castle Howard Gardens.*

3. ENGLAND, E.

CAMBRIDGESHIRE.—The fruit trees in these gardens were a grand sight when in bloom, but we had 8° degrees of frost on May 10, which destroyed nearly all the fruit. Apple trees have been very badly attacked by the "maggot," although they were sprayed twice during the winter months with caustic alkali. The soil here is a very strong loam, resting on clay. *T. W. Barkinshaw, Hatley Park Gardens, Gamlingay.*

— The Apple crop is a very irregular one in this district owing to so many fruits falling when young. Peach and Nectarine trees are carrying heavy crops, and are looking very healthy. Pears are scarce, and some of these fruits are damaged by the Pear maggot. Strawberries have been a heavy crop, but some of the fruits of late varieties decayed on the plants owing to the rains. Raspberries are abundant. Frost prevailed when the Apricot trees were in bloom, consequently there is a light crop of these fruits. *W. J. Snell, Wimpole Hall Gardens, Royston.*

— The Apple and Pear trees flowered well, but the cold weather and heavy storms of rain and hail caused a poor "set." Apples especially are much under an average quantity, being found mostly towards the centres of the trees. Small fruits are good average crops, and the bushes are clean and healthy. Strawberries escaped the frosts and promised well, but the hot, dry weather in June caused many of the berries to open before attaining their full size. Our soil is of a rather light nature and it rests on chalk, consequently hot, dry weather soon shows its effect on vegetation. *B. Goodacre, Moulton Paddock Gardens, Northmarket.*

ESSEX.—The fruit crops are disappointing this season. Apples and Pears are under the average, while Plums, excepting the wall trees, are a total failure. Strawberries, which at one time looked promising for a large yield, rotted badly, owing to the wet and cold weather. Raspberries, Gooseberries, and Red and White Currants are good average crops, but Black Currants are a total failure. Heavy rains followed by severe frosts on two or three nights

during the time most of the fruit trees were in bloom are largely responsible for a poor fruit year, but the cold, inclement weather of last summer and autumn must also be taken into consideration. The soil here is a stiff, cold clay. *Arthur Bullock, Copped Hall Gardens, Epping.*

— Frosts, following rain in the early part of May, while the trees were clothed with a profusion of strong, expanded blossoms, had the effect of completely destroying the prospect of a bountiful fruit harvest. Of Apples there are two notable exceptions, King of the Pippins and Norfolk Beefing bearing heavy crops of good fruit. A large tree of Hambleton Deux Ans, in a fairly-sheltered position, and which was covered with strong, healthy blossoms when the frost came, has only a partial crop, and the points of the young growths are brown. Young trees of Stirling Castle, Lord Grosvenor, Early Victoria, and Red Quarrenden are carrying fairly good crops for young trees. Pears, Plums and Cherries are almost failures. Bush fruits and Strawberries are bearing average crops. The soil is a sandy loam, resting on a sub stratum of clay. The position is 240 feet above sea-level, and the ground slopes to the south. *H. W. Ward, Lime House, Rayleigh, South-East Essex.*

LINCOLNSHIRE.—The fruit crops are disappointing. There was a good show of blossom, but the fruits were small, and they fell off in large quantities. Owing to the unfavourable autumn of last year, the wood did not ripen properly. Peaches and Nectarines have the most satisfactory crops of stone fruits. Strawberries were much effected by rains when ripening. The soil here is a brown loam, resting on blue clay or ironstone. *H. Finden, Harlorton Manor, Grantham.*

— The Apple crop in this locality is very thin. Plums and Pears are slightly more plentiful, but these also are under the average. There was a greater profusion of blossom this spring than for some years past, but the flowers were injured by severe frosts in May. Gooseberries and Currants are plentiful and of good quality, as were the early Strawberries, but later ones have been spoilt by the continuous rains and cold weather. Our soil is of a light, sandy nature. *Fredk. Barton, The Gardens, Hainton Hall, Lincoln.*

— There are very few Apples or Pears in this district, for many orchards have scarcely any fruits. Scores of trees which have rarely failed to carry a crop have this season not a single fruit. The Cherry and Plum crops are also total failures. This is rather difficult to explain since the Pear blossom was very fine, and that of Apples fair, and Plums were a mass of bloom. During the time the bloom was open we did not experience much frost, but the temperature was very low with east winds, and I noticed that the flowers became damaged and eventually turned brown. There are very fine crops of Pears, Plums, Peaches, Figs, Apricots, and Nectarines on wall-trees, but I attribute this to the system of protection we afforded the trees during the critical time mentioned. We covered them with "Frigi Domo," which was fastened at the top of the walls, and removed during intervals of sunshine. *Lewis Smith, Shotesham Park Gardens.*

SURREY.—Owing to the cold, damp season of last year, the wood on Apple and Pear trees was not thoroughly ripened, hence there were but few flower-buds on some of the trees. There are whole orchards around this district with not an Apple to be seen in them. Plums on walls are an average crop, as also are Cherries, which are of good quality. Peaches and Nectarines on south walls, which were protected with glass coping and fish-nets, have set a good crop. A few trees not so protected have only a few fruits, and the growth is very much blistered. Strawberries have been an over-abundant crop, and the small market growers have obtained good prices. *Thos. Simpson, Henham Gardens, Wangford, Suffolk.*

4. MIDLAND COUNTIES.

BEDFORDSHIRE.—With a few exceptions, the Apple and Pear crops in this district are a failure. After a plentiful show of blossom, the fruits failed to set, and even where they did set, many afterwards dropped. I attribute this to the cold winds during May. The best crops of Apples are on trees that fruit at the ends

of the shoots. Strawberries have been very good. Black Currants are satisfactory, and we have a fair crop of Gooseberries. The soil here is a heavy loam, resting on clay. *F. J. Foster, Cranfield Court Gardens, Woburn Sands.*

— The fruit trees in this district are free from blight and mildew than they have been for several years past. The soil is very sandy, and the subsoil is also of sand. *C. J. Ellett, Chicksands Priory Gardens, Shefford, Beds.*

(To be continued.)

NEW GARDEN WORMS.

ONE of the best-known annelids is that which is usually called the Green Worm. It varies greatly in colour, on which account it has received various scientific names, and has been frequently regarded as differing in species. It seems to have been first described by Savigny in 1826 as *Enterion chloroticum* and *E. virescens*. Two years later Dugés published an account of it under the title *Lumbricus anatomicus*. It was entered in the *Catalogue of British Worms*, 1865, as *L. viridis*, while Hoffmeister and others called it *L. riparius*. Eisen, in 1874, adopted the generic term *Alloobophora*, and called the worm *A. riparia*, but Vejdovsky, in 1884, held that Savigny had described the worm before Hoffmeister, and that *riparius* must give place to *chloroticus*. Hence the worm has for the last quarter of a century been known by most authors as *Alloobophora chlorotica*. Oerley, however, pointed out in 1885 that it differed so widely from the typical *Alloobophora* as to merit a different generic name, and he called it *Aporrectodea chlorotica*. I have gradually come to regard Oerley's position as the true one, and am forced to admit that the Green Worm is as different from *Alloobophora longa* as the starling is from the blackbird.

The Green Worm is common under stones on the margins of horse ponds. It is found in gardens also, and is usually very sluggish and very fat. Anglers reject it because of the fluid which it exudes, and because few fish will take it. The worm is almost invariably coiled into a ring when found, and is so rigid and muscular that it is difficult to relax it. Though varying much in colour and size, the type is generally about 2 inches long, round, with a prominent girdle, and a greenish-coloured body. Hitherto it has always been recognised by the presence of three pairs of papillae on the under-surface of the girdle. These do not form a band, as in the typical *Alloobophora*, but occur on alternate segments (31, 33, 35)—whence Oerley's name, *Aporrectodea*. Up till the present no other British worm has been found with this character, except *A. cambica*, Friend, which I described in 1892. This worm is probably a sub-species or variety of *A. chlorotica*, but with marked peculiarities. I think, however, that further research will show that there are allied forms which have been mistaken for the Green Worm, and it is more than likely that the synonyms which I have already given are due to the fact that different worms have been under investigation, but that the characters were not sufficiently defined to enable us to say exactly whether or not new species are involved.

I have received, however, from Kew Gardens a specimen of *Aporrectodea* which, while it might at first sight easily pass for the Green Worm, is certainly a distinct species, and serves to confirm me in the opinion that more than one species has in the past been relegated to *A. chlorotica*. It is just possible that Hoffmeister had a different worm under examination from that which Savigny described. The utmost care is needed in counting the segments, for it is here that one of the chief differences will be found. On account of the close resemblance which the new worm bears to the older species, I have adopted the term *similis* for the specific name. It may be convenient first to describe the species, then to indicate its affinities and differences.

NOTICES OF BOOKS.

THE LADYS RECREATION.

THERE is a mystery attached to this volume which has never been elucidated. The title is a very lengthy one, but the following may serve in place of the whole. "*The Ladys Recreation, or the Third and Last Part of the Art of Gardening Improv'd*, by Charles Evelyn, Esq.; to which are added *Some Curious Observations Concerning Variegated Greens*, by the Reverend Mr. Laurence. London: Printed for J. Roberts, near the Oxford Arms, in Warwick Lane, 1717. Price 3s., stitch'd." The reader is informed that this concludes the series of books, of which Mr. Laurence wrote two, and that the latter not only approved the work, but that he favoured the author with two letters, which are printed as an appendix. Several books on gardening had already appeared, having "Recreation" as a common designation; but of these only Mr. Laurence's bore as sub-title, *The Art of Gardening*, and these were devoted solely to fruit culture. *The Ladys Recreation* does not touch on fruit, but on those denizens of the garden which that author had not already written upon. Nor did he, at this time, intend to do so, for in *The Fruit Garden Kalender*, published shortly subsequent to the book now under review, he states: "To make my two former treatises of gardening compleat, and, if possible, more intelligible, I have been prevailed upon to add this following kalender." Further on he writes: "This leads me to say, for my own sake, and for the sake of the public, that the book called *The Ladys Recreation* could not be published by my approbation, because it was never seen by me till it was in print. Besides, I have reason to think it was an artifice of the booksellers to impose upon the world, under the borrowed name of Evelyn." Some years later, a writer remarks how "the chief rule in buying books is the author's name; since the booksellers have usurp'd the making names as well as titles," and no doubt this is one such instance. There remains to relate that the two letters, one of which contains the "Curious Observations Concerning Variegated Greens," are dated from Yelvertoft, and signed by Mr. Laurence, and, among other evidences of his authorship, it has the unmistakable one of referring to dwarf plants as "reptiles," an expression which he employs in a later work, and one which he alone has ever used. Not improbably, the simple-minded clergyman had been the dupe of "the bookseller." Charles Evelyn's connection with horticulture seems to have begun and ended with *The Ladys Recreation*. We hear nothing of him previous to its publication, and afterwards he is saved from oblivion solely from the name remaining on the title page of this volume.

What is remarkable is that though the subjects discuss of receive only the slightest notice, they are, nevertheless, treated fairly, according to the knowledge of the period. The book is divided into sections—florists' flowers, flowering shrubs, tender exotics, trees, &c. Following a chapter on soils, and the best situation for the garden, is a brief description of those flowers the most usual in gardens, of which the Tulip is the first to be mentioned. This is succeeded by remarks on the Carnation and Gilliflower. The varieties recommended are, of red and white, Crown of Bohemia, Emperor, Charles II., Queen Catherine; of red and blush, William the Conqueror; of crimson and white, Empress, Countess Tishie; of purple and white, Solomon, Prince William, Purple Emperor, Orlinans, Fair Helena, Glory of Worcester; of scarlet and white, Giant, Mayor of London, Romulus, Fair Roxana, Florida, Paramour; black, Pluto; scarlet, Golden Grove, Prince and Princess of Orange, Golden Fleece; blush, Morning Star, Giant Dove, Birtha, Astragon; and purple, The Wiggan.

The directions for layering are good, and rooted layers are directed to be planted not too deep, "a deep plantation being always

destructive." Seeds are advised to be sown in April, "after a shower of rain." "Seeds which produce the greatest variety of flowers are the striped tawnies." These we would to-day call yellow-ground fancies. Carnations grown in flower-pots were to be stood in a pit, "like to a little pond, planted round the edges at top with small pyramid eughs." This is designated an "ornamental preservative." Then follow in succession notes on Auricula, Anemone, Ranunculus, Hyacinth, and Star-flower. One is almost startled on reading those on Narcissus and Jonquils, to find this very evident allusion to wild gardening: "This"—the Narcissus—"is a very common flower, but, considering its great variety, bright colour, and early flowering, the better kinds of them are worthily entertain'd in the garden, especially in avenues, groves, out-hedges, and other shades, which they much delight in." The Indian Daffodil, "which bears many flowers of various colours on one stalk," is a means of exhibiting the author wandering astray. Irises and "Lillies" having been duly honoured, the Peony is recommended as "very becoming in your flower pots or chimneys" (fireplaces), Stock Gilliflowers, and Wallflowers are "to be planted against a south wall and secured from frost." The Cardinal Flower is a "pot flower, and very tender." A "strip'd-flowered" Dame's Violet, double, is mentioned—one of our lost treasures. The Christmas Rose, "which is good only for flowering at Christmas," is condemned because of its lack of beauty! Among sweet herbs are Gold and Silver and double-flowered Rosemary. The first named was in great request at weddings. Flowers to be sent a distance were to be "rubbed over with honey and wrapped up in moss." Rosemary comes up again in the part devoted to shrubs. "The dwarf kind of Rosemary, with a double blossom, kept shear'd, is very comely," and "there's your Rosemary, gilded with yellow, and a sort of it variegated with white, very delightful to the eye." The last named, according to Miller, was entirely lost in the severe winter of 1739-40. The greenhouse plants are extremely few, and among them are the "blue, borage-leaved Auricula" (*Ranondia pyramida*) and "Bear's-ear Sanicle" (*Cortusa Matthioli*), always difficult subjects to manage unless the out door position be absolutely correct. Evergreen shrubs and trees occupy a few pages only, and the kalender is similarly abbreviated. *R. P. Brotherton.*

CALENDAR OF GARDEN OPERATIONS.*

POSSIBLY because of my intimate association with the work of cottage gardeners and allotment holders whose crops I appraise literally in thousands, a copy of the new and enlarged edition of this work, originally prepared by Sir Joseph Paxton, has reached me from the office of the *Gardeners' Chronicle*. Previous editions, which have been in circulation for over 60 years, must have been enormously useful to vast numbers of persons. It was the first of what may be described as modern garden calendars. Under the several months, sound information was given on the raising and cultivation of different kinds of vegetables, fruits, and flowers. That the knowledge imparted was in the highest degree acceptable was proved by the demand for subsequent editions over two generations of time. During the latter part of that long period, the advance in the practice of gardening among the great and ever-growing community of amateurs has been so vast, that it is no wonder that the demand for concise and trustworthy guidance is more and more pressing.

In order to meet the requirements of the present the original matter has been thoroughly revised and the text considerably extended. All kinds of vegetables are well treated upon in the several months. Salient points on the various fruits receive timely cultural reference, and the selection of flowers for gardens,

* *Gardeners' Chronicle* Office, price 7½d. post free.

Aporrectodea similis is about 7 cm. or 3 inches in length in alcohol, and has 180 segments. The colour of the living worm closely resembles that of *A. caliginosa*, i.e., it is grey or indefinite, and differs very little in spirits. The body, like that of the Green Worm, is cylindrical, but the tail is slightly flattened. This is suggestive of a different habit of life. Worms with flattened tails usually burrow and feed on the surface of the soil. The tail serves as a holdfast, but the green worm and some others never need such a security against birds. The male pore, even when the tubercula pubertatis are developed, is invisible, since there are no well-developed papillæ. Dr. de Ribancourt has especially emphasised this point as one of great importance in the study of earthworms. Usually, when a worm has papillæ on the 15th segment, they develop simultaneously with the tubercula.

The segments five to eight are the largest and widest, and are without secondary annuli. There is a groove on the underside of the prostomium or head, which is inserted only a very short way into the peristomium, and has a transverse furrow. The setæ are paired. I am uncertain whether or not the worm exudes any liquid when fixed with alcohol, but I am almost certain that it does not give off a sediment such as the Green Worm and Brandling pour forth from their dorsal pores. When we turn to the girdle, we find it extends over segments 28 to 35, while the tubercula are on 30:32:34 in line with the ventral setæ which they also carry.

FIG. 35.—ALLOOBOPHORA SIMILIS, FR. Girdle segments (28, 35); three pairs of tubercula pubertatis (30, 32, 34) magn.

Thus the new worm resembles the Green Worm in size and shape, in the pairing of the setæ, and in the presence of three pairs of tubercula under the girdle. The differences, however, are such that, when tabulated, they show the two species to be distinct. These may be readily compared as follows:—

APORRECTODEA.

CHLOROTICA, SAV.	SIMILIS, FRIEND.
Colour usually strongly marked.	Grey or indefinite colour.
Giving off turbid fluid.	Little or no fluid exuded.
Length, 5 or 6 centimetres.	Length, 7 centimetres.
Number of segments, 80 to 125.	Number of segments, 180.
Tail cylindrical and narrowing.	Tail somewhat flattened.
Girdle usually from 29 to 37.	Girdle, 28 to 35.
Tubercula on 31:33:35.	Tubercula on 30:32:34.
Male pore on large papillæ.	Male pore hardly visible.

It should be remarked that in *A. leoni*, Michaelsen (a species not as yet found in Great Britain) as well as in our own *A. caliginosa*, there are two pairs of tubercula on alternate segments. In fact, one might place these two worms side by side, as I have done with *chlorotica* and *similis*, for while in *A. anatomica* the tubercula are on 31:33, in *A. leoni* they are on 30:32. The occurrence of this interesting pair makes it easier for us to realise that *chlorotica* should also have its double. The internal structure has not yet been studied for want of material. *Hilderic Friend, St. Asaph, Great Malvern.*

greenhouses, and windows receive adequate attention. Sweet Peas are treated on up-to-date lines, and an excellent chapter is provided on the selection and cultivation of town trees and shrubs. Definite instructions are given on manures; various examples of crops are admirably illustrated, and advice given on their cultivation. The French system of intensive gardening is given a chapter to itself. Cottagers' shows and the details in their promotion and management are not overlooked.

The work is as complete as could well be imagined. It consists of 170 pages, with an excellent index, and all for 6d. It is just the book for diligent cottagers who delight in gardening, or the thousands of boys who are receiving practical education in school gardens, but young professional gardeners may also find it handy for reference. Because the work is so valuable to numerous cultivators, I cordially wish for it a wide circulation. *J. Wright, F.M.H.*

PLANT NOTES.

BOUGAINVILLEA GLABRA.

This lovely plant is generally treated as a stove climber, but it succeeds best under cool treatment and in full sunshine.

Last winter, I had occasion to move a large plant (in a half paraffin cask) to a Rose house, for it did not succeed well in the stove. During the winter the soil and roots were frozen hard. I fully expected the plant would be killed. Instead of this, however, it has grown stronger, and is now a mass of beautiful, very richly-coloured bracts. This is a proof that the species is much harder than is generally supposed.

The finest specimen of this plant I have ever seen is at Park Place Gardens, Henley-on-Thames, and when this specimen is in flower it is worth going many miles to see. *J. S. Higgins, Rug Gardens, Corwen, N. Wales.*

The Week's Work.

PLANTS UNDER GLASS.

By JOHN DONOGHUE, Gardener to JOSEPH PINKSGILL, Esq., Bardon Hill, Westwood, Yorkshire.

Mignonette.—It is now time to make the first sowing for the spring batch of *Mignonette*. Sow the seeds thinly in small 60-sized pots, filled with equal parts of finely-sifted loam, leaf mould, and sand. Place the pots in a cool frame, on a layer of ashes, and keep them shaded from bright sunshine until the seedlings become somewhat hardened off. Thin out the young plants previous to repotting them, four to six plants being sufficient for each 5 or 6-inch pot. When the small pots are well filled with roots, afford the plants a shift. During the autumn and winter months *Mignonette* should be placed close to the glass, and a free circulation of air should be allowed at all times. The best varieties for pot culture are those bearing erect flowers and of dwarf habit, such as *Machott*, in various colours, *Bisnarek*, *Crimson Queen*, and *Dwarf compacta*.

Bulbs for early forcing.—The bulb catalogues will soon be at hand, when a careful selection of early-flowering varieties should be made. Tulips are almost indispensable. Although small in respect to flowers, the *Duc van Thol* varieties are most reliable for very early forcing. *Mons. Tresor* and *Proserpine* are other excellent varieties that readily respond to early forcing, whilst *Vermilion Brilliant* is always appreciated on account of the scarlet colour of its flowers. *Roman Hyacinths* may be had in flower from December onwards through the season. Early *Narcissi* are useful for house decoration; the varieties *Van Sion*, *Cyantes*, and *Horsfieldii* are amongst the best for general forcing. It is important that bulbs intended for early forcing should be well rooted previous to being put into a cool house to prepare for warmer conditions. The bulbs may be potted immediately they are received and the pots covered with sand to the depth of 2 or 3 inches. Examine them at intervals after they are potted, and remove any that have started into growth. These should be stood in the open in an exposed position until required. Where large numbers of bulbs are cultivated,

shallow boxes are the most convenient receptacles. If pots are employed, they should be plunged to the rim in sand or leaves, otherwise the frost may cause them to crack. Tulips may be brought into a warm atmosphere after they have been placed for about a fortnight in a cool greenhouse. It is not advisable to place *Narcissi* into a warm house until the flower-buds can be seen, otherwise the inflorescences are liable to come "blind."

Lilium speciosum.—This beautiful Lily is now producing an abundance of bloom. As soon as the flowering season is over, place the bulbs in the open for the purpose of ripening them. If it is not convenient to pot the bulbs of *L. Harisii* when they are received, they should be removed from their packages and placed in single layers. Fibrous loam and peat, with a quantity of dried sheep or cow dung, form a suitable compost. Where plenty of space is available, the bulbs should be potted up singly and placed into cool frames until the growing shoots are observed. If required to bloom early, they may afterwards be gradually forced into bloom.

THE ORCHID HOUSES.

By W. H. WHITE, Orchid Grower to SIR TREVOR LAWRENCE, Bart., Bulford, Surrey.

Sophrontis grandiflora.—Some plants of this species now commencing to grow may require repotting. They should be grown in shallow pans filled to quite three parts of their depth with drainage materials. A thin layer of compost is all they need to root into, and this compost should consist of *Osmunda*-fibre, *Polypodium*-fibre, and *Sphagnum*-moss in equal parts. The materials should be cut up moderately fine, and some small crocks mixed with them. Each plant should be potted quite firm. Suspend the plants in a moist position over such species as *Odontoglossum crispum*. Afford water rather sparingly until the flower-buds appear, when the quantity may be increased. *S. cernua* and *S. Rossiteriana* may be treated likewise; while the distinct *S. violacea* thrives better in a shady part of the intermediate house, and should be given plenty of root moisture. The well-known *Epiphronitis Veitchii*, provided the atmosphere is suitable, grows and blooms very freely, and, if several specimens are cultivated, one or other of them will always be in bloom. At the present time these plants are producing a number of aerial shoots from the flowering growths. Such growths may now be taken from the parent plant, potting several together to form nice little specimens. Shallow Teak wood baskets are suitable receptacles for these divisions. They should be well drained, and only a moderate quantity of *Osmunda*-fibre and *Sphagnum*-moss will be necessary for the plants to root into. Press the compost firmly about the base of the stem, and place the plants near to the roof-glass of the *Cattleya* house, choosing a rather shady position until they are re-established. Sufficient water may be afforded by spraying them overhead several times a day, especially when the weather is warm and bright. At present, our plants have only sufficient new stems to make one or two moderate-sized specimens; but others that are as yet too small, and those which will come later on will be treated likewise when large enough to be removed.

Sophracattleya and Sophracattleya hybrids.—Many plants of *Sophracattleya* and *Sophracattleya* hybrids are beginning to grow; therefore, if any are in need of repotting or top-dressing, attention should be given them without delay. Grow these plants in pots or shallow pans, and elevate them well up to the light, in a cool position in the *Cattleya* house. The same kind of compost as advised for the *Sophrontis* will suit them. These hybrids require very careful watering at all times, as the leaves and growths are apt to decay if the soil is kept too damp. Plants that are now at rest should be kept in the intermediate house until growth recommences. Many of these hybrids have rich and brilliantly-coloured flowers. Among the best of them are those enumerated:—*Sophracattleya Doris*, S.C., *Chamberlainia*, S.C., *Bluelii*, S.C., *Thwaitesii*, S.C., *eximia*, S.C., *Calypso*, S.C., *Marens*, S.C., *Saxa*, S.C., *Antiochus*, and S.C. *warnhamiensis*; *Sophracattleya beta*, S.L., *Orpetii*, S.L., *heatenensis*, S.L., *Gratrixie*, S.L., *Mariottiana*, S.L., *Felcin*, S.L., *Psyche*, S.L., *valla*, and the dark, purple-red *Sophracattleya Veitchii*, and its variety *Eros*.

Arachnanthe Lowii.—*Arachnanthe (Vanda) Lowii*, now in flower in the warmest house, thrives well when growing with *Aerides*, &c., but its long, green leaves are very susceptible to injury from the sun, therefore it should always be closely shaded even from very strong light. It delights in plenty of root moisture, and requires but a very thin layer of *Sphagnum*-moss for its roots. The roots, being large and fleshy, are frequently injured by cockroaches, therefore these latter must be sought after and destroyed.

Schomburgkia.—Such *Schomburgkias* as *S. tibicinus*, *S. Sanderiana*, *S. Kimballiana*, *S. Humboldtii*, *S. Thomsoniana*, *S. chionodora*, and its variety *rosea*, should now be given attention, if the old material at the root is getting worn out. They thrive either in pots or shallow baskets, but require a light position well up to the roof-glass in the warmest house. These plants do not require much compost, therefore plenty of drainage should be given, and the soil may consist only of *Osmunda*-fibre. This should be packed quite firmly around the base of the hollow pseudo-bulbs. Whilst making growth, they delight in an abundance of water at the root, especially when they are nearly completing their growth, but afterwards they should be kept rather dry. *Schomburgkia crispata*, *S. undulata*, and *S. gloriosa* are quite distinct in habit of growth from those plants already mentioned, but they require, nevertheless, the same kind of treatment, except that they should be grown in a light position in the *Cattleya* or *Mexican* house. At the present time their growths are well advanced, therefore repotting should be deferred until later.

FRUITS UNDER GLASS.

By B. GOODACRE, Gardener to SIR ERNEST CASSELL, G.C.B., Moulton Paddocks, Newmarket.

Figs.—The second crop of *Figs* formed on growths of the current year should now be ripening. Light applications of some mild stimulant should be given to assist the plants at this stage, and where a well-drained border is assured, abundant supplies of water slightly warmed. Syringing should be discontinued, and a little fresh air admitted during the night, even if this necessitates extra artificial heat, as it is important that the atmosphere be not stagnant. It is a good plan, while the *Fig* is in active growth, to carefully insert a sharp knife half an inch above some of the dormant buds at the base of bare branches, causing a deep score. This will have the effect of causing such buds to push into active growth, thus furnishing the lower part of the tree with shoots. Young *Fig* trees raised from cuttings and started in the early spring, provided they have been kept growing freely, as advised, should now be furnishing useful fruits. The pots being full of active roots, light and frequent manurings will do good. If the trees are placed on a shelf in an airy house in full exposure to sunshine, the fruits will mature perfectly. When the crop is gathered, care must be taken not to allow the fruit just forming to push forward, for which reason the plants should be stood in a shady position and gradually hardened off, giving sufficient water only to prevent the soil shrinking from the pots, as it is from these young, vigorous trees that next season's early supply of fruits will be obtained.

Figs in pots.—Trees intended for autumn and winter fruiting must be allowed plenty of heat and moisture. The atmosphere should be kept at saturation point by frequent syringings. Remember that the syringing requires to be done with care, and that a skilful person will not need to use nearly so much water as one unaccustomed to the work. Except in the case of rank-growing trees, liberal feeding should be afforded the plants. The fruits will now be as big as small Hazel nuts; any that are malformed should be removed and others thinned out if the crop is excessive; but no hard-and-fast rule can be laid down in this matter, as much depends on the size and vigour of the individual tree. Small-fruited varieties, such as *Early Violet*, will need no thinning, and, if the crop is at all backward, these small varieties will be found very useful to fill a gap, as, their flowering period being short, they may be given extra heat to forward the ripening.

Suckers.—Remove all suckers directly they appear, as the sap has a tendency to flow first to these, thus robbing the fruiting branches.

THE FLOWER GARDEN.

By E. BECKETT, Gardener to the Hon. VICARY GIBBS, Aldenham House, Hertfordshire.

Violets.—The present season has been an ideal one for Violets; the plants have made excellent growth, and are remarkably free from red spider. Continue to loosen the surface soil at frequent intervals with the Dutch hoe, and give an application of some patent manure to stimulate growth. Remove any runners that form before these get so large as to weaken the plants.

Herbaceous borders.—In consequence of the rainy weather the plants have made excellent growth this season. Remove the dead and untidy spikes from plants that have passed out of flower, and lift any bulbs, such as English and Spanish Irises, that are nearing the stage of ripening. The borders are particularly bright just now with a variety of subjects, but particularly beautiful are the perennial Phloxes, especially the newer varieties with flowers of delicate tones of colour. The improved varieties of *Chrysanthemum maximum* such as King Edward VII., Earl Roberts, The Speaker, Robinsonii and atratum are also grand acquisitions to the flower borders. *Actea spicata* is a striking plant now in flower, and many of the Veronicas, especially *V. virgaurea*, *V. spicata*, and its rose, white and variegated variety, are very showy. The white-flowering variety of *Lysimachia clethroides* is particularly neat, both in its flowers and habit of growth. *Lychnis chalcedonica* and its double form provide brilliant colouring; I recently saw in a cottage garden a pleasing combination of this plant interspersed with *Lilium candidum*. *Oenothera Fraseri* and *O. Youngii* have bright flowers, and the varieties of *Galega officinalis* are very pretty. Annuals, too, are making a pleasing display. For freedom of growth and continuous flowering the improved varieties of *Cosmos bipinnatus* are useful, as also are the Shirley Poppies.

Violas.—The named varieties of *Viola* are equally valuable for spring or summer bedding. Continue to peg down the growths; at this season good stout cuttings can be procured that will root readily in a cold frame in ordinary garden soil, to which should be added a sprinkling of road grit. Beyond protection from heavy rains and excessively bad weather in the winter, these, if well rooted, will require but little attention.

Seasonable work.—The planting of many of the bulbs that flower during the mid-winter, such as *Aconites*, *Scillas*, *Chionodoxas*, and *Crocuses* should be done at the present time rather than at a later date. Early planting enables them to become established and make a good growth, and is in every way more satisfactory than when undertaken shortly before the plants should be in flower. During the past week it has been necessary, owing to the rough winds, to restake many of the trees and stronger-growing plants. Sweet Peas, if in need of extra support, should be attended to at once and, if the plants are in rows, stout poles should be inserted firmly in the ground at intervals of a few yards and a row or two of string stretched between them. Tidy up the rockery, stirring any vacant soil lightly; any spot that has become bare of soil through the heavy rains should receive a top-dressing of suitable material.

THE KITCHEN GARDEN.

By JOHN DUNN, Kitchen Garden Foreman, Royal Gardens, Windsor.

Cucumbers.—Fire heat is still necessary to maintain a suitable temperature and the atmosphere must not be allowed to become too humid or stagnant as the weather is so dull. Fresh air should be admitted on all favourable occasions to sweeten the atmosphere and harden the growths which should be properly regulated, thinned and stopped, overcrowding being an evil that cannot be too strongly condemned. Established plants should, as far as possible, be stopped at the second joint beyond the fruit, and all injured leaves and deformed fruits removed. When Cucumbers have attained a suitable size they should be cut and stored in a cool, clean cellar where they will keep fresh for a few days. Topdress the plants as often as roots appear above the surface of the bed, using a mixture of three parts turfy loam and one part horse droppings. Young plants raised from seed sown a month ago should now be ready for planting out. They may be planted in small mounds placed on a

gentle hot-bed, 4 or 5 feet apart; nothing will be gained by planting closer. Seeds for the winter batch should be sown at once in order that the plants may be ready for planting in the first week in September. Dickson's All-the-Year-Round is a suitable variety for late sowing.

Potatoes.—Early Potatoes will now be ready for lifting, as few, if any, varieties will benefit by being left in the ground after this date. Those that are required for seed purposes should be left undisturbed until the tubers are quite ripe. The practice of selecting unripe tubers for seed purposes and laying them on the ground in the scorching sun is a bad one; it is far better practice to plant a sufficient number at the ordinary time to allow of a few being left for seed purposes. All early Potatoes on which the skins are set may be lifted now, and the ground afterwards planted with Coleworts or some other crop for winter use.

Cabbage.—Another sowing of Cabbage seed should be made now, as from this sowing the principal plantation will be made. These plants will stand a rough winter better than those raised from seeds sown three weeks ago, although, if the winter is mild, those of the early sowing will come into use when most winter vegetables are running to seed.

Mushrooms.—The house intended for furnishing the autumn and winter supplies of Mushrooms should be thoroughly cleaned and washed with hot lime at the earliest opportunity. If the horse droppings are prepared now there should be Mushrooms ready to gather about the middle of October. The preparation of the bed is of far more importance than many persons imagine. The droppings should be collected with as little delay as possible, and placed in an open shed where they should be turned every second day. When almost ready for removal to the Mushroom house they should be placed a little closer together until the temperature reaches 85°; they should then be turned and rammed tightly together. The depth of the bed should then be 14 inches and level on the top, so that water may be applied easily. When the temperature drops to 80° the spawn should be inserted 2 inches deep, and the whole bed made perfectly light and even. In a day or two afterwards a covering of new loam should be placed over the surface of the bed, and the loam should be beaten lightly. The temperature of the house at this season should be about 60°, and frequent syringings are necessary to ensure a humid atmosphere. To keep up an unbroken supply a new bed should be prepared every three weeks.

Autumn-sown Onions are ready for lifting. In order to have the bulbs thoroughly ripened they should be turned daily for at least a fortnight. When they are removed to the Onion loft they will require to be carefully examined, that they may be kept as late into the autumn as possible.

THE HARDY FRUIT GARDEN.

By A. R. SEARLE, Gardener to the Marquis of NORTHAMPTON, Castle Ashby, Northamptonshire.

Peaches and Nectarines.—Examine these trees frequently, and pinch all lateral growths back to the first leaf. To obtain fruits of good colour and flavour they should be well exposed to the light and air, therefore it may be necessary to fasten back some of the foliage round about the fruits; where the trees are in a very healthy condition and the foliage is rather dense, a few leaves near to the fruits may be removed altogether. Trees carrying heavy crops of fruit will be greatly assisted if given an occasional watering of liquid manure from the farmyard, or where this is not available some approved soluble fertiliser, washing the fertilising properties of the same into the soil with clear water. When the fruits have safely passed the stoning period, stimulants may be more freely given to the trees, as food is most essential then to assist the development of the fruits. Continue to tie in the growths as they develop, removing all superfluous shoots to avoid overcrowding. Thoroughly syringe the trees with clear, soft water about four o'clock each afternoon when the weather is fine, in order to keep the foliage clean and healthy. Immediately the fruits show signs of ripening all feeding and syringing must be discontinued. In some localities the early varieties of Peaches, such as Alexander, Duke of York, Amsden June, and Hales' Early will be

ripening; the trees should be frequently looked over for ripe fruits, and placed in the fruit room until required. Carefully-gathered fruits will keep in a good condition for a week or ten days in a cool, airy fruit room.

Apricots.—The fruits of these will now be swelling fast. See that they are not injured through being wedged between the branches and the walls or growing against nails. Apricots come finer and ripen much better when partially shaded with a little foliage. Do not take the fruits from the trees until they are thoroughly ripe, or they will be found to lack good flavour. A sharp look-out must be kept for earwigs and woodlice, as these pests often damage the finest fruits.

Newly-grafted trees.—These should be examined, as the scions are growing freely. Loosen the ties where necessary, and remove all suckers and shoots that develop from below the union.

General work.—Keep all ripening fruits well protected from the birds. Fruit trees on walls should be vigorously syringed with clear water each afternoon during bright weather, in order to keep insect pests in check. Trees of Sweet Cherries devoid of fruit should be given a thorough cleansing with some good insecticide applied with force by means of a garden engine. All nets no longer required this season for the protection of fruit should, when dry, be folded up neatly and stored away in a dry place. Continue to pinch all secondary shoots on Codon Apple and Pear trees, and fasten the leading growths to the walls or trellis.

THE APIARY.

By CHLOEUS.

Further notes on swarming.—Generally speaking, if a colony is headed by a queen under two years old, there is less tendency to swarm than when the stock is headed by an older queen. Sometimes, despite every effort on the part of the apiarist, they will swarm. He may have applied every known preventive, such as giving plenty of ventilation by raising the brood chamber on the stand, extending the brood chamber by giving frames each containing a full sheet of foundation, giving plenty of space above to store in advance; by extracting all honey from the combs in the brood chamber; and even going to the length of removing frames of brood and replacing frames filled with foundation. These efforts may fail, and the beekeeper naturally asks, "What shall I do?" There is one more plan that may be tried, for the bees will doubtless be sulky and doing no work in the supers just at the very time when they ought to be bringing in nectar plentifully. The plan is to fit up frames with full sheets of wired foundation and take out all the old frames, brushing back the bees with a goose quill, and thus artificially swarming them. The frames of brood may be utilised to strengthen weaker colonies, or may be given to a weak stock. This has been found very effectual, and it reduces the inclination to swarm. The colony being strong will work with a will and store in the supers, especially if the shallow frames contain drawn-out comb, for there will be no space in the brood chamber for storing until the foundation is drawn out.

Casts or "after swarms."—These may be prevented if the beekeeper at once attends to the matter by cutting out all queen cells, except one, as soon as the first swarm is thrown. If he has not done this when the first "cast" comes out, the hive should be examined and all remaining queen cells cut out, leave the cast in the skep until the next morning, but let it stand near the parent hive during the period of waiting, and early next day return it. It is too late now for "casts" to be worked up into useful colonies, but earlier in the season a cast, headed by a vigorous young queen, will often produce a valuable colony for the next season, provided the weather is good and there is plenty of forage.

Alighting boards.—It is an excellent practice at this season, when the bees are so busy and returning to the hives very heavily laden, to extend the alighting board if it is narrow. This can often be done with very little difficulty, if a wide and rather heavy board is made to fit in a continuation of the fixed alighting board by the aid of a few bricks, and propped with pieces of tile or slate.

EDITORIAL NOTICE.

ADVERTISEMENTS should be sent to the PUBLISHER, 41, Wellington Street, Covent Garden, W.C.

Special Notice to Correspondents.—The Editors do not undertake to pay for any contributions or illustrations, or to return unused communications or illustrations, unless by special arrangement. The Editors do not hold themselves responsible for any opinions expressed by their correspondents.

Letters for Publication, as well as specimens of plants for naming, should be addressed to the EDITORS, 41, Wellington Street, Covent Garden, London. Communications should be written on one side only of the paper, sent as early in the week as possible and duly signed by the writer. It is desired, the signature will not be printed, but kept as a guarantee of good faith.

FRIDAY—

Imported and Established Orchids in variety. Also Forcing and other Bulbs, at 67 & 68, Cheapside, E.C., by Frotheroe & Morris at 12.45.

Pollination and Fruit-Formation.

The correspondence which has taken place recently in these columns on the question whether it is necessary to pollinate Melon flowers in order to produce fruits raises a number of problems of both scientific and practical interest. Before proceeding to discuss certain of these problems we will consider briefly what is known with respect to the process of pollination and of fertilisation in plants.

It is generally known that in the majority of plants, pollination, that is, the deposition of pollen on the stigma of a flower, is an essential preliminary to fertilisation, and hence to seed- and fruit-formation. It is a matter of indifference with respect to fertilisation whether the pollen is placed on the stigma by the agency of insects or wind, or whether the pollination is effected "artificially," that is, by the gardener himself. All that is necessary is that pollen in sufficient quantity and of the right kind shall be placed on the right spot at the right time.

If these conditions are fulfilled, the pollen grains germinate. Each grain sends out a delicate tube, which grows parasitically in the tissue of the pistil, and pushing its way down the style, enters the cavity of the ovary, so directing its growth that its tip comes into the closest proximity with an ovule. These preliminaries achieved, the act of fertilisation begins. In this act, some of the living substance of the germinated pollen-grain escapes through the soft wall of the tip of the pollen-tube, and entering the ovule, fuses with the egg-cell which that ovule contains. The minute mass of protoplasm which is formed by the fusion of egg-cell and the male generative cell derived from the pollen tube gives rise to the embryo of the seed.

So much for the normal course of events: plants are not lacking, however, in which seed-production occurs, although pollination, and hence fertilisation, have not been effected. That is, plants exist which set seed, although no pollen falls on the stigmas of their flowers. Such plants are said to be parthenogenetic. The phenomenon of parthenogenesis occurs in the higher flowering plants, as well as in lower plants. Species of the water Fern, *Marsilea* are capable of developing embryos parthenogenetically, and so also, among flowering plants, are the Dandelion, certain Hawkweeds, species of *Alchemilla*, and doubtless many others.

Among Orchids an equally remarkable state of affairs must be assumed to exist, namely, one in which pollination is necessary, though fertilisation is unnecessary for seed-production. *Zygopetalum Mackayi* is an example. Unless the flowers of this Orchid are pollinated, seed is not set. But, in order to cause *Zygopetalum Mackayi* to set seed, it is not necessary to pollinate it with pollen of this species. The plant produces seed when the pollen used is that of species of *Odontoglossum*, *Lycaste* or *Oncidium*. But—and this is the remarkable fact—no matter which of these pollens is used, the seeds produced give rise not to hybrids, as we should expect, but to *Zygopetalum Mackayi*, and nothing else. Whence we are driven to conclude that, although pollination has taken place, fertilisation has not. This example is valuable in throwing light on the significance of the process of fertilisation. It leads us to the view that by fertilisation two main effects are produced: one, the sexual fusion referred to already; the other, a stimulus to the growth of the egg-cell. In the generality of cases, both effects are evident, but in such a case as that of *Zygopetalum Mackayi* only the stimulus-effect is produced, and that effect is strong enough to induce the ovules to develop into seeds. Further, this interpretation throws some light on another normal result of fertilisation, namely, fruit-formation. As everybody knows, the consequences of pollination and fertilisation are not confined to the ovules, but are felt also by the ovary, and, in many cases, by other parts of the flower as well. In other words, fruit-formation as well as seed-formation is generally a consequence of pollination and fertilisation. Now the presence of the pollen-grain on the stigma and that of the pollen-tube in the tissues of the style bring about the changes in the ovary-wall which occur during fruit-formation is quite unknown. We must suppose that the germinating pollen-grain exercises a chemical influence on the tissues of the pistil, and that the effects of this chemical influence are transmitted to the other parts of the ovary and to adjacent structures. Whether this is so or not, the fact remains that in the great majority of flowering-plants pollination and fertilisation are essential conditions for fruit-formation. As a rule, if pollination does not take place, seed is not formed, nor does the fruit develop. But just as parthenogenetic plants provide us with exceptions to the general rule that fertilisation is essential for seed-production, so parthenocarpic plants supply exceptions to the rule that fruit-production is a consequence of fertilisation. As the term indicates, parthenocarpic means the production of fruits by unpollinated plants.

Examples of such plants are the Cucumber, certain varieties of Apple, Pear and probably Grape and Banana.

Inasmuch as in these cases pollination is not necessary for fruit-formation, it is possible to obtain seedless fruits. Thus, in the case of the Cucumber, the fruit forms whether the flowers are pollinated or whether they are not; but inasmuch as it is not a parthenogenetic plant, seeds are produced only when pollination and fertilisation have occurred. Up to the present time, there is no good evidence that the Melon is capable of fruit-formation without pollination, though, in default of definite experimental evidence, he would be a rash man who asserted dogmatically that no races of Melons are capable of parthenocarpic. Into the question of seedless fruits of Apple and Pear we need not enter now, for the subject was treated in detail in a leading article which appeared in these columns a few years ago (May 18, 1907). Suffice it to say that seedless Apples exist, but that coreless Apples are yet to seek. Their discovery is, however, only a matter of time and experiment.

OUR SUPPLEMENTARY ILLUSTRATION represents the west side of Belvoir Castle, with the Regent's tower, the flag tower, and the chapel. The photograph was taken from the Duke's Walk, and illustrates what is known as the duchess's favourite view, because it was improved by JANETTA, the wife of the seventh Duke of Rutland, who also placed a seat there for visitors to rest and enjoy the prospect. Near the base of the declivity, in the centre of the picture, the principal drive to Grantham is situated. The trees include many very fine specimens of Oak, intermixed with a few Yews and Firs. Rhododendrons and Azaleas also abound, whilst the ground in many places is brightened in spring with clumps of Narcissi and other early-flowering plants and shrubs.

WISLEY TRIALS.—The Rev. W. WILKS, Secretary of the Royal Horticultural Society, writes as follows:—"A sub-committee of the Fruit and Vegetable Committee, consisting of Messrs. ALEX. DEAN, V.M.H., W. BATES, E. BECKETT, J. JACQUES, G. HOBBS, J. DAVIS, and OWEN THOMAS, V.M.H., visited Wisley on June 30, to examine early Peas, when the following varieties were recommended for an Award of Merit. These were placed before the full Committee on July 5, when the awards were approved, the Council confirming them at their meeting on July 19. The varieties were:—Hundredfold, sent by Messrs. SUTTON & SONS; Laxtonian (re-selected), Messrs. CARTER & Co.; Early Duke, Messrs. CARTER & Co.; and Victor, Messrs. J. VEITCH & SONS."

APPOINTMENT FROM KEW.—Mr. ARTHUR BROOK CULHAM, a member of the gardening staff of the Royal Botanic Gardens, Kew, has been appointed by the Secretary of State for the Colonies a curator in the Agricultural Department of Southern Nigeria.

VISITORS TO KEW.—It is announced that the number of visitors to the Royal Botanic Gardens, Kew, on Monday last was 129,000.

SOUTH-EASTERN AGRICULTURAL COLLEGE.—We are informed that the Mercers Company has made a donation of 30 guineas to the South-Eastern Agricultural College library for the purchase of books of reference. The Fruiterers' Company has presented a very fine copy of that scarce work, *The Herefordshire Pomona*, and the Carpenters' Company a work on forestry, to the college library.

MR. CHARLES DIXON, gardener to MARY Countess of ILCHESTER at Holland House, Kensington, has recently undergone an operation for abscess on the liver. The operation has been successful, and Mr. DIXON is progressing satisfactorily.

MR. JOHN RAMSBOTTOM has been appointed, states *Nature*, an assistant in the Department of Botany, British Museum. Mr. RAMSBOTTOM was lately exhibitor of Emmanuel College, Cambridge, and Robert Platt biological research scholar, Victoria University, Manchester. He will devote himself to the fungi.

BACTERIAL BLIGHT OF APPLE, PEAR AND QUINCE TREES.—A recently-issued Bulletin of the Ontario Department of Agriculture deals with this disease, which has been known for a long time under various names, such as fire blight and twig blight. The malady has totally destroyed many Pear orchards in Canada and the United States, and it has been also very destructive to Apple and Quince trees. The leaves of affected trees become brown and scorched, the dead leaves often remaining on the trees all the winter. The damage is usually seen in summer between May and September, at which time apparently healthy branches may die off in a day or two. Young fruits are attacked and turned into a soft slime, which ultimately shrivels and dries to a brown or blackish mass. The main limbs and trunks of the trees are sometimes destroyed, the bark becoming brown or purplish, and covered with cracks or blisters, from which an amber-coloured gum exudes. The disease is caused by a minute, motile bacterium, *Bacillus Amylovorus*, which is found in enormous numbers in the dying tissues of affected trees, and in the slimy substance which flows from the bark. Some observers have attributed the spread of the disease to wind-borne bacilli carried in the dry, infected gum or slime, while others believed the inoculation to take place through the agency of bees, flies and other insects which visit the blossom. Both these methods may be partially responsible for the distribution of the parasitic bacteria. However, the observations and experiments of Mr. D. H. JONES, of the Ontario Agricultural College, have shown that the organisms are largely spread by two aphides, *Aphis mali* and *Schizoneura lanigera*, in the Apple, and by the bark-boring beetle, *Scolytus rugulosus*, in the Pear. The pruning knives, saws and chisels used by workmen in orchards have also been proved to be effective carriers of the disease germs. Systematic cutting out and burning of all diseased wood as soon as observed, together with the adoption of means to keep down aphides and borers, will do much to reduce the disease. At present the disease appears to be confined to North America.

COCOA BUDDING.—According to the *Port of Spain Gazette*, Mr. W. E. BROADWAY, Curator of the Tobago Botanic Station, exhibited two specimens of budded Cocoa at a meeting held at Trinidad on June 21. In the course of his remarks, Mr. BROADWAY said that, ever since it was published by the Jamaica Department of Agriculture that in that island the successful budding of Cocoa had once been done, trials were made again and again to repeat the operation, without success. Nevertheless, a young student at the Botanic Station had demonstrated, under his instructions, the successful budding of Cocoa, being the first one to do so in these islands. The specimen was budded on March 4, 1910, and gives now a height of about 6 inches. There was also exhibited another specimen of Cocoa by Mr. JAMES BLACKMAN, foreman of the Botanic Station; this was budded by him on April 29, and it is now about 1 inch in height.

VIOLAS IN BATTERSEA PARK.—Those of our readers who are interested in Violas as bedding plants, and chance to be in London during the months of August and September, cannot do better than visit Battersea Park, where, at a short distance from the superintendent's house, at the Bridge Road entrance, they will find a display of the best varieties of Violas in bloom. In the panel garden the Violas are planted in blocks of 10 to 12 feet in length, and 4 feet in width, the colours of the varieties being pleasingly blended, each block consisting of one variety. Wood-pigeons have a mischievous habit of picking off the foliage of Violas, and in places where these birds exist in large numbers, as at Battersea, netting should be suspended over the beds till the plants gain strength or come into bloom. The Viola plants in this park, however, are not protected by nets. The following varieties were noticed:—Admiral of the Blues, deep blue; Admiration, bright blue, very free in blooming; Alexandra, pure white, a large flower, finely rayed; Archie Grant, rich, indigo blue; Ardwell Gem, sulphur yellow, compact and free; Blue Cloud, white, with a blue edge; Bronze King, brown, with a darker centre; Charm, pale lavender; General Baden Powell, orange, very fine, and without rays; Glencoe, lower petals of a mahogany tint upper ones of a copper shade, very distinct; Isolda, bright yellow; Kitty Bell, a fine shade of lavender, a free and continuous flowerer; Maggie Mott, soft mauve, very free; Molly Pope, a deep-yellow self, early and prolonged bloomer; Mrs. J. H. Rowlands, of a shade of rose, and fine form; and Redbraes Yellow, of a deep-golden tint.

ADVISORY COMMITTEE ON AGRICULTURAL SCIENCE.—The Committee appointed to advise the Board of Agriculture and Fisheries on all scientific questions bearing on the improvement of agriculture held its first meeting in Committee Room A, House of Lords, on the 29th ult. In the absence of Lord CARRINGTON, Sir THOS. ELLIOTT, K.C.B., permanent secretary of the Board, presided, and explained the policy of the Board in appointing the committee. The committee subsequently discussed the best methods of carrying out the work entrusted to them, and appointed sub-committees to deal with particular sections of the subject.

FRUIT-GROWING IN BRITISH COLUMBIA.—As showing the great care taken by the Government of British Columbia to prevent the introduction of insect and other pests into the orchards and gardens of the province, Mr. J. H. TURNER, the Agent-general for the Province, has sent us extracts from a report issued in June, 1910, by the chief inspector of fruit and other trees. The report is as follows:—"I have the honour to submit my report of imported nursery stock inspection at the Provincial Inspecting Station in Vancouver for the months of January, February, March and April of the present year. Number of trees and plants inspected in the months of January, 592,002; February, 193,184; March, 767,152; April, 1,255,718—total, 2,718,056. I quite expect that the Fall shipments, when added to the above, will bring the number up to 4,000,000 of trees and plants imported into the province during 1910. This will exceed by 175 per cent. the quantity imported any previous year in our history, and is a good indication of the rapid development of horticulture in British Columbia. When we consider that every tree and plant included in the foregoing statement was individually inspected, it will be seen that the labour involved in inspecting and repacking was a great burden, but so carefully has the work been done that I have not received a single report of any package having gone wrong, nor has there been a single mix-up reported during the season. The

importation of French nursery stock has been very heavy this season, and as it is now properly regarded as being the most dangerous of all nursery stock because of the prevalence of the brown-tail and gipsy moth infection, the stock has to be very carefully inspected. We found many nests of the browntail this season, and for the first time in the history of nursery-stock importations into British Columbia, we discovered two colonies of the caterpillars of the gipsy moth. I may say that these dangerous pests have already caused an expenditure of millions of dollars in Massachusetts and the adjoining New England States. The insects have now spread to the forests of those States so that the control, much less the suppression, of the pests is now practically impossible. With a knowledge of these facts and conditions, we could not afford to take the slightest chance of the pests being introduced into British Columbia, so that if there have been complaints of delay at our inspecting station, there has been good and sufficient cause. In addition to the inspection of imported nursery stock, I am having all the local nurseries throughout the province carefully inspected, not a tree is permitted to be delivered to the planter until it has been inspected. From October 1, 1909, till April 30, 1910, some 16,000 trees grown in our local nurseries were condemned and destroyed for infections of the same character condemned in imported nursery stock. I am thankful to report that this system of local nursery inspection is exceedingly popular with the fruit-growers, who properly regard it as a necessary additional protection."

HYBRID VERONICAS.—We have received from Mr. LINDSAY (late of the Royal Botanic Gardens, Edinburgh), an interesting hybrid Veronica of shrubby habit, for which he proposes the name *V. × myrtifolia*. Edinburgh has long been noted for its shrubby Veronicas, and Mr. LINDSAY himself has a hybrid named after him (see *Gardeners' Chronicle*, 1898, ii., p. 331, fig. 97). This new plant, *V. × myrtifolia*, is the result of a cross between *V. Balfouriana* (seed-bearer) and *V. salicifolia* (pollen-bearer). It is a pretty bush of rather dense habit—inherited from the female parent—with evergreen, ovate-oblong leaves 1 inch long by $\frac{3}{8}$ inch diameter and pointed. The flowers are pure white, $\frac{3}{8}$ inch in diameter, and borne densely on erect, slender racemes 3 inches to 4 inches long. Judging from the specimens forwarded to us by Mr. LINDSAY, this new hybrid flowers with great freedom, and wherever it proves to be hardy should make a useful addition to shrubs flowering as late as mid July. Another hybrid Veronica sent us by Mr. LINDSAY is *V. × edinensis*, the result of a cross between *V. Hectori* and *V. pimelioides*, the former being the seed-bearing plant. It is certainly much nearer to the female parent in habit, although differing from it in having short, stiff, spreading leaves, on stouter stems, those of *V. Hectori* being all pressed close to the stem on the mature branches. The presence of *V. pimelioides* is not evident either in the foliage or flowers, the latter in the hybrid being white. On comparing it with New Zealand specimens, it is found to be closely allied, if not identical, with wild specimens of *V. epacridea*, a species that has not so far been known in cultivation. The plant doing duty in gardens under that name is quite distinct from the true plant, and is most likely of hybrid origin, with *V. loganioides* as one of its parents. All three of the above-mentioned species are found in the South Island, and if the parentage of the present plant can be verified it rather points to *V. epacridea* being a natural hybrid that has been produced artificially by Mr. LINDSAY. The specimens sent show a plant of compact habit, and very floriferous, with dense spikes of white flowers.

LONDON OPEN SPACES.—The Middlesex County Council has, says the *Times*, decided to contribute £5,000 of the £20,000 required to purchase 60 acres of the Grovelands Estate, Winchmore Hill, for a public park. The council has also resolved to contribute £1,000 towards the acquisition of The Grange, Kilburn, as an open space, although the property, which is 8½ acres in extent, is actually within the County of London.

THE LATE MR. J. B. CARRUTHERS.—Respecting the lamented death of Mr. CARRUTHERS (see p. 70), we have received the following letter from our old correspondent, Mr. J. H. HART:—"Coblentz Avenue, Port of Spain, July 18, 1910.—Mr. J. B. CARRUTHERS, who was

THE WILD GARDEN.

THERE is no commoner delusion among amateurs than that a wild garden requires less attention and work than the ordinary borders. The lamentable results that have followed upon numerous attempts to reconcile the competing interests of native and exotic growths have amply proved that the majority of exotics require constant tending to enable them to hold their own amid the luxuriant undergrowth of the woodlands. This is especially the case in humid, western districts, where the growth of summer vegetation is exceedingly rank. But there are certain plants of such vigorous constitution that they may be trusted to take care of themselves. Such are *Campanula lactiflora*, *celtidifolia*, and *Vau Houttei*; the *Montbretias*, several of the

HOME CORRESPONDENCE.

(The Editors do not hold themselves responsible for the opinions expressed by correspondents.)

THE HARDY FRUIT CROP IN HERTFORDSHIRE.—In your report on the condition of outdoor fruit crops, I notice there is nothing in Hertfordshire like the state of things here. There is not one Pear, nor one Apple, nor one Plum, but 30 or 40 Peaches, and a few Apricots (on the part of a tree which is trained against the chimney of furnace). Some of my neighbours are in the same plight, and others not quite so bad. Since writing the above, my gardener tells me he has found two Apples and two Pears! *Albert G. Sandeman, Preslules, Hertfordshire.*

THE LABOUR PROBLEM.—It is much to be hoped that W. W. will join our ranks and demonstrate the effect of skilled management, coupled with efficient labour, a conjunction which he appears to think has never yet been accomplished. However this may be, he may take it for granted that no possible combination can improve matters for the worker so long, as he puts it, "there are three men for two jobs." What is needed is to improve the conditions of the trade until the employer needs three men where he has two now, and then the worker will get what he wants without running round to get help in obtaining it. With regard to taxation, I would remind Mr. Thompson that my letter spoke of "nurseries," not small holdings or jobbing gardeners, so that the £50 limit does not enter into the question. As to the assessment of nursery land, I also spoke from experience, and could obtain instances, substantiating my statement, from every quarter of the country of the doubling of rates on land used as nurseries. One member of the trade took land in three widely-separated districts for growing special subjects, and in each case had to fight an expensive lawsuit to resist an immensely-increased assessment. *Chas. E. Pearson, F.L.S.*

INCREMENT VALUE DUTY.—On p. 87 there appears a letter from Mr. H. Stuart Thompson (in reply to one from Mr. C. E. Pearson, as to the position of suburban nurserymen under the new land taxes), in the course of which he writes:—"Like numerous other persons, your correspondent does not seem to realise that the small holder, occupying a holding not exceeding 50 acres or £50 in annual value, is specially exempted from any increment value duty, whether on agricultural or building values." In view of the pending universal valuation, it is of such vital importance that there should be no misunderstanding on the subject of liability for increment value duty, that I feel sure Mr. Stuart Thompson will forgive me if I venture to correct two or three slips in the above statement, as he was evidently quoting this extraordinarily difficult Act of Parliament from memory and was therefore probably away from his library at the time. It is clear from the Act that the small holder, as such, is only specially exempt from increment duty if his total holding of land in this country (a) does not exceed 50 acres, (b) does not exceed per acre an average *capital* or selling value (not annual value, as stated) of £75 (not £50, as stated), (c) is not occupied with a dwelling-house valued for income tax under Schedule A at more than £30 per annum, and (d) has been occupied and cultivated by the *owner* for 12 months before the claim for duty arises. All these four conditions must be complied with to secure the exemption of the holding. All other "agricultural" land must bear increment duty, unless the land has no higher value than its market value (at the time) for "agricultural" purposes. Hence the danger to suburban nurserymen. *H. Morgan Feitch.*

FIG. 36.—LILIUM GIGANTEUM IN SIR HERBERT MAXWELL'S GARDEN AT MONKREITH.

recently appointed Assistant Director of Agriculture of this island, died here on the 17th (yesterday) of abscess of the lungs. He was ill for over six weeks, following on a tour of the Island of Tobago. Great regret is felt here at the early death of so promising a member of the Tropical Staff of the Agricultural Department. He had the best possible attention from three leading doctors and the constant care of a loving wife. The circumstance has been a heavy blow to the newly-constituted Department of Agriculture."

SALE OF ORCHIDS AT BRISTOL.—Messrs. EDWARD T. PARKER & Co. sold at their mart in St. Stephen Street, on the 28th ult., the Hill Court collection of Orchids, by order of C. E. FICKES, Esq., of Yatton.

Monkshoods, *Astilbe Davidii*, *Senecio Clivorum*, &c.

Two such plants not often seen outside the garden proper are *Liliium giganteum* and *Funkia Sieboldii*. The giant Lily (*L. giganteum*) shown in the photograph (see fig. 36) may be raised in thousands from seed, which it produces very abundantly. The plant illustrated is flowering in the eighth year from sowing. The plantain Lily (*Funkia Sieboldii*) also bears a great quantity of seed, but increases so fast from the root that it is hardly worth while to sow it. It forms, in these gardens, a permanent bordering to a woodland path with *Montbretia* in the foreground. It is too coarse a plant for the flower garden, but its great glaucous leaves show to perfection in the wild ground, and rabbits avoid both it and the giant Lily. *Herbert Maxwell, Monkreith, Wigtownshire.*

THE PLANE TREE AND THROAT TROUBLES.—It has long been suspected that the Plane tree causes throat and lung troubles, and the notes by Lord Walsingham and Dr. Henry (see p. 348) still further increase the suspicion. Several instances have come under my notice of throat troubles being attributed to the presence of the Plane tree, and a notable case in which some of the occupants of an official residence at a well-known public institution in the North-West of London have been obliged to leave their abode, owing, it is thought, to the presence of Plane trees around the buildings, is at present being inquired into. Not only do the seeds give off the spicule that so irritate the throat and eyes, but it is pretty evident, from recent observations, that the minute hairs given off by the pubescent leaves at an early state of their growth are likewise dangerous to health. *A. D. Webster.*

SEEDLING DELPHINIUMS.—I send some flower sprays of seedling Delphiniums grown in my garden. They are the produce of seed saved two years ago from a plant of a good blue variety growing in the school garden at Appleton Roebuck, near Bolton Percy, in this county. There are five distinct shades of colour amongst them. The year the seed was saved no other Delphinium was growing within a mile of the plant they were taken from. Would it be likely that bees carried foreign pollen to the plant in question, or is it a mere instance of seminal variation? There is a semi-double variety amongst them. In the garden one mile away there were no double or semi-double varieties growing at the time named. *H. J. C., Yorkshire.*

PERPETUAL-FLOWERING CARNATIONS IN THE OPEN GROUND.—The cultivation of perpetual-flowering Carnations as border plants is becoming widely recognised in this country, and I believe the time to be not far distant when they will, in some measure, supersede our English border varieties. Some growers will differ from me on this point, but I am acquainted with several large gardens where this is already becoming the case. Border Carnations have to be cultivated for 11 months out of 12, and their flowers last only two or three weeks. How does this compare with the perpetual-flowering Carnations, which not only bloom all the winter, but will do so continuously throughout the summer when planted in the open garden. At the end of May I planted out 200 plants, which had flowered all the winter in 7 inch pots, and since then we have continuously cut a large number of blooms from them. They are planted on a north border, as a slightly-shaded position suits them best. I do not think there is a better way than this of disposing of old plants, and I can strongly recommend anyone to give the system a trial. Some growers raise plants especially for outdoor culture, and the present is a good time to insert cuttings for this purpose. They should be wintered in an atmospheric temperature which does not fall below 45°. If they are potted into 5-inch pots, they will then be well-furnished plants, ready to commence flowering when planted out in May. *J. Gardner, Batsford Park Gardens, Gloucestershire.*

LABELLING HARDY PLANTS.—This subject is more or less always present with horticulturists in both private and public gardens and parks. Nowadays, with the increased interest in hardy plant culture, it is needful that the visitors to the public parks should be given means of ascertaining the names of all the plants growing therein. I have a pamphlet bearing upon this subject prepared by Mr. A. J. Allsop, the parks superintendent at Leeds. During the 10 years or so he has been in Leeds, very great improvements have been made in re-arranging and replanting the various parks under his charge, but especially at Roundhay, which may be termed the centre of the whole. The pamphlet has been prepared to meet the requirements of the many visitors to this particular park. The names of the plants are arranged in alphabetical order under their natural orders, with brief references to cultural details and country of origin. Prefixed to each name there is a number which refers to a similar number prominently fixed on a label in front of the growing plant. For instance, supposing anyone wanted to know the name, &c., of the handsome blue-flowering plant at the back of a wide border under

No. 20, on referring to his pamphlet he would see under the heading Boraginaceæ: *Anchusa italica* (Bugloss)—common soil, sunny border. The price of the pamphlet is 1d. *Yorkshire Gardener.*

SPIRÆA MENZIESII TRIUMPHANS is quite the handsomest of the tall-growing red-flowered shrubby kinds; the spikes sent are only the secondary ones from last year's shoots: those produced on the shoots of this season will come later and will be much longer. *S. superba* is a robust-growing plant, with dense heads of rose-coloured flowers, and *S. notha* var. *superlatifolia* has dense heads of blush flowers. *T. Smith.*

DOUBLE-FLOWERING LYCHNIS DIURNA.—The occurrence in Nature of double flowers, of undoubted wild origin, is so rare, that I am sending you some of the Red Campion (*Lychnis*

FIG. 37 — DOUBLE-FLOWERING LYCHNIS DIURNA: COLOUR OF FLOWERS PUPPLISH-ROSE.

diurna) (see fig. 37), which I found a few days ago in the grounds here. The plant was growing in the midst of a mass of the ordinary single forms, and the soil has probably never been disturbed. *A. A. Pattigrew, Howell Grange Gardens, Redditch.*

EFFECTS OF LAST WINTER UPON VEGETATION.—The more tender plants did not get damaged here so much last winter as in the winter of 1908-09, when the species which were seriously injured were *Camphora officinalis* and *Metrosideros*. We have the following species in cultivation against a south wall:—*Leptospermum grandiflorum* and *L. bullatum*; *Edgeworthia chrysantha*, *Bignonia grandiflora*, *B. Cherrie*, *Quillaja saponaria*, *Abutilon viti-folium* (exceptionally fine this year), *Dendromecon*

rigidum, *Buddleia Colvilei* (in flower), *Coronilla glauca*, *Solanum jasminoides*, *S. crispum* (a mass of flowers 18 feet high in the open), *Myrtus Ugnii*, *M. officinalis*, *Senecio Grayi*, *S. rotundifolia*, *Azara integrifolia*, and *A. microphylla*; *Daphne japonica* (in flower March 20), a fine plant of *Abutilon vexillarium*, *Kadsura chinensis*, *Maudevilla suaveolens*, *Edwardsia grandiflora*, *Lagerstræmia indica*, *Fendlera rupicola*, *Olea fragrans*, *Ceanothus Veitchianus*, *Ephedra altissima*, *Callitris robusta*, *Passiflora cœrulea*, *Lonicera tragophylla*, *Trachylopernum jasminoides* (harmd), *Mandevilla suaveolens* is now flowering freely, several plants of *Sollya heterophylla* (small) went entirely to the bad, and this more on account of wet than frost. I notice one of your correspondents mentions this plant, and then *Clerodendron trichotomum*; but there is a wide difference in the hardness of these two plants. The *Clerodendron* flourishes here like a Larch, and will soon be a mass of flower in the open. *Magnolia Campbellii* is on the outside border, sheltered, of course, but this flowered again for the third year in succession. We have several plants, one a very large specimen, 30 feet high, which has not flowered yet. The *Pittosporums* and *Philesia luxifolia* seem to stand the winters well. When mentioning *Rhododendrons*, neither of your correspondents mentions the tender varieties or species. *R. Falconeri* and *R. cinnabarium* pass through the winters well; it is the Aucklandi and Edgeworthii types that sometimes fail. *Eucryphia pinnatifolia* and *Desfontainia spumosa* do not get injured at all, and both species are in bloom. *Fabiana imbricata* has flowered well, as also has *Olearia Gunnii*, *O. macrodonta*, *O. myrsinoides*; *Crimum Moorei* and *C. Powellii*. *Choisya ternata* has done remarkably well this season, and will soon be flowering a second time. *Ozothamnus thyrsoides* has flowered finely; *Fremontia californica* seems to stand well and has flowered freely; and one plant is close on 18 feet high. *Erica arborea* and *E. lusitanica* have done excellently. Two seasons ago some freshly-planted specimens were destroyed by 24° of frost, but this I think was caused by their removal. There were several hundred, but they were not all damaged, and many are now growing well from the base. Several hundred Palms escaped frost, and appear quite at home. Bamboos were not injured, *Arundinaria nitida* curls up somewhat during frost or cold winds, but it opens again beautifully. Hundreds of *Camellias* were unharmed and they flowered well. *Lilium Hansonii* has flowered beautifully, and *L. pardalinum* is simply grand. *L. auratum* types are already 8 feet in height and strong. It is a good thing to plant a few *Liliums* every year, as in time some of them become exhausted. I find the *L. speciosum* types need more assistance than the others; after two years they appear to want a rest, and therefore some of the flowers should be pulled off in order that the plants may grow away more freely. *W. A. Cook, The Gardens, Leonardlee, Horsham, Sussex.*

BOG SLIDES.—The reports of further threatened bog slides in Ireland, which occur every now and again after prolonged wet weather and, by sweeping over lower levels, cause great destruction of property and even loss of life, provoke a feeling of surprise that no steps seem to be taken to prevent them. The risk is well known, and the principles which govern such catastrophes should be equally known. The slide is due to an accumulation of water on peat formations where hollows exist. In such hollows moss and other semi-aquatic growths accumulate by upward growth and basal perishing, such as the familiar *Sphagnum*-moss exhibits. It is indeed largely due to this particular species of moss that in time a deep, spongy moss is produced. Under ordinary weather conditions, this spongy moss is only saturated here and there, much of the rainfall being evaporated and some of it draining away so that the whole mass of peat retains sufficient cohesion to maintain its position. A long spell of wet weather, however, saturates and softens it, and since, from the very fact that a slide is induced by mere pressure of gravitation, the bog must be formed on a declivity, it is abundantly clear that a system of drainage, even by relief channels being cut, would prevent those lower levels from being invaded by a destructive avalanche of peaty matter when the pent up water finds a

weak spot and follows the line of least resistance. It is the water and the water alone which causes these debacles. The peat mass itself may form to a practically unlimited extent as a solid body if means are devised for preventing the water from accumulating, and, wherever there is such an incline as always seems to be present where these catastrophes occur—since a slide on a level is an absurdity—it would seem that the simple precaution of cutting a few trenches in the dry seasons, at known perilous points, should obviate the risks by providing safety valves which, by affording an early vent for accumulating moisture, would remove the initial cause of disaster. Nothing, however, of this kind appears to be done until it is too late, for once "the bog begins to move," a visit of the county surveyor to the spot to investigate and report on the matter to the county council is little likely to save from disaster the unfortunate farmers in the track of the impending deluge. In the case we have in view, the locality was visited only two years ago by a disastrous slide of a bog, so that the risk of further slides should have been foreseen, as similar conditions must have been known to exist by those in the vicinity, whose farms were threatened with destruction. It would be interesting to know what the local authorities did on the last occasion in the way of preventive measures, not indeed of the slide itself when it commenced its irresistible course, but in the shape of rational attacks upon the primary cause wherever the danger was known to exist. *Chas. F. Druey, F.M.H., F.L.S.*

CULTURAL MEMORANDA.

SCHIZANTHUS

THE best results in growing these plants are obtained by sowing the seed in autumn. I have found August 1 to be the most suitable date for sowing, as the plants get established before the short days, when growth is very slow. The potting compost should consist of loam, leaf-mould, and sand in equal parts, and the materials should be passed through a ¼-inch sieve. This compost should be placed in pans, and it should be watered a few hours previous to sowing the seed. The seeds being very small, they only need a very light covering of soil. Pieces of glass placed over the pans will prevent excessive evaporation, and the seed-pans may be put in any cool structure. As soon as germination takes place, keep the plants near to the glass in order that the seedlings will make a sturdy growth. When large enough to handle, prick the seedlings out into pans, putting them 2½ inches apart, and again keep them near the glass. After the plants have become about 4 inches high, pot them off separately into 3-inch pots, using a compost containing a good proportion of leaf-mould.

If the grower should possess a vinery with a shelf on the back wall near the top ventilators, he cannot do better than grow his Schizanthus in that position. They will then have a dry, airy position, and an abundance of light, which will increase as the vine leaves fall. Each plant will need a neat stake and frequent attention to tying. Schizanthus plants are apt to damp off, especially in the early stages of growth, unless very great care is exercised in regard to watering. They should be allowed to become dry before water is again given them. Pinch the shoots occasionally in order to promote a bushy growth.

When the pots become nicely filled with roots, another shift is necessary, and on this occasion four plants may be placed in an 8 inch pot; one or four plants may be used according to individual taste, but if large, bushy plants are desired, then it is as well to employ four. A similar compost to that employed at the previous potting may be used, with the addition of finely-broken charcoal, being careful not to pot too firmly.

The most critical time is past when this potting has been done, and growth will be quicker as the days lengthen. Stake and tie the shoots neatly, using thin Bamboo canes, and again pinch the shoots. For the final potting, which should take place at about the latter end of February,

10-inch pots may be used, and a somewhat coarser compost of the same nature as before, with just a sprinkling of soot.

Place the plants in a greenhouse or other cool structure, and they will soon cover themselves with many-hued flowers. The Schizanthus is very useful for house decoration, as the flowers last quite a month in good condition. If the plants are kept in a greenhouse when in flower they will need to be shaded from sunshine.

The most popular strain is that known as *S. Wisetonensis*, which has a compact, bushy habit, and exhibits a wide range of colouring. *S. hybridus grandiflorus* has a dwarf, somewhat pyramidal habit, and large flowers. *A. W. Proudlock*.

TREES AND SHRUBS.

SPECIMEN TREES AT COBHAM HALL.*

ON December 13 a visit was paid to Cobham Hall, near Gravesend, for the purpose of selecting planks of various kinds of timber, which the Earl of Darley had promised to present for the Forestry Museum. The estate has long been famous for well-grown timber, and competent authorities credit it with producing the largest Ash in the country. About the garden, a number of fine ornamental trees were observed, particularly Ginkgo biloba, Quercus Phellos, Q. Ilex, Taxodium distichum, Sophora japonica, Sequoia gigantea, S. sempervirens, Cedrus Libani and Liriodendron Tulipifera. In the deer park and plantations, however, the largest trees were noted. The ground is rather heavy and well suited for Ash, Oak, and Sweet Chestnut, in fact a large area of land in the neighbourhood is given over to coppice wood, in which Ash and Sweet Chestnut figure largely. Among the park trees conifers were rarely noted, whilst comparatively few were to be seen in the plantations. Hornbeam grows to a large size, while the same may be said of Beech and Sycamore.

Time did not allow of measurements being taken of the large trees, but Mr. Scriven, the estate agent, kindly furnished me with the dimensions of the following trees, which were taken a short time ago. The girth, except where otherwise stated, was taken at 5 feet from the ground:—

	ft.	in.
Quercus Ilex	75	15 10
" Phellos	83	9 3
Sophora japonica	81	10 4
Ginkgo biloba	75	9 5
Liriodendron Tulipifera	75	8 6
Sequoia sempervirens	83	
" gigantea	77	14 7
Liquidambar styraciflua	75	
Taxodium distichum... ..	78	7 4
Acer Pseudo-platanus	102	17 10
"	91	15 3
Tilia vulgaris	104	15 2
Fraxinus excelsior	144	14 6
"	144	11 9
"	128½	12 6
"	79	14 9
" .. with curiously twisted trunk, known as the "Twisted Ash"	116	17 8
Carpinus Betulus	82	11 6
"	82	8 8
Fagus sylvatica	97	12 6
Castanea sativa	92	14 9
"	82	14 2
Quercus pedunculata	91	17 2
"	76	12 10
Ulmus campestris (at 4 feet)	91	17 1
Juglans regia	76	13 6
" nigra	67	8 2
Populus nigra	96	11 4
Æsculus Hippocastanum (at 4 feet)	87	14 0
Prunus Avium	91	12 10
Quercus Lucombeana	81	11 10
Cedrus Libani	99	15 5
" .. (at 2 feet)	86	19 2

SOCIETIES.

ROYAL HORTICULTURAL.

AUGUST 2.—The inexpediency of holding a meeting immediately after a Bank Holiday was strikingly illustrated in the very meagre exhibition on Tuesday last. The display was the smallest ever held in the Society's Hall, and there were scarcely any visitors. It is clear that exhibitors do not desire a flower show to follow a popular holiday, as the preparation of the exhibits entails work on the day previous to the show. Another reason for their dislike of such a show is the fact that any trouble and expense entailed is but thrown away, there being so few visitors. The ORCHID COMMITTEE recommended one Award of Merit and one Botanical Certificate. The FLORAL COMMITTEE recommended three Awards of Merit. The FRUIT AND VEGETABLE COMMITTEE confirmed awards made at Wisley to some varieties of Potatoes, Peas and Lettuces.

Few persons attended Mr. A. Clutton-Brock's lecture at the 3 o'clock meeting, although the subject, "Small Rock-gardens," was of much interest.

Floral Committee.

Present: W. Marshall, Esq. (in the Chair); and Messrs. H. B. May, W. J. Bean, T. W. Turner, Jas. Douglas, J. F. McLeod, C. Blick, Chas. E. Pearson, J. T. Bennett-Pue, Chas. E. Shea, W. P. Thomson, E. H. Jenkins, George Paul, and Wm. Howe.

Messrs. H. B. MAY & SONS, The Nurseries, Upper Edmonton, showed finely-flowered plants of *Campanula isophylla* and a batch of *Ixoras*. (Silver Flora Medal.)

MR. CHAS. BLICK, Warren Nurseries, Hayes, Kent, staged a choice group of border Carnation, in about 70 varieties, all, save one, raised at Hayes. (Silver Banksian Medal.)

MR. WALTER EASLEA, Duncroft Rosery, Eastwood, Essex, exhibited bunches of his seedling Carnation named *Scarlet Perfection*.

MR. JAS. DOUGLAS, Edenside, Great Bookham, showed five new varieties of Carnations.

MESSRS. DOBBIE & CO., Edinburgh, showed some choice annuals, including two fine Marigolds, named *Sulphur Queen* and *Orange King*. There were also a selection of *Scabiosa* of the type known as *Dobbie's Fall Double*, *Antirrhinum*, *Sweet Peas*, and *Cosmos bipinnatus*. (Silver Banksian Medal.)

MESSRS. JAS. VEITCH & SONS, LTD., King's Road, Chelsea, displayed annuals, such as *Candytufts*, *Lupins*, and *Marigolds*, also vases of *Pentstemon Newbury Gem*.

MR. FRANK LILLEY, St. Peter's, Guernsey, showed *Montbretia rosea*, *Sparaxis pulcherrima*, *Gladii*, and spikes of *Hyacinthus caudatus*.

MESSRS. KELWAY & SON, Langport, Somerset, exhibited over 300 spikes of *Gladioli*, with large, bold flowers in many hues, ranging from creamy-white to purple. (Silver Flora Medal.)

A floor group of *Phlox decussata* and *Chrysanthemum maximum* was made by Messrs. G. PAUL & SON, Cheshunt. (Silver Banksian Medal.)

MESSRS. W. WELLS & CO., Mersham, Surrey, showed a selection of *Violas*, border *Phloxes*, *Poppies*, *Pyrethrums*, *Gaillardias*, and other hardy flowers. (Bronze Flora Medal.)

MESSRS. HARKNESS & SONS, Bedale, Yorkshire, displayed spikes of *Verbascum* bordered by a row of *Gaillardias*.

MR. G. REUTHE, Hardy Plant Nursery, Keston, Kent (Bronze Flora Medal), and the GUILDFORD HARDY PLANT NURSERY (Bronze Banksian Medal) displayed garden flowers.

AWARDS OF MERIT.

Carnation Mrs. J. A. Reynolds.—An orange-buff coloured border variety, a little deeper in colour than *Elizabeth Schiffer*. The plant is free in flowering, the blooms being produced on stiff stems and with non-splitting calyces.

Carnation Forest.—A large, yellow ground Fancy, with markings of chocolate and red. An erect, free-blooming variety, well suited for the flower border. Both these were shown by Mr. JAMES DOUGLAS.

Phlox Fran Antonin Buchner.—A fine, white variety of border *Phlox*, growing about 3 feet high. The individual flowers measure 1½ inch in diameter, and are of great purity. Shown by Messrs. W. WELLS & CO., LTD.

Orchid Committee.

Present: Harry J. Veitch, Esq. (in the Chair); and Messrs. Jas. O'Brien (hon. sec.), de B. Crawshay, F. J. Hanbury, C. H. Curtis, W. H. Hatcher, H. G. Alexander, W. H. White, H. Ballantine, Gurney Wilson, and J. Charlesworth.

DE B. CRAWSHAY, Esq., Rosefield, Sevenoaks (gr. Mr. Stables), sent *Odontoglossum Nerissa* (nævium × crispum), an elegant white hybrid, profusely spotted with ruby-red; *O. Astarte* (Harryanum × tripodians), closely following *O. Harryanum* both in colour and form; *O. Amneris* (Crawshayanum × cristatum), and a pretty sulphur-yellow-tinted form of *O. ardentissimum*.

J. S. MOSS, Esq., Wintershill House, Bishop's Waltham, exhibited his new *Odontoglossum Mauritana* (septrum × Rolfeae), the sepals of pale sulphur-yellow, with broad bands of chocolate brown; the petals creamy-white, blotched with chocolate brown, and a broad white lip, having one large purplish blotch in front of the yellow crest, and small, rose-purple-coloured lines on each side.

H. S. GOODSON, Esq., Fairlawn, Putney (gr. Mr. G. E. Day), showed *Odontoglossum crispum* *Herbertii*, a variety with white ground colour, the purple at the backs of the segments showing to the surface, and having a profusion of purple spots on all the segments; also the scarlet *Odontioda Goodsoniae* *Herbertii*.

WILLIAM THOMPSON, Esq., Walton Grange, Stone (gr. Mr. Stevens), showed a distinct form of *Masdevallia coccinea* (Harryana), with white flowers, slightly tinged with yellow.

MR. H. A. TRACY, Amyand Park Road, Twickenham, showed as *Catasetum Tracayanum* (provisionally named) a very distinct whitish green *Catasetum* from Peru. The species is probably new to gardens, but the Committee deferred making an award until the name had been verified.

MR. E. V. LOW, Orchid Nursery, Vale Bridge, Haywards Heath, showed *Laelio-Cattleya Lambauiana rubra*, a distinct *Brasso-Cattleya*, &c.

MONS. MERTENS, Ghent, showed a small selection of hybrid *Odontoglossums* and an *Odontioda*.

MESSRS. J. & A. A. McBEAN, Cooksbridge, sent a magnificent plant of an excellent variety of *Cattleya Germanica*, with 11 finely developed flowers on one spike.

AWARD OF MERIT.

Cattleya Warscewiczii *Ohlho*, from Lieut.-Col. Sir GEORGE L. HOLYOARD, K.C.V.O., West-inch (gr. Mr. Alexander).—A magnificent and richly coloured variety of the small-flowered class, including *C. Warscewiczii saturata*, and having features suggestive of *C. Hardyana*. The sepals and petals are coloured rosy-lilac, the large lip being mauve-purple, with a small yellow spot on each side of the tube, which has a slight gold veining.

BOTANICAL CERTIFICATE.

Dendrobium Tullianum, from Sir TREVOR LAWRENCE, Bart., K.C.V.O., Burford (gr. Mr. W. H. White).—A very distinct species from the Philippine Islands, with short, many-flowered racemes of orange-yellow flowers, having purple stripes, and each an inch in length. It was originally introduced by Messrs. Hugh Low & Co., and described by Professor Reichenbach in 1862. *D. erythroxanthum*, Rehb. f., *Gard. Chron.*, 1874, II, p. 162, is a closely-allied species.

CULTURAL COMMENDATION

to Mr. W. H. White (Orchid grower) to Sir TREVOR LAWRENCE, Bart., K.C.V.O., for a fine specimen of *Oncidium incurvum* with 27 branched spikes of its pretty white and rose-coloured flowers. The plant has been in the Burford collection for upwards of 25 years.

Fruit and Vegetable Committee.

Present: G. Bunyard, Esq., V.M.H. (in the Chair); and Messrs. J. Cheal, C. G. A. Nix, G. Wythes, J. Willard, J. Davis, G. Holdday, and A. Dean.

The superintendent, Mr. S. T. WRIGHT, exhibited from the Wisley gardens a dish of superb fruits of the old Barrington Peach. This grand old Peach was raised in Surrey fully 100 years since, and is unexcelled by any modern variety for beauty and flavour.

MESSRS. SPOONER & SONS, Hounslow, Middlesex,

sent fruits of Early Red Margaret, or, as sometimes called, Summer Margaret Apple.

MESSRS. DOBBIE & Co., Mark's Tey, sent 10 perfect examples of their stock of the glaucous and singularly-pointed Wimmingstadt Cabbage. MESSRS. DOBBIE also showed their green, curled Scotch Victoria Kale.

From the Society's gardens, Wisley, came Peas, Potatos, and Lettuces, grown under trial, and recommended for awards by a deputation from the Committee.

AWARDS OF MERIT.

Pea Prince of Peas (SCITON & SONS).—The pods are short and densely filled. The variety is very free in cropping.

Pea Prestige (JAS. VEITCH & SONS).—A very fine, long-podded Pea, of medium height, and a heavy cropper.

Pea Money Maker (KING & Co.).—A variety of the No Plus Ultra type. The pods are well filled, but of medium height, and the variety is an abundant cropper.

Potato Selected Ashleaf (BARR & SONS).—A good type of this well-known variety.

Potato Walker's Sculling (Messrs. BREWER).—A white kidney variety of excellent edible and cropping qualities.

Potato Faithful (W. SMITH & SONS, Aberdeen).—A white kidney variety, having a rather yellow flesh, of most excellent quality.

Potato Deus Favourite (MESSRS. DENS).—A white-fleshed kidney Potato. Very dry, and of pleasant eating.

Lettuces (Cabbage) Supreme (SCITON & SONS).—A large, massive, somewhat curled variety.

Heartwell (SCITON & SONS), *Green's Favourite* (BARR & SONS), *White Favourite* (BARR & SONS), and *Lechard*.—These four were all of the All-the-Year Round type, and they resembled each other very closely.

HORTICULTURAL CLUB.

ANNUAL OUTING.

JULY 25.—On this date, at the invitation of N. N. Sherwood, Esq., the members of this club spent a most enjoyable day at Prested Hall, Kelvedon, Essex. The party numbered about 40, leaving Liverpool Street Station by special saloon at 10.55. Prested Hall was reached about 1 o'clock, after a short drive from Kelvedon Station. The pretty grounds, diversified by streams and tastefully laid out, were first inspected, and then lunch was partaken of to the accompaniment of a military string band. A local elocutionist subsequently gave some recitations in the Essex dialect. After lunch the party divided, the majority being driven some five miles or so to Merle, where a splendid mansion of the Tudor period was visited and an old church inspected, containing some quaint tombs surmounted by recumbent statues of its founders. The Rector kindly gave a most interesting summary of the history of the building. The rest of the party devoted their attention to the trial grounds, where a very large area of land is devoted to seed raising and experimental studies. On the return of the two parties, tea was partaken of, and the party afterwards proceeded to Kelvedon Station en route for Liverpool Street.

NATIONAL VEGETABLE.

AUGUST 2.—A meeting of the committee was held at the Horticultural Hall on the above date. The Chairman (Mr. A. Dean) reported that a further report on the autumn-sown Onion trials and the spring-planted early Potatos was in course of preparation, and would shortly be published. The Treasurer (Mr. G. Wythes) made a statement as to the finances. It was decided to allow all firms subscribing two guineas to exhibit at the annual show. The charges of admission to the show on September 28 were fixed at 1s. between 1 p.m. and 6 p.m., and 6d. from 6 p.m. to 8 p.m. The Westminster and St. Thomas's Hospitals will be invited to collect all vegetables left by competitors. The arrangements as to judges, stewards and other business connected with the show were deferred till the meeting on August 30.

BEBINGTON HORTICULTURAL.

JULY 29, 30, AUGUST 1.—This society's show was held this year in conjunction with the Wirral Agricultural Society, at Bebington. Two large tents were filled with horticultural exhibits.

In the class for a group of miscellaneous plants in and out of bloom, T. G. WILLIAMSON, Esq., Arrowe Hall (gr. Mr. D. McPhee), was well ahead with a light and handsome exhibit. MESSRS. JOHN R. SAMUEL and C. H. CAEASEY, Birkenhead, were placed 2nd and 3rd respectively.

The best collection of four stove and greenhouse plants was shown by J. HERRON, Esq., Cloughton (gr. Mr. W. Hemming), *Lilium auratum* being especially fine.

For one stove or greenhouse plant, Mr. D. McPHEE won with a *Dipladenia*; 2nd, J. H. KENTON, Esq., Egerton Park (gr. Mr. E. M. Stokes).

Two exotic Ferns were best shown by Mr. S. BELL, Bebington, who was well ahead with fine specimens of *Nephrolepis*; 2nd, Mr. D. McPHEE.

Mr. W. HEMMING won the 1st prize for three Pelargoniums. Other 1st prize winners in the plant classes were: J. J. EVANS, Esq., Higher Bebington (gr. Mr. W. H. Beer), for Begonias; Mr. E. M. STOKES, for Fuchsias; and Mr. HEMMING, for six stove or greenhouse plants, six table plants, and two Coleuses.

The best table decorations were exhibited by Mrs. H. RUTTER, Miss NEWSHAM, and W. L. NICKELS, Esq. (gr. Mr. M. Buckland), the first two employing Sweet Peas and Mr. BUCKLAND Roses.

Mr. D. McPHEE led for nine bunches of herbaceous cut flowers, followed by Messrs. M. BUCKLAND, Mr. W. HEMMING, who in both classes for Cactus flowered Dahlias, and Mr. J. COOPER, Port Sunlight, excelled with Carnations.

There were three classes for Sweet Peas, for twelve, nine, and six varieties respectively. Mr. G. FAULKNER, Chester, won the 1st prizes in the largest and smallest classes, with Queen of Norway, Aurora Spencer, Marjorie Willis, Nancy Perkin, and other varieties. Mr. S. BELL led for nine varieties.

For 12 spikes of Gladioli, Mr. D. McPHEE was placed 1st.

In the Rose classes, J. WATSON TODD, Esq., Spital (gr. Mr. S. Swenney), led for twelve varieties and for six varieties. In the class for 12 double blooms of Begonias W. S. EDWARDS, Esq., Sidecup (gr. Mr. T. Rabbit), staged well, winning the 1st prize. Mr. W. G. COCKER and Mr. A. F. STONE were 1st in the classes for Pansies and Asters respectively.

FRUIT.—For a collection of six kinds, Mr. D. McPHEE was to the fore. Mr. S. BELL, Higher Bebington, won for two bunches of Black Hamburg Grapes. Mr. M. CLOVER, Wollaston, had the best Madresfield Court Grapes and the best two bunches of white Grapes in Muscat of Alexandria. Other prize-winners for fruits were:—Mr. CLOVER, Peaches; Mr. HEMMING, Nectarines and Melons; Mr. W. BARTON, Prenton, Cherries, dessert Apples, and culinary Apples; and W. K. FERRIE, Esq., Thornton Hoagh (gr. Mr. W. Piper), Pears.

VEGETABLES.—Mr. JOHN WILLIAMS won in the class for eight distinct varieties. Mr. W. FLETCHER led for Tomatoes, Cucumbers, and French Beans; Mr. M. BUCKLAND for Peas, Cabbage, and Lettuce; Mr. J. WILLIAMS for round Potatos, Carrots, Beet, and Turnips; Mr. W. HEMMING for long Potatos, Celery, and Cabbage Lettuce; Mr. D. McPHEE for Cauliflowers and Onions; and Mr. E. M. STOKES for Vegetable Marrows.

Some interesting non-competitive groups were staged. Messrs. YOUNG, West Derby, showed Carnations; Mr. W. HENDERSON, Oxtou, a group of miscellaneous plants; Mr. W. L. PATTISON, Shrewsbury, cut Pansies and Violas; Messrs. JONES BROS., Mount Nursery, Conifers, Pansies and Dahlias; Mr. R. WRIGHT, Liverpool, Sweet Peas; Messrs. T. & E. CROKER, cut flowers and plants; Messrs. BEES, LTD., Liverpool, cut flowers and floral designs; Mr. W. ROWLANDS, Wavertree, a collection of clipped trees and shrubs; Mr. H. MIDDLEHURST, Liverpool, Sweet Peas, hard flowers, and vegetables; Messrs. DICKSONS, Chester, Sweet Peas; and Mr. J. BRAMHAM, Liverpool, pergola and arches.

LEAMINGTON AND COUNTY.

JULY 27, 28.—The second annual flower show of this Society, held in the spacious Victoria Park, Leamington, on the above dates, was a pronounced success. The weather on the opening day was fine, and the visitors thoroughly appreciated the spectacle provided for them. This exhibition showed an advance over the one held a year ago, both in the number and quality of the exhibits.

Without attempting to particularise much, reference may be made to the magnificent Sweet Peas shown by Mr. T. JONES, of Ruabon, the Roses from Mr. GEORGE PRINCE, of Oxford and from THE KING'S ACRE NURSERY CO., Hereford; the beautiful dinner tables decorated with flowers and the groups of plants arranged for effect. Fruit and vegetables were grand.

Honorary exhibits were numerous, and many of them displayed much taste in arrangement. Increased interest was given to this year's show by the fact that four challenge cups, valued at 25 guineas each, and one valued at 15 guineas, were offered for competition. The Society is to be congratulated upon having as its chairman Alderman Robt. Mayor of Leamington, to whose zeal and organising ability so much of the success of the Society is due. The Mayor is ably assisted by Mr. J. T. Hayes, the show superintendent, upon whose shoulders fall the many unobserved details incidental to the smooth working of the show. The secretarial duties are carried out by Councillor H. V. Richards and Mr. Leo Raw. Ineson.

PLANTS (OPEN).

Eleven classes were provided for plants, and there was competition in all of them. In the principal class, for a group of plants arranged to face two ways on a space of 20 feet by 12 feet, along the centre of the tent, there were three competitors, viz., MESSRS. JAMES CYFER & SONS, of Cheltenham; Sir GEORGE H. KENRICK, of Edgbaston (gr. Mr. J. V. Macdonald); and Mr. W. VAUSE, of Leamington, to whom the prizes were awarded in the order named. The blending of colours in the 1st and 2nd prize groups was good throughout. Both groups were constructed on pretty much the same lines. The centrepieces consisted of a cork arch or bridge, on which choice foliage and flowering plants were arranged, and handsome Palms marked the highest point. The corner mounds were in proportion to the centre, and were clothed with Codiaums, Dracaenas, Selaginellas, Ixoras, Fuchsia triphylla, Orchids, &c. The spaces between the mounds were filled with Ferns, Begonias, Caladiums, Codiaums, Silver-leaved Abutilons, Orchids, Clerodendron fallax, Kalanchoe flammea, Lilliums, Verbenas, and similar plants.

In a class for twelve stove and greenhouse plants (not fewer than four to be in flower), in pots not exceeding 10 inches in diameter, MESSRS. JAS. CYFER & SONS were again placed 1st. They showed two well-coloured Codiaums, two plants of Acalypha Sanderiana, two Kentias, and one plant each of Davallia polyantha, Clerodendron Balfouri, Allamanda Williamsii, Ixora Pilgrimii, Statice profusa, and an unnamed Aralia. 2nd, Mr. W. VAUSE, who showed good Codiaums, Ixoras, and Bougainvilleas. The 3rd prize was won by Mrs. RAYSON, Newstead House, Leamington (gr. Mr. W. G. Jones), who secured 1st prizes for (1) three well-flowered pyramid Fuchsias, (2) six large profusely-flowered Gloxinias, and (3) three zonal Pelargoniums.

ALFRED HOLT, Esq., J.P., Oaklands, Leamington (gr. Mr. C. Finch), won the 1st prize in a class for three Coleus plants. 2nd, J. H. BURLEY, Esq., Brandon Parade, Leamington (gr. Mr. H. J. Finch).

Mr. W. VAUSE won the 1st prize in a class for the best foliage plant with a well-coloured Codium, and the 1st prize in another class reserved for one plant in flower. He showed a rather small, well-flowered Epacris.

J. H. BURLEY, Esq., Leamington (gr. Mr. H. J. Finch), had the best three Ferns, dissimilar: Mrs. CHAPPELL, Wellesbourne Hall, Warwick (gr. Mr. T. Parry), being 2nd. The best named exhibitor brought the best half-dozen table plants, consisting of five beautifully-coloured Codiaums and a narrow, dark-leaved Dracaena. 2nd, Mr. W. VAUSE.

Of the six contestants in a class for six tuberos rooted Begonias, Mr. W. ELLIS MAS-

TERS, Warwick, was placed 1st, with particularly good double-flowered varieties; 2nd, Mr. GEORGE ROGERS, Leamington.

ROSES (OPEN).

A new and important class was included for an exhibit of Roses on a table space of 12 feet by 4 feet. The 1st prize was a Challenge Cup value 25 guineas presented by the High Sheriff of Warwickshire (J. F. Shaw, Esq., J.P.); 2nd, Silver Flora Medal; 3rd, Silver Banksian Medal. There were seven splendid exhibits, constituting quite a show in themselves. After a very close contest, the coveted trophy was won by Mr. GEORGE PRINCE, Longworth, Faringdon, Berks., who had a collection of good flowers well arranged. The tall background was formed of Rambler Roses, and in front masses of Edu Meyer, Lyon Rose, Hugh Dickson, and Laurette Messimy were noteworthy. Near the front, four tall, slender stands, decorated with Mme. Abel Châtenay, Viscountess Polkestone, Mrs. David McKee, &c., were effective. The 2nd prize was awarded to Messrs. GUNN & SONS, Olton, Birmingham, for a grand group, in which tall arches, rather thinly clothed with Rambler Roses, formed a pleasing background, and receptacles of various shapes and sizes, filled with beautifully fresh flowers, completed a very pretty exhibit. A few of the best varieties were Mme. Ravary, Princess Marie Mertschensky, Lady Ashtown, Harry Kirk, Edu Meyer, Louis van Houtte, and Mrs. Theodore Roosevelt. 3rd, Mr. W. T. MATTOCK, Oxford, who showed large masses of Mrs. W. J. Grant, Countess of Gosford, Gottfried Keller, Simplicity, Lyon Rose (extra good), Mme. Abel Châtenay, and Theresa Bevan.

Twenty-four blooms, distinct.—Of the nine exhibits placed before the judges, the 1st prize was awarded to THE KING'S ACRE NURSERY CO., Hereford, who had a particularly fine lot of flowers. A selection of the best varieties included A. K. Williams, Comte de Rambaud, Alice Lindsell, Mrs. John Laing, Gustave Piganeau, Horace Vernet, Mildred Grant, Bessie Brown, Mons. E. Y. Teas, Frau Karl Druschki, Alfred Colomb, and Dean Hole. 2nd, Messrs. PERKINS & SONS, Coventry, with an even lot of flowers, in which Mrs. David McKee, Lyon Rose, Ulrich Brunner, Gustave Piganeau, Mildred Grant, and Dr. O'Donel Browne were of superior merit. 3rd, FRANK DENNISON, Esq., Cranford, Leamington (gr. Mr. H. Skeys).

The best half-dozen H.P.s (one variety) were Frau Karl Druschki, shown by THE KING'S ACRE NURSERY CO., Hereford; 2nd, Messrs. PERKINS & SONS, Coventry, with clean, shapely flowers of A. K. Williams.

Mr. GEORGE PRINCE, Oxford, had the best collection of 12 Tea Roses, distinct. His blooms of Golden Gate, Comtesse de Nadaillac, Muriel Graham, Mrs. E. Mawley, and Medea were very meritorious. 2nd, Mr. W. T. MATTOCK; 3rd, THE KING'S ACRE NURSERY CO.

Mr. GEORGE PRINCE won the 1st prize in a class for six Tea Roses (one variety), with exquisitely-shaped flowers of Mrs. E. Mawley, which variety was also shown by Mr. HARRY DREW, Longworth, Faringdon, Berks., and Mr. W. T. MATTOCK, Oxford, who were awarded the 2nd and 3rd prizes respectively.

MESSRS. PERKINS & SONS beat six contestants in a class for 12 H.P.s, dissimilar. They had lovely flowers of Gustave Piganeau, Frau Karl Druschki, A. K. Williams, Horace Vernet, Hugh Dickson, Duke of Edinburgh, and Marie Corelli. 2nd, THE KING'S ACRE NURSERY CO., whose best flowers were Frau Karl Druschki, E. Y. Teas, Mrs. John Laing, and A. K. Williams. 3rd, Mr. GEORGE PRINCE.

HARDY HERBACEOUS AND MISCELLANEOUS FLOWERS (OPEN).

A class that created a good deal of interest was that for a collection of 25 kinds of herbaceous flowers arranged on a space of 8 feet by 4 feet. The 1st prize consisted of a Challenge Cup, value 25 guineas, presented by F. A. Chandler, Esq., Leamington. There were five entries, but owing to a misinterpretation in the reading of the schedule three exhibits had to be disqualified. This was unfortunate, because the disqualified exhibits were much superior to that of FRANK BOUSKELL, Esq., Market Bosworth, Leicestershire (gr. Mr. G. Hollis), who was awarded the Cup. 2nd, Mr. J. H. MARSDEN, Malvern Link.

Of the seven exhibits in a class for 12 bunches

of hardy herbaceous flowers (distinct kinds), Mr. C. H. HERBERT, Hazelwood Road, Acocks Green, was the best. Included in this exhibit were handsome bunches of Gaillardias, Lychnis chalcidonica, Cimicifuga racemosa, Alströméria aurantiaca, and Galega Niobe; 2nd, FRANK BOUSKELL, Esq. (gr. Mr. G. Hollis).

Mr. W. HARPER, Leamington, won the 1st prizes in classes for (1) a bouquet, composed of sprays of Oncidiums, Odontoglossums, &c., over a groundwork of Cattleyas (2) a bridal bouquet, consisting principally of Orchids and Lilies of the Valley (3) three sprays and (4) three button-hole bouquets.

In a class for 12 Carnations dissimilar, Mr. C. H. HERBERT Acocks Green, took the lead with large, refined flowers of Sam Weller, Robin Hood, R. A. Rowberry, Eldorado, King Solomon, and Linkman; 2nd, Mr. A. R. BROWN, King's Norton. In another class for 12 Self Carnations the same two exhibitors were placed as before. Daffodil, Cardinal, W. H. Parton, and Firefly were the best varieties in the 1st prize stand.

Three classes were provided for Dahlias, viz.: (1) 12 cactus varieties (2) 12 show varieties, and (3) 12 single varieties. In each of these classes HUGH MITCHELL, Esq., Mercote Hall, Hampton-in-Arden (gr. Mr. T. Batchelor), won the 1st prizes.

SWEET PEAS.

In the Society's class for six varieties of Sweet Peas there were 11 excellent exhibits. The 1st prize was won by Mr. T. JONES, Bryn Penylan, Ruabon, whose flowers were unusually large, strong, and handsome. The varieties exhibited were Etta Dyke, Asta Ohn, Nancy Perkin, Miriam Beaver, Sunproof Crimson and Elsie Herbert; 2nd, J. W. LAMPLUGH, Esq., Manor House, Leamington (gr. Mr. S. Vincent).

Mr. H. Eckford's prizes were offered for nine distinct varieties. J. W. LAMPLUGH, Esq., won the 1st prize with exquisite flowers of Frank Dalby, Elsie Herbert, Princess of Wales, Henry Eckford, John Ingman, Black Knight, and Nora Unwin; 2nd, Mr. RANDALL, Leamington.

In Messrs. Baker's class for six varieties, the 1st prize was won by Mr. ROBERT SUMMERS, Coventry, who showed beautiful flowers of Clara Curtis, Anna Lumley, and Etta Dyke; 2nd, Mr. W. ELLIS MASTERS, Warwick.

Messrs. Webb's prizes were offered for eight bunches, and here the redoubtable Mr. T. JONES, of Ruabon, won the 1st prize with remarkably large, substantial flowers borne on very strong stems. The varieties exhibited were John Ingman, Etta Dyke, Mrs. H. Sykes, Asta Ohn, Tennant Spencer, Helen Lewis, Mrs. Routzahn, and Othello Spencer; 2nd, Mrs. CHAPPELL, Wellesbourne Hall, Warwick (gr. Mr. T. Parry), with a very fine lot, the variety Elsie Herbert being particularly good.

There were ten competitors in Mr. Robert Sydenham's class for nine distinct varieties. Mr. T. JONES was again placed 1st, with wonderfully large flowers of Clara Curtis, Helen Lewis, Constance Oliver, Sunproof Crimson, and Evelyn Hemus; 2nd, SIR THOMAS HESKETH, Bart., Easton Neston, Towcester (gr. Mr. G. F. Hallett), whose best flowers were George Herbert, Clara Curtis, Etta Dyke, and Constance Oliver.

FRUIT (OPEN).

Eighteen classes were provided for fruit. The leading class was for 8 distinct dishes (Pineapple excluded). Black and white Grapes were allowed. The schedule required each collection to be decorated with plants or cut flowers, for which separate awards were made. In addition to the Society's 1st prize of £6, R. E. L. Naylor, Esq., Leamington, presented a Challenge Cup, value 25 guineas, to become the property of the exhibitor who wins it three times in succession or four times in all. The Duke of PORTLAND, Welbeck Abbey, Notts (gr. Mr. J. Gibson), and the Earl of HARRINGTON, Elveton Castle, Derby (gr. Mr. J. Goodacre, V.M.H.), were the only competitors, and the 1st and 2nd prizes for both fruit and decorations were awarded in the order named. The 1st prize collection of fruit consisted of well-finished Muscat of Alexandria and Black Hambro' Grapes, large, well-coloured Marguerite Marillat Pears, Pineapple Nectarine (extra good), Crimson Galande Peach, Negro Largo Fig, James Grieve Apple, and an unnamed seedling Melon. The decorations consisted of pink Malmaison Carnations, Eulalia leaves, and sprays of Selaginella. The 2nd prize collection

included very good dishes of *Précocée de Croucelles* Nectarine and *Triomphe de Vienne* Pears. The decorations were poor.

The Earl of HARRINGTON had the best of three exhibits in a class for four dishes of fruit. He showed Countess Melon, Thomas Rivers' Peaches, Kirke's Plum, and a shapely bunch of Muscat of Alexandria Grapes. 2nd, the Duke of PORTLAND, whose exhibit included splendid dishes of *Crimson Galande* Peaches and *Spencer Nectarines*. The last-named exhibitor won 1st prizes in classes provided for (1) one dish of Nectarines with handsome fruits of Pineapple (2) one dish of Plums, with the Jefferson variety in splendid condition (3) one dish of Dessert Apples, with very handsome fruits of James Grieve (4) three dishes of Dessert Apples, distinct varieties, and (5) one dish of Cherries.

LORD WILLOUGHBY DE BROKE, Compton Verney, Kington (gr. Mr. John Lloyd), had the best pair of Black Grapes, showing large, well-berried bunches of Black Hambro'. The same exhibitor also showed the winning dish of Red Currants. The best dish of Black Currants came from Captain STARKEY, Bericote House, Leamington (gr. Mr. G. L. Blackburn), and the winning dish of White Currants was sent by Mrs. CHAPPELL (gr. Mr. T. Parry).

The best two bunches of White Grapes were Muscat of Alexandria, shown by F. J. MYERS, Esq., Charlton Lodge, Banbury (gr. Mr. Jas. M. Bush), who also had the best-flavoured Melon, in the variety Easton Castle.

H. E. WISE, Esq., Shrubland Hall, Leamington (gr. Mr. W. Casley), won the 1st prize in a class for Apricots. Mr. THOS. MARSH was the only competitor in a class for six dishes of kitchen Apples.

VEGETABLES.

In a class for a collection of 10 kinds of vegetables there were five entries. The 1st prize was won by the Hon. VICARY GIBBS, Aldenham House, Elstree (gr. Mr. E. Beckett), whose produce showed remarkably high culture. The same exhibitor also showed the best brace of Cucumbers, as well as the winning dish of dwarf Beans and the best three Cauliflowers. Mr. JOHN HUDSON, Leicester, was awarded the 1st prize for (1) 12 Onions and (2) 12 Tomatos.

Prizes were offered by Messrs. Sutton & Sons for nine distinct kinds. There were four exhibits, and the 1st prize was won by Mr. JOHN HUDSON, Leicester, who showed excellent *Ailsa Craig* Onions, *Centenary* Peas, *Pink Perfection* Celery, *Magnum Bonum* Cauliflowers, and 11 Tomatos, all nicely arranged; 2nd, Mr. E. DEAKIN, Hay Mills, Birmingham, whose best examples were *Magnum Bonum* Cauliflower and *New Red Intermediate* Carrot.

Messrs. Dickson & Robinson's prizes were for six distinct kinds. 1st F. E. MUNTZ, Esq., Umberslade, Hockley Heath (gr. Mr. S. Foster), for a nice lot, in which *Snowdon* Cauliflower, *Premier* Onion, and *Perfection Intermediate* Carrot were meritorious; 2nd Lord WILLOUGHBY DE BROKE.

Of the five competitors in Messrs. Webb's class for six distinct kinds, the Hon. VICARY GIBBS won the 1st prize. He showed splendid Cauliflowers, Onions, Potatos, Tomatos, Peas, and Carrots. 2nd, Mr. J. HUDSON, Leicester.

AMATEURS AND GENTLEMEN'S GARDENERS RESIDENT IN THE COUNTY OF WARWICK.

Three entries were made in a class for a group of plants arranged for effect on a space of 12 feet by 9 feet. The 1st prize was well won by J. H. BURLEY, Esq., Brandon Parade, Leamington (gr. Mr. J. H. Finch), who had a well-balanced group, in which bright foliaged and flowering plants were artistically arranged; 2nd, the Misses ROBINSON, The Newlands, Leamington (gr. Mr. A. T. Friend).

FRANK DENNISON, Esq., Crauford, Leamington (gr. Mr. H. Sykes) won the 1st prize in classes for (1) 12 Roses, dissimilar, (2) six Tea Roses, dissimilar (3) six Roses, any variety. Included in the above three classes we noted particularly good blooms of J. B. Clarke, *Bessie Brown*, *Gustave Piganeau*, *Dean Hole*, *Comtesse de Nadaillac*, *Bridesmaid*, and Mrs. E. Mawley.

The Misses ROBINSON (gr. Mr. A. T. Friend) showed the best half-dozen bunches of hardy border flowers, dissimilar; 2nd, Mrs. MANN, Harbury, Leamington.

Mr. W. ELLIS MASTERS scored in classes provided for (1) *Zinnias* and *Cactus Dahlias*. The best Carnations came from Mrs. RAYSON, and

G. T. PARSONS, Esq., Warwick, took the lead with *African Marigolds*.

The principal fruit class was for four distinct dishes. The Society offered 90s. in three prizes, and a Challenge Cup, value 15 guineas, was added to the 1st prize of £2. There were four good exhibits. 1st, Rev. F. HODGSON, Clopton House, Stratford-on-Avon (gr. Mr. W. Nicholls), who showed splendid dishes of *Rivers Orange Nectarine*, *Bellegarde* Peach, *Superlative* Melon, and *Muscat of Alexandria Grapes*; 2nd, the Marquis of HERTFORD, Ragley Hall, Alcester (gr. Mr. C. Harding).

LORD WILLOUGHBY DE BROKE led in the next class for two bunches of Black Grapes. The variety exhibited was *Madresfield* Court.

C. T. GARLAND, Esq., Moreton House, Moreton Morrell (gr. Mr. W. Keam), had the best two bunches of White Grapes, showing *Muscat of Alexandria* in excellent condition.

DINNER-TABLE DECORATIONS.

One large tent was required to accommodate the exhibits in the classes provided for dinner-tables decorated with flowers. Each table measured 8 feet by 4 feet. A popular class was that reserved for ladies, there being 15 entries. The 1st prize was well won by Mrs. MANN, Harbury, Leamington, who used pink Carnations, *Gypsophila*, and delicate green and variegated foliage; 2nd, Mrs. BELLBY, Leamington.

Mr. Robert Sydenham's class was for Sweet Peas set up in rustic stands. The 1st prize was secured by Miss ADA TOWNSHEND, Lower Broadheath, Worcester, who displayed some very pretty pink Sweet Peas, relieved with *Selaginella* and *Codiaeum* leaves; 2nd, Miss F. JENKS, Codrall.

Mr. W. HARPER, Leamington, beat 10 competitors in the Society's open class with a beautifully-arranged table, consisting mostly of sprays of small flowered Orchids and *Selaginellas*; 2nd, Mr. W. T. MATLOCK, Oxford, whose principal flowers were *Rose Irish Elegance* and a pretty single pale-pink variety; 3rd, Miss ADA TOWNSHEND, Worcester.

HONORARY EXHIBITS.

Messrs. T. S. WARE, LTD., Feltham, showed a large collection of cut flowers of double and single *Begonias* in good condition.

Mr. H. N. ELLISON, West Bromwich, had a well-arranged group of Ferns in great variety.

From Messrs. W. H. SIMPSON & SON, Birmingham, came a representative collection of Sweet Peas.

Mr. HENRY ERFORD, Wem, Salop, also had a large exhibit of Sweet Peas.

Messrs. W. ARTINDALE & SON, Sheffield, sent a wonderfully good collection of *Violas* arranged in masses over a groundwork of black cloth. A selection of *Roses* and herbaceous flowers were also shown. Seven bold arches decorated with *Dorothy Perkins* Rose, *Francous*, *Gladioli*, &c., gave a pretty finish to an attractive exhibit.

Messrs. GUNN & SONS, Olton, Birmingham, showed *Roses*, *Violas*, and *Gaillardias*.

Mr. VINCENT SLADE, Tamton, brought a good collection of cut flowers of single and double *Zonal Pelargoniums*.

Mr. AMOS PERRY, Winchmore Hill, London, exhibited *Spiraeas*, *Japanese Irises*, and *Water Lilies*.

ROBERT SYDENHAM, LTD., Birmingham, had Sweet Peas in rustic stands.

Messrs. HEWITT & Co., Solihull, showed a bright collection of hardy flowers.

Mr. G. LANGE, Hampton, had a beautiful group of long-stemmed Carnations arranged in large vases. The varieties *Winsor*, Mrs. H. Burnett, *Britannia*, *Beacon*, and *Fair Maid* were shown in splendid condition.

Messrs. BAKERS had an assortment of border flowers and Alpine plants, and some very good *Nymphæa* flowers.

From Mr. FRANK LILLEY, Guernsey, came early flowering *Gladioli*, and *Montbretias* arranged in bold masses.

Messrs. DICKSONS, Chester, contributed a large collection of hardy flowers, in which *Roses*, *Liliums*, *Irises*, and *Iceland Poppies* were conspicuous.

Messrs. JOHN PEED & SONS, West Norwood, had an effective group of *Caladiums*.

Messrs. WEBB & SONS, Stonbridge, had a large exhibit of Sweet Peas, fruits and vegetables, arranged on a circular stand near the end of the

large plant tent. The Challenge Cup offered for the best non-competitive exhibit was awarded to Messrs. WEBB & SONS.

Miss ADA BRANSTONE, Leamington, sent a pretty collection of floral devices.

ALFRED HOLT, Esq., J.P., Leamington (gr. Mr. C. Finch), contributed a small group of miscellaneous foliage and flowering plants.

From Mr. W. L. PATTISON, Shrewsbury, came nearly 100 varieties of *Violas*, made up into sprays.

Messrs. JARMAN & Co., Chard, Somerset, had a pleasing stand of *Centaureas* and *Sweet Peas*.

Mr. W. HARPER, Leamington, sent *Carnations*, *Spiraeas*, and floral devices.

Messrs. YOUNG & Co., Cheltenham, showed a grand lot of *Carnations*.

Mr. L. R. RUSSELL, Richmond, Surrey, sent a handsome group of foliage and flowering plants.

Messrs. WHITE & Co., Worcester, staged border flowers and *Water Lilies*.

Messrs. HINTON BROS., Warwick, showed *Sweet Peas*, *Roses*, and floral devices.

Messrs. CLIBRAN & SONS, Altrincham, exhibited a large collection of vegetables.

Messrs. JOHN WATERER & SONS, Bagshot, Surrey, had a few well-coloured *Couters* and *Hollies*, and a fine batch of *Spiraea Anthony Waterer*.

ROSE SHOW AT LIEGNITZ.

THE German Amateur Society of Rosarians held their annual exhibition of *Roses* in this old Silesian town. It drew a large number of visitors from far and near, for it was the largest show that has been held in that part of Germany for the last 30 years. It will suffice for our readers if we notice the new varieties and a few others exhibited on this occasion.

Mr. PETER LAMBERT, of Treves, showed a large assortment of cut blooms of all classes, besides *Tea* hybrids, *Rugosa* hybrids, and wild *Roses*. Mr. H. W. CORDES was another exhibitor of fine blooms. It was said that the best had been cultivated under glass, but it was probably the goodness of the soil of the *Marsch* which had contributed to the excellent quality of his exhibits of *Jacob's Pearl*, *Lyon Rose*, *Königin Emma*, *Mildred Grant*, *Dean Hole*, *Papa Lambert*, *Laurent Carle*, *Mme. Segond Weber*, &c.

The principal exhibitors of new *Roses* were Messrs. J. C. SCHMIDT, Erfurt, and KIESE & Co., Viesslbach, in Thuringia. This last-named firm are the raisers of the variety *Otto von Bismark* that is recommended as an improved *La France*. The firm of KIESE & Co. are the raisers of the new *Bengal Rose Leuchtfener*, which, in colour, resembles *Grass an Teplitz*, but is an improvement on that variety, except in one point, namely, the new *Rose* is weaker in the stem. Mr. KIESE employs the variety *Frau Karl Druschki* in his crosses. One of his crosses with this variety gave *Gross Herzogin von Weimar*, which combines the good features of *Frau Karl Druschki* and *K. A. Victoria*. The colour is a light yellow. Excellent is likewise the novelty, *Deutschland*, a creamy *Rose*, with bronze, and well filled. *Stadtrat Glaser* is another fine novelty, obtained from a cross between *Frau Karl Druschki* and *K. A. Victoria*. Further deserving of mention is a seedling from *Etoile de France*, likewise a new climbing variety, *Wartburg*, of a light red colour and well filled; and *Eisenach*, a grand flower, a perpetual bloomer, with glistening foliage.

Mr. J. C. SCHMIDT showed an interesting seedling from a cross of *Caroline Testout* with *Frau Karl Druschki*, and the climber *Veilchenblau*, which has the otherwise not admired violet colouring.

Here VICTOR TESCHENDORFF, Cossebaude, showed, among other varieties, a strong red sport from *Levassasseur*, named *Ema Teschendorff*. H. CHRISTIAN WEIGAND, Soden, showed a new *Wichuriana* hybrid named *Sodenia*, to be put into commerce next year. It is a well-filled flower of fiery-red colour.

T. RÖHM, Obercaassel, showed *Graf Zepelin*, a sport from *Crimson Rambler*, and which was shown last year. H. CARL SCHMIDT, Kostnitz, showed a cross between *Johanna Selous* and *B. lutea*, with a similarity to *Dora Hansen*.

H. N. WETTEL, Treves, showed a fine bloom of *Herzogin Marie Antoinette*, the raisers being given as *Welter* and *Ja. obs.* The intense yellow-flowered hybrid is a fine addition to the class, which is weak in yellow colours.

SALTAIRE ROSE.

JULY 19.—The eighth annual exhibition of the Saltaire Rose Society was held on the above date. The weather was dull, and at times threatening, but no rain fell, and the attendance was exceedingly satisfactory, the receipts being only £2 short of last year, when a record was established.

In previous years the local show has been held in conjunction with provincial exhibitions of the National Rose Society and the National Sweet Pea Society, but on neither of these occasions did the general interest and attractiveness of the exhibition reach the high standard attained this year.

The society's gold medal and the 50-guinea challenge rose bowl (given by Mr. G. C. Waud) for cut Roses were again won by Messrs. ALEX. DICKSON & SONS, Newtownards, Ireland. This was the fourth time in succession that they have won the trophy, and it thus becomes their absolute property. 2nd, Mr. HUGH DICKSON, Belfast; 3rd, Messrs. D. PRIOR & SONS, Colchester. For 16 distinct varieties, three trusses of each, 1st, Mr. HUGH DICKSON; 2nd, Messrs. ALEX. DICKSON & SONS; 3rd, Messrs. D. PRIOR & SONS.

In the Sweet Pea classes the silver bowl presented by the Lord Mayor of Bradford (Alderman W. Land) was won by Sir R. L. BAKER, Bart., M.P., Blandford. In the amateurs' classes (open) the society's silver bowl and medal went to Mr. J. CONWAY JONES, Hucclecote, Gloucester.

In the classes for amateurs residing within a radius of 20 miles from Saltaire, the National Rose Society's bronze medal was awarded to Mr. DUNCAN G. LAW, of Hawksworth Hall (gr. Mr. J. Johnston), for a fine bloom of William Sheen, a light pink variety with a delicious silvery tint. In the classes for Sweet Peas grown within a similar area, Mr. S. SHACKLETON, of Cross Hills, gained the special silver cup offered.

In the local classes great interest was taken in the competition for the silver rose bowl given by the president, Mr. Percy H. Ulingworth, M.P. This trophy, which accompanied the 1st prize in the class for cut Roses, 12 blooms of H.T.s, of not fewer than nine varieties, was won by Mr. DUNCAN G. LAW, of Hawksworth Hall. The silver bowl presented by Mr. W. A. Whitehead went to Mr. A. HOFFMAN, of Baildon (gr. Mr. T. Nixon), for a collection of 24 blooms, but the National Society's Medal for the premier bloom was given for Avoca, which was included in the 3rd prize exhibit shown by Mr. J. M. TANKARD, of Baildon (gr. Mr. R. Wilde). Another medal, given to the premier bloom in classes open only to growers of fewer than 500 trees, was awarded to a Lyon Rose, among the 12 blooms shown by Mr. JOHN AMBLER, of Baildon (gr. Mr. R. Backhouse). Another bronze medal, offered for the premier bloom in the classes for smaller numbers of specimens, went to William Sheen, shown by Mr. S. WOODHALL, of Shipley, a similar medal falling to Mrs. ALFRED BROOKSBANK, of Saltaire, for an excellent specimen of Caroline Testout.

The 1st prize in the open classes for floral displays of Roses, arranged for effective display, went to Messrs. W. & J. BROWN, of Peterborough. Mr. ARTHUR H. RIGG, who secured the 2nd prize, showed a collection hardly inferior so far as the individual flowers were concerned, but the arrangement was not quite so effective. G. C. WAUD, Esq., Baildon (gr. Mr. W. Taylor), secured the 1st prize, a silver bowl and silver medal, for 24 blooms shown in the local classes.

NON-COMPETITIVE EXHIBITS included a collection of Sweet Peas shown by Mr. R. BOLTON, Warton, Carnforth (gold medal). Messrs. MAWSON BROS., of Windermere, staged a collection of herbaceous flowers (silver-gilt medal); Messrs. E. I. BATCHELOR & SONS, of Harrogate, gained a gold medal for Ferns; Messrs. JAMES BACKHOUSE & SON, LTD., of York, received a Bronze Medal for a collection of herbaceous flowers; Mr. JOHN BROOKE, of Bradford, displayed decorative plants, crosses, and wreaths (gold medal); G. C. WAUD, Esq., Baildon (gr. Mr. W. Taylor), showed foliage plants (gold medal); Messrs. R. SYDENHAM, LTD., showed Sweet Peas; and Messrs. W. CONWAY & SONS, Halifax, showed hardy flowers (silver medal).

SOUTHAMPTON CARNATION.

JULY 27.—The 12th annual show was held on the pier, and, although not so large as in some previous seasons, it was a very good display.

DRESSED FLOWERS.

Three competitors entered in the class for 12 flakes and Bizarres, distinct, Mr. J. DOUGLAS, Edenside, Great Bookham, Surrey, showing best. He staged the following varieties: Gordon Lewis, Recorder, Rowena, Torchlight, Master Fred, Peter Pan, George Melville, Sarah Payne. Sportsman, T. H. Hextall, and Arthur. 2nd, Mr. A. R. BROWN, King's Norton, Birmingham.

For six varieties, distinct, C. A. LINZEE, Esq., Bramdean Lodge, Alresford (gr. Mr. R. Ransom), was the only exhibitor, showing good blooms of Sportsman, Master Fred, Mr. T. Lord, and George Melville.

In the class for 12 varieties, distinct, other than flakes or Bizarres, Mr. DOUGLAS had the best of four exhibits, staging Sam Weller, Daffodil, Linkman, Hercules, Hidalgo, King Solomon, Lord Steyne, Queen Eleanor and Dido. 2nd, Mr. HAYWARD MATHIAS, Medstead, Hants.

Mr. LINZEE again won the 1st prize in the smaller class for six varieties, there being four entrants.

In the class for 12 Picotees, distinct, there were four exhibits. Mr. HAYWARD MATHIAS led with choice blooms of Gloria, Constance, Libra, Togo, Lady Gascoigne, Exquisite and Her Majesty. 2nd, Mr. J. DOUGLAS.

For six varieties of Picotees, Mr. J. J. KEEN, 37, Avenue Road, Southampton, won the 1st prize. Golden Pippin, John Ruskin, Libra, Her Majesty and Exquisite were his best examples. 2nd, Mr. LINZEE.

The premier flower of a Bizarre or flake was R. Houllgrave, shown by Mr. LINZEE.

Mr. H. MATHIAS showed the best self-coloured Carnation in Irma, and the best Fancy in Hecla.

The best yellow-ground Picotee was Onward, shown by Mr. J. DOUGLAS.

UNDRESSED BLOOMS AND BORDER VARIETIES.

For a display of Carnations and Picotees arranged with their own foliage in a space 5 feet by 2½ feet, three growers competed. Mr. H. LAKEMAN, Thornton Heath, Surrey, won the 1st prize with a good display of such varieties as Solomon Gill, Santa Claus, Liberté, Togo, Daffodil and Pathfinder. 2nd, Mr. E. C. GOBLE, Nurseryman, Ryde.

In a smaller class, Mr. J. FAIRLIE, Springfield Park, Acton, was placed 1st, and Mr. J. H. LINNINGTON, Southlands, Newport, I.O.W., 2nd.

Mr. LINZEE had the winning exhibit in the class for 20 blooms of Carnations or Picotees arranged for effect in a vase, Mr. J. FAIRLIE being placed 2nd.

Mr. DOUGLAS showed the best white variety in Mrs. T. E. Henwood, the best scarlet kind in Cardinal, the best yellow Self in Daffodil, the best buff in Mrs. Griffith Jones, and the best dark Self in Agnes Sorrel.

Mr. A. R. BROWN had the best rose or salmon self in Mrs. Pope, whilst Mr. H. MATHIAS showed the best pink-flowered sort.

Mr. DOUGLAS excelled in the class for six blooms of fancy-ground Picotees with Liberté, whilst Mr. H. MATHIAS showed best in the similar class for yellow-ground Picotees.

Mr. LINZEE won many of the premier awards in the smaller classes in similar sections.

Mr. J. H. LINNINGTON, Southlands, Newport, I.O.W., won the silver cup offered by Mr. H. Lakeman, Queensbury Nurseries, Thornton Heath, Surrey, for 12 undressed blooms of Carnations and Picotees.

Sir RANDOLPH BAKER, M.P., Ramston, Blandford (gr. Mr. Usher), won the 1st prize in the class for three blooms each of three American varieties staged in vases.

There were seven exhibitors in the class for a dinner table arranged with Carnations or Picotees. Mrs. ERNEST LADLAMS, Wordsworth Road, Shirley, Southampton, won the 1st prize.

SWEET PEAS.

In the Sweet Pea classes there were three competitors. For Messrs. R. Sydenham & Co.'s prize for 12 varieties, Mr. F. GREEN, The Polygon, Southampton, was placed 1st, his varieties including Countess Spencer, Clara Curtis, Dorothy Eckford, Frank Dolby, and King Edward VII.

Five competed for Messrs. Toogood's prizes for nine bunches, distinct, and Mr. USHER won the premier place with a delightful display, including Etta Dyke, Elsie Herbert, Mrs. A. Ireland, John Ingman, Audrey Crier, and Mrs. Rutzahn.

Mr. C. WAPEY, Broadstone, Dorset, won the 1st prize in Mr. H. Eckford's class for nine varieties.

BISHOP'S WALTHAM HORTICULTURAL.

JULY 27.—The 36th annual show was held in the Palace Ruins, Bishop's Waltham, on this date, and was much the best of the series. This society was started for the benefit of cottagers, but it has grown into a position of wider importance. The committee, with Mr. E. Molyneux as their leader, arranged all the details satisfactorily.

In an open class for decorated dinner tables, 6 feet by 3 feet, Orchids being excluded from the arrangement, prizes of £5, £3 and £2 were offered. Seventeen exhibitors entered, and, after a close competition, Miss G. SAUNDERS, Fareham, was awarded the 1st prize for a delightful arrangement of Carnation Fair Maid and Lily of the Valley, with suitable greenery arranged in a low glass bowl with globular glass vases around. Mr. E. C. PERN, Droxford, Hants, was a close 2nd. 3rd, Mrs. COLSTON HALE, Virginia Lodge, Warrminster. An extra prize was awarded to Mr. F. G. BEALING, Bassett, Southampton, for a table decorated with Lyon Rose.

For a table arranged with wild flowers, Miss ELSIE COLLINS, Swanmore Park Lodge, was easily 1st; she employed Scarlet Poppies and Camomile; 2nd, Mrs. W. PARVIN, Dursley. In the class, confined to members of the society only, for a decorated table, Miss D. GUNNER, Ridgemed, Bishop's Waltham, was awarded the 1st prize for an effective arrangement of Nemesis.

Eleven competed in the class for a basket of flowers, the best exhibit being a pretty combination of Sweet Sultan and other subjects arranged by Mrs. COLSTON HALE.

Mr. COLSTON HALE was 1st for the best arranged vase of Sweet Peas in competition with 18 other exhibitors, Mr. F. G. BEALING being placed 2nd.

For a bowl of Roses Mrs. ARTHUR BIDE, Alma Nurseries, Farnham, won the 1st prize easily with a charming mass of Lyon Rose; 2nd, Miss V. CRABBE, Aldershot, with General MacArthur.

Roses were shown in large numbers. For six bunches, distinct, W. H. MYERS, Esq., Swanmore Park, Bishop's Waltham (gr. Mr. G. Ellwood), was easily 1st, as he also was for six bunches. Miss GLADSTONE, Hampton Hill, Swanmore (gr. Mr. W. Cooper), was awarded 2nd prize in the class for six bunches, and this exhibitor won the premier position for six bunches of Carnations.

Mr. B. PEPPLE, Vernon Hill, Bishop's Waltham, was placed 1st for six bunches of annuals; whilst for 18 bunches of flowers grown out-of-doors, Mrs. C. MACRAE, Meonstoke House, Bishop's Waltham (gr. Mr. H. Child), won the 1st prize with a representative exhibit of seasonable subjects. Mr. ELLWOOD won Messrs. Ladhams's prize offered for 12 bunches of hardy flowers in a close competition.

Mr. E. J. J. EDWARDS, Portland Place, Bishop's Waltham, won the 1st prize for 12 bunches of Sweet Peas, distinct varieties. Mr. COOPER won Mr. Eckford's 1st prize for 12 bunches, and he also excelled in Messrs. J. Carter & Co.'s and Messrs. R. Sydenham & Co.'s classes. Miss BASHFORD, Soberton Towers, won the 1st prize in Mr. C. Breadmore's class for six varieties.

FRUIT.—W. H. MYERS, Esq., was 1st for six dishes, distinct, with Muscat of Alexandria and Madresfield Court Grapes, Melon, Peaches and Nectarines as his best dishes. H. W. TRINDER, Esq., Northbrook House, Bishop's Waltham (gr. Mr. Tursey), was 1st for four varieties. For four varieties of fruit grown in the open, T. C. WILSON, Esq., The Thickets, Bishop's Waltham (gr. Mr. Barnes), won easily.

Displays of vegetables were numerous and good. W. H. MYERS, Esq., won Messrs. Toogood's prize for eight dishes, and he also excelled in Messrs. Sutton & Son's and Messrs. E. Webb & Son's classes. Mr. COOPER won Messrs. J. Carter & Co.'s prize offered for six dishes.

PERTSHIRE SWEET PEA.

JULY 30.—This society, the first of its kind in Scotland, was formed last autumn, and immediately met with a most encouraging amount of support. The first show was held on the above date, a large tent being completely filled with excellent exhibits. In several classes competition was very keen.

In the class for a group open to trade growers only, Messrs. YOUNG & SON, Elgin, won the gold medal; 2nd, Messrs. THYNE & SON, Dundee. This was the only class in which we could not agree with the judges' decision, as Messrs. THYNE'S flowers were much superior, though the arrangement was not so effective.

The principal class in Section II., from which traders were excluded, brought some magnificent exhibits. Mr. THOMAS FENDER, Cultoquhey, Crieff, was placed 1st, thus winning the challenge cup offered. He showed magnificent bunches of John Ingman, Elsie Herbert, Helen Lewis, Constance Oliver, Mrs. Routzahn, Olive Ruffle, The King, Masterpiece, Prince of Asturias, Etta Dyke, Mrs. H. Sykes, and Evelyn Hemus. 2nd, Mr. GEORGE REID, Dundee; 3rd, Mr. WM. YOUNG, Falkland Palace.

There was many non-competitive displays, the exhibitors including Mr. H. ECKFORD, Wem; Messrs. BAKERS, Wolverhampton; Messrs. ALEXANDER & BROWN, Perth; and Messrs. DOBBIE & CO., Edinburgh, who had a very fine collection, and were awarded a Gold Medal.

The president of the society is the Earl of Moray, the chairman, the Rev. J. S. Clark, Bridge of Earn, and the secretary, who did much to make the show a success, Mr. R. S. Halley.

BASINGSTOKE HORTICULTURAL.

AUGUST 1.—Held in Poldings Park on this date, the annual show may be described as successful, although in the open classes there was a falling off in the number of entries, especially in the plant section. Cut flowers of high quality were contributed in satisfactory numbers.

In the section devoted to floral decorations confined to lady exhibitors there was a good and interesting display.

PLANTS.—For a group of miscellaneous plants, arranged for effect in a space of 10 feet by 7 feet, two competed, the 1st prize being awarded to W. H. McCONNEL, Esq., Baughurst, Basingstoke (gr. Mr. G. Wassell). At the back of the group there was a well-grown plant of *Kentia Forsteriana*, whilst here and there were placed well-grown, single-stemmed *Codiaeums* and *Acalyphas*, amongst a groundwork of Ferns. The flowering plants were tall specimens of *Campanula pyramidalis alba*, *Pancreatum fragrans*, *Gloxinias*, and several plants of an exceptionally fine form of a dwarf, pure white *Phlox Drummondii*. The whole was effectively edged with *Abutilon megapotamicum*, *Campanula isophylla* and a deep-bronze-coloured *Lycopodium*. 2nd, S. E. BATES, Esq., Marrydown Park, Basingstoke (gr. Mr. W. Green), with good material too formally arranged.

Tuberous Begonias were well represented. For eight varieties there were four entries, J. G. HOLT, Esq., Kingsclere (gr. Mr. F. H. Sweet), winning the 1st prize with splendidly-grown and well-flowered specimens of both single and double varieties. 2nd, the Rev. A. H. GAY, Worting, Basingstoke (gr. Mr. W. E. Perrie).

Specimen plants in flower were not numerous. Dr. MAPLES, Kingsclere, had the best exhibit, a particularly well-flowered *Lilium lancifolium album* being conspicuous in his group.

Pyramidal-trained *Coleus* are a feature at this show. For four specimens, S. E. BATES, Esq., was placed 1st, with richly-coloured examples, from 5 feet to 6 feet high. W. H. McCONNEL, Esq., was awarded the 1st prize for four foliage plants, showing excellent *Kentia Belmoreana*, *Dracena Lord Wolseley* (richly coloured), and *Maranta zebrina*.

For a collection of hardy flowers, arranged on a space of 6 feet run of tabling, quality and effective arrangement to be considered, there were three entrants. L. SIMONDS, Esq., was easily 1st for a good display of Roses, Carnations, Spiraeas, Phloxes, Delphiniums, and other kinds.

Exhibits of Sweet Peas were numerous and good. For 12 bunches, distinct, the Hon. Mrs. F. BARING, Candover House, Alresford (gr. Mr.

A. Childs), was placed 1st, and L. SIMONDS, Esq., 2nd among six entrants.

Dahlias formed an interesting display, the Hon. Mrs. BARING winning in the classes for both show and Cactus-flowered varieties in 12 distinct sorts. J. G. HOLT, Esq., had the best six *Gladioli* and also the best three dozen *Carnation* blooms, arranged with their own foliage.

Miss N. WADMORE, Woodside, Basingstoke, showed the best table decoration, having pink *Carnations* and *Sweet Peas* effectively blended with suitable foliage; and for a similar class, in which *Orchids* were permitted, Mrs. E. LADHAMS, Shirley, Southampton, won easily.

The exhibits of fruit were not noteworthy, but vegetables were numerous and good. Mrs. TREVOR GOFF, Sheffield Hall, Basingstoke (gr. Mr. H. E. Wallis), won the society's leading prize for eight dishes of vegetables, S. E. BATES, Esq., winning Messrs. Sutton's prize for six dishes, in both cases staging desirable produce.

WEST DERBY HORTICULTURAL.

AUGUST 1.—This annual exhibition was held on August Bank Holiday, in a field adjoining the Rectory, the residence of the president, the Rev. Percy Stewart. The entries were as numerous as ever, and a good show resulted. The decorated tables came in for considerable praise, Miss WILSON securing the premier award in one section, with *Sweet Peas*, and Mrs. V. YOUNG, in the open section, with *Carnations*.

The 1st prize-winners in the open classes were as follow:—

Twelve bunches half hardy annuals, H. McCUBBIN, Esq. (gr. Mr. R. Clifton); 12 bunches herbaceous cut flowers, Drs. TISDALL & INGALL (gr. Mr. G. Osborne); 12 *Roses*, Miss HEAP (gr. Mr. H. Osborne); 12 *Dahlias*, the Rev. P. STEWART (gr. Mr. J. Edgar); 12 *Carnations*, Mr. H. OGDEN; 12 vases of *Sweet Peas*, Drs. TISDALL & INGALL; bouquet, Mr. H. OGDEN; vegetables (nine varieties), Drs. TISDALL & INGALL, with an excellent exhibit: six varieties, Rev. P. STEWART; two dishes of Peas, H. McCUBBIN, Esq., with capital pods; two *Cucumbers*, A. H. JONES, Esq.; *Tomatoes*, Drs. TISDALL & INGALL, with fine fruits; six dishes of hardy fruits, Miss HEAP, who also won the 1st prize for six dishes, and the same exhibitor staged good black and white *Grapes*, *Peaches*, *Nectarines*, *Cherries*, and *Gooseberries*; six table plants, Drs. TISDALL & INGALL, the same exhibitors having the best foliage plant, the best plant in bloom, and the best two pots of *Liliums*. Drs. TISDALL & INGALL showed the best-arranged group, rather overdone with *Codiaeums*. The 2nd prize in the group class went to W. G. LAYTON, Esq. The Silver Challenge Vase, offered by the chairman, Mr. C. A. Young, for 12 vases of *Sweet Peas*, was won by Mr. NICOLL.

PRESCOT HORTICULTURAL.

AUGUST 1.—The annual show of this Society was held in the park of Knowsley, the residence of the Rt. Hon. Earl of Derby, on the above date. The entries were somewhat below the average number.

There was only one exhibit of a group of plants arranged for effect. The exhibitor was DIXON NUTTALL, Esq. (gr. Mr. W. H. Roberts), and he was awarded the 1st prize.

The same exhibitor excelled with two *Palms* or *Cycads*, having *Lantanas*; 2nd, J. STONE, Esq. (gr. Mr. D. McKelvie), who showed best in the class for four stove or greenhouse plants, T. HENSHAW, Esq. (gr. Mr. J. George), being awarded the 2nd prize in this class.

Mr. D. McKELVIE won the 1st prize for four greenhouse plants in flower. Messrs. W. H. ROBERTS and J. GEORGE being 2nd and 3rd respectively.

Mr. J. GEORGE secured 1st honours for one stove plant in bloom with a well-flowered specimen of *Clerodendron Balfourii*; 2nd, Mr. D. McKELVIE, with a small *Ixora*.

Mr. W. H. ROBERTS led in the class for Ferns with a good *Nephrolepis Piersonii*, and he also won the 1st prizes for one fine foliage plant with *Cycas revoluta* and one hanging basket.

Caladiums were best shown by E. S. ECCLES, Esq. (gr. Mr. C. Houghton).

Mr. A. ROSE showed the best six *Gloxinias*, and also the best four *Begonias*.

Mr. W. H. ROBERTS led for three *Zonal Pelargoniums*, and he was also placed 1st for three *Fuchsias*.

Mr. W. J. BARKER won the 1st prize for 18 *Roses*; whilst Mr. J. GEORGE had the best hardy herbaceous flowers and *Carnations*.

FRUIT.

In the class for four dishes, distinct, J. BEECHAM, Esq. (gr. Mr. W. Oldham), took the premier position with good *Black Hamburg Grapes*, *Melon*, *Royal George Peaches*, and *Downton Nectarines*. Mr. D. McKELVIE and Mr. T. EATON followed in the order of their names.

Mr. D. McKELVIE showed the best *Black Hamburg Grapes*, and he excelled in the class for two bunches of any other *black Grape* with *Madresfield Court*.

Muscat of Alexandria were best shown by E. STAPLETON BRETHERTON, Esq. (gr. Mr. T. M. Nelson); whilst Mr. W. OLDHAM had the winning stand of two bunches of any other *white Grape* with well-finished bunches of *Buckland Sweet-water*.

Mr. T. EATON showed the best *Melon* and *Nectarines*, and Mr. T. M. NELSON the best *Peaches*.

In the vegetable classes Mr. J. GEORGE secured the leading award for eight varieties, staging good *Celery*, *Cauliflowers*, *Tomatoes*, *Onions*, and other kinds.

DEBATING SOCIETIES.

DEVON AND EXETER GARDENERS'.—The members, on the occasion of their summer outing, journeyed by train from Exeter to Kingsbridge, and by steamer from that town to Salcombe. There is probably no milder climate in the United Kingdom than that of Salcombe, and of this there was ample proof in the vegetation in and around this South Devon village. The first place visited was Woodcott, the residence of Mr. A. McIlwraith, overlooking the estuary. Growing luxuriantly were *Fuchsia corymbosa*, flowering finely, *Acacia Baileyana*, *Olearia argophylla*, *Hydrangeas*, many large and vigorous *Pittosporums*, *Eupatorium Weimannianum*, and *Brachyglottis repanda*. Against the terraced wall, the top of which was sheltered by glass coping, were *Citrons* bearing heavy crops of exceptionally large fruits. Oranges were noticed in flower and fruit. A three-mile walk brought the excursionists to Sharpitor, the Devonshire seat of Mr. Edric Hopkins. *Pomegranates* and *Bananas* were bearing fine fruits; while such plants as *Desfontainia spinosa*, *Feijoa Sellowiana*, *Myosotidium nobile*, *Acacia Ricciana*, *Sollya heterophylla* and *Abelia floribunda* were flowering finely. A grand specimen of *Griselinia littoralis*, 10 feet by 10 feet, another of *Drumys Winteri*, 10 feet high; several noble trees of golden variety of *Cupressus macrocarpa*, *Phormium tenax variegata*, *Bambus* and *Phyllostachys* in great variety were noticed. Amongst the rarer plants blooming freely were *Polygala Dalmaissiana*, *Escallonia organensis*, *Piptanthus nepalensis*, *Lonicera Hildebrandtii*, *Melaleuca hypericifolia*, *Correa magnifica* and *Grevillea sulphurea*. A fine avenue of *Eucalypti* was observed, *L. globulus* being in bloom. *Plumbago capensis*, *Cassia corymbosa*, and *Dipluchis coecinea* were in full flower. From Bolt Head, on which Sharpitor is situated, a grand view is obtained, reaching across Torbay and on to Portland Bill. The members returned by steamer from Bolt Head, via Salcombe and Kingsbridge, and thence by train to Exeter. A. H.

HASLEMERE GARDENERS'.—A party of 50 members of this society journeyed to Reading on Thursday, July 28, to visit Messrs. Sutton & Son's nurseries. Reading was reached at noon, the party being met at the station by a representative of the firm. After tea Fawley Gardens were visited.

WARGRAVE AND DISTRICT GARDENERS'.—The summer meeting of this association took the form of an outing on Wednesday, July 27, when a visit was paid to Bear Place, the residence of the president, H. F. Nicholl, Esq., J.P. The company, numbering 25, visited the mansion, the woods, home farm, and gardens and greenhouses. The party broke up about 7.30 p.m., the members having greatly enjoyed their first outing of the kind.

GARDENING APPOINTMENTS.

(Correspondents are requested to write the names of persons and places as legibly as possible. No charge is made for these announcements, but if a small contribution is sent, to be placed in our collecting box for the Gardeners' Orphan Fund, it will be thankfully received, and an acknowledgment made in these columns.)

Mr. W. B. GINGELL, for the past 20 years Superintendent of Ravenscourt Park, Hammersmith, has been appointed to succeed the late Mr. F. SPIVEY, as Superintendent of Dulwich Park, London.

Mr. JAMES R. SMITH, for the past 5 years Gardener at Addington Park, Croydon, and previously 6 years General Foreman at Melton Constable, Norfolk, as Gardener to ISAAC LEWIS, Esq., Redgbury Park, Godduburst, Kent.

Mr. A. V. DOVE, late Gardener to MUSGRAVE DYNE, Esq., Perryfield, Sollershope, Ross-on-Wye, as Gardener and Bailiff to EDMUND PAGE, Esq., Weatherstone, Hinderton, near Neston, Cheshire. (Thanks for I.S. received for R.G.O.F. Box.—Eds.)

Mr. A. PETCHY, previously General Foreman, also as Gardener to the Right Hon. Lord BATH, Stansted, Essex, as Gardener to R. E. GOSWOLD, Esq., Hasselbury, Bishop Stortford, Herts. (Thanks for 2s. sent for R.G.O.F. Box.—Eds.)

ENQUIRIES AND REPLIES.

PLANTING AN ORCHARD IN WORCESTERSHIRE.—My employer has a farm in Worcestershire, and wishes to plant an orchard of standard fruit trees, principally Apples and Plums, with a few Pears. The land is under grass and is a heavy, clay soil. Can you furnish me with particulars as to varieties suitable for planting, including one or two varieties of Apples suitable for cider? *T. G.*

—For planting an orchard of 100 standard fruit trees for market purposes in Worcestershire, a good selection would be as follows: Apples, 20 trees of Worcester Pearmain, 20 Bramley's Seedling, and 20 Newton Wonder; Plums, 10 Rivers's Early Prolific, 10 Victoria, and 10 Czar; Pears, 5 Williams' Bon Chretien, 5 Pitnaston Duchess, and 5 Catillac, a stewing variety for which there is always a great demand at remunerative prices. The two best varieties of Apples for cider production are Foxwhelp and Kingston Black. Prepare the holes for planting at 30 feet apart, each station being 5 feet in diameter. Do not mix animal manure with the soil, but if the ground is naturally poor, mix a sprinkling of $\frac{1}{2}$ inch bones with the surface soil and afterwards apply a good mulching of farm-yard manure, and repeat this dressing of manure annually to conserve the moisture in the soil as well as to nourish the trees. The best time to plant is as soon as possible after the leaves have commenced to fall, say November, for at that time of year the soil is warm and the roots will commence to grow. Avoid planting when the soil is sticky and wet, or during snow and frost. Remove the turf to a depth of 2 inches, dig out the soil one spit deep, shovel out the crumbs of fine soil, and fork up the sub-soil one spit deep. Break up the bottom layer, and place the sods grass-side downwards on the sub-soil, and also about one-half of the removed top soil. Place a stake firmly in the centre of each hole, the top of the stake to be the same height as the stem of the young tree. Arrange the roots horizontally and fill in with the remainder of the top soil broken finely. Tread the ground firmly after planting, and then apply the mulch of half-decayed manure.

ANALYSIS OF SOIL BY R.H.S.: *W. G.* The Royal Horticultural Society's chemist, Dr. J. A. Voelcker, M.A., 22, Tudor Street, New Bridge Street, London, undertakes the analysis of soil for Fellows at a reduced fee. Write to the secretary, Rev. W. Wilks, Royal Horticultural Hall, Westminster, for particulars. The soil should be forwarded to Dr. Voelcker direct. With regard to your question respecting the cost, this will be regulated by the nature of the analysis; the fee for a complete analysis of a soil being £3.

ANTHRINUM: *G. C.* Anthrimum are not strictly annuals—that is, seedlings do not flower and perish in a single season, if grown from beginning to end out-of-doors. For this reason we should not advise their selection for forming one of "12 distinct kinds of annuals" at a competitive show. The Butterfly Delphinium is said to be an annual.

BOOKS: *H. H.* *The Young Botanist*, by W. Perceval Weston and C. S. Cooper. You can obtain copies from our publishing department.

CROWN BOWLING GREEN: *J. I.* So far as the general formation of a Crown Bowling Green is concerned, with the exception of the raised centre, it differs but little from the ordinary Scotch green. Good drainage and a well-laid turf are essential to success in both cases. To secure a uniform fall from the crown to the edge we would suggest that the ground be set out in concentric circles at equal distances from each other (see fig. 38), commencing from the edge of the crown. Each circle would then have an equal rise or fall from the one immediately adjoining it, and a true gradient thus obtained. Supposing, by way of illustration, that the crown—which is set out 9 inches higher than the edges—is 10 feet across, and

from its centre to the edge of the grass is 65 feet. By staking out four circles, the first of which is 15 feet from the border of the crown, and each additional circle 15 feet from the last, it would be found that a uniform fall would be obtained by making the inner circle 2 $\frac{1}{2}$ inches below the level of the crown, the second circle 2 $\frac{1}{2}$ inches below the inner one, and so on, until the last circle would be exactly 9 inches below the level of the crown. In other words, a gradient of $\frac{1}{4}$ in 100 would be obtained. The corners might be made dead level, as this could not possibly interfere with the game as played on such a green. We would advise laying the turf from the centre to the circumference. The following method is employed in the Liverpool parks, where 22 greens are provided for the use of the game of bowls. A trench is made 12 feet in width, and in the bottom of this is placed a layer, 4 inches in depth, of clinkers. On the top of this are placed the old turves taken from the top of the next trench. The sods are placed grass sides downwards, and they prevent the clinkers, used as drainage material, becoming choked with the finer soil. Above this layer of turves is placed soil to the depth of about 12 inches. After careful levelling this is covered with a layer of sea-sand about $\frac{1}{2}$ inch deep. Another trench, 12 feet in width, is dug out, and the process repeated, until the bowling green is made. When all is well settled down, the top is covered with the finest turf procurable. In your case you can make the trenches 15 feet wide. You will find some in-

FIG. 38.—CROWN BOWLING GREEN.
Showing how to secure a uniform fall.

formation on Bowling Greens in *Lawns and Greens*, by T. W. Sanders, obtainable from our publishing department, price 1s. 2d. free by post.

FIGS, PEACHES AND CARNATIONS: *W. E.* The Fig is badly affected with disease, caused by the fungus *Cercospora bolleana*, whilst the Peach is equally badly attacked by silver leaf disease. As the complaint is confined in each case to a single tree, and there are others to which the fungus may spread, it is advisable to destroy those diseased at once, burning every portion. Afford fresh soil if other trees are planted in their places. For checking rust on Carnations spray the plants with potassium sulphide, using $\frac{1}{2}$ oz. in two gallons of water.

GARDENING EMPLOYMENT IN AMERICA AND AUSTRALIA: *G. F. J.* You will find information regarding the conditions affecting gardeners in America in the issue for February 19, 1910, p. 122. With regard to Australia, a note on gardening in Australia and New Zealand, written by the late Mr. James Melhous in reply to a question by *W. B.* was given in the issue for May 16, 1908, p. 324. You cannot advertise for a situation in America unless you reside there, this being contrary to law, but you may do so in the case of Australia.

GRAPES FAILING TO COLOUR: *S. H. G.* Grapes may fail to ripen perfectly from various causes. In your case it is probable that the roots have entered unsuitable soil, in which case you must

lift them late in autumn, and relay them nearer to the surface of the border in some good, rich soil. If your subsoil is cold and wet, the bottom should be covered with a thin layer of concrete to prevent the roots from penetrating again into it, taking particular care to give the border efficient drainage. It is possible that the border was made too loosely, as this is a very common error. In regard to the tank, we would strongly advise you to remove it and place it where it will not interfere with the roots. You must also clear out all the old soil on which the tank has been standing. We do not think the methylated spirit will have interfered with the colouring of the Grapes, as it is commonly used for the destruction of mealy bug. If you disturb the roots to any great extent this autumn, the vines must only be allowed to develop a very moderate crop of fruit.

INJECTOR FOR CARBON-BISULPHIDE: *T. T. & Co.* Insert a small advertisement.

JOBBER GARDENER: *W. W.* You ask—Should a man who is engaged at six different places on as many days of the week be regarded as a professional gardener? This depends entirely upon his previous training. If he has been engaged in gardening or nursery work as a profession from a boy upwards he could properly lay claim to the title, but if he is one of those who take up jobbing gardening after having failed in other walks of life he is merely a garden labourer. A bothy boy is only a prospective gardener. He is not a professional gardener any more than a hospital student is a qualified doctor. Some day or other it may be hoped that gardeners will have a hall mark which will serve to distinguish qualified members of the profession.

NAMES OF PLANTS: *M. H.* *Lonicera involucrata* (syn. *L. Ledebourii*).—*Frank Newman*. The *Viola* is a garden seedling. If it was found in India it must have been introduced there.—*W. A.* A spray of *Ruscus aculeatus*, the common Butcher's Broom, that has been coloured by a red aniline dye. They are sold in bunches in Covent Garden Market, some being dyed a blue colour.—*T. N.* 1, *Periploca graeca*; 2, *Lactuca Plumieri*; 3, *Sisyrinchium striatum*; 4, *Juniperus chinensis*; 5, *Crataegus tanacetifolia*; 6, *Geranium* sp. (too much withered).—*J. E.* 1, *Lathyrus sativus*; 2, *Omphalodes limifolia*; 3, *Pisum elatius* var. *umbellatum* "Crown Pea"; 4, *Alyssum argenteum*.—*A. Young*. The scented-leaved shrub is *Myrica cerifera*; 2, cannot recognise this from such a shrivelled scrap; 3, *Oxycoocus macrocarpus*.—*R. W. N.* 1, *Myrtus Ugni*; 2, *Diosma ericoides*. (Thanks for contribution to R.G.O.F. Box).—*Dejuinere*. 1, *Senecio Clivorum*; 2, *Veronica longifolia* var.; 3, *Achillea Ptarmica* fl. pl.; 4, *Lychnis chalcidonica*; 5, *Veronica longifolia* var.; 6, *Leycesteria formosa*; 7, *Spiraea arifolia*.—*R. G.* *Cypripedium Nellie* (*Charlesworthii* \times *tonsum*).—*Villa*. 1, *Sophronis grandiflora*; 2, *Oncidium flexuosum*; 3, *Calogyne flaccida*; 4, *Odontoglossum Andersonianum*; 5, *Oncidium pubes*.—*R. S.* 1, *Pteris longifolia*; 2, *P. tremula*; 3, *Dendrobium Hedycoosmum*; 4, *Brassia verrucosa*.—*O. G.* We do not undertake to name Roses; send the variety to some grower who can compare it in his collection.

PEA FOR IDENTIFICATION: *Beeswar*. The variety is known as the Purple-podded Pea.

RENT OF ROOM: *T. S.* You had better consult a local solicitor.

TOMATOES AND CUCUMBERS FOR WINTER: *W. G.* Winter Beauty, Sunrise and Kershaw's Premier are all good varieties of Tomato for fruiting in winter. Kershaw's Premier is not much known, but it is one of the best all-round Tomatoes in cultivation. One of the best winter-fruited Cucumbers is that known as "All the Year Round."

CLANDON PARK, GUILDFORD.

(See Supplementary Illustration.)

THE rule of the holiday maker is to go to the sea or to pass beyond the confines of these islands to other lands in search of beauty. It is not for me to decide whether the seaside is the best place to spend a holiday, but I may say that no one need go beyond the seas to find varied and charming scenery. Londoners have only to travel a few miles into Surrey to find the most delightful country surroundings and many magnificent gardens. One such garden is that at Clandon Park, the home of the Earl of Onslow, G.C.M.G.

The small station of Clandon is situated on the L. & S.W. Railway, and is 25 miles from Waterloo, whilst the entrance to Clandon Park is one mile from the station. The park is not a very large one, but it is naturally undulating, and it contains many handsome trees, while the surrounding views of hill and vale, woodland and pasture are very beautiful. The entrance from Clandon is not the principal one, that being situated on the Guildford road, but it is a convenient entrance, for it abuts upon the lawns and gardens. The mansion

was built in 1730; it is a formal-looking structure, conveying an impression of internal comfort and external strength rather than architectural beauty.

The sunken garden is a comparatively modern feature, which was modelled upon the garden at Hampton Court, and its character may be seen in the supplementary illustra-

pergola clumps of *Lilium auratum* constitute the principal feature. Near by is a handsome bower covered with a plant of *Wistaria sinensis*, which forms a beautiful object when in flower.

Passing along the lawns of beautiful turf between superbly-coloured groups of *Acers*, the lower lawn is reached, and a row of

[Photograph by the Earl of Onslow.]

FIG. 39.—CLANDON PARK: THE IRIS GARDEN IN JUNE.

tion. It has a pool in the centre, and the borders are occupied by bold groups of handsome flowers, whilst specimens of clipped plants are dotted over the grass. From a higher point close to this garden there is an excellent view of the mansion over the pergola (see fig. 46), which has a Japanese lantern at one end and the sunken garden at the other. The pergola is furnished chiefly with *Roses* and *Clematises*, and they grow and flower abundantly. In the borders within the

Irish Yews on the left that look like sentries. In a parallel row, *Golden Yews* have been planted more recently. On the rise of the lawn from this spot is an avenue of *Cupressus Lawsoniana* (see fig. 42), with occasional vases for plants, and the avenue leads to a rather higher level than Lady Onslow's "Aromatic" garden, which comes well into view. In this garden may be seen the only formal planting at Clandon Park, and, although the beds are of a set

[Photograph by the Earl of Onslow.]

FIG. 40.—CLANDON PARK: DAFFODILS FLOWERING IN THE IRIS GARDEN IN SPRING.

design, nevertheless the plants utilised are of sufficiently free-growing habits to prevent any severe aspect. As far as flowers are concerned, the feature at the time of a recent visit (August 5) was the gorgeous *Anchusa italica*, known as "Dropmore variety," but the plants which entitle the garden to its name include, amongst others, Roses, Lavender and Southernwood. On the contiguous terrace are grand specimens of *Hydrangeas* in tubs. Mention may be made of the Cranley Avenue, with its inner line of Copper Beeches and its outer line of Green Beech; it extends to the front entrance, and was designed as the drive leading to the Guildford road before the present line through Clandon was constructed.

Turning from the mansion and its surroundings, the visitor will find the most charming

finest varieties then in commerce as a nucleus. Every year since that time additions have been made, until, at the present, the collection is as representative as any in these islands. The varieties are legion, and it were hopeless to expect that space would be allowed me here to mention even a selection of them. Here and there are serpentine beds of English and Spanish varieties, and, at the foot of the bank, clear of the water in winter and 3 inches under it in summer, are splendid plants of *I. lævigata* in variety. A line at the top of the bank near the path is formed of *I. stylosa*, where the plants get literally baked in summer. To maintain the attraction there are great clumps of *Lilium candidum* and *Hemerocallis*, while here and there are uncommon *Iris* species, and the finer of Sir Michael Foster's

greatest luxuriance. *P. denticulata* Cashmeriana sends its flower-stems up to a height of 30 or more inches, and at the summit of each is a ball of blossoms as large and as shapely as a tennis ball; *P. japonica* has immense leaves, and such specimens of *P. rosea* are seldom seen elsewhere. Some appear to live in water, whilst over the roots of all the species a flowing stream can be turned at will. The gardener, Mr. Blake, is exceedingly proud of the plants, and there is every excuse for this. Besides the Primulas, there are clumps of *Meconopsis Wallichii*, *M. integrifolia*, and *M. paniculata*, with thousands of Forget-Me-Nots and Polyanthuses. Mr. Blake has formed a nursery for the raising of Primulas, and has already many thousands of plants still in the seed beds or pricked out into suitable situations. The day will probably come

FIG. 41.—CLANDON PARK: THROUGH THE IRIS GARDEN.

features of Clandon Park in the Iris border and Primula dell.

THE IRIS BORDER.

Having spoken of Lady Onslow's "Aromatic" garden, a regard for consistency should cause me to call the Iris border Lord Onslow's "Iris garden," since it is his especial delight and hobby. It is entered by a steeply-sloping, stepped path, and on the left of the path Bamboos rise to a height of 12 feet or more, whilst a hedge of Sweet Brier is on the right hand. The Iris border extends for 250 yards, and its average width is 3 to 4 yards. Its charm in spring lies in the immense clumps of such popular *Narcissi* as Sir Watkin, Empress, Emperor and others (see fig. 40), and these flowers are succeeded by the Irises. It is 14 years or so ago since Lord Onslow commenced to form the border, and he procured all the

hybrids may be seen in carefully-selected places. *I. Snow Queen* and *I. sibirica alba* are shown in fig. 41.

At the back of the border there are superb groups of *Spiræas* suitable to such a situation, whilst on the opposite side of the canal, where it was originally intended to cultivate *Liliums*, there are conspicuous masses of *Rhododendron molle* in variety, *Alströméria anrantiaca*, *Salvia "Fireball," S. patens*, *Atriplex hortensis*, and *Spiræa giganteum*. In the winter season colour effects are afforded by the Willows, Dogwood and *Rubus biflorus*. It is a wonderful garden, with changing features during the whole year.

THE PRIMULA DELL.

Totally different to the Iris garden in every respect is the dell in which the hardy Primulas are cultivated. The plants grow with the

when the Primula dell will rival the Iris border in its attractiveness, and, fortunately, there is plenty of space for both gardens to grow in extent.

THE WATER GARDEN AND MAORI HOUSE.

A passing reference should be made to the water garden and the Lily pool, situated near to the Maori Council House, which is a reminder of the days that the Earl of Onslow spent in the service of his country in New Zealand. The water is notable for the magnificent clumps of hardy perennials about its banks as much as for the aquatic plants. There are groups of *Kniphofias*, *Senecio*, *Crambe*, *Inula*, *Verbascum* and other plants, with many Irises in the margins of the water and on the soil immediately adjoining it. Some fine plants of *Rosa rubrifolia* may be seen, and plants of *Iris lævigata*, continuously

in water. Near the Maori Council Chamber (see fig. 43), which is finely carved by New Zealand natives, is a Water Lily pool, the congenial home of these charming Nymphæas, of the Canadian bull frog, whose tones are often heard at certain seasons of the year.

The supply gardens and houses, the historic structure known as Temple Court, now the residence of Lord Onslow's agent, Mr. Bowles; the kitchen gardens, the glasshouses, and the fruit plantations have features of interest to the visitor, and, the excellent condition of the gardens reflect much credit upon Mr. Blake, who has served Lord Onslow as gardener for a period of nearly 20 years. II.

It is too early to estimate this year's seed crops; but it is likely that the seeds offered next season will be from the 1908 crops, in which case the sowings will have to be made much thicker than usual. *P. Aquatics.*

THE NATURAL HISTORY OF CONIFERÆ.

(Concluded from p. 96.)

Thus the design of the conifer, when compared with that of the broad-leaved tree, seems to be rather the result of an alternative policy than

withstand injuries or are exposed to more numerous foes. In other words, it is conceivable that conifers are more vulnerable and more attacked.

This suggestion seems at first sight to gain support when we call to mind the considerable mortality of transplanted conifers that die from desiccation. Yet we are not justified in regarding this fact as denoting any greater susceptibility to injury on the part of conifers when compared with broad-leaved trees: to arrive at any conclusion, it would be necessary to compare the death-rate of transplanted evergreen conifers and dicotylous trees equally suited to the climate and of

NOTES FROM A "FRENCH" GARDEN.

THE Melons planted early in April have been cleared away, and the ground has since been hoed and mulched lightly for the benefit of the Cauliflowers which were planted there five weeks ago. The frames and the lights have been removed to Melons planted under the cloches in the middle of May. This crop must receive careful attention to promote a quick growth, as the fruits should be ready for cutting in September. The lights should be removed from the batch of Melons planted late in April or early in May, as the glass would be injurious to the Cauliflowers growing between them.

Should the weather be dry, caterpillars will cause much damage to the Cauliflowers. These pests should be removed by hand and destroyed. Frequent waterings will act as a slight check to them.

The Carrots sown in the middle of July must be thinned as soon as possible. They will require frequent waterings for the next five or six weeks.

French Beans sown late in July are now well above the soil. The ground should be stirred frequently. The plants are spread out as much as possible by putting some soil in the middle of the clumps.

The Celery blanchéd eight or ten days ago is now ready for market. The beds should be broken up and the soil utilised for the autumn sowings. The main batch of Celery should be given frequent and heavy waterings. If Celeriac is grown, the bottom leaves must be removed from time to time. When the plants are well established, some growers cut off all the side roots with a long knife to throw all the growth into the main root.

Lettuces raised from seeds sown in the middle of July will soon be planted out at a distance of 9 or 10 inches apart. If a succession is required, a few seeds of Lettuce Passion may now be sown to provide plants for out-of-doors late in September.

The winter batches of Endive and Batavian Green should now be planted out. When the ground is very rich they require a distance of 11 to 12 inches apart, but in sandy and poor soil 9 to 10 inches will be sufficient space for them.

A new year begins at this season in the "French" garden, and the grower must arrange for a rotation of crops for the coming year. He must also estimate the quantity of manure he will require for the making of the hot-beds. It is now time to collect the first half, which is termed "dry manure." Where the supply of decayed manure is limited, a substitute may be found in peat-moss. This will be dug in, leaving the decayed manure as a top-dressing. All the frames, lights, and cloches should be examined, and repaired where necessary, and the lights painted.

Cultivation under the "cold" system is likely to be largely adopted in "French" gardens next spring. This method incurs little labour and cost; but it is necessary to have a large quantity of decayed manure in hand, as this system requires a fair amount of this material.

[Photograph by H. N. King.]

FIG. 42.—CLANDON PARK: A CUPRESSUS AVENUE.

necessarily inferior in plan. Yet there remains to be explained the fact of the extinction of many conifers and the general victory of broad-leaved dicotylous trees.

Even if it is admitted that in cold-temperate regions conifers thrive better than dicotylous trees under certain more or less unfavourable conditions, and work quite as well as the latter under some more favourable conditions, it is, nevertheless, quite conceivable that, as compared with broad-leaved trees, conifers are less able to

equal ages. (It would be interesting to have the experience of gardeners as to the relative mortality in the transplanted evergreen, hardy species belonging to the two classes.)

Yet many facts point to the conclusion that conifers are less capable than our broad-leaved deciduous trees of recovering from injury. When their leaves are destroyed by smoke, by fungus, or by insects, conifers readily perish; whereas the Oak and other deciduous trees may be defoliated year after year by insects without any fatal result.

Only few conifers, such as the Yew, can withstand considerable cropping or persistent browsing, whereas broad-leaved trees can be pruned drastically. Again, conifers readily succumb to serious attacks by bark beetles that tunnel in their bark; but the Ash, Elm, and other leaf-shedding dicotyledons can endure the severest attacks of bark beetles for 60 years or more. Even insects tunnelling in wood cause graver injury to the conifer than to the broad-leaved deciduous tree.

We can in part—but only in part—explain the smaller power of recovery of the conifer. In the first place, the dicotyledon has crowds of resting-buds, all ready to develop into new shoots and produce new foliage when occasion arises; moreover, it usually has the power of producing new buds on old parts of the trunk, stump, or roots. The ordinary conifer, on the contrary, has comparatively few resting-buds, and its power of producing new ones on older parts of the tree is limited or wanting. Secondly, when the leaves of a conifer are entirely destroyed by any agency, the tree loses organs that required several years to produce, and whose replacement will demand several years. This loss of foliage represents not only so much loss of substance, but also a prolonged decrease in power of producing new substance. The complete defoliation of a deciduous dicotyledon, on the other hand, involves the loss merely, at most, of one season's crop of leaves; indeed, the lost foliage may be replaced in the same season and within a few weeks of the loss. Thirdly, the weakness of recuperative power on the part of the conifer may be also partly due to a possibly slower rate of working of the tree, and this may result in slower healing of wounds and slower replacement of injured organs.

Finally, the question arises: "Have conifers or broad-leaved deciduous trees the more numerous serious fungal and animal foes?" When we think of the hordes of insects and fungi attacking orchard trees, and when we compare these ravages with the apparently healthy condition of many conifers growing in our gardens, we inevitably gain the impression that the conifers are less attacked by these foes. But the comparison thus instituted is specious: any reliable comparison must necessarily be instituted among wild trees of different kind growing in their own countries and with natural surroundings, and must not be between artificial races of plants and exotic plants far removed from at least many of their natural foes. For this reason I therefore institute comparisons between those coniferous and dicotylous trees that largely enter into the composition of forests in Northern and Central Europe. The result of the comparison (which is given in very abbreviated form in the subjoined table) indicates that evergreen conifers have the larger number of serious foes among fungi and insects, and that the deciduous conifer—the Larch—stands in this respect between evergreen conifers and deciduous dicotylous trees.

	Approximate Number of Species of Serious Foes.	
	Fungi.	Insects.
Common Silver Fir (<i>Abies pectinata</i>)	14	13
Common Spruce (<i>Picea excelsa</i>)	18	30
Scots Pine (<i>Pinus sylvestris</i>)	15	43
European Larch (<i>Larix decidua</i>)	9	18
Beech (<i>Fagus sylvatica</i>)	5	21
Birch (<i>Betula alba</i>)	3	10
Hornbeam (<i>Carpinus Betulus</i>)	2	6
Alder (<i>Alnus glutinosa</i>)	2	7
Ash (<i>Fraxinus excelsior</i>)	2	4

The larger number of serious foes of the conifers may be due either to the longer geologic periods during which their evolution was possible, or to the greater facility of evolution of foes attacking relatively weak victims, or it may merely represent another aspect of the fact that the same degree of hostile attack has a graver effect on the evergreen conifer than on the deciduous dicotyledon. *Percy Groom, D.Sc.*

HARDY FLOWERS AT SUMMERVILLE, DUMFRIES.

A LARGE collection of hardy flowers is cultivated in the gardens at Summerville, Dumfries, the property of James Davidson, Esq. The Eryngiums or Sea Hollies include such species as *alpinum*, *amethystinum*, *Oliverianum* and *Bourgatii*. *Actæa racemosa* is also admirably grown, and there is a good representation of the best of the Helianthus, including such double forms as *Soleil d'Or*, *maximus*, and *plenus*. The genus *Heliopsis* is represented by two or three species and varieties, *levis*, *Wolley Dod's* variety, and *pitcherianus* being, perhaps, the better sorts. *Ligularia macrophylla*, known now as *Senecio Ledebourii*, with *Senecio pulcher*, and one or two other species were fine in their own way. It is seldom we see the Silphiums in gardens, but, at Summerville, *Silphium perfoliatum* variety *connatum* always does well, although it was not in bloom at the time of my visit. It is a good back-row plant, and is distinct, with its bold foliage and its heads of yellow, composite flowers.

spectabile and *C. calceolus*; *Orchis foliosa* was especially fine. An unusually good plant of *Dianthus Napoleon III.* was in bloom. It is still the finest of the Male Pinks, but its profusion of crimson, double flowers exhausts it so much that it is difficult to retain it long, unless it is constantly propagated. A good plant of the rather scarce *Erica cinerea coccinea*, with scarlet flowers, was in bloom in one of the borders. Another good plant was the bright *Prunella Webbiana*, said to be of garden origin, and much finer in its red colour than *P. grandiflora*, which it resembles in habit. There were many other interesting plants in the borders, such as a huge plant of *Philadelphus microphyllus*, which here belies its reputation as a shy flowerer, covering itself annually with its small, white, sweet-scented blooms.

Alpine flowers are mainly cultivated in the front of the borders, or on low rockeries. Among the most successful of the dwarf Irises is the lovely little *Iris cristata*, which spreads into large masses, and flowers very well. *Piblesia buxifolia* requires special treatment, being covered here with a handlight, the top of which is re-

[Photograph by H. N. King.]

FIG. 43.—CLENDON PARK: THE MAORI COUNCIL HOUSE.

Centaureas succeed well, and include the best varieties of *C. montana*, *C. dealbata*, *C. macrocephala*, *C. babylonica*, and *C. ruthenica*. There are large masses of *Sidalcea Listeri* and *S. candida*. Not many of the *Astromeris* are hardy in the district, and *A. psittacina* suffered much last winter, though a small plant is left; but *A. chilensis* is hardier. *A. aurantiaca* and its variety *aurea* very well displayed their glowing orange and yellow flowers. Although not a popular class of plants, a few of the *Symphytums* are worth growing, and, of these, that at Summerville, *S. bohemicum*, is probably the best, with red-purple flowers. *Scabiosa caucasica*, both the typical lavender and the white varieties, do splendidly. *Eriophyllum caspitosum*, frequently known as *Bahia lanata*, was giving plenty of its yellow flowers. *Verbascums*, *Lychnis chalcidonica*, both single and double, and other *Lychnises* were showy; and *Spiræas*, *Astilbes*, *Achilleas*, and other good border flowers were present in variety.

Among the other border plants in bloom at the time of a recent visit, were a fine clump of the Kilmarnock Orchis, and good varieties of some of the other hardy Orchids, such as *Cypripedium*

moved in summer. It is thriving splendidly, and gives many of its scarlet, tubular, *Lapageria*-like flowers. The *Ramondias* and *Haberleas* are most successful here when treated in the same way, and flourish to perfection. In the corner in which these *Ramondias* are cultivated, *Xerophyllum asphodeloides* had just finished its flowering, and the long spike showed how well it had done.

On the rockeries a number of the plants had already flowered. Among those in flower I noted a good plant of *Campanula Tomassiniana*, *C. pulla*, *C. pulloides*, *C. Portenschlagiana*, *C. G. F. Wilson*, the yellow-leaved form, and a good plant of the flower sold as *Campanula alpina*, which is a form of *C. rotundifolia*, the true *C. alpina* being little grown. *Hypericum confusum* was very fine, but *Saxifrages* were nearly out of flower; *Sedums* and *Sempervivums* are well represented in the collection. *Dianthus*es, *Silenes*, *Oxytropis*es, *Ericas*, *Alpine Geraniums*, *Erodiums*, *Potentillas*, *Erigerens*, *Gypsophilas*, *Arenarias*, *Achilleas*, *Androsaces*, *Drabas*, and other favourite genera are well represented in this good and carefully-cultivated collection, the general condition reflecting credit upon Mr. Davidson and his gardener, Mr. J. Wilson. *S. A.*

REMARKS ON THE CONDITION OF THE FRUIT CROPS.

(See Tables and Summaries, ante, pp. 77-82.)

(Continued from page 98.)

4, MIDLAND COUNTIES.

BEDFORDSHIRE.—The fruit crops in this locality are very disappointing, especially with regard to Apples, Pears, Plums, and Cherries. Small fruits are about the average, and the quality is good. I attribute the failure of the Apple, Plum, Pear, and Cherry crops more to unripened wood than to late frosts. Fruits which set became yellow, and dropped. The soil is a light loam, resting on a sub-soil of sand and gravel. *George Mockinlay, Wrest Park Gardens, Ampt-hill.*

BUCKINGHAMSHIRE.—The failure of the fruit crops was, to a very large extent, due to the low temperatures which prevailed from April 23 to May 10. The following dates, with the degrees of frost registered, prove this:—April 23, 5°; 27, 4°; 29, 4°; 30, 5°; May 3, 2°; 5, 1°; 7, 2°; 8, 2°; 9, 7°; 10, 5°. *J. G. MaitGregor, Mentmore Gardens, Leighton Buzzard.*

—The late spring frosts practically destroyed the whole of the Apple, Pear, Plum, Gooseberry, and Currant bloom. In very few gardens, orchards, or allotments in this district are there any fruits. Mid-season and late Strawberries furnished heavy crops of excellent quality; indeed, we have never had a better season for Strawberries. The fruit trees are, on the whole, healthy and clean, with the exception of outdoor Peaches; the young growths of these were badly damaged by frost and wind. Our soil is a heavy retentive loam, resting on clay, and the natural drainage is bad; because of this, our crops are generally deficient in wet seasons. *W. Hedley Warren, Aston Clinton Gardens, Tring.*

—The fruit crops are much under the average; the cold nights during the time the trees were in blossom caused the flowers of Apple and Pear trees to drop, in many cases before they had expanded. The best crops of Apples are found on pyramidal trees, the varieties Grenadier, Lod-dington Seedling, Lane's Prince Albert, and Peas-good's Nonesuch being amongst the best of the culinary varieties, whilst of dessert kinds Cox's Orange Pippin, King of the Pippins, Wealthy, James Grieve, and Charles Ross are carrying good crops of clean fruits. Pears are a failure, except on walls. Cherries, which are largely grown in this neighbourhood, were not more than half a crop, and the fruits cracked badly through the wet. Gooseberries are an average crop, and very good. Black Currants, which are largely grown here by market gardeners, are a failure. Strawberries were a good crop, but the berries were depreciated by the rains. *Chas. Page, Droppmore Gardens, Maidenhead, Bucks.*

DERBYSHIRE.—The crops of Apples, Pears, and stone fruits are disappointing. There was an abundant show of blossom, which failed to set, owing, no doubt, to last year being dull and sunless. Small fruits are good average crops, and the trees, so far, are clean. Strawberries have furnished a good crop of fine quality berries. The old Black Prince variety is still one of the best sorts. This, with Royal Sovereign, President, Dr. Hogg, Gunton Park, and Waterloo, form six of the very best varieties for small growers. Raspberries and Loganberries are looking well. The latter is one of the most useful fruits of recent introduction. The Loganberry is very satisfactory when planted under glass in a cool house, where the fruits ripen a month earlier than on plants in the open. Vegetables are looking well, and Potatoes escaped the late frosts. One of the best early Potatoes is May Queen, whilst of Early Peas, Bountiful is a good cropper and of fine quality. *Bailey Wadds, 181, Uttorester New Road, Derby.*

HERTFORDSHIRE.—Apples, Pears, and Plums are much under the average, and in many gardens they are a complete failure. In a few sheltered gardens the trees are carrying average crops. The Plum crop is the worst in this district for 20 years. All kinds of fruit trees gave promise of good crops until Tuesday, May 3, when 9° of frost were registered. *C. E. Martin, The Hoo Gardens, Welwyn.*

—Although fruit trees generally promised well for good crops early in the year, the late frosts and long continued easterly winds in spring severely damaged the young fruits. The Pear and Plum crops were ruined while the trees were in full bloom; most of the Plums that escaped the frost, also many Apples, shrivelled and fell from the trees as a result of the cold winds. Peaches are carrying moderate crops of good fruits. Small fruits are good, and Strawberries have been plentiful. Insect pests have been very troublesome to fruit trees this year. *H. Prime, Hatfield House Gardens, Hatfield.*

—The fruit crops in this locality are very bad. Apples are scarce, whilst the Pear and Plum crops are failures, especially on stand-ard trees. There was a good promise for a bountiful fruit year, but the late frosts ruined the blossom, and, in many cases, the damage was done whilst the flowers were in the bud stage. Peach and Apricot trees, which were protected, are carrying good crops. Our soil is a stiff clay. *Edwin Beckett, Aldenham House, Gardens, Elstree.*

—With a few exceptions amongst small fruits, the fruit crops in this district are failures such as we have not experienced for some years past. Apples are bad, although a few varieties, such as Lane's Prince Albert, Stirling Castle, Keswick Codlin, and Robert Fish, are showing an average yield. Boskoop Giant Black Currant is again proving a good and productive variety. *Wm. Whitelaw, Batchwood Gardens, St. Albans.*

LEICESTERSHIRE.—As stated by *Southern Grower* in the issue for July 9, there is a "mystery" surrounding the partial failure of the crops of Apples, Pears and Plums. There was an abundance of bloom on all the varieties of fruit trees, but it was of a very fugitive nature and failed to set, especially on trees exposed to the north-east winds which prevailed during the time the trees were in bloom. Apple trees in sheltered positions have full crops of fruit. A market grower in this district, who last year had not a single bushel of Apples on his trees, informs me he has a good average crop of Apples this season. This confirms my opinion that there was a lack of stability in the fruit buds on trees which carried a crop of fruit last year. There are no Plums or Pears, except on the wall trees. The Strawberry crop was very promising at the time of flowering, but owing to drought in June many of the flowers failed to develop. The heavy rains and dull days of July caused many of the berries to decay. There is a good average crop of Red and White Currants, whilst Raspberries and Loganberries are above the average. Gooseberries in the kitchen garden are more than an average crop, but orchard bushes are a failure, owing, mostly, to birds destroying the buds; this also applies to standard trees of Plum and Damson. Aphids and caterpillars have been very troublesome this season. *D. Roberts, Prestwold Hall Gardens, near Loughborough.*

—All kinds of fruit trees blossomed very freely with the exception of Pears on walls, which, however, set their fruits well, and have an average crop. The failure of the Apple crop cannot in this district be attributed to cold during the flowering period, because, with the exception of May 8 and the three following days, when only the earliest trees were in flower, the weather was very good. It is interesting that the trees which flowered during those four cold days have good crops; I am convinced the failure of the fruit crop is due to a deficiency of sunshine in the autumn of 1909. The only failure that can be attributed to spring frosts is the Gooseberry crop. A few bushes of these, partly sheltered by pyramidal Pear trees, have borne well; cordon Gooseberries on a north wall are carrying good crops, whilst those bushes quite in the open have none. All fruit trees are much cleaner than usual this season. *W. H. Divers, Belvoir Castle Gardens, Grantham.*

NORTHAMPTONSHIRE.—The failure of the fruit crops is due chiefly to several frosts which occurred when the trees were in flower. The soil is heavy, being principally clay. *Robt. Johnston, Wakefield Lodge Gardens, Stony Stratford.*

—There was a good show of blossom, but, owing partly to immature wood, the flowers were very weak. At the flowering period of Apple

trees we experienced abnormally dry weather and the fruits failed to set. Plums on walls are good, but we have scarcely any fruits on bush and standard Plum trees. Raspberries are very good. Our soil is a light, porous loam, overlying limestone rubble. *A. R. Searle, Castle Ashby Gardens, Northampton.*

NOTTINGHAMSHIRE.—There was a good promise for fruit in the spring, all fruit trees being covered in blossom, but cold winds caused many to drop. Apricots, Peaches and Nectarines were protected at night time while they were in bloom, and these have good crops. Apples are an average crop, but Pears are not so good. Cherries of all kinds have been extra good. Plums are about the average. Gooseberries, Red Currants and Raspberries are all very good, but Black Currants are poor. Strawberries have been very plentiful and of splendid quality. Our soil is of a light texture, on a subsoil of sand. *James B. Allan, Osberton Gardens, Worksop.*

—With the exception of Strawberries and Red Currants, the fruit crops are almost failures. Blossom was abundant on all the trees, but in the case of Plums it was small and weak, and probably partly from weakness and also from the sunless weather and cold winds the fruits failed to set. Of Apples, Bramley's Seedling, Newton Wonder, Lord Grosvenor, and Stirling Castle are the only varieties carrying fruits. Pears and Cherries are poor, and Black Currants dropped nearly all their fruits. Gooseberries are about half a crop. Wall trees have only a partial crop. *J. R. Pearson & Sons, Loughdam, Notts.*

OXFORDSHIRE.—This is the worst fruit year we have experienced for twenty years. Apples are a complete failure in many gardens; absence of bloom in the spring was very noticeable. Strawberries have been good, especially the variety Kentish Favourite. Black Currants are good, but we have very few Pears, Gooseberries, Currants (Red and White), Damsons or Apricots. Peaches out-of-doors are fairly good. Our soil being a light loam, resting on gravel, a showery season benefits flowers and vegetables. Roses are especially fine. *J. J. Hall, Shiplake Court Gardens, Henley-on-Thames.*

—Apple trees in this district did not bloom well, and fruits are very scarce. Plum trees were a mass of bloom, and at one time promised to give good crops, but when the fruits were about the size of peas nearly all turned yellow and dropped. Pears also bloomed well, but the weather was very cold, and scarcely any fruits set. Apricots, Peaches and Nectarines appeared to be affected by the same cause. The hail storms in June destroyed large quantities of Cherries. Raspberries, Strawberries, Currants and Gooseberries are all good crops, although some of the Strawberries were damaged by wet. The soil is very stony and shallow, requiring more manure than most gardens. *A. J. Long, Wyfold Court Gardens, Reading.*

SHROPSHIRE.—The fruit crops are very unfavourable, owing mostly to frosts and cold, dry winds when the trees were coming into bloom. Apples experienced an extra bad attack of the codlin moth; the orchard trees were not grease-banded this year and suffered severely in consequence. Apple trees in the kitchen garden were sprayed, and they escaped the pest, thus proving the advantage of preventive measures. *Alex. Haggart, Moor Park Gardens, Ludlow.*

WARWICKSHIRE.—The fruit prospects early in the season were very good. There was an abundance of blossom, but, owing to east winds and late frosts, all stone fruits and Apples are under the average. Small fruits are very good and well up to the average. Strawberries have been particularly fine, especially the variety Leader. The soil in these gardens is of a light nature, and the subsoil gravel. *Chas. Harding, Rayby Hall Gardens, Alcester.*

—The fruit crops this season, with the exception of Strawberries and Apples, are very disappointing. Small fruits in particular are very scarce, partly owing to frosts during the flowering period. Stone fruits are much under the average. Apricots and Cherries bring almost failures. Plum trees blossomed freely, but the fruits set badly. Pears set better, but are not

up to the average. Figs in the open are much over the average, and providing the weather is favourable we shall have a good crop of this fruit. The soil rests on a gravel subsoil, and soon becomes dry. *H. P. Smale, Warwick Castle Gardens, Warwick.*

5. SOUTHERN COUNTIES.

BERKSHIRE.—The Apple crop is mostly a failure, although there are a few trees with a fair number of fruits. Pears and Plums are also scarce. Amongst small fruits, Gooseberries are above the average and very good in quality. Raspberries are about the average, whilst Strawberries have been very plentiful, although the berries have lacked good flavour. *J. Howard, Benham Gardens, Newbury.*

— Although the trees flowered freely. Apples, Pears and Plums are extremely scarce, and many of those fruits that we have are cracking and dropping. *W. Fyffe, Lacking Gardens, Wantage.*

— The crop of Black Currants is very bad, owing to spring frosts. We have had a good crop of Strawberries. Raspberries are small. Plums and Quinces are scarce. The soil in this locality is clay. It produces excellent crops of Wheat, Barley, Oats, and Beans. *Edward Freed, East Hendred, Stevenon.*

(To be continued.)

THE ALPINE GARDEN.

SAXIFRAGA FLORULENTA.

Of all the Saxifrages I have collected, this august and lonely plant is by far the most sensational to discover. Seen high above one's head, impregnable in the face of a dark granite cliff, the rich, glassy-green rosettes have a rare and impressive brilliancy. They are like nothing else I know, and their opulent verdure seems almost inappropriate in those gaunt places. The species, of course (it is rumoured that certain standard works do not know it as well as they should), stands far apart from all its kindred in a splendid isolation, possibly the oldest of all existing Saxifrages, and it is certainly among the grandest. It does not occur anywhere in the world except on the primary rocks of the Maritime Alps, in the ranges that centre round the great mass of the Argentera. To the west it extends to certain glens above St. Etienne de Tinée; it finds its easterly limit in the Valmasco Valley, where it is rare and poor. Elsewhere, within these bounds, it may be sighted by the persevering traveller in vertical rock-faces at about 7,500 to 8,000 feet, generally preferring, where possible, a directly easterly exposure (so as merely to have a few hours sunshine in the morning), but not showing itself very rigid in the matter of aspect, so long as it can be certain of a perfectly vertical position.

From repeated and almost intimate acquaintance with the plant this season, I have gathered one or two notions that may have a bearing on the problem of its culture. In the first place, its specific name is wrong and misleading. *Saxifraga florulenta* is not slow to flower—at least, not by any fault of its own. Its aim in life is to grow as quickly as it can, flower, and die. Unfortunately, it very often germinates in crevices that fail to offer it congenial soil or scope. And these plants it is that live on to an immense age, perpetually hanging fire, and unable to attain flowering strength. They form deep cones of dead foliage, with a dwindling rosette at the top, and at last they give up the struggle and die flowerless. One sees such ineffectual corpses on every other ledge, looking like sodden tufts off a poodle's tail. But more fortunate plants, which can follow their own inclination, grow merrily on into huge, wide rosettes and flower in about their fifth year from seed. I suppose I may have seen some

thousand plants: never once did I see an old specimen flowering: all the spikes were being thrown up by big, but quite young, rosettes, which in some four or five seasons had expanded to a stretch of 5 or 6 inches across. *S. florulenta*, then, either hurries on through a short life into flower if it can, or else it spins out a long and barren existence, which proves abortive in the end. If it doesn't succeed in getting up flowering force by its sixth or seventh year, I should doubt if a given specimen would ever flower at all. From comparing this season's leaves with those made last year, one can judge how very quickly the plant develops if circumstances allow. Clearly, generous conditions and culture are indicated.

But the vertical position is even more clearly indicated and stringently insisted on by *S. florulenta*. Never does it abandon this: even though I found it growing actually in moraine among *Viola nummularifolia*, it was always on its side, sheltered by slabs of stone. The appearance of the plant is deceptive, though not in the least villous or downy, but hardy and glossy emerald, and as spiny as any Juniper to touch, the plant has a far intenser hatred of surface moisture than anyone has

FIG. 44.—*CISTUS PURPUREUS*, THE PURPLE-FLOWERED ROCK-ROSE.

yet allowed for. The reason for this strange fantasy may lie far back in the ages that saw the plant's evolution: the fact of it remains, and has to be coped with. Not only does *S. florulenta* invariably keep the vertical position in cliff or cave, or even open moor, but one can also gather the same lesson from its peculiar characteristic habit. For whereas *S. longifolia* recurves its leaves to welcome rain, *S. florulenta* always incurves its leaves, like an irritated Sea Anemone, so as to be doubly certain that the inner surface of its rosette receives no undue moisture. When you see the plant growing you at once realise the significance of that curious symptom. More than this, to make the explanation yet more inevitable, *S. florulenta* does, at last, recurve its foliage and open out. But this only happens when the plant is about to flower and die.

The mystery still remains why those hard, shiny, indestructible-looking leaves should have such a morbid horror of moisture. That they have it, though, is certain, and in that idiosyncrasy lies, I believe, the only real difficulty about cultivating the plant. In itself, *S. florulenta* has every sign of being a hearty and amenable species, asking only for generous cultivation, to grow ahead rapidly, to flowering size (alas! it

never proliferates; clumps and apparent offsets are only symbiotic seedlings). But it must be grown in such a position that overhead moisture does not lodge in the rosette, or even visit the rosette unduly. Moisture in the soil it requires, and tolerates almost to the extent of thriving in water runnels on a cliff. But its real good nature is foreshadowed by its indifference as to compost. I have seen it thriving equally heartily in moraine-dust, in peaty humus, in mossy silt, and in rich, yellow turfy loam. It is always on the granite, though, and can never, it seems, be too tightly and pitilessly squeezed into a crevice. It also shows its vigour by the readiness with which it appears to germinate wherever the seed falls, even if it be upon detritus, amongst grass and weeds, at the foot of a cliff.

Rare and restricted as this strange species is, it is nevertheless very abundant in the chosen places of its range: were it not for its incapacity to make headway against an uncongenial crevice, it might even be a spreading species. In nature it even tolerates full exposure to sun, but that shady gullies, just above the last Pines, are its favourite dwelling place, affords a significant hint. For some years past I have grown the plant in pots, losing a few annually, because, as I now realise, the pot stood level on the ground, and the rosette sat level on the pot. Encouraged by the fact that some survived, and inspired by personal acquaintance with the plant at home, I believe that, with rich soil and the horizontal position, one ought never again to lose a plant of *S. florulenta*, except through the glorious consummation of its flowering. On the cliff, I have from last year a fine, large rosette now established, and apparently unresentful of a calcareous cranny. I hope to put more specimens in various soils and minute crannies, in expectation that I may someday see that glorious viscid spike of nodding rose-pink bells. *Reginald Farrer.*

CISTUS PURPUREUS.

THIS is the finest red *Cistus* in cultivation. On several occasions I have found an inferior plant grown under its name, and have been surprised how rare the true plant really is. It grows about 4 feet high in a few years, and produces numerous flowers over a considerable period, each flower being nearly 3 inches in diameter. The colour is lilac-purple; at any rate, that is the nearest to it in the *Répertoire de Couleurs* published by La Société Française des Chrysanthémistes, but the great beauty of the flower is enhanced by the large, ruby-red spot near the base of the petals. In addition to this, and at the extreme base of the petal, hidden by the numerous yellow stamens, is a yellow blotch. The habit of the shrub is somewhat spreading, being quite as broad as it is high. It branches freely, and all the younger stems are clothed with a rusty pubescence. The leaves are usually oblong in shape but they vary to some extent, being sometimes broadest above the middle. They are slightly rugose, and covered with stellate hairs on the under side. The petioles are short, and joined together to sheath the stem. The flowers are terminal on the branches, and usually there are three together, two being frequently open at the same time. The young stems are somewhat sticky, and the resinous secretion exhales a peculiar fragrance. The sepals are broadly ovate, and, like the leaves, are covered on the under side with stellate hairs. The petals are broader than they are long, measuring $1\frac{3}{4}$ inches across, and overlap considerably; they are very broadly wedge-shaped: the filaments are yellow, and the anthers orange-coloured; the ovary is very densely clothed with silky hairs, and the style is very short, the stigma large and papillose.

Cistus purpureus (see figs. 44, 45) has been regarded as a native of the Levant, but Grosser, in Engler's *Pflanzenreich*, which includes a

Monograph of the Cistaceæ, describes it as a garden hybrid between *C. ladaniferus* and *C. villosus*. There is strong support for the correctness of this view, for a wild specimen has never been seen, nor have capsules or seed ever been described. This is the only purple flowered *Cistus* figured in Sweet's Cistaceæ that has the fine basal spots which make the plant so distinct and ornamental.

This brings me to the other kinds with spotted petals, and I find that all of them are garden hybrids, originating from *Cistus ladaniferus maculatus*, as the parent responsible for the spots. There is, however, I believe, only one other hybrid in cultivation, viz., the well-known *C. cypricus*, a cross from *C. laurifolius*. It is a free-growing shrub, with white flowers and dark-maroon-red spots, similar to those of *C. ladaniferus maculatus*, but differing rather in shape, being much rounder. The flowers are several in each inflorescence, while those of *C. ladaniferus* are borne singly. It is a very fine plant, flowering very freely for several weeks, and possessing a very great degree of hardiness. A spotted hybrid not now cultivated, I believe, is *C. Loretii*, a cross between *C. ladaniferus maculatus* and *C. montspeliensis*. A plant with spotted yellow flowers, sometimes known as *Cistus algarvensis*, is, of course, not a *Cistus* at all, but rather a *Helianthemum*, though Grosser, in the Monograph referred to above, adopts the genus *Halimum* of Dunal, and calls the plant *H. ceymoides*.

These spotted *Cistus*es are among the finest of ornamental flowering shrubs for garden decoration. They are very readily cultivated, and strike freely from cuttings. Though slightly tender, they have not been injured in the Cambridge Botanic Garden for some years past. *R. Irwin Lynch*.

THE ROSARY.

FEATURES OF THE PRESENT SEASON.

We have had very changeable weather in Mid-Sussex. A few hours have frequently been followed by chilly spells, whilst the amount of rain in June and July was greater than I remember in any previous year. A short time ago we had hailstones of a size I hesitate to mention. The storm was so local that one of our adjoining grounds scarcely felt it. In the other, the hail penetrated the blossoms like small bullets. Even Pea pods were traversed the whole of their length in some few instances.

It has occurred to me, in looking over the Roses, that, no matter what the season is like, a considerable number of varieties do well; they are what a friend called "all-season varieties," such, for example, as *Mme. Ravary*, *Mme. Abel Chatenay*, *Caroline Testout*, *Viscountess Folkestone*, *Kaiserine Augusta Victoria*, *Captain Hayward*, *Conrad F. Meyer*, *Dupuy Jamain*, *Fisher Holmes*, *Frau Karl Druschki*, *Mme. Antoine Mari*, *Georges Nabonnand*, *Gruss an Teplitz*, and *Killarney*. Unfortunately, there are several varieties of very little service except in favourable seasons.

I do not call to memory any season when such climbers as *Crimson Rambler*, *Blush Rambler*, *Dorothy Perkins*, and the many beautiful hybrid *Wichuriana*s have been more universally good. Mistakes in association of varieties are still far too frequent, such, for example, as placing *Dorothy Perkins* against a pale-red brick wall, or *Crimson Rambler* against a dark-coloured one.

In one instance a plant of *Dorothy Perkins* climbs over a light-coloured verandah on the next house to one built of pale red bricks. In another instance, a long row or hedge of drooping varieties is marred by the comparatively upright growth of *Blush* and *Philadelphia Ramblers*, with a few similar-habited varieties interspersed among those of very pendant character. I cannot help thinking that, grand

as the present effect is, it could have been improved if the same habit of growth had been maintained in all the plants. These are merely a few impressions that have struck me more forcibly since the advent of so many good climbers; but the same idea applies to beds of *Roses*, and it would be well to pay a little more attention to the style of growth when planting.

The stocks were never more promising, and the frequent showers have, at any rate, been very welcome to the budders, keeping the sap nicely active. At the time of writing (August 4), we have scarcely touched a standard stock, so we are greatly behind. However, the showers have kept the shoulders growing, and, in conjunction with shortening them when they first reached 18 inches or so, have caused the base of the shoulder to swell in a pleasing manner. We think this a better plan than to bud upon the shoulder as soon as it is large enough. In the latter case the Rose bud is frequently overgrown by the whole season's swelling.

Now the first crop of flowers from the Teas and their hybrids is passed, the plants are breaking into growth in a very promising manner. Perhaps I should not have written "is passed," for

[Photo, taken by Irwin Lynch.]

FIG. 45.—*CISTUS PURPUREUS* IN THE CAMBRIDGE BOTANIC GARDEN.

when does that occur with these beautiful sections, between mid-June and the advent of frost?

SPORTS FROM DOROTHY PERKINS.

THIS grand climber has produced several very beautiful sports. I should like to know if any reader has noticed the tendency of the sports to revert to the normal variety. I have *White Dorothy*, with a flower-truss having in the centre blooms of pure *Dorothy Perkins*. In another case, where a large number of buds has been worked, there is one plant at present that is unmistakably *Dorothy Perkins*. Now, in working some 800 of these, with the stocks following one another, it is quite inconceivable that one particular bud should have come from any variety other than *White Dorothy*. A very promising sport which appeared here some three years ago has a piece of the original variety in the centre of a truss, and the growth from one eye upon a standard has reverted similar to *White Dorothy*. Both sports from *Heinrich Schultheis*, namely, *Merrie England* and *Mrs. Harkness*, sometimes revert, and the two sports from *Comtesse d'Oxford*, namely, *Pride of Reigate* and *Pride of Waltham*, have reverted, whilst the sports themselves have appeared simultaneously upon the same plant. *A. P.*

LARGE-LEAVED ANTHURIUMS.

IN the days when fine foliaged stove plants were more popular than they are at the present time, the advent of a decided novelty was sure to attract a good deal of attention. This happened particularly in the case of *Anthurium Veitchii*, which still remains one of the grandest of all foliage plants to be seen in the stoves.

It was discovered and introduced by *Gustave Wallis*, when travelling in *New Grenada* for *Messrs. Veitch*, from 1872 to 1874. When distributing the plant in 1878 *Messrs. Veitch* described it as a very handsome Aroid of striking aspect, and this must certainly be regarded as a very modest estimate of the plant.

The leaves, which are supported on stout, upright stalks, are from 3 feet to 5 feet in length, and 1 foot to 1½ feet in width. A striking feature is furnished by the principal veins, which diverge from the midrib. They are arched in shape and deeply sunk, thus giving a waved appearance to the whole leaf. This character is still further enhanced by the deep, glossy green colour and metallic lustre, particularly when the leaf first ex-

pands. When this *Anthurium* was first distributed plants were sold at three guineas each and upwards, and, what is more, large numbers were disposed of, though nowadays such a price would be almost prohibitive.

Another very striking *Anthurium* sent home by the same collector, and distributed at the same time is *A. Waroquanum*, whose leaves in good examples attain a length of 2 feet to 3 feet. They are broadest at the base, and come gradually to a point. In colour they are of a rich deep green with a velvety lustre, while the midrib and veins are of a lighter tint.

Anthurium crystallinum, a native of *Colombia*, is an older plant than those mentioned previously and the leaves, though large, do not attain the same size. Still they are so exceedingly beautiful that this species must be regarded as one of the choicest of the entire genus. The blade of the leaf is heart-shaped, and of a rich, bright velvety green, while the course of the midrib and principal veins is marked with silvery bands. The young leaves are of a striking purplish tint. A good deal of variation is to be found in the markings of the leaves of *A. crystallinum*, some being in this respect decidedly superior to others. The finest form is sometimes met with under the varietal name of *magnificum*. There is

also a well-marked variety known as *A. crystallinum illustre*, in which the leaves are variegated in various ways with creamy white.

For their successful culture the Anthuriums above mentioned need a compost of an open, fibrous nature, effective drainage, and ample supplies of water at all seasons, but especially when the plants are growing freely. A stove temperature, a liberal amount of atmospheric moisture, and shading from the sun are also essential.

In none of these Anthuriums are the flowers at all showy. A hybrid between *A. Veitchii* and *A. Andreanum*, known as *A. mortfontanense*, has large, crimson spathes, but from a foliage point of view it is not to be compared with *A. Veitchii* itself.

There are many other large-leaved Anthuriums, and numerous hybrids have been recorded, but those above named are not only the best, but practically the only sorts in general cultivation. The flowering kinds, represented by *A. Andreanum* and *A. Scherzerianum*, with their varieties and hybrids, are more popular than those that produce ornamental foliage. *W.*

The Week's Work.

PLANTS UNDER GLASS.

By JOHN DONOGHUE, Gardener to JOSEPH PICKERSGILL, Esq., Bardon Hill, Westwood, Yorkshire.

Dieffenbachia.—This useful stove Aroid is a very decorative plant, and, although it succeeds best in a stove temperature, it will thrive well in an intermediate house. Propagation may be effected at any season of the year. Cuttings inserted in small pots will soon form roots, but if a considerable number of plants is required, the quickest method of propagation is by division of the old stem; each piece should contain one or two eyes. They must be placed in well-drained, shallow pans or pots, filled with sandy material, and plunged into bottom heat. As soon as growth commences, pot them singly into small pots. Plants of a useful decorative size may be cultivated in pots 6 inches in diameter. Young stock is preferable to cut-back plants, therefore, where specimens are desired, several plants should be potted together and repotted into pots or pans as they develop in growth. When the pots are well filled with roots, weak liquid manure may be given alternatively with clear water.

Heliconia.—The culture of this plant is similar to the *Dieffenbachia*.

Bougainvillea.—Plants which have completed their season of flowering should be hardened off out-of-doors. They should remain outside as long as the state of the weather will permit. Although *Bougainvilleas* will stand a few degrees of frost during the resting period, it is safer to place them in a cool greenhouse where frost is excluded during the winter.

Clatrodendron fallax.—Plants of this species may now be afforded more exposure to sunshine, and a free circulation of air should be maintained on all favourable occasions. Syringing may be dispensed with altogether, but an occasional damping of the stages on bright days is necessary. A temperature of about 60° during the flowering season will suffice. Extreme care must be exercised when applying water, as excessive moisture at this stage will seriously affect the development of the flowers. Afford the roots occasional top-dressings.

Begonia Gloire de Lorraine.—The latest batch of plants should be repotted into their flowering pots without further delay. The compost should consist of the best fibrous loam and peat, with sand, charcoal, and a small quantity of well-decayed sheep manure. The roots should be treated with care when potting, as the potting compost at this stage, being of a lumpy nature, is liable to cause them injury. These *Begonias* grow rapidly during August and September, and, if in good health, they will make luxuriant foliage. An occasional watering with soft-water helps to impart a dark-green colour to the leaves. The atmosphere should be constantly charged with moisture. Continue to shade the plants during hot weather, and damp both the stages and paths occasionally with weak farm-yard manure.

THE HARDY FRUIT GARDEN.

By A. R. SEARLE, Gardener to the Marquis of NORTHAMPTON, Castle Ashby, Northamptonshire.

Apples.—These fruits are very scarce in this district, but some of the freer fruiting varieties, such as Keswick Codlin, Lane's Prince Albert, Lord Suffield, Lord Grosvenor, and Schoolmaster are carrying fair crops. If any thinning is necessary, this should be done now for the last time: these surplus fruits may be used for making tarts and puddings. Occasional waterings with liquid manure will benefit the trees and assist the fruits in developing to a large size. Early dessert varieties, such as Irish Peach, Early Harvest, Mr. Gladstone, Beauty of Bath, Langley Pippin, and Lady Sudeley, should have nets placed over them to protect the fruits from birds. American blight is developing on some of the old trees; measures should be taken at once to combat this pest, dressing the infested parts with methylated spirit or with the mixture recommended in a former Calendar.

Figs.—The crop of Figs out-of-doors is much better than last year. The fruits are swelling rapidly, and should now be finally thinned to three or four on each shoot. Allow the leading growths to extend where space permits, as these, when well ripened, will produce the finest fruits next season. Fasten the shoots securely to the wall, and avoid shading any of the fruits when doing this. Train in those growths which have short joints and are firm in texture, as these mature the best and are consequently the most fruitful. Cut out all weak and useless growths, so as to avoid overcrowding of the shoots, it being very important that the fruiting wood matures properly. Expose the fruits fully to the rays of the sun, as this is essential to good flavour, and do not gather them before they are quite ripe. Continue to apply liquid manure to old trees carrying heavy crops, and renew the mulching material if necessary. Discontinue the application of manual stimulants immediately the fruits show signs of ripening, and afford less moisture, otherwise the fruits will be liable to splitting. Ripe fruits must be protected from birds and wasps, either tying them in muslin bags or covering the trees with wasp-proof netting.

THE ORCHID HOUSES.

By W. H. WHITE, Orchid Grower to Sir TREVOR LAWRENCE, Bart., Burford, Surrey.

Cattleya.—When such plants as *Cattleya gigas*, *C. Rex*, *C. Dowiana*, and its variety *aurea*, also the hybrid *C. Hardyana*, pass out of flower, they should be kept on the dry side for a few weeks, and be exposed to more light and air than at any other time. The compost should not be kept very wet, otherwise the roots will not grow from the newly-made pseudo-bulbs in the free manner necessary to recover the vigour of the plants after flowering. Should any of these plants need repotting, commence the operation immediately young roots begin to develop. Use the best *Osmunda* and *Polypodium*-fibres in equal parts, with plenty of small crocks intermixed. Afford plenty of drainage materials. Pot each plant firmly, and see that the rhizome of the plant is kept just on a level with the rim of the pot. Pack the compost well up under the pseudo-bulbs, gradually sloping it down towards the pot-rim, so that, when watering, the moisture will settle more to the sides than the centre. When repotted, the plants should be placed at the cooler end of the *Cattleya* or intermediate house, where they will be exposed to the light and air. Until the plants are re-established, only sufficient moisture is necessary to prevent the roots perishing. With copious waterings after flowering, plants are apt to start away into growth instead of taking the long rest that is necessary. *C. speciosissima* should be treated likewise, although the plant will stand more drying during the resting period than any of the others mentioned. This plant thrives best when suspended near to the roof-glass in the *Cattleya* house. Plants of *C. Gaskelliana* now commencing to root may also be repotted, care being taken to cause only the least possible disturbance to the old roots so as not to affect the flower-buds now beginning to show themselves.

Lalia.—*L. purpurata*, *L. tenebrosa*, *L. cinnabarina*, and many of their hybrids should now be examined in order to see if more root-room is required. By this time their new growths will have increased a few

inches, and they will soon produce roots. When giving plants larger pots, cut away old and useless back pseudo-bulbs. If two or three are left behind each leading growth, it will be found sufficient. Enough space should be allowed in the receptacle for at least two seasons' growth. Old plants which require to be broken up should now receive attention. All worn-out pseudo-bulbs and dead roots should be cut away, the decayed compost removed, and the pieces potted separately into pots as small as it is possible to get them in, so that, when they again become well rooted, they may easily be shifted into larger ones.

Stanhopea.—The *Stanhopeas* are suspended well up to the roof-glass in the intermediate house. Several of the earliest-flowering varieties are now pushing their spikes, and where a fairly representative collection is grown, there will be blooms on some for several months to come. Among the best are *S. eburnea*, *S. insignis*, *S. Wardii*, *S. Rodigasiana*, *S. Mastersii*, *S. tigrina*, *S. florida*, *S. platyceras*, *S. Lowii*, *S. saccata*, *S. Amesiana*, *S. Devonensis*, *S. oculata*, and *S. Bucephalus*. These should be supplied abundantly with water at this season, but when the flowers begin to open, being very fugacious, care must be taken to avoid wetting them. When watering plants in flower, lay them carefully on their sides, water them thoroughly, and, before suspending again, allow them sufficient time to drain properly. For the present, keep the plants well shaded from the sun, but when growth is completed and the flowering season over, they may be gradually exposed to more light and air, and the amount of water at the root lessened by degrees.

Vanda.—At this season *Vandas* of the *V. tricolor* and *V. suavis* section often lose a number of their lowermost leaves. The East Indian house is too warm for them. What they need is a well and evenly-balanced intermediate temperature, a constantly-moist atmosphere, and sufficient water at the root to keep the *Sphagnum*-moss in a fresh and growing condition. Afford the plants plenty of fresh air, and shade them from sunshine.

THE FLOWER GARDEN.

By E. BECKETT, Gardener to the Hon. VICARY Gibbs, Aldenham House, Hertfordshire.

Shrubs at present in flower.—There are few, if any, flowering shrubs more worthy of extensive cultivation than the better forms of *Buddleia variabilis*, with their large trusses of handsome flowers, varying in colour from pale lavender to deep purple. At Aldenham we have raised many plants from seed obtained from China two years ago. These seedlings are now good flowering specimens, and are making a grand display, both in the shrubberies and at the back of the hardy flower borders. Two of the best varieties in commerce are those known as *magnifica* and *Veitchii*. The flowers are very attractive to coloured butterflies. Of *Spiræas* now in flower, the varieties of *Spiræa japonica* make neat bushes for cultivation in various positions in the flower garden, and are very free-flowering. The variety *Anthony Waterer*, when obtained true, is valued for its rich, red flowers. *S. j. Balmalda* is not so rich or bright in colour; the variety *ruberrima* has flat heads of dark red flowers. Other *Spiræas* at present in flower are *S. Douglasii*, an excellent plant for the woodlands, producing masses of pink flowers, and *S. Aitchisonii*, with elegant foliage and white flowers. Among the *Broom* family, *Cytisus nigricans* is flowering very freely, and it makes a dense, round bush. *C. leucanthus* or *schipkaensis* is a dwarf shrub, with pale flowers, and forms a useful plant for the rockery or front of the shrubbery. *Genista tinctoria*, the "Dyer's Greenwood," is also conspicuous. *Ceanothus Gloire de Versailles* is a grand subject for training against a wall or similar support.

Variiegated shrubs and trees.—At this season of the year, when flowering shrubs are few, the value of variegated trees and shrubs is especially obvious. Though, in most cases, the plants are poor growers, there are many exceptions, and the following may be recommended as free growers of the deciduous section:—*Acer Negundo-variegatum*, *A. N. versicolor*, and the white and yellow variegated forms of *Aralia chinensis*. The two variegated forms of the Spanish Chestnut make handsome trees, as also do the several variegated forms of *Cornus alba*, such as *Spathii* and

variegata, and these will thrive almost anywhere. The coloured forms of *Cornus Mas*, the Cornelian Cherry, although not so free as the species already mentioned, make interesting shrubs. *Kerria japonica* variegata, the two variegated varieties of *Philadelphus coronarius*, the *Sambucus nigra argentea* variegata are all of free growth. Of evergreen, there may be mentioned *Aucubus*, *Hollies*, *Box*, *Aristotelia Macqui* variegata, *Eleagnus glabra* variegata, *Eunymous* in variety, *Tree Ivies*, *Osmanthus*, and *Vincas*.

Montbretia.—*Montbretias* are now developing their flower-spikes. The plants should therefore be examined, and, if necessary, supports given in the neatest manner possible. The newest hybrids of these are distinct improvements on the old *M. crocosmiflora*, producing flowers on large, arching sprays, while many of the individual blooms are 3 inches in diameter. If the ground is dry, afford a good soaking of water. The flowers are extremely useful for house and table decoration, and the spikes remain in excellent condition for several days in a cut state.

General work.—The seedlings from the late sowing of *Mignonette* should be thinned out, allowing the plants ample room to develop. Remove any batches of annuals that pass out of flower or become unsightly. Continue to tie up and attend to plants on the borders. Keep the hoe at work amongst the transplanted subjects intended for spring bedding, and induce these to form neat, bushy plants. Syringe all *Roses* that require it, whether for fly or mildew. Apply dustings of artificial manure during showery weather to border *Chrysanthemums* and *Dahlias*.

THE KITCHEN GARDEN.

By JOHN DUNN, Kitchen Garden Foreman,
Royal Gardens, Windsor.

Winter Onions.—The August sowing of *Onion* seed should be made on some day between the 15th and 25th, according to the district. Select a loamy soil which was manured liberally for the previous crop rather than soil which has to be freshly manured. The ground should be dug deeply and the soil broken as finely as possible, after which it may be allowed to remain for a few days until it is dry enough for treading and raking. The seeds should be sown in drills drawn at 15 inches apart, and they should be covered only very lightly with fine soil. Excellent varieties for present sowing are *Giant Lemon Rocca*, *Ailsa Craig* and *Long Keeper*. These varieties stand through the winter well, and the bulbs grow to a large size.

Shallots and Garlic.—Seedling *Shallots* and *Garlic* will now be ready for lifting. They should be dried thoroughly, and may afterwards be bunched and suspended in an open shed until they are required for use.

Tomatos.—Plants intended for fruiting in winter will now be ready for potting into the final pots. The compost for use at this potting should be composed of loam three parts, and leaf-mould one part. Make the soil moderately firm about the roots, and place the plants in a cool house, where plenty of air can be admitted both by night and day until a crop of fruits is set.

Sweet Basil.—Make a sowing of *Sweet Basil* for use in winter. This herb is most difficult to cultivate in winter, and it is seldom seen in the markets during that period. The best method of culture is to prick off the young seedlings into 6-inch pots, putting four or five seedlings in a pot, and placing the pots in a cool pit until autumn, when they should be removed to a forcing pit, having an atmospheric temperature of 60°, arranging them on a shelf exposed to the light. Another sowing may be made in pots about the end of the present month for a supply in spring.

Herbs.—Herbs for drying should be cut as soon as possible and placed in a dry, airy shed until they are ready for bunching.

Spinach.—Make another sowing of *Spinach*, and, directly the seedlings are large enough thin them out to distances of 6 inches apart. The flat hoe should be kept frequently at work amongst the plants in order to promote a free growth.

Leeks.—Plants that were put into trenches early in the summer should now be given a thorough soaking of liquid manure. The trenches

may be filled to the ground level as soon as the plants are large enough. Later plants may still be planted for use in winter and early spring. Before removing them from the seed beds, the beds should be given a thorough watering, and every care taken to prevent breaking the roots during the process of lifting.

Celery.—Proceed with the earthing-up of the earliest plantations of *Celery* when the foliage is perfectly dry. It is a good plan to give the beds a thorough soaking with weak liquid manure a day or two previous to earthing them up. Examine each plant, and remove all side shoots and deformed leaves before adding the soil. During the process of earthing-up the plants should be tied loosely with matting, and every care taken to prevent the soil getting between the leaves. The operation should be carried out at frequent intervals rather than by adding a large quantity of soil at one time. The soil should be broken up very finely, and it should be placed carefully round each plant with the hand.

Celeriac.—Plants of *Celeriac* require frequent waterings with weak liquid manure between the rows, in order to induce the development of large roots.

FRUITS UNDER GLASS.

By B. GOODACRE, Gardener to Sir LINFEST CASSELL,
G.C.B., Moulton Paddocks, Newmarket.

The viney.—Where *Grapes* are fully matured and in greater quantity than the demand of the establishment, care must be taken to keep the berries in a good, firm condition. Dryness of the atmosphere is one of the chief requisites, therefore, when the weather permits, admit plenty of fresh air during the day, and also at night-time. On dull, damp days, a little fire-heat will be necessary to keep the atmosphere in circulation, but care must be taken to see that the border near to the hot-water pipes does not become dry. Vines still swelling their fruits should be encouraged to ripen them, for all *Grapes* should now be showing some signs of colour. Most varieties require fully six weeks after commencing to colour to reach a stage when they are fit for exhibition, and another fortnight to be at their best for the dessert table. Take every care to keep the houses charged with moisture. Use the syringe freely, and, if red spider is noticed, employ means to check it. Choose a clear, warm evening after the sun has lost its power, and give the vines a drenching overhead with clear, soft water, wetting every part of the foliage both above and below. Allow time, if possible, for the foliage to become dry the same evening, and, if necessary, to ensure this, permit a little extra heat from the hot-water pipes, with a little more top ventilation. If this syringing is carefully done, the berries will not be in the least marked, and it is the best way to rid a viney of this troublesome pest. Many persons prefer syringing with an insecticide, but this is a long and tedious task, and it generally results in torn and scalded leaves, as well as marked berries. Any vines which are still growing should be pinched regularly. Some varieties, such as *Madresfield Court*, *Mrs. Pince*, and *Gros Colman*, are benefited by allowing a little extra growth to remain as the berries commence to colour, this having a tendency to prevent the fruits from splitting. At the same time, do not allow the growths to become so dense as to exclude the light, for all three of these varieties are sun-lovers, and rarely finish their bunches satisfactorily if subjected to shade.

Cucumbers.—Plants in full bearing require to be fed freely. Any useless or decayed growths should be removed immediately to make room for young, fruitful wood. Continue to stop and pinch the laterals. Keep the atmosphere well charged with moisture. It is advisable to shade *Cucumbers* in frames with a few *Spruce* branches during the hottest part of the day. Close the frames early in the afternoon, so as to store enough sun-heat to suffice, if possible, for the night. Cut the fruits directly they are suitable; the small ones will be useful for pickling purposes. If any signs of mildew are seen, sulphur the frame thoroughly, and either admit a little ventilation last thing at night, or syringe the plants well with clear water on the following morning. The present is a good time to sow seeds for the winter batch of *Cucumbers*.

THE APIARY.

By CHLORIS.

Foul brood.—Since the season of 1910 has not, thus far, proved very favourable to the collecting of nectar, it will be well for the beekeeper to keep a watchful eye on his stocks, for the bees in many parts are barely able to gather sufficient for the daily wants of the hives. The beginner may be at a loss to understand why such a warning is necessary, especially during the summer months, when there is such a seeming abundance of food. When he has had more experience, he will find that weak and badly-fed colonies are more liable to disease than those which are strong and well nourished. Further, these stocks, when attacked by disease, have little desire or strength to defend their stores; they work, if they do at all, in a languid manner, there being at the entrance an absence of bustle which marks the energy of healthy colonies. Earlier in the season there would be no swarming, but a very marked dwindling of the number of bees on the wing on fine, working days. When the bees have little strength to defend their hives, other bees commence to rob them, and thus the diseased hive becomes the centre of an epidemic disease. Not only do bees thus help to spread the contagion, but the ignorant beekeeper is himself a very active agent, for, if he handles diseased and healthy colonies indiscriminately, without taking great care to disinfect himself and all that he has handled, he may spread the disease throughout the apiary. One more warning is necessary. Spores of the disease remain in the cells which have contained foul brood, and the workers store honey or pollen in them, thus spreading the disease, for the nurse bees feed the larvæ with this contaminated food. Much trouble is often caused by leaving frames from diseased hives in exposed places, exposing the healthy bees to contamination.

Symptoms of foul brood.—Weakness of the stock is generally the first symptom; lack of energy, and crawling about the alighting board, without any seeming desire to work and fly, are all indications of foul brood in the hive. On opening the hive and removing the quilts, during the early stage of the complaint, there will be noticed a slightly bad odour, a great contrast with the sweet smell which rises from a healthy stock. When the disease has reached an advanced stage, the smell will be easily noticed on reaching the hive, without opening it. On proceeding to examine the brood chamber, the cappings of the cells containing dead or diseased larvæ will be sunken. Those containing healthy brood never shrink, being slightly convex, and always whole; but the diseased cell has often a perforation. On removing the capping, the larvæ will be found shrunken (not plump and pearly white, as brood free from disease appears), flabby, quite horizontal, and a pale straw colour, changing to a deep brown when decomposition has commenced. Later, it will be sticky, very foul smelling, and when a match is inserted it adheres to the wood, and will be found very elastic. Some beekeepers have confused foul brood with chilled brood, but it is easily distinguished when it is remembered that chilled brood first turns grey, and then almost black; but, in foul brood, the brood is first yellow and then coffee coloured.

Remedies and prevention.—Make all hives perfectly watertight; let them be well ventilated, and place them on a suitable site, where the air can circulate easily about them, free from the drip of trees, and having shelter from cold winds. Let the colonies be headed by a young and vigorous queen, which will keep each stock well filled with brood, and let them have a good supply of the wholesome food, thus keeping up the vitality of the inmates to enable them to resist the disease. Disinfecting should be done by spraying Calvert's No. 5 carbolic (two parts of water to one of carbolic) on all that has been handled, and for washing the hands. If the colony is weak, destroy it and the frames, &c., by burning, then wash the whole of the hive with boiling water and carbolic soap. When dry, paint all over, inside and outside, with a strong solution of Calvert's No. 5 carbolic. If the colony is strong, shake off the bees into a straw skep, feed them on good syrup, and confine them for at least 48 hours, previous to returning the bees to a clean hive fitted up with full sheets of foundation. Use about five frames, wrap the hive up warmly, and destroy the old skep.

EDITORIAL NOTICE.

ADVERTISEMENTS should be sent to the PUBLISHER, 41, Wellington Street, Covent Garden, W.C.

Special Notice to Correspondents.—The Editors do not undertake to pay for any contributions or illustrations, or to return unsolicited communications or illustrations, unless by special arrangement. The Editors do not hold themselves responsible for any opinions expressed by their correspondents.

Letters for Publication, as well as specimens of plants for naming, should be addressed to the EDITORS, 41, Wellington Street, Covent Garden, London. Communications should be written on one side only of the paper, sent as early in the week as possible and duly signed by the writer. If desired, the signature will not be printed, but kept as a guarantee of good faith.

Local News.—Correspondents will greatly oblige by sending to the Editors early intelligence of local events likely to be of interest to our readers, or of any matter which it is desirable to bring under the notice of horticulturists.

Newspapers.—Correspondents sending newspapers should be careful to mark the paragraphs they wish the Editors to see.

APPOINTMENTS FOR THE ENSUING WEEK.

TUESDAY, AUGUST 16—
Roy. Hort. Soc. Com. meet.

WEDNESDAY, AUGUST 17—
Shropshire Hort. Soc. Exh. at Shrewsbury (2 days).

AVERAGE MEAN TEMPERATURE for the ensuing week deduced from observations during the last Fifty Years at Greenwich—62°.

ACTUAL TEMPERATURES:—
LONDON.—Wednesday, August 10 (6 P.M.): Max. 72°; Min. 55°.

Gardeners' Chronicle Office, 41, Wellington Street, Covent Garden, London—Thursday, August 11 (10 A.M.): Bar. 30.2; Temp. 64°; Weather—Bright sunshine.

PROVINCES.—Wednesday, August 10; Max. 68° Essex; Min. 55° Scotland N.E.

SALES FOR THE ENSUING WEEK.

MONDAY—
Great Trade Sale of Dutch Bulbs, at 67 & 68, Cheapside, E.C., by Protheroe & Morris, at 10.
Special Sale, Lilium Harrison, Roman Hyacinths, and numerous other Bulbs, by Protheroe & Morris, at 5.

WEDNESDAY—
Trade Sale of Dutch Bulbs, at 67 & 68, Cheapside, E.C., by Protheroe & Morris, at 10.

THURSDAY—
Trade Sale of Dutch Bulbs, at 67 & 68, Cheapside, E.C., by Protheroe & Morris, at 10.

The ceaseless vigilance required to keep garden and field free from weeds is understood by no one but the cultivator who is confronted year by year with this difficult task. Nor do the uninitiated understand precisely how important is this branch of the work of land cultivation.

In their invasion of cultivated land, the weeds have Nature on their side, and he who would stem the tide of the invasion must learn something of the arts and wiles which Nature has given to weeds to help them in their attack. Of the numberless regiments of weeds, some working unseen, with deliberate approach underground, gain access, like sappers and miners, to the citadel of farm or garden. In these ranks are the plants with underground rhizomes or root-stocks, such as Couch grass and Convolvulus. The bud at each inter-node of plants like Couch is a potential plant. Cut the rhizome in two and two plants are produced. Thus by all but the most thorough methods of extermination the enemy is multiplied instead of being destroyed. Multitudes of other weeds effect their invasions through the air, descending on cultivated ground, as parachutes or aeroplanes. Though each of these delivers its attack singly, yet they come without much intermission through the summer months. They alight unobtrusive and unobserved, sow themselves and, once established, are difficult of

dislodgment. To this class belong the weeds with winged seeds and fruits, Sorrel, Dock, Thistles, Dandelion, and the like.

Other weeds again press into service for purposes of invasion the animals of the farm. By the hooks and bristles which cover the seeds or fruits they attach themselves to the coats of cattle and the wool of sheep, to the hairs of dogs and the clothes of men, to the sacks and implements which are carried about from one part of the farm to another. Among the plants which thus make their attack under cover are the Wild Oat, Brome Grass, the Corn Cockle, Agrimony, Wild Carrot, Wild Comfrey, and many other species.

The diversity of their modes of advance is equalled only by the powers of endurance possessed by the seeds and the prolific production of seeds. A single plant of Purslane may bear a million seeds, and the seeds of many plants, such as Dock, Evening Primrose, and others, may lie dormant in the ground for upwards of 30 years and still be capable of growth.

The smaller animals of the farm contribute, like the larger animals, to the sowing of weed-seed. Birds carry large numbers attached to feathers and feet, and even ants may be responsible for the carriage of minute seeds to very considerable distances.

But it is not only with the resourceful arts of Nature that the good cultivator has to contend. His work is rendered harder by the unwatchful husbandman who is his neighbour, and on whose land, whilst he sleeps, the enemy Nature sows tares. Hence it is wise for the vigilant man to bring home to everyone the insidious character of the common enemy and to spread knowledge of methods of weed-eradication. Much might be done in rural districts by teaching scholars the ways and habits of weeds. No subject could be rendered more fascinating, and unfortunately there is none which can be more readily illustrated by actual, living specimens. Such a course of instruction, including the identification of seeds and fruits, their modes of distribution, length of life and ways of vegetative propagation of weeds and a hundred other simple yet fascinating facts, would not only serve as a splendid introduction to the study of natural history, but would also bring home to all the reality of the damage which these invaders inflict upon garden and field crops.

The agriculturists of this country are, as a general rule, alive to the value of close cultivation, and no English horticulturist worthy of the name tolerates weeds in the cultivated land under his control. Nevertheless, for the reason already given, namely that one neglectful person may do harm not only to his own land but also to that of his neighbours, it is necessary to point out from time to time the necessity for systematic extirpation of weeds. The urgency of this need is the greater in newer countries like America, where the cultivated area is greater, the yield smaller, and the farming community as a whole less skilled than in Britain. A visit to Canada and the United States demonstrates that the need for dissemination of information about weeds is even more urgent than in this country. In the States and in Canada, the farms are generally large; labour is scarce and double as costly as in this country. Hence it is not surprising that the land and the crops it bears

suffer from weeds. When the visitor expresses surprise at the state of affairs common in many parts of Canada and the United States, he is met with the answer that systematic cultivation of the land, with the object of keeping down weeds, is impossible owing to the high cost of labour.

Nevertheless, American experts are fully alive to the fact that, in the long run, the farmer is likely to pay very dearly for this neglect. Thus Mr. W. J. Beal, botanist to the Michigan State Agricultural College Experiment Station, has issued a timely warning in Bulletin No 260. In the bulletin, which contains an admirable account of the seeds of Michigan farm weeds, he points out that it has been demonstrated that the annual cost of cleaning a weedy farm of 100 acres in Ontario was found to be 75 dollars, that is about three shillings per acre; whereas it is indisputable that the increased yield from the cleaned farm would much more than cover the outlay.

It is a fact of peculiar interest that more than 50 per cent. of the common weeds of the State of Michigan are of European origin, the exact number being 124 out of a total of 250. Of the remainder many are of other alien origin. So that just as the population of the North American Continent is composed of good Americans who but yesterday were emigrants from all parts of the earth, and particularly from Europe; so the weed population is mostly of foreign origin, and, having come to the new country, has found it so congenial that it has naturalised itself without delay and is spreading as fast as the Saxons and Teutons are spreading over the broad acres of the continent.

The damage done by weeds is far reaching. Whereas all compete with cultivated plants for food, water, and space, many have more subtle ways of making their obnoxious presence felt. Some, like Burdock, cause depreciation in the value of wool; others, like the Wild Onion, affect dairy produce adversely. Penny-cress mars the flavour of the meat of cattle which have fed on it, and the Common Hemlock is actually poisonous.

ROYAL HORTICULTURAL SOCIETY.—The next meeting of the committees of this Society will take place on Tuesday, the 16th inst., in the Society's Hall, Vincent Square, Westminster. In the afternoon Mr. A. C. SMITH will deliver a lecture on "The Lesser Known Grapes."

THE SCHRÖDER MEMORIAL.—The Rev. W. WILKS, M.A., secretary of the Royal Horticultural Society, writes us as follows:—"The Council of the Royal Horticultural Society have established in grateful memory of the late Baron SCHRÖDER a perpetual pensionership under the rules and regulations of the Gardeners' Royal Benevolent Institution, and have suggested to the committee of the Benevolent that it would be very pleasing to the Council if the widow of the late Mr. WILDSMITH, head gardener to Lord EVERSLEY at Heckfield, were appointed the first Schröder pensioner. Mr. WILDSMITH rendered great and willing help to the Society in the difficult days of the Society's leaving South Kensington. The Society has to-day (August 9) been informed that Mrs WILDSMITH has been duly appointed."

ROYAL METEOROLOGICAL SOCIETY.—We are informed that His Majesty the KING has graciously consented to become the patron of the Royal Meteorological Society.

THE "BARR" MEMORIAL AND THE GARDENERS' ORPHAN FUND.—We are informed that the PETER BARR Memorial Fund is progressing steadily, but the executive committee are anxious that all who desire to honour the memory of the late Mr. PETER BARR should have ample opportunity of doing so. The object is to provide a sufficient sum of money to maintain one child through the medium of the Royal Gardeners' Orphan Fund, and to provide a medal to be awarded annually for special work in connection with Daffodils. Subscriptions should be sent to Mr. H. B. May, Chingford, the treasurer of the fund. Full particulars may be obtained from Mr. Wm. Marshall, V.M.H., Bexley (chairman), or Mr. Chas. H. Curtis, Adelaide Road,

& Simpson, Wheadon & Sons, J. S. Brunton, W. A. Watts, T. H. Lincoln, T. Kine, J. Bunting, J. H. Kerston, Otto Mann, V. van Zanten, P. van der Neer, Van Meerbeck & Co., W. H. Page, Van Hartman, Van der Eest, H. de Graff & Sons, Chas. Smith & Sons, Arnold Weiss, and Protheroe & Morris. We hope that those who have not yet contributed to these worthy objects will communicate with Mr. Henry B. May.

"THE BOTANICAL MAGAZINE." The issue for August contains plates and particulars of the following plants:—

BULBOPHYLLUM VIRESCENS, tab. 8527. This plant formed the Supplementary Illustration in *Gardeners' Chronicle* of October 15, 1906. The

PTEROSTYRAX HISPIDUM, tab. 8529. *Pterostyrax* is nearly allied to *Halesia*. The species under notice was described by the late Dr. Masters as *Halesia hispida* in *Gardeners' Chronicle*, 1884, vol. xxii. The illustration is reproduced in fig. 47. The trees at Kew flower freely almost every year, and form striking objects in the garden in June. The species is hardy, but at the same time does best in favoured districts. The specimen which supplied the material for the *Botanical Magazine* plate is growing in Canon ELLACOMBE'S garden at Bitton, near Bristol. Propagation is readily effected by means of seeds.

GAMOGYNE PUCHRA, tab. 8530.—A showy Aroid, with bright-red spathe, near to *Pipto-*

Photograph by H. N. King.

FIG. 46.—CLANDON PARK: PERGOLA WITH LILIAM AURATUM FLOWERING IN THE INTERIOR.

Brentford (hon. sec.). Those who have contributed to the fund since publication of the last list are Messrs. W. Robinson, H. Backhouse, J. Pope, Dorrien Smith, C. G. A. Nix, the Glamorgan Daffodil Society, Haage & Schmidt, Hurst & Son, Harvey Clarke, W. Welchman, Byvoet Brothers, Guldemond & Sons, R. & G. Cuthbert, B. Ruys, E. Kerston, Vilmorin & Co., Robert Veitch, Bellis & Meek, G. Forbes, C. Lemeslie Adams, Ant. Roozen & Sons, J. H. Stroud, G. Monro, N. Naylor, Jas. Hunter, Lowe and Sawyer, Dobbie & Co., Mrs. Penton, W. Mauger, C. W. Cowan, Foster & Robins, G. Monro, Jun., Boyd Barrow, R. H. Beamish, W. H. Cranfield, W. Waemar, W. Goldring, Watkins

plant received a First-class Certificate at the Holland Park Show of that year. It is very nearly related to *B. Binnendijkii*, and is a native of the New Guinea region.

PATRINIA TRILOBA, tab. 8528.—A member of the Valerianaceæ, with bright-yellow flowers in terminal cymes, and with sharply-lobed, cordate leaves, with reddish margins. The species is a native of Japan, and differs from *P. gibbosa* in its larger flower, rather smaller and sharply-lobed leaves, and its leafy stem. It thrives in the rock-garden at Kew, flowering during July and August. A note on the species of *Patrinia* in cultivation, with an illustration of *P. palmata*, was given in *Gard. Chron.*, Oct. 9, 1909, p. 244

spatha Rolleyi. The leaves are ornamental, and the plant forms an attractive subject on the small rockery in the Nepenthes house at Kew. The spathe is much brighter-red than that of *G. Burbridgei*, and the stamens also are red. The plant is found wild by a rocky stream on Gunung Pulau in Johor.

PSORALEA AFFINIS, tab. 8531.—This is an old garden plant, better known as *Psoralea pinnata*, and said to have been in cultivation since 1690. It forms a showy greenhouse subject, either as a pot plant, or planted in the border, where it grows to a height of 10 feet. Specimens in the temperate house at Kew flower each spring, and it is also used for the decoration of the conservatory

at Kew. In the Isles of Scilly, *Psoralea affinis* blooms in the open, and plants in Mr. T. A. DORRIBEN SMITH'S garden at Tresco Abbey furnished the material for the *Botanical Magazine* illustration.

MR. W. J. TUTCHER.—Mr. S. T. DUNN has resigned the superintendency of the Botanical and Forestry Department at Hong Kong. He is succeeded by Mr. W. J. TUTCHER, who has been acting superintendent on many occasions. Mr. TUTCHER has served in Hong Kong for nearly 20 years, for he left the Royal Botanic Gardens, Kew, in September, 1891, to succeed Mr. WESTLAND.

BRITISH ASSOCIATION.—The Association will meet at Sheffield on 31st inst., forming the eightieth annual meeting, when Canon T. G. BONNEY, F.R.S., will deliver the presidential address. The section devoted to agriculture and plant life will be presided over by Mr. A. D. RAVEN, director of the Rothamsted Experimental Station of the Lawes Agricultural Trust, who will deal with the causes of the fertility of the soil. The *Times* states that there will also be papers on the effect of organisms other than bacteria on soil fertility, by Dr. E. J. RUSSELL, and Mr. W. B. HURCHINSON. Some recent phases of the problem of nitrogen fixation by bacteria will be discussed by Professor BOTTOMLEY and Mr. JOHN GOLDING. Other papers will include:—"Scientific Breeding of Live Stock," Mr. K. J. J. MACKENZIE, of Cambridge; "Effect of Town Atmosphere on Vegetation," by Dr. CROWTHER, of Leeds; "A Bacterial Disease of Potatoes," by Mr. A. HOWE, of Armstrong College, Newcastle-on-Tyne; and "Costs of Danish Farming," by Mr. CHRISTOPHER TURNOUR. In Section K (Botany), Professor F. O. BOWER will read a paper on "Sand Dunes and Golf Links." Papers have also been promised by Professor BOWER (a) on "Two Synthetic Genera of Filicales," (b) "Note on *Ophioglossum palmatum*"; by Dr. F. DARWIN, on "A New Method of Estimating the Opening of Stomata"; by Mr. S. MARCHAN, on "The Paths of Translocations of Sugars from Green Leaves"; by Professor F. W. OLIVER, on "The Pollen Chambers of Fossil and Recent Seeds"; by Mrs. THODAY, on "The Morphology of the Ovules in *Gnetum* and *Welwitschia*"; by Dr. M. C. STONES, on "Further Observations on the Fossil Flower"; by Mr. HAROLD WAGER, on "Chromosome Reduction in the Hymenomyces"; by Professor V. H. BLANKMAN, on "The Sexuality of *Polystigma rubrum*"; by Professor FARMER and Miss DIGBY, on "Telophases and Prophases in *Galtonia*"; by Dr. LLOYD WILLIAMS, on "The Zoospores and Trumpet hyphae of the *Lanina* riaceae"; by Mr. WILSON, on "Plant Distribution in the Woods of North-east Kent"; and by Mr. A. S. HORNE, on "The Absorption of Water by Leguminous Seeds."

FORESTRY.

FORESTRY AT HURSLEY PARK.

SIR GEORGE COOPER, Bart., acquired this estate less than 10 years ago, but he has greatly improved the property. The close attention that is being paid to the forestry department was apparent on the occasion of a recent visit of the southern section of the Royal English Agricultural Society. For many years previous to 1904 very little or no planting had been done on the Hursley Estate, and the underwood, which is mostly Hazel, had long since ceased to pay. Sir George Cooper, therefore, decided to adopt a system of clear felling and replanting. This policy

was necessary, as the woods, prior to this date, had been ruthlessly thinned from the time they reached even pole size. Afterwards, as they began to grow into timber, severer thinnings were practised, the cleanest and best trees being cut out. As a result, in a great many cases, the crop consisted of a few bushy, branching trees per acre. The present plan is to clear, cut, and replant 30 to 35 acres each year.

A plantation comprising 13 acres was planted in 1904-5 with Beech, Ash, Oak, and Sycamore, 6 feet apart, and filled up to 3 feet with Scots Pine and Larch. A few Douglas Firs were introduced in 1905-6, and, it is now considered advisable to cut these out, as, having grown so rapidly they threaten to hinder the surrounding trees. This plantation gives an idea of the futility of forming indiscriminate mixtures with this species. In 1909 many of the Scots Fir were killed by a root fungus. The diseased plants were grubbed and burnt, and the blanks made good with Sycamore and Beech.

Another portion, called the Ratlake plantation, some 22 acres in extent, was also planted in 1904-05 with similar trees to the 13 acres already referred to. The Scots Firs in this plantation were attacked by the Pine shoot tortrix; hand-picking was resorted to before the larvae escaped. No. 3 plantation, of 17 acres, was planted in 1903-09 with Beech, Ash, and a few Oaks, at 6 feet apart, and filled to 3 feet apart with Scots Pine, Larch, and a few Silver Firs. In planting this plantation, the ground was "holed" 6 feet apart for the hardwoods, the softwoods being notched.

A nursery, 3 acres in extent, was formed in the Ampfield part of the estate in the winter of 1908. Only one-half of this nursery is under forest trees at one time. These are followed by a crop of Potatoes, when about 12 to 15 tons of manure are given to the acre, with a light dressing of artificial manure. In this nursery were noticed seed beds of many Pines and Firs, the tiny seedlings looking the picture of health. Beds were noticed of Beech, Oak, and other deciduous trees, in a more advanced state of growth.

Mr. Storrie, head forester at Highclere Castle, expressed the opinion that this nursery was one of the first in the country. Dr. Henry thought it a mistake to manure the ground, as trouble with fungus would be more likely to follow than if no manure were employed. This opinion was shared by others present.

At the luncheon, a most interesting discussion was opened by Mr. M. C. Duchesne (Bucks.) on converting coppice woods into standard woods, and, at this discussion, Sir George Cooper, his agent (Mr. Thorold), and head forester (Mr. Bruntton) were commended for the excellent manner in which forestry was being carried out at Hursley. In the course of this discussion, it was mentioned that Dr. Henry had expressed his belief that English Ash, in 20 years time, would fetch 8s. per foot.

It was stated that in no case had the Larch sawfly been found in mixed plantations in this country. Specimens of the sawfly, together with cocoons and larvae, created a great deal of interest.

The timber yard and saw-mill at Hursley received attention on the occasion of this visit. The power used for sawing is electricity, which is found to be both efficient and cheap. For the year ending December, 1909, the charge for current was £60 5s. 3d., or an average of 3s. 10½d. for each working day, with two saws running.

Mention must be made of a plantation of Douglas Fir which has been planted recently. The healthy and vigorous appearance of all the young trees in the various plantations indicates that the work of planting has been carried out in a thoroughly efficient manner. *Wilmet H. Yates.*

HOME CORRESPONDENCE.

(The Editors do not hold themselves responsible for the opinions expressed by correspondents.)

ABSORPTION OF COPPER BY LEAVES.—It is interesting to note in the article on lime and sulphur sprays in your issue of July 9, that Mr. W. M. Scott's experiments at the U.S.A. Bureau of Plant Industries indicate that lime and sulphur sprays are efficient substitutes for Bordeaux mixture in controlling leaf-spot and Apple scab (*Fusicladium dendriticum*), but are less efficacious with Apple blotch (*Phyllosticta solitaria*) and bitter rot (*Glomerella rufimaculans*). In the Woburn report for 1910, it is stated that the fungicidal properties of Bordeaux mixture lie in the fact that although the copper sulphate, when first applied, is combined with the lime, the copper becomes gradually dissolved again on the surface of the leaf under the action of damp atmosphere, and permeates the cell walls in dilute solution, thus rendering the cell sap toxic to fungoid growth. If much copper sulphate is dissolved on the leaf and gets absorbed by the cells in too large quantities scorching occurs, but if small quantities pass through no damage ensues. Scorching is much more marked in warm, muggy weather than in wet or dry weather. In rainy weather some of the surplus soluble copper gets washed off, and in dry weather the copper becomes soluble much more slowly. The increased scorching in warm, muggy weather may also perhaps be partly attributed to the more sappy vegetation growth and the consequent thinner epidermis of the leaves. The results of some experiments on this point of the absorption of copper by the leaves are given in the Woburn 1910 report, which may be of interest to the readers of the *Gardeners' Chronicle*. Twelve leaves of Bismarck Apple were sprayed with Bordeaux, and two days afterwards carefully washed in alternate washes of weak acid and water till all the surface copper had been removed. The leaves were then burnt and the ash analysed. The ash was found to contain .0005 grammes of copper. A note was made to the effect that much rain had fallen after the spraying, so that the amount of soluble copper absorbed might even have risen higher than the figure above stated if the weather had been warm and muggy. The point to be noticed is that the probable reason why lime and sulphur washes are less effective in the case of Apple blotch and bitter rot, is that in the two last mentioned diseases the mischief is much deeper seated than in Apple scab and leaf-spot, anyhow in the early stages, and hence a fungicide is required which will penetrate the tissues when applied superficially. In this case a certain amount of scorching is bound to occur, but the good done in most cases outbalances the injury. One very possible serious drawback to Bordeaux mixture is that, when frequently applied to long-standing crops such as orchard trees, a good deal of soluble copper must get washed from the trees into the soil. Also, as it has been ascertained by experiment that 12 leaves of Apple can contain as much as .0005 grammes of copper, when leaves are allowed to lie and rot under the trees where they fall in the autumn, the amount of copper present in the soil must be considerably increased. At Rothamstead it was found that one part in a million of soluble copper in the water in which Buckwheat was growing was sufficient to kill the plant. This shows what risks may be run of making the soil infertile by the frequent use of Bordeaux mixture or any other copper compound. So far, no cases seem to have occurred of injury to the soil, and so it is thought that the copper must combine with some substance in the soil to form insoluble compounds. But in soils dressed with frequent and heavy dressings of organic manure or any of the acid artificials, there might be some danger of these insoluble compounds being broken down again. Also, Bordeaux mixture is poisonous and cannot be used after fruit has attained a certain size, whereas lime and sulphur is not. Hence spraying can be done with the latter wash much later in the season. Of course, in that case the arsenate of lead which Mr. W. M. Scott suggests adding as an insecticide would have to be omitted in the later sprays. It would be interesting to know if the sulphur in the sulphur and lime washes does penetrate the cell walls of the leaves, although one would

FIG. 47.—PTEROSTYRAX (SYN. HALESIA) HISPIDUM: FLOWERS WHITE.
(See p. 123.)

imagine that it might require more sulphur than copper to render the cell contents toxic to fungoid growth. Injury from Bordeaux spraying cannot be always put down to faulty mixing, although, of course, considerable care should be exercised during the making. The best results seemed to have been obtained by adding the copper sulphate in a fairly concentrated solution into lime water diluted to the full volume of the mixture minus the amount of water used to dissolve the copper sulphate. The reverse process of adding concentrated lime water to dilute copper sulphate is not nearly so effective in bringing about a fine precipitate. But if, in spite of precautions, some scorching occurs, there is always some satisfaction in knowing that copper sulphate has penetrated into the tissues of the leaves and may do good in the long run. *D. M. Cayley.*

A RECENT FAILURE.—Relating to the account of my affairs published in the last issue (see p. 91), I should like to state, with reference to the same, that the interest payable under the agreement of 1898, was at the rate of 10 per cent. per annum, excepting as to £400 at 6 per cent. I cannot avoid the reflection that this failure, the root of which is this excessive interest, might well serve as a warning to other persons, whilst it serves to explain my present position to those readers not familiar with all the circumstances. I beg to add also that Mr. A. Hassall, my late partner, is not a creditor, as stated in the original report of the Official Receiver, and that this fact was admitted at the public examination on July 29. *H. Stanley.*

INCREMENT VALUE DUTY.—I am indebted to Mr. H. Morgan Veitch for his courteous letter correcting the mistake I had fallen into, which I regret. Instead of consulting the Finance Act itself, I quoted from leaflet No. 24, published by the Budget League, of Whitehall House, S.W., which I happened to have in my pocket. I can only suppose that since that leaflet was published the Bill had undergone further amendment. Landowners should be grateful to Mr. Veitch for his exposition of the Land Clauses in this very complex Act published in the issue of *Gardeners' Chronicle* of July 30, p. 75. In regard to the assessment of nursery land for rating purposes, I do not wish to quibble; but though undoubtedly there are plenty of instances in which nurseries, and every other kind of property, have been grossly over-assessed, I maintain that Mr. C. E. Pearson's sweeping assertion that "assessment committees always assess nursery land at double or treble its value" is both unjust and absolutely incorrect. *H. S. Thompson.*

EUCRYPHIA PINNATIFOLIA.—An undeserved reputation for tenderness is probably the reason that this handsome deciduous shrub is still comparatively rare. When grown in a sunny position, where its growth becomes well ripened, *Eucryphia pinnatifolia* will safely pass through more than the average winter cold that we experience in the southern counties. The large, pure-white flowers are now opening, and, although unrelated, they bear a certain resemblance to those of *Hypericum calycinum*. This resemblance is due to the long filaments and yellow anthers of the *Eucryphia*. When the flowering is done, the rose-like foliage assumes a most attractive autumn colouring. Since writing the above lines, I have read Mr. Cook's interesting account of the "Effects of Last Winter upon Vegetation" (see p. 105) and it seems that Mr. Cook's experience is that *E. pinnatifolia* will stand at least 24° of frost, so we can safely call it a hardy shrub. *A. C. Bartlett.*

TWO RARE NATIVE ORCHIDS.—I have just received from the North of Ireland a flowering specimen of the rare little *Spiranthes Romanzoffiana*, a plant which is unknown elsewhere in Europe, though it extends from the Atlantic to the Pacific in North America. The original Irish station was a little meadow at Bantry Bay, which, unfortunately, was ploughed up and planted with Potatoes in 1836. Since that time I have recorded three other stations at Armagh, Londonderry, and Antrim, and specimens from these districts have been sent to me. The delicate, fragrant flowers are ivory white; they are arranged in a spiral spike fully 2 inches long. The plant grows in damp, sandy soil, usually by

the sea coast. The Lizard Orchid (*O. hircina*) is flourishing at two different places at least near Dover, where it flowered freely during early July. These are new stations for this singularly-interesting Orchid, so that the extermination of the plant, as long ago predicted, is not likely to take place—at least, for a long time to come—the grounds in which it occurs being inaccessible to the general public. *A. D. Webster.*

WILD DOUBLE FLOWERS.—I have in my possession specimens of double flowered forms of the following plants found growing wild:—*Anemone nemorosa* (Hitcham Wood, Suffolk), *Ranunculus heterophyllus* (Woolpit, Suffolk), *Ranunculus acris* (Hitcham, Suffolk), *Saponaria officinalis* (near Ross), *Lobelia erinus* (slopes of Table Mountain). *Lobelia erinus* occurred on the roadside in barren ground as a slender, wiry plant from a few inches to 13 inches high, with very small flowers. There are about 30 species of *Lobelia* in South Africa. *George Henslow, Drayton House, Leamington.*

SOCIETIES.

ROYAL HORTICULTURAL.

Scientific Committee.

AUGUST 2.—*Present:* Mr. E. A. Bowles, M.A., F.L.S., F.E.S. (in the Chair), Messrs. A. W. Hill, J. W. Odell, W. Hales, R. Hooper Pearson, J. T. Bennett-Poe, J. Douglas, A. Worsley, and R. J. Chittenden (hon. sec.).

Phlox spotting.—Mr. J. DOUGLAS showed flowers from the plants shown on August 31 last year which until then had produced white flowers, but were then flaked with lilac. These plants had been carefully marked, and had this year produced flowers almost entirely white, but with slight touches of lilac in them. The calyx was purple.

Aberrations in *Antirrhinum*.—Mr. W. HALES showed a variety of aberrations in the common *Antirrhinum*, consisting mostly of flowers tending to become regular. In one case the terminal flower had become completely peloric, and on the same shoot the normal corolla had at its base an anterior outgrowth very like the palate in form and colouring.

Gall on Willow.—Mr. BOWLES showed examples of galls on willow (*Salix alba*) from Enfield similar to those shown from the neighbourhood of Buckhurst Hill by Mr. Chittenden in October, 1906. The galls are apparently formed through the irritation set up by a mite (*Eriophyes salicis*), causing the repeated branching of a shoot which produces small and narrow, rather soft leaves, so that the whole mass measures up to a foot in length and 9 inches in diameter. The growth turns bright-red in autumn.

THE BRITISH PTERIDOLOGICAL.

AUGUST 1.—As customary on the August Bank Holiday this Society held its annual meeting on August 1. The place of meeting this year was at Moffat, in Dumfriesshire, the actual business meeting being conducted at Beattock Junction. The report of the Society was of a particularly satisfactory nature, the establishment of the *British Fern Gazette* in conjunction therewith having resulted in the addition of about one hundred new members, and the placing of the Society upon a far more substantial and far-reaching basis than before. Despite the expense incurred by the issue of the *Gazette* the financial report showed an increase of funds in hand. It was resolved that the publication of the *Gazette* should be continued permanently, Mr. Chas. T. Drury, V.M.H., having consented to continue the editorship. This gentleman was also appointed honorary secretary, owing to the much-regretted resignation of Mr. G. Whitwell, who has held the office since the inception of the Society. A vote of thanks was passed to Mr. Whitwell for his services in the past. The treasurer, Mr. Wilson, also resigned, and Mr. W. B. Cranfield was appointed to fill the vacancy. The rest of the business was of a more or less formal nature, and terminated, after the re-election of Mr. Alex. Cowan as president and chairman, and a vote of thanks had been passed to that gentleman for the great trouble he had taken in making the arrangements at Moffat.

As usual on such occasions, Fern-hunting parties were organised for the exploration of the district, but the weather was very unfavourable, and no very marked "finds" were discovered, though a number of angustate and crispate forms of *Lastrea montana*, the prevalent species, were met with. It was decided to hold the 1911 meeting at Barnstaple, in Devonshire, in order to afford the members in the Midlands and the North, where the species are relatively much less numerous, an opportunity of studying the more abundant and more varied Fern flora of the South of England. The subscription is five shillings, and the secretary, Mr. Drury, 11, Shaa Road, Acton, London.

EALING TENANTS' HORTICULTURAL.

AUGUST 1.—The summer exhibition of this society was held on August Bank Holiday, being the second annual show. There were two large tents, one devoted to flowers and the other to vegetables. Exhibits of Roses were poor, but Sweet Peas were excellent. Carnations and Picotees did not attract a great number of entrants, but the exhibits which were staged included some very fine blooms. In the class for Pansies and Violas. The blooms were all of very high quality. The class for indoor decorative plants attracted a very fair entry.

Some fine non-competitive exhibits were staged. Mr. LEOPOLD DE ROTHSCHILD, Gunnersbury House, Gunnersbury, filled the greater part of the central portion of one tent with stove and greenhouse plants. Mr. TIGWELL, Greenford, showed Sweet Peas in 22 different varieties, including King Edward Spencer, Helen Lewis, Countess Spencer, Audrey Crier, Clara Curtis, Minnie Christie, and Mrs. Hardecastle Sykes. He also staged a new variety, Mrs. Tigwell, having a cream ground, with carmine flaking. Mr. MAURICE HULBERT also staged a non-competitive exhibit, which consisted of a large bank of fine foliage and flowering plants, including some large standard trained Fuchsias. Messrs. FISHER, Thornton Heath, staged a very fine lot of Sweet Peas.

Altogether some 400 exhibits were staged, and the secretary, Mr. Sutton, who has worked very hard to bring the Ealing Tenants' Horticultural Society up to its present healthy state, is to be congratulated on the fine show.

In addition to the ordinary exhibits of horticulture and floriculture, the Arts and Crafts Class put up a show of articles made during the past session.

Whilst judging was taking place, Mr. John Burns, President of the Local Government Board, inspected the show and the estate generally. He was taken over the estate by Mr. Vivian, M.P., and he expressed pleasure at seeing the progress made since his visit 15 months ago.

LEICESTER ABBEY PARK FLOWER SHOW.

AUGUST 2, 3.—This exhibition took place, as usual, on the Tuesday and Wednesday following Bank Holiday. The number of entries and the number of competitors were about equal to those of last year.

The two great features of the show were the Sweet Peas and the Roses. It is estimated that over 3,000 stands of the former were set up, and of the latter nearly 30,000 blooms.

There were five competitors in the largest group class. The exhibits were arranged along the centre of the tent, and each occupied 160 square feet. The 1st prize was awarded to Messrs. JAMES CYPHER & SONS, Cheltenham, for a collection of Palms, with *Codiaeums* and other foliage plants, relieved with Orchids, including several well-flowered plants of *Disa grandiflora*. Messrs. CYPHER & SONS dispensed with the usual central bank, and arranged in place thereof a kind of rustic arch, standing well above the general groundwork. The arch was flanked at each bow with fine specimens of *Cucis*, and crowned with a magnificent specimen of *Kentia Belmoreana*; each corner had a highly-coloured plant of *Codiaeum Warronii*. The 2nd prize group was exhibited by Mr. A. HOLMES, Chesterfield, the display being very little inferior to that of Messrs. CYPHER & SONS; 3rd, Mr. H. ROGERS.

In the gentlemen's gardeners' class only two exhibitors entered, Mr. Weston (gr. to C. F.

OLIVER, Esq., Huggenden, Leicester) and Mr. Bolton (gr. to F. BUCKLER, Esq., Thurmaston). These were placed as their names appear.

At the end of the tent, Messrs. JAMES WRIGHT & SONS, Thurmaston, set up a group of plants, "not for competition," the group containing Roses, Palms, Lilies, Fuchsias, Pelargoniums, with a central bank of Begonias.

The table decorations were delightfully graceful and light, the first award going to Mr. Weston (gr. to C. F. OLIVER, Esq.) for an arrangement of salmon-pink-coloured Sweet Peas, and the 2nd prize to Mr. SIMS, of Barrowash, who also employed Sweet Peas.

In the classes for bouquets, Messrs. PERKINS & SON, Coventry, were 1st all round. Messrs. SIMPKIN & JAMES followed closely, and received many awards.

For a collection of herbaceous flowers, C. F. OLIVER, Esq., was placed 1st, and Messrs. J. WRIGHT & SONS 2nd, both with choice collections of fresh bright specimens well set up.

Violas were shown by Messrs. W. PEMBERTON & SON, Bloxwich; Mr. W. BARSBY, Leicester; and Mr. LANSDALE, Desford, who received the 1st, 2nd, and 3rd prizes respectively.

The best collection of 24 blooms of Begonias was exhibited by Messrs. JAMES WRIGHT & SON, who were awarded the 1st prize.

In the class for 36 H.P. Roses, Messrs. PERKINS & SON were placed 1st, closely followed by the KING'S ACRE NURSERIES, LTD., Hereford; 3rd, Mr. W. H. FRETtingham, Beeston.

In the class for 24 blooms, Messrs. PERKINS were again placed 1st, but for 12 Tea Roses, the KING'S ACRE NURSERIES took the premier place, with Mr. FRETtingham 2nd.

In the class for 12 blooms of one variety, Messrs. PERKINS were awarded the 1st prize, having Lyon Rose; 2nd, Mr. FRETtingham.

A bloom of Wm. Sheen in Messrs. PERKINS'S box received the premier award offered for the best Rose in the show.

The KING'S ACRE NURSERIES showed the best exhibit of 12 blooms of Tea Roses of one variety.

Vegetables are always a strong feature at Leicester, and this year the production was not inferior to that seen in former years. Mr. J. HUDSON, of Gimson Road, Leicester, won the premier prize in the class for a collection and in many of the single-dish classes.

In the fruit classes Mr. W. PARKER, of Market Rasen, was placed 1st for a collection.

NON-COMPETITIVE EXHIBITS.

Mr. W. BENTLEY showed a collection of Roses. (Gold Medal.) Another very fine display of Roses was made by Mr. J. BARROW, The Rose Garden, Oadby. (Gold Medal.) Messrs. SIMPKIN & JAMES, Leicester, had a table of floral decorations, which contained many wreaths and other designs. (Gold Medal.) Mr. FRANK BOUSKELL, Market Bosworth, occupied the whole semi-circular end of a tent with a display of herbaceous plants. (Gold Medal.) Mr. GEO. UNDERWOOD, Saffron Hill Nurseries, occupied the whole side of one tent with Sweet Peas, Violas, and Pansies. There were many items in this exhibit of special merit. Messrs. LAMB & SONS, Birmingham, set up a fine table of Sweet Peas, as did Mr. F. E. RIDDLE, of Belgrave Great, who also showed Roses. Messrs. HARRISON & SONS, Market Place, had a display of vegetables, fruit, and Sweet Peas. Mr. C. WARNER, The Abbey Nursery, made a good show of Fuchsias, Pelargoniums, Salvias, Coleus, and other plants; also a collection of shrubs, mostly Conifers in pots. Mr. W. J. UNWIN, Histon, showed Sweet Peas. Messrs. JARMAN & CO., Chard, had a showy stand of Zonal Pelargoniums and Sweet Sultan. Mr. R. PRINGLE, Belvoir Street, Leicester, set up an unusually fine table of herbaceous and general garden flowers and Sweet Peas. Messrs. BAKER'S, Wolverhampton, filled half the centre of a large tent with Roses, Phloxes, and Violas, making a very imposing display.

A rock-garden exhibit was made by Mr. J. WILKINS, Syston.

SCOTTISH HORTICULTURAL.

AUGUST 2.—The monthly meeting of this society was held at 5, St. Andrew Square, Edinburgh, on this date. Mr. Whytock, the president, was in the chair, and there was an attendance of 80 members.

Mr. Thos. MacPhail, Archerfield Gardens, Dirdleton, read a paper on "The Cultivation of Peaches and Nectarines under Glass." To

illustrate the results of the practice he advocated, he showed some fine examples of fruit of Hale's Early Peach and Lord Napier Nectarine. He attached much importance to the thorough ventilation of the fruit houses, and the free use of the syringe. He said the best results could not be obtained by growing several unlike varieties in one long house; rather would he have the house in compartments, each compartment being under separate control as to heating, &c., and each containing only one kind of tree—early, mid-season, or late. He described in detail the construction of the border, drainage, soil, selection of trees, planting, feeding of the plants, pruning, training, thinning of the fruit, dis-budding, and general management. After the gathering of the fruit, the efforts of the cultivator must, he said, be wholly concentrated on the building up of the trees for the following season; neglect of this would tell a tale later in bud dropping, in the fruit not setting or not stoning, or in splitting at the stone. The trees could not be kept too cool during the resting period. The management of pot trees was also remarked upon.

Certificates of Merit were awarded to a very fine new bedding Pelargonium named Amalgamation (a cross between Paul Crampel and West Brighton Gem), exhibited by the raiser, Mr. ALEX. THOMSON, Dean Gardens, Edinburgh; and to a bedding Calceolaria, Queen Alexandra, exhibited by Messrs. DOERIE & Co., Edinburgh.

A Cultural Certificate was awarded to Mr. R. CAIRNS, the manager of the City of Edinburgh Distress Committee's farm at Murieston, for an exhibit of Strawberries grown on land reclaimed by the unemployed there. The varieties included Givon's Late Prolific, McMahon, Duke of Edinburgh, Scarlet Queen, and The Laxton. The average weight of the fruits of Givon's Late Prolific being 2 ounces. The ground had been treated with city refuse, but no dung or artificial manure had been used.

Six new members were elected. The arrangements for the excursion to Yester and Gosford on August 13 were announced.

The paper for the meeting on September 6 will be on "Perpetual-flowering Carnations: Their Past, Present, and Future," by Mr. J. S. Brunton.

MIDLAND CARNATION AND PICOTEE.

AUGUST 4, 5.—This society's 20th annual exhibition, held at the Botanical Gardens, Edgbaston, on the above dates, was a good average show. The weather was fine on both days, and the attendance of subscribers and visitors unusually large. Sweet Peas, for which special prizes were offered by Robt. Sydenham, Ltd., were well shown.

DRESSED FLOWERS ON STANDS.

The first class was for 12 self Carnations. Six good exhibits were placed before the judges, who awarded the 1st prize to Mr. A. R. BROWN, Wychall Lane, King's Norton, who showed well-finished, even-sized flowers of the varieties W. H. Parton, Ayesha, Mrs. Howard Green, Albion, Modesty, Theodore Galton, Solfaterre, Bonnie Dundee, Lyndsay, Elizabeth Schiffer, Ariadne, and Mulberry. In the 2nd prize collection, from Mr. HAYWARD MATHIAS, Medstead, we noted splendid flowers of Ann Hathaway, Titan, Helen, Daffodil, and Deux. 3rd, Mr. W. SYDENHAM, Melbourne, Derbyshire.

In a smaller class, for six self Carnations, Mr. F. W. GOODFELLOW, Walsall, won the 1st prize with superb flowers of Sir Galahad, John Pope, Miss Willmott, Daffodil, Dinah, and Cardinal. 2nd, Mr. G. D. FORD, Acocks Green, whose best flowers were W. H. Parton, Crystal, and Cardinal.

Twelve yellow-ground Picotees.—Mr. HAYWARD MATHIAS took the lead with exquisite flowers of Gloria, Her Majesty, John Ruskin, Exquisite, Deux, S. Weston, Mrs. Heriot, Togo, Astrophel, Thisbe, and Archie Brown. 2nd, Mr. A. W. JONES, Stechford, with a beautiful set of flowers. His best varieties were Agnes, Mrs. Oldfield, Santa Claus, and Togo. 3rd, Mr. W. SYDENHAM.

In a class for six yellow-ground Picotees, there appeared to be very little difference between the exhibits from Mr. F. W. GOODFELLOW and Mr. G. D. FORD, who were placed 1st and 2nd respectively. The blooms in each stand were shapely, of good size, well-coloured, and fresh. 3rd, Mr. HARRY SKEELS, Walsall.

Fancy Carnations.—Mr. H. MATHIAS was successful amongst six competitors for 12 blooms, showing very fine examples of Mrs. Leo Hunter, Highland Lass, Lord Steyne, Rhea, Linkman, Hidalgo, Hecla, Samuel, Father O'Flynn, Devonian, Orlando, and M. Thurstan. 2nd, Mr. A. W. JONES, who had grand flowers of Lord Steyne, Linkman, Billy Barlow, and Sam Weller. 3rd, Mr. A. R. BROWN.

Ten entries were made in the next class, which was for six fancy Carnations. Mr. F. W. GOODFELLOW won the 1st prize; he showed large flowers of Lord Steyne, King Solomon, Ronny Buchanan, Sam Weller, Linkman, and Jupiter. 2nd, C. ALCOCK, Esq., Blundellsands, whose blooms were beautifully fresh, but smaller than those exhibited by Mr. GOODFELLOW. 3rd, Mr. G. D. FORD.

Twelve white-ground Picotees.—The leading award in this class went to Mr. C. F. THURSTAN, Penn Fields, Wolverhampton, who had beautifully-fresh flowers of Amy Robsart, White Heather, Excelsior, Brunette, Fortrose, Thos. William, Carrie Goodfellow, Mrs. Huskier, W. E. Dickson, Fair Maiden, Myra, and Queen of Spain. 2nd, Mr. C. H. HERBERT, Acocks Green, whose best varieties included Clementina, Favourite, Ganymede, and Thos. William. 3rd, Mr. A. R. BROWN.

In a smaller class for six white-ground Picotees, the Rev. C. A. GOTTWALTZ, Hadzor Presbytery, Droitwich, gained the 1st position, with refined flowers of Lady Sybil, Beatrice, Mrs. C. H. Herbert, Maud Brown, Thomas William, and Elaine. 2nd, Mr. F. W. GOODFELLOW, who had shapely blooms of Mrs. Gorton, Brunette, and Carrie Goodfellow. 3rd, Mr. G. D. FORD.

Twelve flaks or bizarres.—Although only four exhibits were shown in this class, the flowers were of excellent quality, especially those shown by Mr. HAYWARD MATHIAS, who was awarded the 1st prize. The varieties exhibited were Master Fred, Gordon Lewis (extra good), S. Payne, Mrs. Rowan, Merton, George Rudd, Free Trade, G. Melville, Robert Houlgrave, Sportsman, Wm. Skirving, and Admiral Curzon. 2nd, Mr. C. H. HERBERT, whose flowers of Peter Pan, Gordon Lewis, Master Fred, and Meteor were of outstanding merit. 3rd, Mr. C. F. THURSTAN.

In the next class, which was one for six flaks or bizarres, Mr. G. D. FORD was awarded the 1st prize for large, well-formed flowers of Peter Pan, George Rudd, Wm. Skirving, Gordon Lewis, Arthur, and Admiral Curzon. 2nd, Mr. C. J. WHITE, Walsall. 3rd, Mr. H. BOYS, Walsall.

SINGLE BLOOMS.

Competition was keen in several of the classes provided for single blooms. The successful 1st prize winners were Mr. C. H. HERBERT, Mr. A. R. BROWN, Mr. H. MATHIAS, Mr. W. SYDENHAM, Mr. C. F. THURSTAN, Mr. C. WALL, Rev. C. A. GOTTWALTZ, Mr. A. W. JONES, Mr. W. H. TWIST, and Mr. F. W. GOODFELLOW.

UNDRESSED FLOWERS.

The undressed flowers, shown in vases, with Carnation foliage, were both numerous and good. The seven exhibits in a class for 12 self Carnations made a very pretty feature. The 1st prize was won by Mr. W. H. PARTON, Hollywood, Birmingham, who showed exquisite flowers of Daffodil, Hildegard, W. H. Parton, Helen Gottwaltz, Conrad, Nubian, Sir Galahad, Bridegroom, Mrs. Guy Sobright, Hadzor, Lady Hermione, and Cassandra. 2nd, Mr. C. ALCOCK, Blundellsands. With the exception of Duchess of Wellington and Kaffir, all the blooms in this stand were excellent. 3rd, Mr. A. R. BROWN.

For six self Carnations, A. GORDON RUSSELL, Esq., Wheatley, Oxford, beat 11 competitors. He had large flowers of Sir Galahad, Agnes Sorrel, Cardinal, Mrs. Flight, Euid, and Daffodil. 2nd, Mr. W. H. TWIST, Yardley, whose flowers were of good size, fine quality, and very fresh.

There were eight splendid entries in the class for 12 fancy or yellow-ground Carnations. The 1st prize was gained by Mr. W. H. PARTON for a meritorious set of flowers, effectively staged. He showed Liberté, Voltaire, Lord Steyne, Merlin, Sam Weller, Mrs. F. Wellsley, Pasquin, Ronny Buchanan, Erl King, Mandarin, R. A. Rowberry, and Westfield Seedling. 2nd, Mr. A. W. JONES, whose long stemmed flowers were much admired. 3rd, Mr. A. R. BROWN.

In the next class, for six fancy or yellow-ground Carnations, there were 10 entries. 1st, Mr. J. D. WILLIAMS, Smethwick. The varieties Ronny Buchanan, Sam Weller, and Merlin were well shown.

FLOWERS SHOWN IN TREBLES.

The most important class in this section was for 12 varieties of selfs, yellow-ground Picotees, or fancies, arranged on a space not exceeding 30 inches by 24 inches. The eight exhibits made a prominent feature of the show. The 1st prize was won by Mr. W. H. PARTON, who showed magnificent flowers of Sam Weller, Mandarin, Lord Steyne, Merlin, Voltaire, Sappho, Sir Galahad, Ronny Buchanan, R. A. Rowberry, W. H. Parton, King Solomon, and Bridegroom. The flowers in the 2nd prize set were well arranged, but the quality was hardly equal to that of Mr.

Picotees was shown by Mr. A. W. JONES, in Santa Claus. Mr. H. MATHIAS was next with Togo. The best yellow, buff, or terra-cotta self Carnation came from Mr. A. R. BROWN. His blooms of Elizabeth Schifner were excellent. Mr. C. WALL won the 1st prize in a class for yellow or buff ground fancy Carnations, showing Mandarin in beautifully fresh condition.

AMATEUR CLASSES.

Five prizes were provided for exhibitors who do not grow more than 300 plants nor employ a gardener regularly. The premier position in a class for six white-ground Carnations or Picotees (dressed) was won by Mr. J. B. WILLETTS, Yardley. His flowers of Mrs. W. H. Twist and Fair Maid were particularly good. 2nd, Mr. E. KENWRIGHT, Smethwick.

In the next class, which was for six self Carna-

PREMIER FLOWERS (DRESSED).

Bizarre Carnation Master Fred, shown by Mr. H. MATHIAS; flake Carnation Gordon Lewis, shown by Mr. H. MATHIAS; heavy-edged white-ground Picotee Mrs. Twist, shown by Mr. W. H. TWIST; light or wire-edged white-ground Picotee Mrs. Gorton, shown by Mr. F. W. GOODFELLOW; heavy-edged yellow-ground Picotee Santa Claus, shown by Mr. C. H. HERBERT; light-edged yellow-ground Picotee John Ruskin, shown by Mr. C. WALL; yellow-ground fancy Carnation Highland Lass, shown by Mr. H. MATHIAS; self Carnation W. H. Parton, shown by Mr. A. R. BROWN.

PREMIER FLOWERS (UNDRESSED).

Self Carnation W. H. Parton, shown by Mr. A. H. BIRCHLEY; fancy Carnation Mandarin, shown by Mr. C. WALL; yellow-ground Picotee Agnes, shown by Mr. A. W. JONES.

SPECIAL MEDAL AWARDS.

The Silver Champion Medal, offered to any exhibitor gaining the greatest number of points in the large classes was won by Mr. HAYWARD MATHIAS, with 111 points. Mr. A. R. BROWN (95 points) obtained the Bronze Medal. The Silver Medal offered in the smaller classes was won by Mr. G. D. FORD, with 72 points. Mr. F. W. GOODFELLOW secured the Bronze Medal, with 69 points. The above medals were offered by the Birmingham Botanical and Horticultural Society.

Mr. C. H. HERBERT won the Silver Medal offered in the single bloom classes, &c., with 37 points; and Mr. A. H. BIRCHLEY secured the Bronze Medal offered to the most successful exhibitor in the amateur classes, with 73 points.

SWEET PEAS.

The 1st prize in a class for 12 varieties of Sweet Peas was won by Mr. T. JONES, Ruabon; 2nd, Mr. J. HAYCOCKS, Wrexham; 3rd, Mr. E. DEAKIN, Hay Hall, Birmingham.

For six varieties of Sweet Peas, Mr. E. TILT, New Oscott, was placed 1st with a handsome set of flowers. 2nd, Mr. J. SCEANEY, Harborne.

There were five entries in a class provided for Sweet Peas arranged in rural decorations on separate tables, each 5 feet by 3 feet. 1st, Mr. A. J. BLAIR, Stoke-on-Trent, who employed pale pink Sweet Peas, Gypsophila, and sprays of Selaginella. 2nd, Mr. E. DEAKIN.

HONORARY EXHIBITS.

Messrs. W. H. SIMPSON & SONS, Birmingham, furnished the entire front of the orchestra with a well-arranged group of Sweet Peas. (Silver-gilt Medal.)

ROBERT SYDENHAM, LTD., Birmingham, had a long table decorated with Sweet Peas of excellent quality, in rustic stands, of various sizes and designs. (Silver-gilt Medal.)

From Messrs. JARMAN & Co., Chard, Somerset, came an attractive exhibit of four varieties of Centaureas. (Silver Medal.)

THE LAPWORTH NURSERIES, Hockley Heath, sent a group of cut flowers indifferently arranged. (Bronze Medal.)

Mr. A. WELHAM, Bridgnorth, had cut flowers of his new Chrysanthemum A. Welham. (Vote of thanks.)

Mr. J. J. W. THACKRAY, Côtel, Guernsey, sent Gladioli and Sweet Peas. The Sweet Peas had suffered in transit, and they were not set up to the best advantage.

UNITED HORTICULTURAL BENEFIT AND PROVIDENT.

AUGUST 8.—The monthly meeting was held at the Royal Horticultural Hall, Westminster, on the above date. Mr. Chas. H. Curtis occupied the chair. One new member was elected, making a total of 50 this year. The death certificate of Mr. Robert Anderson (a lapsed member) was produced, and a cheque for £29 13s. 6d., being the amount standing to his credit, was granted to his nominee. Several members over 60 years of age have taken advantage of Rule 18 to withdraw the interest on their deposits, to enable them to pay their contributions. The amount of sick pay for the past month amounted to £29 17s.

FIG. 48.—BORDER CARNATION "FORESTER," AS SHOWN BY MR. JAMES DOUGLAS. COLOUR, YELLOW WITH CHOCOLATE, AND RED MARKINGS.

Obtained an Award of Merit at the Royal Horticultural Society's meeting on August 3, 1910 (see p. 100).

Parton's collection. The exhibitor was Mr. A. W. JONES.

In a smaller class for six varieties of selfs, yellow-ground Picotees, or fancies, Mr. G. D. FORD showed some wonderfully good blooms of Linkman, Liberté, W. H. Parton, Crystal, Bernice, and King Solomon. 2nd, Mr. J. D. WILLIAMS.

In the classes for single vases containing three blooms of any one variety, there was fair competition, and some very fine blooms were exhibited. A. GORDON RUSSELL, Esq., Wheatley, Oxford, had the best vase of white Carnations in the variety Sir Galahad. Mr. A. R. BROWN was 2nd with Alba. Mr. W. H. PARTON brought the winning vase of rose, salmon, or scarlet self Carnations. He exhibited the variety Mrs. Guy Sebright in capital condition. The same exhibitor also had the best vase of dark self Carnations in Harry Parton. The best vase of yellow-ground

(dressed), Mr. A. H. BIRCHLEY, Selby Oak, won the 1st prize with a very fine set of flowers. His varieties were Ann Hathaway, W. H. Parton, Mrs. G. W. Flight, Hildegard, Camilla, and Seagull. 2nd, Mr. J. B. WILLETTS. Mr. WILLETTS was placed 1st for six fancy or yellow-ground Carnations or Picotees (dressed). 2nd, Mr. A. H. BIRCHLEY, who secured 1st prizes in classes for six self Carnations (undressed), and for six fancy or yellow-ground Carnations or Picotees. Mr. J. B. WILLETTS was 2nd in both classes.

AWARDS TO NOVELTIES.

First-class Certificates were awarded to rose flaked Carnation Peter Pan, shown by Mr. C. H. HERBERT; dark self Carnation Harry Parton (W. H. Parton × Nubian), shown by Mr. W. H. PARTON; fancy Carnation Hecla, shown by Mr. BAYWARD MATHIAS; and yellow-ground Picotee Gloria, shown by Mr. HAYWARD MATHIAS.

KNARESBOROUGH AND DISTRICT HORTICULTURAL.

AUGUST 2.—The annual show in connection with the above society was held on Tuesday, in the grounds of Conyngnam Hall, the residence of C. E. Charlesworth, Esq., J.P. Notwithstanding very unfavourable weather, the show proved an unqualified success, the attendance being very large. All the exhibits reached a high standard of excellence, Sweet Peas being exceptionally fine. Two features of the show were a grand exhibit of Sweet Peas staged by Mr. BREADMORE, Winchester (gold medal), and a fine stand of hardy flowers and Roses, staged by Messrs. DICKSONS, LTD., Chester. (Silver medal.)

Amongst the principal prize-winners were A. S. LAWSON, Esq., J.P., Aldboro Manor (gr. Mr. A. Nicholson), LORD MOWBRAY & STOURTON, Allerton Park (gr. Mr. P. Coldham), J. ADAMS, Esq., Harrogate, D. W. WYRRANTS, Esq., Winsley Hurst, Ripley, Leeds (gr. Mr. W. Towns-end), Mr. ELLIOTT, Ripon, Mr. G. KNIGHT, Scriven, and Mr. J. W. DAVIDSON, Dacre Banks, Leeds.

KIRKCUDBRIGHT HORTICULTURAL.

AUGUST 5.—The annual show of the Kirkcudbright Horticultural Society was held in the Town Hall of the burgh on this date. Exhibits of outdoor flowers were not quite so fine as usual, but, on the whole, the show was quite equal to the average of these annual exhibitions. The classes open to gardeners were well contested as a rule, and pot plants, cut flowers, especially Sweet Peas, vegetables and fruit were all of much excellence. In the class for a table of pot plants two well-known exhibitors, Colonel GORDON, Threave (gr. Mr. James Duff), and the Countess of SELKIRK, Balmae (gr. Mr. W. McGuffog), competed, the former being the winner of the 1st prize with a well-arranged table of good plants, Mr. McGuffog being a close second. Colonel GORDON and Mr. W. BROWN, Millburn Street, were the most successful competitors in the other classes for pot plants. In the cut flower section several amateurs competed with the gardeners successfully. The leading winners in these classes were Mr. W. McCORMACK, Tariff; Misses BLACKBURN, Park House (gr. Mr. J. Wallace); Mr. J. DUFF; Mr. R. WEBSTER, Tongland; Mr. J. HALLIDAY, Greystone Cottage, and Mr. W. W. MORRISON, Kirkcudbright.

Roses were very good, the winner of the 1st prize for H.P. and H.T. varieties being Mr. J. WALLACE, and for Teas, Mr. J. DUFF. Mr. J. DUFF and Mr. J. SCOTT, Barwhimock, led for Sweet Peas.

Fruit is usually well shown at these shows. Major MAXWELL, Glenlair (gr. Mr. B. Rutherford); Mr. J. DUFF, and Mr. W. MCGUFFOG were the leading prize winners. Mr. RUTHERFORD was placed first for Black Hamburg Grapes; and Mr. DUFF for white and also black Grapes, except Black Hamburgs. Mr. RUTHERFORD was awarded the 1st prize in the class for a collection of fruit; and Mr. DUFF excelled with Apples.

In the vegetable classes Mr. W. BROWN, Millburn Street, Kirkcudbright, was placed first for a collection; 2nd, Countess SELKIRK (gr. Mr. W. McGuffog). Mr. R. MIDDLETON, Kirkcudbright; Mr. B. RUTHERFORD; Mr. J. DUFF; Mr. F. HANNAH, Kirkcudbright, and Mr. R. COLEMAN were also successful exhibitors of vegetables.

DEBATING SOCIETIES.

BATH GARDENERS'.—The monthly meeting of this society was held on Monday, July 25, in the Foresters Hall, under the presidency of Mr. T. Parratt. "Romance of plants" formed the subject of an interesting paper by Mr. J. D. Halliburton. The lecturer dealt chiefly with plant life in a wild state.

BRISTOL & DISTRICT GARDENERS'.—The monthly meeting was held on July 29, at St. John's Parish rooms. Mr. Hayball presided. Mr. Taylor, of Bath, read paper upon "Grape Thinning." The lecturer said the first operation in connection with thinning is disbudding, deciding which buds to leave, preference should be given to those on the upper side of the stems. Ten days after flowering thinning should be commenced, and, as seven out of eight berries will have to be cut out, this cannot be done too early. The bareness on the top of the bunches so generally seen is the fault of cutting out too many berries, and, if more were left, they would push each other up and side the stem. The Muscat of Alexandria Grape should be thinned sparingly at first, but in the case of Black Alicante the removal of surplus berries must not be long deferred.

LAW NOTES.

CLAIM FOR SEEDS.

At the King's Lynn County Court on the 4th inst., his Honour Judge Mulligan, K.C., gave judgment in the Sensation Wheat case, between Charles W. Marsters, seed merchant, Lynn, and John William Whittome, farmer, Rosslyn, March.

His Honour said: The plaintiff claims £13 15s. for wheat sold, and the defendant counterclaims £48 on the ground that the goods delivered were bad. The plaintiff is well known as the introducer of French seed Wheats; the defendant is a farmer who is accustomed to sow 250 acres or more of land with wheat. He knew some fine crops had been raised from Sensation Wheat supplied by the plaintiff, and made up his mind to plant 16 acres with it. Accordingly on November 8, 1909, he went to St. Ives Market and met the plaintiff. The plaintiff there and then agreed to sell, and the defendant agreed to buy, five quarters of Sensation seed Wheat (second year), 55s. per quarter, to be delivered at March Railway Station. The particular purpose for which the goods were to be used, namely to produce a crop of Sensation Wheat, was known to both parties. A memorandum to satisfy the Statute of Frauds was not drawn up, but the negotiations were finished, all the terms were agreed, and the parties separated. It only remained for the seller to deliver the wheat and for the buyer to pay the price. As between man and man the bargain was concluded. On November 9 the plaintiff's manager at King's Lynn posted an envelope addressed to the defendant at March, containing what he called "an invoice." But on close examination the document turns out to be something more than an invoice, more than a letter of advice of the dispatch of the wheat with the price. It contains two new provisions, first, "Terms: Net cash in 14 days; interest at 5 per cent. charged upon overdue accounts," and secondly, underneath in small print, "C. W. M. gives no warranty as to description, quality, productiveness, or any other matter of seeds or seed corn, and is not in any way responsible for the crop." The first is not insisted upon, but the second, the small print clause, is strongly relied upon by the plaintiff. It is not clear whether the envelope containing the so-called invoice was open or closed, or whether it had or had not the word "invoice" on the outside. Be that as it may, I am perfectly satisfied, after paying great attention to the very searching cross-examination of Mr. Whittome by Mr. Crawford, and to his able argument, that the document so sent had the appearance of an ordinary bill, and nothing else, and that the defendant understood and regarded it as a bill and nothing but a bill. The defendant did not open or read the document, but put it just as it came into a drawer to take to town and pay when he went to market, as a farmer would naturally do. It remained in the drawer until after the Wheat was taken from March Railway Station and planted towards the end of November. The defendant believed there was a bill in writing, or printing, in the envelope. But I have come to a conclusion, and find as facts, that the defendant did not until after he saw his solicitors in 1910 know or suspect that the envelope so sent, or anything in it, contained any stipulation or condition relating to the bargain which had been made at St. Ives on November 8; that the plaintiff never did what was reasonably sufficient to give the defendant notice of the new terms now sought to be imposed upon him by the so-called invoice, and that nothing whatever occurred to give the defendant the slightest indication of any alteration in, or addition to, the terms he and the plaintiff had openly agreed upon face to face on November 8; the taking of the Wheat by the defendant to his farm had reference to the bargain of November 8, and nothing else. But, argued Mr. Crawford, the small print clause only expresses a custom of the seed trade, and must be read into the agreement. The alleged custom was unknown to the defendant, and does not exist in relation to farm seeds. If it did prevail it would resemble a cancer rather than a custom. It would eat the heart out of contracts. It would, for example, change the very substance of this transaction from a sale of seed for sowing to a sale of grain for grinding into flour. No sane man would give 50 per cent. above the market price for

Wheat for that purpose. Common sense and common law with one voice say that any such custom would be repugnant to the fundamental condition of this purchase, and would be utterly unreasonable and invalid. Counsel further said he did not care whether the defendant had read the invoice or not, for he had it in his possession, and he (counsel) was entitled to assume as matter of law that the defendant was bound by the printed terms in the invoice. All I need say is the House of Lords held otherwise. Lord Herschel said: The knowledge of the contents of such a document and the sufficiency of the notice given of an additional term were questions of fact for a jury. (Richardson v. Rowntree (1824), A.C. 217.) As the defendant had not notice and was not aware of what was printed, the printed terms never formed any part of the bargain. In fact, the only bargain from first to last was that made at St. Ives. This is strongly confirmed by the plaintiff's own particulars of claim, which are as follows:—"1909, November 8. To 5 quarters of Wheat Sensation (second year) at 55s. £13 15s." It is on the bargain of the 8th, and nothing else, the parties must stand or fall. Hence I need not now consider the decision of Mr. Justice Channel in Howeroft v. Perkins (16 Times, L.R. 217) or the conflicting decision of Mr. Justice Bray (in Wallis v. Pratt, 26 Times, L.R. 253) relied on by the construction of the small printed matter, or the dissonant review of those decisions in the Court of Appeal, which has since been reported (26 Times, L.R. 572).

The next question is: Did the plaintiff carry out his bargain? He tried hard to show that the Wheat sent to the defendant was grown on a farm at Mildenhall, but an essential link in the chain of evidence was wanting, for I place no reliance whatever in the story of the witness who sent this and nine other lots of Wheat away from Docketing on the same day; his mind is a blank as to the other nine, and altogether his evidence is worthless for any purpose except to reveal the confusion and want of intelligent supervision which prevail at Docketing when the plaintiff is not there. It is utterly impossible to say where the Wheat sent to the defendant was grown. But no matter where it came from, the defendant planted it under the most favourable conditions, during a period of dry weather, in the best of soils, well prepared to receive it. Only one-tenth germinated. Ordinary seed Wheat bought at 36s. a quarter, and planted alongside and around this Sensation Wheat at the same time and under the same conditions, sprang up and gives promise of a abundant crop. Why did the Sensation Wheat fail? The witnesses put it down to heating or kiln-drying. Mr. Stephen Gregory (a witness for the plaintiff), whose testimony in these matters always carries great weight, said he could not account for the occurrence unless the Wheat delivered was bad or heated. I refer, and find as facts, that nine-tenths of it was not seed; that the bulk of it consisted of grains or carcasses of Sensation Wheat in which the embryo had been killed by heating, or some other means before it left Docketing. Even the plaintiff said heating would kill the germ. If a farmer employed a well-known and skilful agent to buy for him 10 shorthorn heifers for breeding purposes, and agreed to pay the cost price and 10 per cent. commission, and if that agent delivered one heifer and nine carcasses of heifer beef with or without an invoice, saying he (the agent) gives no warranty, could it be said that the agent fulfilled his contract? Certainly not. Neither did the plaintiff in this case. Again it is said the plaintiff did not know that the Wheat germs were killed. True, but that is no justification. In Reese v. Smith (1869), 4 E. & J. Ap. 79, Lord Cairns said: "I apprehend it to be the rule of law that if persons take upon themselves to make assertions as to what they are ignorant, whether they are true or untrue, they must, in a civil point of view, be held as responsible as if they had asserted that which they knew to be untrue." And in Redgrave v. Hurd (1881) 20 Q.D. 12, Sir George Jessel adds: "Even assuming that moral fraud must be shown, you have it where a man, having obtained a beneficial contract by a statement which he now knows to be false, insists upon keeping that contract. To do so is a moral delinquency; no man ought to seek to take advantage of his own false statement." These are not singular instances of contract like the cases cited in argument. They are the

generalisations of two of the three great judges of the Victorian Age (the third being Lord Blackburn). To apply those rules to the facts before me: The plaintiff sold this Wheat for sowing. He represented it to be the seed Wheat, and in the witness box he admitted that a Wheat that is incapable of germinating is not a seed Wheat. It turned out that the bulk of this Wheat was incapable of germinating, though the plaintiff did not know it at the time. Now that he does know it, he insists upon keeping that contract and demands the full 55s. per quarter. The claim in accordance with the principles laid down by Lord Cairns and Sir George Jessel is bad in law and bad in morals. A merchant is, of course, justified in charging the highest price he can obtain, but he must deliver the genuine article as sold.

As to the counter claim, the defendant is entitled to be paid for his extra work and labour in re-sowing. He thinks he also should be allowed something for the difference in value between a crop of ordinary spring-sown Wheat and a crop of autumn-sown Sensation Wheat, which might have served to renew his seed next year. But that loss is too problematical and too remote. At the same time I must say that a farmer who buys seed at 50 per cent. above the market price of ordinary Wheat, though he may have no legal claim for problematical losses, might reasonably expect an enterprising and experienced grower and seller like Mr. Marsters to exercise greater diligence. He would expect him to select such a high-priced Wheat from fields where he saw the young plants springing up vigorously and regularly in the drills—where no blight came to injure the ears—where the Wheat was cut dry and did not remain too long in the shocks. He would expect him to see that the Wheat did not smoke in the stack, that it did not heat in the granary, and that it was well cleaned and sifted, and kept free from damp. If in this way young Wheat had been selected, and watched by Mr. Marsters from the cradle until the grave was prepared for it as farmers used to do, he would not have had 40 or 50 complaints last year. Greater care would be advantageous to him as well as to the farmer and smaller holder. These three together might bring back to the corn-lands the agricultural smile.

There will be judgment for the plaintiff in the claim for £1 7s. 6d., but without costs. There would be judgment for the defendant on the counter claim for £17 10s., with costs on Scale C.

WHAT IS A GARDENER?

The Duke of Bedford, who was represented by his agent, was summoned before Mr. Marsham, at Bow Street Police Court, on the 3rd inst., for employing five male servants without having proper licences for them. Mr. Pickford supported the summons on behalf of the London County Council. Mr. Bodkin appeared for the defendant.

Mr. Pickford stated that the five men in question were employed as gardeners by the Duke of Bedford, their duties being to attend to Bedford Square Gardens, Ridgmount Street Gardens, and a number of spaces at the end of houses on the Bedford estates. There were shrubs, plants, and flowers in the gardens, and he (the counsel) maintained that the men who looked after them were gardeners or under-gardeners, and therefore came within the Act.

George Beck, foreman of the men referred to, said he was employed by the Duke of Bedford, and was paid a salary of £2 a week. One of the other men received 32s., and the others 30s. a week. At one time he was a farm labourer, and was afterwards employed by a cheesemonger. He had worked on the Bedford estate for many years. He looked after the gardens, kept the grass cut, and in the spring planted Pelargoniums [Geraniums] and Stocks. Although he could do that, he did not regard himself as a skilled gardener, and would not take charge of a gentleman's garden even if he had the opportunity.

Mr. Bodkin: Of course you can plant a Geranium the right way up? (Laughter.)

The Witness: Certainly.

But you don't propagate flowers? No, we get the Geraniums every spring from a firm in Covent Garden. There are only a few Geraniums round the edges.

In reply to the magistrate, the witness said he formerly sowed the seeds of annuals, but he had not done so for more than twelve months past.

Mr. Bodkin: Is there a man in this court who has not at some time or another sown mustard and cress in a box, or even on a piece of wet flannel? That does not make him a gardener.

Mr. Bodkin went on to say that the Duke of Bedford disputed this matter, because it was of some importance both to him and owners of property throughout the country who maintained open spaces. A man who worked in a garden was not necessarily a gardener, and the men in question simply did rough work which did not bring them within the Act. They only put in flowers which had been grown by someone else, and it could not in any sense be said that these gardens were places in which flowers were cultivated. The men were not attached to any establishment; they were not skilled men, and they were only paid the wages received by labourers in London.

Mr. Marsham: One of them received £100 a year. That is not a labourer's wage.

Mr. Bodkin: The Duke of Bedford, being a large employer of labour, pays wages quite up to the standard, and the man you refer to is a kind of foreman.

Mr. James Weston Marchant, chief clerk in the Bedford estate office, stated that about 150 dozen Geraniums were planted in the gardens in question every year, and he ordered them. Nothing was propagated in the gardens. When a shrub died it was replaced by another one. A labourer's wage in London was 7d. an hour. This was the first time the Duke of Bedford had been asked to pay a tax for the men employed to keep the square gardens in order.

Mr. Bodkin: Have you considered the advisability in the event of these men being taxed of employing lady gardeners?

The Witness: I think it will be worth consideration.

The case was adjourned.

On the 10th inst. Mr. Marsham delivered a considered judgment. He said that since the last hearing he had visited the gardens, and was impressed by the beautiful array of flowers. He came to the conclusion that the foreman Beck was a gardener within the meaning of the Act. He had some doubt about the other man, whose wages were 32s. a week, but with regard to the other three men they were, in his opinion, not gardeners, but men who worked in a garden. In regard to the foreman, he imposed a penalty of 20s., which would include the cost of the licence, 15s. It was intimated that there might be an appeal.

GARDENING APPOINTMENTS.

Mr. JOHN T. LIDSTERS, 18½ years as General Foreman at West Riding Asylum, Wakefield, has now been appointed as Gardener and Superintendent at the same place.

Mr. T. RUSSELL, for the last 3 years Inside Foreman at Downside, Leatherhead, and previously a Journeyman in the Royal Gardens, Windsor, as Gardener to J. M. CARR LLOYD, Esq., Lancing Manor, Lancing, Sussex. (Thanks for 2s. received for R.G.O.F. box.—Eds.)

Mr. G. PHILLIPS, for 9 years Gardener to VERNON J. WAINEY, Esq., as Gardener to the Honorable Henry B. PORTMAN, Buxted Park, Sussex.

Mr. F. PAGE, for 12 months Gardener to ELMER SPEED, Esq., Knowlton Court, near Dover, as Gardener to J. E. A. GWYNNE, Esq., Folkington Manor, Polegate, Sussex.

Mr. JAMES WATSON, for the past 4 years and 9 months Foreman at Cullen House, Cullen, N.B., and previously at Keir Gardens, Dunblane, N.B., as Gardener to ARTHUR HAYWOOD, Esq., Glevering Park, Wickham Market, Suffolk.

Mr. A. HAMMOND, for past 18 months employed in Messrs. J. VEITCH & SONS Nursery, Kings Road, Chelsea, and previously for 4 years Gardener to H. C. BENTLEY, Esq., Nubsdale, Market Harborough, as Gardener to MALCOLM BOWKICK, Esq., Brockfield Hall, near York.

Mr. A. WILLIAMS, for the past 3 years Gardener to JOSTADWYLL, Esq., Widney Manor, Warwickshire, as Gardener to H. SCHWARZ, Esq., Avon Clavow, Avon Dassett, Warwickshire.

Mr. C. T. B. CLARK, previously Foreman at Leigh Park, Havant, as Gardener to Colonel BOYLE, Clifton House, Trichfield, Epsom. (Thanks for contribution of 2s. to R.G.O.F. box.—Eds.)

Mr. G. MAHER, late Gardener to R. WILLIS, Esq., Ashfield Arnold, Notts., as Gardener to A. E. HAWLEY, Esq., Leicester Grange, Hinckley.

THE WEATHER.

THE FOLLOWING SUMMARY RECORD of the weather throughout the British Islands, for the week ending August 6, is furnished from the Meteorological Office:—

GENERAL OBSERVATIONS.

The weather.—At the beginning of the week the weather over England was mostly fair and dry, with a temperature differing but little from the average. In Ireland and Scotland the conditions were less settled, and on Tuesday rain extended to all parts of the Kingdom, the remainder of the week being cool and very changeable. Thunderstorms occurred in many parts of the country on the 3rd and 4th, and again in several English districts on the 5th, and were in many instances accompanied by heavy falls of rain and hail.

The temperature was below the average in most of the western and southern districts, as well as in the Midland Counties. In the eastern parts of Great Britain and in Scotland W. it agreed very closely with the normal, while in Scotland N. it was above the average. In the northern, eastern and central districts the highest readings were registered very generally at the commencement of the week, but in the west and south-west they occurred more commonly in the latter half of the period. In England N.W. and S.W. the thermometer did not reach 70°, but in most other districts it exceeded that level, and in the Midland Counties (at Rains) it rose to 76°. At Sumburgh Head a reading as high as 82° is reported to have occurred on Saturday. The lowest readings, which were experienced at various times in the different districts, ranged from 37° at Scotland E. (at Balmoral) to 47° in England E. and to 53° in the English Channel. The lowest grass temperatures reported were 32° at Sheffield, 34° at Balmoral, and 35° at Birmingham and Markee Castle.

The rainfall varied considerably in amount in different localities. In most of the western and southern districts and in Scotland E. it was in excess of the average, but elsewhere there was a fairly general deficit. More than an inch was reported at Scilly and in the south-eastern parts of Ireland on the 1st (as much as 1.8 in. at Waterford), and at a few places in the north of Scotland and the south-east of England on the 5th; on the last mentioned occasion heavy hailstorms occurred in some parts of our eastern and southern counties.

The bright sunshine amounted to more than the average in the eastern and central parts of England and in the northern parts of Ireland and Scotland. Elsewhere there was a slight deficiency. The percentage of the possible duration ranged from 51 in England E. and 47 in the English Channel to 25 in Scotland E. and W.

THE WEATHER IN WEST HERTS.

Week ending August 10.

A cool and gloomy week.—The day temperatures, with one exception, have remained low for the time of year, but on the other hand there have occurred only two cold nights. On the coldest of these two nights, however, the exposed thermometer indicated a reading within 7° of the freezing point. Both at 1 and 2 feet deep the ground is now about 1 degree colder than is seasonable. Rain fell on four days, but the total measurement amounted to less than half-an-inch. With the exception of a few drops of rainwater which passed through the bare-soil gauge on three days both the percolation gauges have been quite dry. The record of bright sunshine proved very poor, averaging only 3½ hours a day; or nearly 2½ hours a day short of a seasonable duration. On the first day of the week the sun shone brightly for 10 hours, whereas, during the last two days, less than an hour's sunshine was altogether recorded. Calms and light airs have alone prevailed, and for the last two days the direction has been exclusively some northerly point. The mean amount of moisture in the air at 3 o'clock in the afternoon exceeded a seasonable quantity for that hour by as much as 13 per cent.

Weather in July.—It was stated (p. viii.) in the heading to the remarks on the month of July that it was the coldest July for 22 years, but the mean temperature of July, 1907, was, I find, slightly lower than in that of the present year. E. M., Berkhamsted, August 10 1910.

CATALOGUES RECEIVED.

BULBS.

AUSTIN & McASLAN, 80, Mitchell Street, Glasgow.
T. METHVEN & SONS, 15, Princes Street, Edinburgh.
Wm. BULL & SONS, King Street, Chelsea.
THOMAS KENNEDY & Co., Dumfries.
DICKSONS, Chester.
CLIBRANS, Altrincham and Manchester.
JOHN KEE & SON, West Notwood, London.
COOPER, TABER & Co., 90 & 92, Southwark Street, London—wholesale.
TYNDSIDE SEED STORES, LTD., 65, Clayton Street, Newcastle-on-Tyne.
DAVID W. THOMSON, 113, George Street, Edinburgh.

MISCELLANEOUS.

H. CANNELL & SONS, Swanley, Kent—Strawberries.
WELLCOME CHEMICAL RESEARCH LABORATORIES, King Street, London—Exhibits at the Japan-British Exhibition, including Botanical and Materia Medica Specimens, with descriptive notes.

FOREIGN.

HAAGE & SCHMIDT, Erfurt, Germany—Bulbous and other Plants.
E. H. KRELAG & SON, Haarlem, Holland—Bulbs.
WILLY MULLER, Nocera Inferiore, Italy—Bulbs and Roots.

SCHEDULE RECEIVED.

The Sheffield Chrysanthemum Society will hold its annual shows in the Corn Exchange, Sheffield, on Friday and Saturday, September 16, 17, and Friday and Saturday, November 11, 12. Secretary, Mr. C. Cook, City Road, Sheffield.

MARKETS.

COVENT GARDEN, August 10.

[We cannot accept any responsibility for the subjoined reports. They are furnished to us regularly every Wednesday, by the kindness of several of the principal salesmen, who are responsible for the quotations. It must be remembered that these quotations do not represent the prices on any particular day, but only the general averages for the week preceding the date of our report. The prices depend upon the quality of the samples, the way in which they are packed, the supply in the market, and the demand, and they may fluctuate, not only from day to day, but occasionally several times in one day.—Eds.]

Cut Flowers, &c.: Average Wholesale Prices.

Table listing various cut flowers such as Alströméria, Asters, Carnations, Coreopsis, and others with their respective prices in s.d. and s.d.s.

Cut Foliage, &c.: Average Wholesale Prices.

Table listing various cut foliage plants such as Adiantum, Asparagus, Croton, and Ferns with their respective prices in s.d. and s.d.s.

Plants in Pots, &c.: Average Wholesale Prices.

Table listing various potted plants such as Aralia Sieboldii, Asparagus plumosus, and Begonia with their respective prices in s.d. and s.d.s.

Fruit: Average Wholesale Prices.

Table listing various fruits such as Apples, Apricots, Bananas, Cherries, Currants, Figs, Grapes, and others with their respective prices in s.d. and s.d.s.

Vegetables: Average Wholesale Prices.

Table listing various vegetables such as Artichokes, Aubergines, Beans, Broccoli, Cabbages, Carrots, Cauliflowers, Cucumbers, Endive, Greens, Marrows, and others with their respective prices in s.d. and s.d.s.

REMARKS.—English Apples are arriving in slightly increased quantities; the quality of the fruits is not particularly good. Supplies of Plums from Kent are only moderate; they are realising satisfactory prices. Large consignments of foreign Pears are being received, but not many are in a ripe condition. Red Currants still realise good prices. The Grape trade is only fair, but there is an improvement in the demand for Pines and Bananas. Spanish Grapes are arriving in a fine condition, and are selling freely. The prices for home grown Tomatoes are a little higher. E. H. R., Covent Garden, August 10, 1910.

Table listing New Potatoes and Bedfords with their respective prices in s.d. and s.d.s.

REMARKS.—Trade is still very bad, and there is little demand for tubers. E. H. R., Covent Garden and St. Pancras, August 10, 1910.

COVENT GARDEN FLOWER MARKET.

Garden flowers are abundant. Roses are plentiful, and generally of good quality. The finest blooms with long stems make fairly good returns, but many consignments have to be cleared at prices which can give very little profit to the growers. I have been asked why prices given in the list above are often in excess of what the flowers may be bought for in the streets. The hawkers in some cases pay the full market value, but usually they clear out surplus stocks at reduced prices and are thus enabled to undersell the florist. Gladiolus the Bride is still procurable, and there are spikes of the hybrid G. gandavensis. Gypsophila paniculata is at its best condition. The double-flowered variety will be seen a little later on. Double-flowered white Stocks are good. Sweet Peas are abundant, but the quality of the blooms varies considerably. Centaurea cyanus (Cornflower) and Centaurea suaveolens (Sweet Sultan) are procurable. At this season of the year there are considerable quantities of cut flowers wasted owing to there being no purchasers.

POT PLANTS.

Few plants will be required by the florists for the next month or six weeks. Many stands are empty, and the salesmen are away on holiday. Some growers send supplies all the year round, but it is doubtful if it pays them to market plants now, except for country orders. A. H., Covent Garden, August 10, 1910.

The Editors will be glad to receive, for consideration, large photographs of horticultural subjects, suitable for reproduction as Supplementary Illustrations in this Journal.

ADDRESSES: J. P. M. Latour-Marliac, Temple-sur-Lot, France.—W. M. D. We cannot trace the address of such a firm.

ALMUG OR ALGUM TREES: H. J. C. According to Grindon in his Scripture Botany, the name Almug* is transcribed without change from the original of the Old Testament, and is not a Hebrew one, but an Indian, corresponding in origin with the Hebrew names of apes, peacocks, and ivory. The tree is indigenous to the mountainous parts of the Indian Peninsula, especially Mysore and parts of Coimbatore and North Canara, in the Madras Presidency, north and north-west of the Neigherry Hills. It grows in dry and open places, not in forests, often in hedgerows, and attains the height of 20 feet or 30 feet, and a circumference of nearly a yard, the branches forming a beautiful spherical head. The leaves are opposite, ovate, pointed, entire, and bright green; the flowers resemble those of the Persian Lilac, and are clustered in much the same manner, but in colour are buff or yellowish, changing with age into deep purple; the fruits, when quite ripe, resemble small black Cherries.

ASTERS DISEASED: E. F. The plants are attacked by a fungus (Rhizoctinia) on the "collars." Water them with a solution of sulphate of potash.

BEGONIA LEAVES: J. C. The trouble is not due to disease, but results from an excess of water at the roots, combined with too much moisture in the atmosphere. Afford an increased amount of ventilation.

CLEMATIS: B. L. The sudden failure of Clematis plants is not usually due to disease, but to a more or less imperfect union between stock and scion. In such circumstances no harm would ensue from planting another plant in the same spot. (See also p. 92 in the last issue.)

EXHIBITION: W. V. G. The specimens were not exactly alike. If you wish to have them properly named, we must ask you to forward us fresh specimens, not only of the flowers, but also of the foliage of each plant.

GOOSEBERRY MILDEW: R. H. B. The mildew is only the common European form, which is not injurious to any great extent. There are no signs of the American mildew.

GRAPES: W. S., Richmond. A species of Botrytis has attacked the Grapes. Give increased ventilation in the viney early in the day.

GRAVELLING GARDEN PATHS: E. W. S. There is no necessity to remove the ashes unless the addition of the gravel is likely to raise the paths too much above the level of the surrounding ground. Under any circumstances,

* This name is applied in the Old Testament to Santal in album, the Sandal Wood Tree.

the surface must be loosened, and the paths reformed and rolled before gravel is applied, otherwise the result will not be satisfactory. You must not think that the substitution of gravel for ashes will prevent the surface of the walks from picking up after a frost or a slight rain, unless special preventive measures are taken. Generally speaking, there are only two conditions which obviate this difficulty. The surface of a path must either be impervious to moisture, or so porous that it passes through it at once. The use of asphalt or cement secures the first condition; a clean, non-binding gravel the second. You do not state the kind of gravel you purpose using. Whatever kind it may be, it will be as well to screen it, using the coarser material for the bottom and the finer for the top. Roll the bottom layer well before applying the fine gravel, and afterwards give whole a good rolling. If you use a crushed limestone gravel, apply water while the fine portion is being rolled, as this will make it cohere better and more quickly. If you do not object to having loose gravel on the surface, a dressing of Bideford (Pea) gravel will assist in keeping the surface from picking up after rain or during a thaw. In forming the paths, be sure and give a good camber—not less than 1 in 60—so that the rain may be carried to the sides. Unless you have some very special reason for doing so, we would advise you not to put on the gravel thicker than 2½ in. to 3 in., as this is ample for any ordinary garden path.

HELLEBORE: *A. C. B.* The injury is caused by the unfavourable season. No disease is present.

LAVENDER WITH MALFORMED GROWTHS: *Lavender.* There is no disease present in the shoots. The most probable cause of the trouble is the unfavourable autumn of last year, the shoots being sappy and tender in consequence. Give the plants some stimulant, applying liquid manure at intervals.

"MOSS" ON LAWN: *H. B.* The plant infesting your lawn is not a *Moss*, but one of the flowering plants. It is a *Cerastium*, or a closely-allied plant, the specimen being too withered for accurate identification. If you apply some nitrogenous manure, it will cause the grass to grow luxuriously, and in time crowd out the weed. Mix, say, nitrate of soda, or sulphate of ammonia, with fine soil, and apply it as a top-dressing. Lawn sand will have the same effect.

NAMES OF FRUITS: *J. O. Edwards.* Peaches: 1, Dymond; 2, Stirling Castle; 3, Early York; 4, Violette Hative.

NAME OF PLANTS: *James John Foster.* *Cotoneaster Nummularia.*—*Stort.* 1, *Crataegus mollis*; 2, *Liquidambar styraciflua*; 3, *Morus nigra* (Mulberry); 4, *Ginkgo biloba* (Maidenhair Tree); 5, *Sequoia sempervirens* (Redwood); 6, *Pyrus Aria* (Whitebeam); 7, *Olearia Haastii.*—*H. P. Ruthin.* *Cistus ladaniferus*, *Gum cistus.*—*R. S. Q.* 1, *Campanula* (too withered for identification of species); 2, *Dracocephalum argenteum*; 3, *Campanula carpatica* variety; 4, *Mimulus cupreus* probably; 5, *Campanula carpatica turbinata*; 6, *Veronica subsessilis*; 7, *Sedum grandiflorum.*—*Correspondent.* 1, *Codiaeum (Croton) chrysophyllum*; 2, *C. Weissmannii*; 3, *C. Evansianum*; 4, *C. angustifolium*; 5, *C. variegatum*; 6, *Ananassa sativa variegata* (variegated Pine Apple plant); 7, *Kochia scoparia.*—*H. H. S.* *Dendrobium crystallinum.*—*H. H.* 1, *Pteris longifolia*; 2, *Lo-maria nuda*; 3, *Cheilanthes elegans*; 4, *Notholaena chrysophylla*; 5, *Pteris arguta*; 6, *Blechnum brasiliense.*—*R. P. Bushey.* 1, *Cypripedium consipicuum (Harrisianum × villosum)*; 2, *Cypripedium Savaganum (Spicerianum × Harrisianum)*; 3, *Cattleya elongata (Alexandrae)*; 4, *C. Fenillatii (Leopoldii × superba)*; 5, *C. superba.*—*O. R.* 1, *Cattleya luteola*; 2, *Ada aurantiaca*; 3, *Odontoglossum blandum*; 4, *Cochliola vulcanica.*—*H. S.* *Veratrum nigrum.*—*H. B.* *Cattleya guttata*; its value is only that of an ordinary garden Orchid.

NECTARINE WITH CRACKED SKIN: *G. H.* There is no disease present. The trouble is due to keeping the temperature of the house too low. Next season, afford a little extra warmth when the fruits are swelling, and attend to the stopping, tying, and training of the shoots at the proper time.

NOTICE TO TERMINATE EMPLOYMENT: *A. B.* It is usual for a head gardener to give or receive

one month's notice to leave. If your employer could prove the allegation he has made, you could not claim the usual notice.

PEACH WATERLOO: *A. G.* It is characteristic of this variety to be woolly and of poor flavour, but it is not likely to be so good even as usual in this unfavourable season. In some districts the variety comes better than in others. The cracking of the fruit is caused by excessive moisture, but Waterloo is peculiarly subject to this trouble, its skin being very thin, and when ripe it will hardly stand handling. The fruits should be gathered and used as soon as they are ripe, as they do not remain long in good condition. The variety Hale's Early does not ripen quite so early as Waterloo, but it is far more reliable and of better flavour. You would do well to substitute the one for the other.

PELARGONIUMS WITH YELLOW FOLIAGE: *S. A. B.* and *J. P.* Neither fungus nor insect pest has caused the leaves to turn yellow, which is due solely to the unfavourable weather.

PHLOX COQUELICOT AND ASPHODELUS LUTEUS. *B. L.* In many soils and localities Phlox Coque-licot develops swollen or gouty stems, a probable outcome of rupture to the sap vessels from some cause undetermined. It appears to be the more liable to this condition after division of the clumps, and when growing in heavy or wet soils. To prevent this trouble the variety should be raised from cuttings periodically, planting the cuttings out directly they are well rooted. In some instances the failing referred to has caused the variety to be discarded, and Flambeau has been substituted for it. We have not found *Asphodelus luteus* difficult to flower when grown in moderately light soils. The plant, however, needs some time to become well established.

PLANTS ATTACKED AT THE ROOTS: *F. J.* The roots are infested with eelworms. The best plan is to use entirely fresh soil, sterilising (by baking) that which is infested with eel-worm. Sulphate of potash applied to the soil is to be recommended, and any of the ground insecticides, such as vaporite or apterite.

PROLIFEROUS ROSE: *W. J. W., Ltd.* The blooms exhibit proliferation. For some reason, not determined, the central axis, instead of terminating in the flower, continues to develop. The abnormality is common in Roses.

RASPBERRIES FAILING: *Rubus.* The trouble is due to unfavourable soil conditions. No disease is present. You should not employ gas lime unless the land is fallow, first ascertaining by means of an analysis if this material will be beneficial. From your description of the ground, we suspect it requires a good dressing of farmyard manure.

RED SPIDER ON VINES: *A. H.* It is not safe at this stage to subject your vines to excessive sulphur treatment. The better way to deal with them now is to carefully sponge the leaves with weak, soft-soapy water, with a little sulphur added. This will keep the pest in check until the crop is cleared, when the foliage should be drenched several times at intervals of a few days with the same mixture, used in greater strength. It is a good plan to sprinkle sulphur on the pipes several times during the growing season, as a preventive measure. You must also clean the rods thoroughly after the winter pruning.

SHOWER AND WEDDING BOUQUETS: *W. A. W.* During August there is an abundant supply of suitable flowers for making all kinds of wedding bouquets. Among the most useful are Roses, especially such varieties as Madame Abel Chateau, President Carnot, Sunset, Sunrise, Liberty, and the Wichurajana type, which selection will be found most suitable for shower bouquets. The sprays, however, should be cut before the flowers are fully open, as if this is not done the trusses are round at the top and heavy. There are also border and Perpetual-flowering Carnations in great number and variety. The best are Fairmaid, Winsor, Mayday, and Britannia (scarlet). White Perfection is very suitable for a bridal bouquet. Lily of the Valley and *Odontoglossum crispum* or *O. Pescatorei* can also be obtained during this

season, and are specially useful for mixing with Carnation White Perfection or other large, white flowers for wedding bouquets. The flowers enumerated are suitable for the making of costly bouquets, but hardy flowers, including annuals, provide good material for bouquets throughout August. Some of the most suitable are small side pieces of Delphinium with *Nigella Miss Jekyll*, and *Gypsophila paniculata*. *Gypsophila* should be used sparingly, and in small sprays, as, although so light in itself, too much of it "kills" the other subjects in a bouquet or any other floral design. Iceland Poppies, with grasses and a few small flowers of herbaceous Sunflowers used below them, or still better, some *Coreopsis grandiflora*, form an attractive scheme. *Cactus Dahlias* may be used either alone, or, if the bronze and yellow varieties are used, a few spikes of *Montbretia* may be added. Endless other combinations, such as *Scabiosa caucasica* with many Sweet Peas and *Gypsophila*, or Sweet Peas with their buds and a few light points of their own foliage, and perhaps a mere suspicion of *Gypsophila*, will readily suggest themselves to anyone who has a good herbaceous or annual garden to draw upon. All the above suggestions can be added to by the judicious mixture of a few sprays of brown or autumnal foliage, or *Asparagus plumosus* or *A. Sprengeri*, but *Adiantum Fern* should be avoided, as it does not last well, and moreover, although beautiful on the plant, it has a very stiff and formal effect. The ordinary type of shower bouquet is not to be recommended as it hangs too low; the three-quarter shape bouquet, with a few flowers, buds, and sprays of foliage depending, is to be preferred. This form of bouquet is held most conveniently about the level of the elbow, and this creates an effect both above and below the waist. A bouquet now in fashion is one which can be held over the arm and not in the hand. As to the method of fixing the wires; do not adopt the usual method of wiring flowers and sticking them into moss pads. It is far better to make the bouquet entirely in the hand, binding the flowers firmly into position, working a light foundation of foliage into it as the work proceeds. To bring about the semi-shower or three-quarter effect, the lower flowers and sprays of foliage and buds will have to be pulled over so that they entirely cover the hand of the person carrying it. You will find much information on the subject in a book just published by Messrs. Adam & Charles Black, entitled "British Floral Decorations," by Mr. R. F. Felton, reviewed in *Gardeners' Chronicle*, June 18, p. 399.

TOMATO DISEASED: *Anxious.* The plants are *Verbena* is attacked by *Peronospora effusa*, diseased plants, and soak the soil of the entire house with a solution of sulphate of potash.—*W. S. P.* The plants are attacked by *Cladosporium fulvum*. Bordeaux Mixture alone will arrest its progress.

TURF TURNING BROWN: *F. M. V.* The trouble is caused by a fungus which is present in the roots of the grass. Soak the diseased patches thoroughly with a solution of sulphate of iron, using 1 lb. to 1½ gallons of water.

VERBENA AND MYRTLE DISEASED: *G. G.* The *Verbena* is attacked by *Peronospora effusa*. Spray the plants early in the season with liver of sulphur, using ½ oz. in two gallons of water. The fungus *Cladosporium* is present on the Myrtle, which should be sprayed with the same specific as the *Verbenas*. *A Text-book of Plant Diseases*, by George Massee, will be suitable for your purpose.

"YELLOWING" IN LEAVES: *Wessner.* Sickly, yellow foliage is very common in the case of trees and shrubs this season, owing to the unfavourable weather. In addition to the manures you mention, try the effect of some nitrogenous compound.

THE GENUS EREMURUS.

(See Supplementary Illustration.)

THE Editors have asked me to write an account of this genus to accompany the illustration which was taken in my garden early in June this year by Mr. Gerald Strickland. To revise the genus from a botanical point of view would be beyond my power, for it is evident that the characters on which botanists have relied to separate the supposed species in this genus are so variable in cultivation that, without a much better knowledge than we have of them in a wild state, I should only become lost in a maze of difficulties. Baker, in his revision of the genera and species of Anthericæ and Eriosperrmæ [*Linn. Journ. Bot.*, vol. xv., 1876], recognised 18 species, and in the *Index Kewensis*, 1893, about 10 more are catalogued. But for horticultural purposes, it seems to me that not more than five or six at present in cultivation are of importance in ordinary gardens, and these have in the last few years become most popular plants, on account of their striking habit and easy cultivation.

The Eremuri are found in Western and Central Asia, often at considerable elevations, and in grassy steppes, where the season of vegetation is very short, and where the heat of summer and the cold of winter are very great; but, notwithstanding the difference of climate, they seem to grow well in all but the wettest parts of Great Britain, and, provided

that the ground is well drained, they do not require to be lifted annually.

Their root-system is very peculiar, consisting of a stout central axis, from which a number of thick, fleshy roots radiate like the arms of a starfish in a horizontal plane. These roots are long and easily broken, and in lifting the plants from the ground care must be taken to begin at a good distance from the crown and to undermine the whole plant before taking it up, as the roots often extend 2 or 3 feet horizontally. As a new crown and a new series of roots are formed annually on the top of the old ones, it is necessary to lift, divide and re-plant every two, or at most three, years, and I find that the roots may be kept dry without injury, and in wet autumns with advantage, for two or three months, from about the beginning of August till the middle of October. The principal cultural difficulty that must be guarded against is the tendency of the plants, especially *E. robustus* and **Elwesii*, to grow early in spring, at a time when rain and severe frosts are usual, and, though the thick, fleshy leaves will endure 10° to 15° of frost in March and April without much injury, yet, if water lodges and freezes at the base of the leaves, the young flower-spike is certain to be damaged, and often destroyed. Therefore, it is a good plan to cover the crown at night with a flower-pot or handlight as late as possible, and to place the plants in a situation where they are protected, by a wall or by a thick hedge, from the morning sun.

This is not so necessary in the case of the narrow-leaved, yellow-flowered species which are later in growth, but some of these require a warmer and drier position, and do not flower and seed as freely as those of the robustus section. I have planted and seen Eremuri growing well among shrubs, but though the shelter is good for them in spring, they cannot in such situations be lifted without much trouble, and the shade of shrubs around them is bad in summer. Therefore, I prefer to grow them in a bed by themselves, and do not find them particular as to soil, though, from their remarkable vigour on chalk and limestone soils, I suppose that lime is congenial to them. They may be easily raised from seed, though it ripens slowly, and, in wet summers, most of the capsules fall off without maturing. I sow the seed in pans as soon as ripe, and keep the pans in a frame for a year or two, when the young plants may be planted out in a frame or in the open border. Three to five years is required before the seedlings flower, and there is a good deal of variation in colour and size among them.

The best known of the thick-leaved species are as follows:—*E. himalaicus* Baker, has small, white flowers and a spike 5 to 8 feet or more high, which has a tendency to bend over, and often requires staking.

E. robustus was described and introduced from Turkestan by Regel about 1875, and has become a common plant in our gardens. A form of it was, I believe, first raised or noticed by Max Leichtlin, and called by him *Elwesianus*, and this was later figured in the *Jardin du Crest* by Micheli, and described by him as *E. Elwesii* in the *Revue Horticole*, p. 280 (1897). This has thicker and broader leaves, and, in the first plant which was sent to me by

* Printed in Supplementary Illustration as *E. robustus* *Flvesianus*.

Max Leichtlin, the flower-spike was earlier, shorter, and had the flowers extending much lower down the stem than in *robustus*, which, in addition to its larger individual flowers, makes it, from a horticultural point of view, distinct from and better than *robustus*.

But the seedlings which I have raised from *Elwesii* do not always show these characters, and a great majority of the plants now in cultivation and commonly sold under the name of *Elwesianus* are hardly, if at all, distinct from *robustus*.

The white form of it, which has been raised in some quantity by myself and in the garden of M. Philippe de Vilmorin at Verrières, is a very fine plant, much superior in vigour and size of flower to *E. himalaicus*.

Beside these, I have a form which I call *tardiflora*, which, for horticultural purposes, is very distinct from either; partly by its leaves, which are narrower and more upright, but principally because it is at least a month later; and this peculiarity not only saves it from damage by spring frost, but extends the flowering season until the yellow-flowered species come in. I cannot tell whether this is a chance seedling in my garden, or how I got it, but I showed it at the Holland House Show in July four years ago, when the Committee wished to see it again.

I brought up three fine spikes two years later, when all the *robustus* and *Elwesianus* in my garden were long over, and was told that, in the opinion of the Committee, it was not distinct from *robustus*. But this is not the opinion of those who really know Eremuri, and in the Supplementary Illustration some spikes of this may be seen peeping out over my shoulder; did not flower till a month later than the group, which is composed principally of *Elwesii* and *Elwesii albus*.

After these come the yellow-flowered species which are grown under the following names: *E. Bungei* Baker = *aurantiacus* Baker from Afghanistan, and *Olgæ Regel* from Turkestan. There are hybrids or seedlings from them known as *Warei*, *Isabellinum*, *Sheltordii*, *Sir Michael*, &c., which vary in colour between pale yellow, puce and pink, and which will, sooner or later, have to be treated as florist flowers, as they vary too much to be treated as species, even if their parentage or origin were correctly known.

What florists should aim at in improving these plants are shorter stems, larger and less-crowded flowers, clearer and brighter colours and a late-flowering habit. I see no reason why we should not obtain in course of time as great an improvement in the yellows and pinks as we have in the white *Elwesii* over the original himalaicus.

But, taken as we see them now, they are about the most stately and attractive of all hardy plants in the early summer, and though expensive to purchase at present, will soon become more abundant. *H. J. Elwes, Collesborne.*

HYBRID JAVANESE RHODODENDRONS.

THE members of this section are remarkable among Rhododendrons, from the fact that instead of the flowering period being limited to any particular season, it extends over the entire year.

The persistent flowering qualities just noted are influenced by the style of growth, as directly a cluster of blossoms is over, at whatever season it may be, a new shoot is pushed out, which

gradually develops and forms a flower-bud at the apex. This, in the ordinary course of events, expands, be the season winter or summer.

Considering that the original species, whence these garden varieties have sprung, are all natives of islands in the Malayan Archipelago, one would almost expect them to require a store temperature for their successful culture. They, however, occur only in the more elevated and, consequently, cooler regions. Such being the case, a warm greenhouse—that is, one in which the thermometer during the winter ranges from 50° to 60°—is sufficient to meet their requirements.

As far as cultural matters are concerned, these Rhododendrons are not at all difficult to strike from cuttings, although some of the weaker varieties make more shapely plants when grafted on to the stronger-growing forms than when increased in this way. The cuttings must be put into well-drained pots of sandy peat, and kept in a close propagating case in a warm house, and shaded from the sun till rooted.

In potting Rhododendrons of this class, it must be borne in mind that their parents are, for the most part, epiphytes, and, consequently, a compost made up of fibrous peat and sand is better for them than a mixture containing loam. Thorough drainage, too, is very essential, for a free supply of water is needed, and, at the same time, stagnant moisture is very injurious.

In fine weather the syringe may be used freely, as a dry atmosphere is inimical to the welfare of the plants, leading, as it does, to the foliage being attacked by thrips. With care, however, in this respect, insect pests give very little trouble.

As befitting a race of Rhododendrons raised at the Royal Exotic Nurseries, Chelsea, well within the London area, the members of this group are but little affected by the sulphur-laden fogs too often experienced in winter throughout the London district. Certainly few, if any, greenhouse plants are as little injured as they.

Among the different varieties composing a group I saw recently at one of the shows, the following were particularly noticeable:—Amabile, bluish pink; Clorinda, deep rose; Exquisite, a pleasing shade of fawn yellow; jasminiflorum carminatum, rich carmine, having the tubular flowers and habit of the original *R. jasminiflorum*; Imogene, buff yellow; King Edward VII., large, bold trusses of bright-yellow flowers; Lord Wolseley, deep-orange yellow; luteo-roseum, a combination of rose and yellow, forming a peculiar yet pleasing tint; President, buff-yellow, tinged with rose; Primrose, pure primrose-yellow; Purity, white; Souvenir de J. H. Mangles, orange, suffused with pink; and Thetis, a distinct shade of light yellow. W.

POLEMONIUM CARNEUM.

THIS distinct *Polemonium* illustrated in fig. 49 is a native of California, whence seeds were received by Mr. Stein, Island of Islay, Scotland, some fifty years ago. Its correct name was unknown, and it was grown and known under the name of "California" till two years ago, when specimens were sent to Kew for identification. It turned out to be *P. carneum*, a native of mountain woods, Siskiyou Co., California. Branching freely the plants grow 1 foot to 3 feet high, but not so stiffly erect as the well-known *P. coruleum*. The leaflets are ovate or oblong-lanceolate, 1½ inches long, whilst the branches are somewhat umbellately 3 to 5 flowered. The flowers are of good size, salmon colour or flesh colour (fading to purple), and are very freely produced for nearly two months in May and June. It is a very attractive plant, quite hardy and easily grown, but preferring a partially shady position. The plant illustrated is growing in a shady part of the rock garden, where it is exposed only to the morning sun. Seeds are produced freely, and it seems somewhat strange that such a good and distinct plant should have remained obscure for so long. W. I.

THE BULB GARDEN.

GLADIOLUS SAUNDERSII.

THIS *Gladiolus* is now a superb sight in the garden, a clump with about 40 flower-spikes producing a most brilliant effect, with its vivid colouring. It was introduced into this country from South Africa in 1871, but, though it has been known for nearly 40 years, it is an extremely rare plant in gardens. One reason for the neglect it has experienced is probably that, its habitat being South Africa, it is thought to be too tender for culture in the open air. As a matter of fact, however, it appears perfectly hardy, for, though my plants have never received the slightest protection, they come up stronger every year, and they have increased greatly in number. It is also a wonderfully vigorous grower for a *Gladiolus*, the spikes attaining a height of 3 feet 6 inches, and the blossoms, three of which are fully expanded on a spike at the same time, are strikingly handsome. They are of a light, bright scarlet colour, and the three lower petals have each a white centre, which is liberally spotted with vermilion. The upper petal is lance-shaped,

FORESTRY.

THE ROYAL SCHOOL OF FORESTRY AT EBERSWALDE.

THE Eberswalde School of Forestry is one of the most important institutions of its kind in the world, as it is the special training ground of the Prussian forest officer. It may not be the most important, as there is a sister college in Munden, near Hanover, which is devoted to the same purpose, but the former institution is probably better known to foreigners on account of its nearness to Berlin, and the great amount of experimental work which is carried on there. Eberswalde itself is an unimpressive mixture of market village and manufacturing town, with residential outskirts, the 25,000 inhabitants being for the most part engaged in the sawmills, paperworks, and other factories which usually spring up around a town that lies in the centre of a woodland and agricultural district. The surroundings, however, make up for any lack of beauty in the town itself.

The old school was given up some 30 years ago on account of lack of space, and the present

[Photograph by W. Irving.]

FIG. 49.—POLEMONIUM CARNEUM FLOWERING ON A ROCKERY.

and inclines slightly forward, whilst the side petals are much reflexed, and the expanded blossoms measure rather over 3 inches across. If, however, the petals are stretched out to their fullest extent, the flower will measure 6 inches in diameter. Considering its hardness, its beauty, and the highly-ornamental qualities of the flowers, it seems a great pity that this *Gladiolus* is not more generally grown, as in the south, at all events, it should succeed well and increase in beauty year by year. It is most valuable for indoor decoration, the flower-spikes lasting for over a week in perfection, and a tall vase with a dozen or more of them makes a lovely and bright picture. Here we find it a far more reliable plant than *G. princeps*, which was described as perfectly hardy when first sent out. In the south-west, *G. princeps* is a very bad doer, continually dying out, and its culture has, on that account, been discontinued in many gardens. *G. Saundersii*, on the contrary, always flowers magnificently, so that it can be strongly recommended to take the place of *G. princeps* where that plant does not succeed. Wyndham Fitzherbert, Kingswear, Devonshire.

structure was erected specially for its present purpose. It cannot be looked upon as imposing, being more or less box-like, but the lecture rooms and collections are well worth a visit. There are four lecture halls, each capable of accommodating some 50 to 60 students, but as the number of scholars rarely exceeds 60, and these are divided into various sections according to the time they have been at the college, there is never any fear of overcrowding. The collections include sylvicultural instruments for the measuring, cutting and transportation of wood, &c.—altogether over 2,000 different exhibits. These are forestry implements proper, but in addition there are magnificent collections of chemicals, minerals (over 20,000), surveying and physical instruments, botanical specimens, and animals and insects indigenous to Germany. The rooms are open to the students at most hours of the day, and they are of great value for teaching purposes. One of the chief difficulties in English forestry schools lies in the fact that there is generally no good ground for demonstration purposes within easy reach of the institutions where forestry is taught, but Eberswalde is surrounded by four State forests with a total area

of over 40,000 acres, so that no difficulty is experienced in this respect.

The botanic garden is small, being only about 3 acres, but it fully satisfies the purpose for which it was established, namely, for a collection of indigenous forest trees and the more important shrubs. The lectures begin in summer at 8 a.m., and continue at intervals until 1 p.m. The afternoons are generally free, although the first-year student must devote one whole afternoon in each week to land-surveying demonstrations in the open, and, as he has to prepare charts of the surveyed land, at least two or three afternoons in the week are thus occupied. Saturdays are generally devoted to excursions in the woods, and, occasionally, afternoons are spent in the same way. In winter, the lectures begin for the most part at 9 a.m., although on some days they begin as early as 8 o'clock. On the average, two afternoons a week are devoted to other lectures or demonstrations. The average number of hours per week devoted to study in the college itself is about 24. In the third and sixth terms, that is to say, the two terms previous to the first and second examinations, the student is more or less free for the whole day, as the lectures are so arranged that the bulk of them can be heard in the first two terms, only two or three series of a more practical nature remaining as a kind of finishing polish. The number of professors and teachers employed is 14, those concerned with the forestry subjects proper being all practical men, in fact the directors of the neighbouring forests, whilst the others, without exception, are men of undoubted ability.

The students are divided into two classes, known as students proper and hospitants. The students take the full course and sit for the examinations, whilst the hospitants are generally men who wish to specialise, or who only want to hear a few lectures. The charges are 15s. entrance fee, and £3 10s. per term of half a year for the students, and 10s. entrance fee and 10s. per series of lectures for hospitants. Foreigners are required to pay double fees.

The college is by no means self-supporting, and a large grant is necessary to defray expenses. The cost of living in the town varies considerably; in the college prospectus the average, for a young man of moderate tastes, is given at £7 10s. per month. It may be that this information is given to prevent the extravagant son from demanding too much from his parents, but, on the average, the amount spent considerably exceeds the sum mentioned, mainly on account of the fact that forestry in Germany is one of the most exclusive of occupations, so that only persons of means are able to pursue it. G. W.

THE ALPINE GARDEN.

PENTSTEMON AZUREUS.

THIS is one of the most interesting, if not charming, plants in this genus for the Alpine or rock-garden. The glaucous-green foliage forms a very effective setting to the clear azure-blue of the flowers, which are borne in spikes about 1 foot high. These delightful little plants are quite hardy, and they are easily propagated from cuttings inserted under a bell glass in May or June. They are also very useful for planting in the foreground of herbaceous borders, in groups of five or six plants.

ANTHEMIS AIZOON.

AMONG the many species of this genus there are few that can excel in beauty or usefulness A. Aizoon, especially for growing on rockeries or for edging purposes. When well grown, it soon forms a pretty carpet of silvery-grey foliage and produces numerous creamy-white flowers about 1 inch in diameter, borne on stems 6 to 9 inches long. This singularly beautiful plant delights in a well-drained, sandy soil, and it needs but very little moisture during the winter months. An occasional soaking with water when in bloom is beneficial. W. F. Glover, Langport.

REMARKS ON THE CONDITION OF THE FRUIT CROPS.

(See Tables and Summaries, ante, pp. 77-82.)
(Continued from page 118.)

5. SOUTHERN COUNTIES.

DORSETSHIRE.—This is the worst fruit season experienced in these gardens during the past 11 years. Cold north-west winds, with frequent hailstorms in the fourth week of April, and 6° of frost on April 27, destroyed the Pear and Plum blossom, also that of Withington Fillbasket, Bismarck, and a few other early-flowering Apples. On March 30 we experienced 10° of frost, which ruined the blossom of bush fruits, and I have never known such a complete failure of the Black Currant crop. On most bush Apple trees, we have a fair quantity of fruits, but there is a poor crop on trees in orchards. There are some Pears on trees against south walls, but in other aspects the Pear crop is practically a failure. Sweet Cherries have been a full crop, but Morellos are very scarce. Strawberries proved an average crop, but many of the berries were spoiled by the rains. Both Walnuts and Cobnuts are poor crops. T. Turton, Castle Gardens, Sherborne.

—There were early prospects for abundant crops of all fruits, but late frosts destroyed the blossom. Our sub-soil being chalk, the land is drier and more favoured during a cold spring than heavy soils. Apples are a fairly good crop, especially Striped Beefing, King of the Pippins, Keswick Codlin, Rival, Peasgood's Nonesuch, and Reinette de Canada. Of Pears, we have an abundant crop, especially on trees of Le Ductier, Beurré Diel, Glou Morceau, Josephine de Malines, Seckle, and Doyenné du Comice, &c. Plums are very poor, but Morello Cherries are good. Currants and Gooseberries also are good, with the exception of Black Currants, which promised a heavy crop, but the late frosts destroyed most of them. Strawberries have been a fair crop, but the berries were not so large as usual, the first flowers being destroyed by cold. Thos. Denny, Down House Gardens, Blandford.

—Pears, in the case of wall trees, are carrying good crops, the fruits being very clean and free from spots. Plums are so abundant on wall trees, they require to be thinned. Pyramid and espalier Apple and Pear trees in the open garden produced a fine show of blossom, but the trees have poor crops. This I attribute to the cold, sunless season of last year, the wood failing to ripen. Most of our trees are netted to protect them from frost when in bloom. Constant attention is given to spraying the trees both in winter and summer, and this year especially I have noticed an absence of insect pests. The soil is a deep, adhesive loam, lying on chalk. A. J. Rogers, Langton Gardens, Blandford.

—Currants and Raspberries are very heavy crops, and Gooseberries are a good crop, except where birds attacked the buds. The fruit blossom suffered much injury from cold winds, and there was a scarcity of blossom, which I attribute to the sunless season of last year. Strawberries furnished a splendid crop, the fruits being some of the finest I have ever seen. Our soil is light in texture, the sub-soil being green sand on chalk. F. Oliver, Minsterne, Dorset.

HAMPSHIRE.—Apple trees generally blossomed well, and the fruits appeared to set, but they dropped freely later. The most promising varieties are Bramley's Seedling, Worcester Pearmain, Peasgood's Nonesuch, Lord Grosvenor, and Mère de Menage. The Apple trees are specially healthy. The Plum crop was injured by frost. Gooseberries are a heavy crop, as they usually are here. I have known but one failure in 50 years. Quite recently, a bad case of Gooseberry-mildew occurred within two miles of these gardens, without any apparent reason. Strawberries were again a very heavy crop, and the quality of the fruit was good. Royal Sovereign is still the best variety, although The Laxton runs it very close. I never saw Potatoes more promising; the haulm is especially luxuriant, and the yield of tubers is heavy. E. Molyneux, Swanmore Park, Bishop's Waltham, Hants.

—The wet, sunless season of last year is responsible for unripened wood, and to this I attribute the scarcity of hardy fruits this year. The trees, generally, were laden with blossom, and looked very promising, but the flowers were

weak, and soon fell. Apples are very scarce, many trees not having a fruit on them. There are also few Pears, whilst Apricots and Plums are both light crops. Gooseberries and Raspberries are the best amongst small fruits. There are no Black Currants, owing to spring frosts. Red Currants are only a partial crop. Strawberries are under the average; the first flowers were destroyed by frost, and the continued wet weather caused many berries to rot. A. G. Nichols, Strathfieldsaye Gardens, Mortimer, R.S.O.

—Apple and Pear trees flowered well, but frost and hail in May destroyed the greater part of the blossom. Plums did not flower very abundantly. Our soil is light and gravelly, and rests on clay. R. Learmouth, Sherfield Manor Gardens, Basingstoke.

—This is not a very good fruit district, but this season is the worst I have known for the past 14 years. Peaches and Nectarines were destroyed by the late frosts. Currants always crop well here. Strawberries were extra good, but the wet weather spoiled the late fruits. The soil is a heavy loam with a yellow clay sub-soil. Henry Martin, Bartley Lodge Gardens, Cadnam, Southampton.

—We had a splendid show of fruit at blossoming time, but the late frosts ruined the crops. All small fruits, such as Gooseberries, Red and Black Currants and Strawberries, produced large crops, but many fruits were spoiled by the wet weather. All fruit trees are very clean this year. The soil is of a sandy loam, in which all kinds of fruit trees do well. R. G. Onslow, Dogmersfield Park Gardens, Winchester.

—The fruit crops are the worst I have known here during the past six years. Apple trees in orchards produced no flowers, and we have only a medium crop of fruit on trained trees. This I attribute to the absence of sunshine last summer. Pears flowered well, but on unprotected trees the fruits were spoilt by spring frosts. Plums are satisfactory only on wall trees. Red and Black Currants are failures through frost when the bushes were in flower, but Gooseberries, being protected at the time from bullfinches by netting, and being in nearly full leafage, escaped much injury. Our soil is marl over chalk. E. Henderson, Stratton Gardens, Micheldever.

—Apples generally are very scarce in this district, but Pears are a good average crop, and we have an abundance of all bush fruits. The soil is a medium to heavy loam, with a clay and flint sub-soil. The gardens are situated 470 feet above sea level. A. W. Blake, The Castle Gardens, Highclere, Newbury.

—The fruit crops this season are the most unfavourable for a number of years past, and especially with regard to Apples and Pears. There was a good show of blossom; the chief cause of failure I attribute partly to frost, 7° being registered in the second week in May, also to north and north-east winds. The weather was very dry at the time the trees were in flower, otherwise much more damage would have been caused. Strawberries which promised well, were damaged, first by frost and later by excessive wet and cold. Gooseberries, although not so plentiful as last year, are a good average crop. Black and White Currants, also Raspberries and Loganberries are very good crops. The gardens are well protected by trees, although the altitude is 290 feet. Our soil is a sandy loam, resting on sand. A. G. Shadbolt, Blackmore Gardens, West Liss.

KENT.—Apples set well, but from various causes the young fruits dropped in large quantities when about the size of Walnuts. Pears are almost a total failure, the only variety carrying even a half-crop is Durondeau, which is generally very good here. The Plum and Damson crops are almost total failures. Cherries dropped in great numbers, and the fruits cracked badly. The Peach and Nectarine crops in the open are about half the average. The trees have made excellent growths, and have been very free from blight, having been sprayed with "Meldal." G. Woodward, Barham Court Gardens, Teston.

—The general failure of the hardy fruit crops is due to unripened wood, the trouble being accentuated by low temperatures at the time the trees were in flower. George Bunyard, Maidstone.

—The hardy fruit crops are very poor. Apples, Pears, Plums, and Sweet Cherries are all

scarce. Morello Cherries are good. Gooseberries are unsatisfactory, but Raspberries are very fair. Strawberries were a heavy crop. Our soil is principally chalk. *J. T. Shann, Batts-hanger Park Gardens, Easing. Dover.*

— All fruit trees bloomed freely, but, owing to cold winds, the fruit did not set. We have a wall planted on both sides with Plums; on one side the trees are laden with fruits, on the other they are barren. Strawberries were an extra large crop, but, owing to wet weather, many of the berries were spoilt. *J. G. Weston, Eastwell Park Gardens, Ashford.*

— There is a very good crop of Gascoyne's Scarlet Seedling Apple, as the trees, blooming rather late, escaped the spring frosts. This is often the case with this variety. An orchard, half a mile away from my garden, and 200 feet above sea level, has scarcely any Apples or fruit of any kind. *Charles E. Shea, The Elms, Foots Cray.*

MIDDLESEX.—The fruit crops, generally, are much below the average. We have good crops of Peaches on a south wall, but on west walls they are a failure. Apples are very scarce, owing principally to the wood not ripening last autumn. Pears are a fairly good crop. Strawberries were excellent, but the flavour was deficient, and the berries were soon over. Raspberries are the most

with quassia extract. Black Currants are scarce, but Red Currants are very good. Many Gooseberries were damaged by frost. Our soil is a light loam, overlying gravel. *James Hawkes, Osterley Park Gardens, Isleworth.*

SURREY.—The fruit crops are very disappointing, albeit the prospects in early spring were extra good. Severe frosts on May 9, 10, and 11 destroyed the blossom. Even the shoots of Apricot and Pear trees were damaged, many spurs being killed. Apples are under the average; what fruits we have are mostly on bush trees. The Queen, Fearn's Pippin, Cellini, Allington, Pippin, King of the Pippins, Lane's Prince Albert, Lord Grosvenor, Keswick Codlin, James Grieve, Grenadier, Lady Sudeley, and Worcester Pearmain are the most satisfactory. Plums are a light crop; the best varieties are Jefferson, Monarch, Victoria, and Pond's Seedling. Cherries are an average crop, but, owing to wet, the dessert varieties split badly. Morello Cherries promise well. Strawberries were over the average, but inferior in quality. Royal Sovereign was the best variety. The soil here is a medium to light loam, with a gravel sub-soil. *George Kent, Norbury Park Gardens, Dorking.*

— The hardy fruit crops are much below the average. Apple and Pear trees produced little bloom, and, in addition, birds were particu-

good quality; Raspberries an average crop of fair quality. Some kinds of Plum trees had very little blossom, whilst others flowered freely, but more than half the fruit turned yellow when quite small, and dropped off. Apples also varied greatly in blossoming. The blossom set fairly well on a few varieties, but failed to set on others, or, though it set, the fruit dropped largely. On the whole, we have about half an average crop of Apples; Pears are almost a total failure, in spite of profuse blossoming; Cherries are a quarter of a crop; Nuts also are much below the average. *William E. Bear, Magham Down, Hailsham.*

— The crops of Apples and Pears in orchards are very light, which I attribute to excessive wet on our heavy, cold soil, together with low temperatures at flowering time. The trees are making splendid growth. Bush and cordon trees in the garden have satisfactory crops, and the fruit promises to be of excellent quality. Many varieties of Apples and Pears have been thinned of their fruits. Cherries are an average crop, but the fruit is not so good as last season. Black Currants and Raspberries are both excellent. Strawberries have been very good, but the weather was too wet when they were ripening. *W. A. Cook, Leonardlee Gardens, Horsham, Sussex.*

— The prospects in early spring were favourable for a good crop of Apples, but late frosts and a severe hailstorm destroyed many of the fruits. Plums, Pears and Cherries were all damaged by cold weather. The Cherry trees were heavy with blossom, but the fruits nearly all fell as soon as they had set. Black and Red Currants, in one or two gardens in this locality, were much damaged by a heavy hailstorm, but in other gardens they are plentiful and good. Gooseberries, where the buds were protected from birds, are excellent. Strawberries have been plentiful and very good in quality, the varieties Royal Sovereign and Waterloo being of exceptionally good flavour. Plums and Pears are best on wall trees and Apples on bushes. Our soil is a very stiff clay, and, in consequence, is wet and cold in rainy seasons. *Wm. J. Langridge, Ote Hall Gardens, Burgess Hill.*

WILTSHIRE.—Apple trees bloomed well, but the fruits set badly, so that the crop is a very indifferent one. Pear trees carried but little bloom, but what few fruits developed are very good. Plums promise well, although silverleaf disease is becoming prevalent. Cherries are not much grown in this district. Small fruits are later in ripening this year, but they are very good in quality. Strawberries have been plentiful and of fair quality, considering the absence of sunshine. Our soil is mainly of a calcareous nature and shallow. *W. Gullick, Nurseryman, Salisbury.*

(To be continued.)

FIG. 50.—GRAPE CANON HALL MUSCAT, AS GROWN IN GUERNSEY FOR THE LONDON MARKET.

(See p. 137)

satisfactory among small fruits. Some Plum trees on walls are bearing well, others are lightly cropped. The bad fruit year may be attributed to three causes, (1) Unmature wood, (2) cold and frosty weather when the trees were in bloom, and (3) a sudden rise of temperature after the fruits had set. Our soil is light and gravelly. *H. Markham, Wrotham Park Gardens, Barnet.*

— Pears generally are a very light crop, but the variety Hesse is quite up to the average. Plums vary considerably; some trees of Victoria have very good crops, but, on the whole, Plums are under the average. The most evenly cropped variety is Monarch. Belle du Louvain is also very fair. *W. Poupart, Marsh Farm, Twickenham.*

— There was plenty of blossom on all Apple and Pear trees, but east winds, accompanied by sharp frosts at night-time, destroyed the flowers. Pears on walls, such as Pitnaston Duchess and Marguerite Marrilat, are satisfactory. The following varieties of Apples are carrying good crops:—Lane's Prince Albert, Allington Pippin, and Worcester Pearmain. Strawberries have been a heavy crop, but many of the best fruits were spoiled by the wet and sunless weather. The best varieties were Royal Sovereign, Reward, Givon's Late Prolific, and Epicure, a fine new variety resembling Reward. Peaches on walls are a failure; the trees were badly infested with aphids, although repeatedly syringed

larly destructive to the flower-buds, biting them off and making the branches appear as though trimmed with a knife or scissors. *W. H. Honess, Hopedale Gardens, Holmby St. Mary, Dorking.*

— We have average crops of good fruit. Bush fruits, where not protected by wire netting, were attacked by bullfinches. Strawberries have been abundant. The Bedford, Bedford Champion, Reward, Givon's Late Prolific, and Laxton's Latest are all desirable varieties. Leader I consider the most suitable for our soil, and the berries ripen as early as Royal Sovereign. The soil is a heavy, weald clay; very wet, and difficult to work in spring and early summer. *James Watt, Mythenurst Gardens, Reigate.*

— The Pear, Apple, Peach, Nectarine, and Apricot crops were affected by spring frosts, which caused many of the fruits to drop. Raspberries are a very heavy crop, and Strawberries have been plentiful, although heavy storms and lack of sunshine caused many of the berries to rot. Gooseberries are under the average. Red Currants are good, but Black Currants are very scarce. Our soil is of a light, sandy nature. *Jas. Lock, Outlands Lodge Gardens, Weybridge.*

SUSSEX.—Gooseberries, in spite of many fruits dropping in consequence of frost, are an average crop of fair quality; Red Currants are a full crop of fair quality; Black Currants are half a crop of

NOTICES OF BOOKS.

SUMMER FLOWERS OF THE HIGH ALPS.*

A NICELY-GOT-UP book this, but probably not intended to be taken as a companion to the Alps. The author has some pleasantly-written remarks on the subject of Alpine plants in general, contrasting them with the flora of the Lowlands, but refrains from the exaggerated depreciation of the latter that may be met with too often in works of this sort. We wish we could praise the coloured illustrations. Some are good, e.g., that of *Viola biflora* and *Dryas octopetala*. But the tints of the majority show up the defects of the process work more effectively than they portray the beauty of the originals. There are disagreeable tinges of blue where the flower only shows pink or carmine. It may be urged that the blue is there all the same in, for example, the Moss Campion (*silene acaulis*). Doubtless it is, but we are ordinarily incapable of seeing it, and could well let it pass. The letterpress accompanying the plates is rather slight, but we recognise the difficulty of hitting the happy mean between superficiality and abstruseness. The chief fault that we find with the author is on the ground of the subjects he

* By Somerville Hastings. Illustrated by reproductions from direct colour photography by the author. (London: Dent & Co.)

has chosen. Whilst some are admirable, others might well have been replaced by more interesting forms. The common Monkshood forms a picture neither artistic nor particularly successful from a technical standpoint. A good picture of *Androsace glacialis* or some other more characteristically Alpine plant might have replaced it with advantage.

PROFITABLE FRUIT GROWING.*

THE author, Mr John Wright, V.M.H., at one time editor of the *Journal of Horticulture*, has done good service to gardening by the publication of numerous works, such as *The Fruit Grower's Guide*, *Flower Grower's Guide*, *Vegetable Grower's Guide*, *Primer of Greenhouses and Window Plants*, *Mushrooms for the Million*, and others.

Mr. Wright does not overload his books with technical terms, and is therefore readily understood by the general reader. *Profitable Fruit Growing* is the ninth edition of an essay which was written for the Fruiters' Company in 1889, when it gained a gold medal and £25, offered by the company for an essay not exceeding 20,000 words. It has been revised and enlarged, and we recommend it to the notice of cultivators of small holdings and allotments who may be desirous of adding to their knowledge of fruit culture and acquiring an idea of the principles underlying the art. It contains useful information on pinching the lateral shoots on Apples, Pears, Plums, &c., winter pruning, how and when trees should be planted, the varieties to be chosen, and the conditions which cultivators may hope to see remedied, such as obstructive land laws, ecclesiastical charges, high railway freight rates, market tolls, salesmen's exactions and shopkeepers' extortions, which at the present time are hindrances and impediments to the extension of the cultivation of hardy fruits in Great Britain. If these are swept away, fruits can be grown here as cheaply, and as good in quality, as anywhere else. Even under present conditions we are improving our fruit culture, and extending the areas under fruit. Cottagers, and small holders in general, should cultivate fruit as an adjunct to, but not as substitutes for, other crops, and they should destroy the worn-out and cankered trees and plant new orchards on the best land they possess.

The book is furnished with many useful diagrams and illustrations of methods of planting small areas, of good and improper pruning of trees, of the planting and subsequent treatment of Strawberries and Raspberries, and the gathering, storing, and packing of fruit for the market. The lists of Apples and Pears are good, but they contain only the names of the finest varieties; there are others which are suited for cold, exposed situations, or as shade trees in pastures.

GRAPE CANON HALL MUSCAT.

THIS variety is the handsomest of all Grapes, and it has the highest value in the market. Most gardeners, however, know how difficult it is to obtain a perfect set of berries, as the variety is a shy "setter," and from this cause the bunches are often of straggling and ungainly appearance. Those illustrated in figs. 50 and 51 were grown at the St. Stephen's Vineries, Guernsey, the weight of the single bunch being 6 lbs. The photographs were forwarded by Mr. Frank H. Sarchet, with the following note:—

"Enclosed are photographs of Canon Hall Muscat Grapes. I am sending them (1) because they are a good sample of that fine variety; (2) to disprove a belief common in England that we in Guernsey grow only a very poor quality Grape, such as is seen in quantities in the markets in September. The colour of the berries was deep golden-yellow, the bunches realising very satisfactory prices when sold in Covent Garden Market."

TREES AND SHRUBS.

OLEARIA VIRGATA AND O. RAMULOSA.

MR. GUMBLETON has just sent me a flower-spray of *Olearia virgata*, which he says is flowering with him in Co. Cork for the first and, he thinks, the last time. At first he was doubtful if it was an *Olearia*, but the name was confirmed at Kew. The flowers, which are very small, being only $\frac{1}{4}$ inch in diameter, are by no means showy, the centre being greenish-white, studded with yellow anthers, and surrounded by tiny, white ray-florets. The leaves are nearly an inch in length and about $\frac{1}{4}$ inch wide at the broadest part. It does not appear to be a very decorative shrub, and can certainly not compare for effect with such species as *O. Haastii*, *O. stellu-*

THE ROSARY.

ROSES ON THEIR OWN ROOTS.

THE excellent illustration of Caroline Testout which appeared on p. 97 has suggested the following notes. The question of growing Roses upon their own roots or otherwise is often a matter of variety or soil. Many varieties have not the same vigour as Caroline Testout, consequently they are budded on foster stocks. At the same time, there is some considerable advantage in having those Roses on their own roots which are known to succeed. More especially is this the case with inexperienced amateurs, for they are not then called upon to distinguish between the Rose and stock when strong shoots appear from the base. Then, again,

FIG. 51.—CANON HALL MUSCAT GRAPE.

lata, *O. nitida*, *O. macrodonta* and *O. insignis*. A plant was given to me last spring under the name of *O. ramulosa*, and now, though it is under 2 feet in height, has come into bloom. In appearance it is far superior to *O. virgata*, and bids fair to be a handsome shrub when it has attained good proportions. The narrow-petalled, white flowers are starry in shape, and are slightly over $\frac{1}{2}$ inch in diameter, and, if they are borne in quantity on large specimens, should produce a pretty effect. The leaves are very minute, being only about $\frac{1}{4}$ inch in length, and about half that width. They are of dark, polished green, and are thick and of great substance, while on the underside they are covered with a white felt-like substance. It is referred to in Nicholson's *Dictionary of Gardening*, but is, apparently, a rather rare plant in gardens. *Wyndham Fitzherbert*.

two seasons are saved in the increasing of stock, always provided the variety is one suitable for this form of culture. It takes one year to get a cutting stock of Manetti or Briar, and this has to be planted out and budded before it can become a maiden Rose plant in the following year. Thus, three years are needed before a plant is obtained. On the contrary, a cutting is a Rose plant as soon as it is rooted, and certain varieties will make fairly good bushes in the following year, corresponding to the time the Rose bud is being inserted in the stock. But a bud inserted in an established stock has the benefit of the roots possessed by that stock, and so frequently overtakes the cutting.

Cuttings are preferable in the case of Dorothy Perkins and most of the Hybrid Wichuriana Roses. These naturally produce a great number of valuable suckers, and it is better these should

* *Profitable Fruit Growing*, by J. Wright, V.M.H. (London: W. H. and L. Collingridge.) 1s.

be all Rose suckers. They also root much freer than any Rose stock, not even excepting the Manetti. As a rule, it is the stronger growers which are suitable for own-root culture. Conrad F. Meyer and Frau Karl Druschki will root very freely indeed, and I prefer growing them in that manner. The China Roses are almost always increased in this manner; indeed, it would be difficult to procure buds of sufficient size to work upon stocks. Nor would there be any advantage in this, seeing that Roses of this class do better on their own roots. There are some Roses, however, that will not root from cuttings, notably the Scotch Briars. The old Cabbage, Moss, and Provence Roses are also difficult to increase in this way; but these types can readily be propagated by division of the suckers with a few roots attached, and this plan is adopted generally.

Now a word about the cutting itself. Provided you have fairly-ripened wood, any part of September is an excellent time to insert the cuttings. This allows of them, in many cases, making a few roots before winter. Wichuraianas are seldom ripe enough until October. The

plied to settle the soil well around them. A very sandy soil is best for this indoor propagation, and a compost consisting of half loam and half coarse sand has answered best in my own experience. *Grower.*

SCOTLAND.

THE LILY SEASON.

Owing to the exceedingly favourable atmospheric conditions, especially since the advent of the recent rains, the Lily season in south-western Scotland has been highly successful up to the present period. The first Lily to flower in my own garden this year was *L. davuricum*, a native of Siberia. The finest and most effective variety is the dark-hued *incomparabilis*, which is much more reliable and enduring than most of its contemporaries. It was followed by *L. monadelphum* var. *Szovitzianum*, a magnificent Lily, from Mount Caucasus and Northern Persia. It often approaches to the stature of *L. giganteum*, generally reaching a height of between 8 feet and 9 feet.

bilities most impressively in a peaty or fibrous soil, such as is suitable for the cultivation of *Rhododendrons* and *Azaleas*. Its largest and most strikingly effective varieties are *rubrovittatum*, *platyphyllum*, and the almost pure white *virginale*. The variety *virginale* is exceedingly beautiful, but in many situations it is not enduring. *David R. Williamson.*

CULTURAL MEMORANDA.

GREEN LAWNS.

WHATEVER may be our colour tastes, even if they incline specially to buff and brown, no one finds pleasure in looking on a brown lawn. Thanks to the wet season, grass has grown luxuriantly, and if the weather has damaged flowering plants, both trees and lawns have benefited, the former being especially clean in foliage and sturdy in growth. Though excessive moisture creates luxuriant growth, yet at the same time it gives rise to soil exhaustion, and when the time of stress shall come, as come inevitably it will—for we shall presently have hot, dry summers—then the exhaustion of the soil will be seen and felt all the more forcibly. Just now, whilst rains fall so abundantly, it would be unwise to add to lawns or greens any manurial elements, but these may well be added early in the ensuing spring, as no one can tell what the coming summer may be. If it is hot and parching, then great good will result to the grass if it has had the benefit of rich feeding, and the sward will retain its vigour and greenness all the longer under adverse conditions. On the contrary, impoverished lawns will become so burnt up as to be literally distressing to look upon. Too many who have lawns or greens under their charge forget that constant mowing means constant depletion of fertility, nothing being returned to compensate for the loss of the mown grass. Artificial manures do much good, but dressings which add something insoluble with them, such as fine soil, grit, sand, or a dressing of some substance such as native guano, are more helpful, because furnishing new material into which the grass can root. A danger in such case to be avoided is the adding of any soil-material that contains seeds of weeds. Because of this, ditch cleanings or roadside trimmings are to be avoided. Probably, the best material is found in sifted old pot soil, with basic slag added, though native guano used liberally may be used instead. *A. D.*

HARDY FLOWER BORDER.

ARGEMONE GRANDIFLORA.

THIS fine plant is a beautiful sight when in full flower. Its white blossoms, with their central cluster of golden anthers, are 4 inches across, and of dazzling purity. They bear a close resemblance to those of *Romneya Coulteri*, which are fully three weeks later in expanding. Those who are unable to grow the *Romneya* satisfactorily, will find a good substitute in *Argemone grandiflora*. It is a very old garden plant, having been known to Dioscorides more than 13 hundred years ago. It commences to bloom about the middle of June, and, if the seed pods are cut off as soon as they form, it continues to flower until the late autumn. A few years ago Mr. Archer-Hind had a splendid specimen in his garden that was 5 feet in height, had a circumference of 15 feet, and bore at least 50 expanded flowers. The blossoms last little longer than a day, but are produced in such profusion that their fading is unnoticed. The grey leaves are prickly, and are from 6 to 9 inches in length. Seeds are borne freely in pods liberally armed with prickles, and the seeds germinate readily. The *Argemone* is generally considered to be an annual, and is classed as one in Nicholson's *Dictionary of Gardening*; but with me it invariably throws up strongly from the base in the spring, and has done so for the past four years. The grey-green, spiny leaves associate charmingly with the pure white flowers, and the plant makes a pretty picture for many weeks. *Argemone grandiflora* was introduced into this country from Mexico in 1327; but, notwithstanding the many years that have elapsed since it was first brought into England, it is by no means common in gardens. *Wyndham Fitzherbert.*

FIG. 52.—PORTION OF THE ROSE GARDEN AT KING'S WALDEN DURY.

(Photograph by A. J. Hartless.)

propagator should take his cuttings of a length of about 9 inches, being certain to cut with a knife just below the bottom eye or bud. When making the cutting, the bottom leaves should be removed, and the cuttings should be inserted firmly in sandy loam. On no account add manure when rooting cuttings: the feeding must come later on, when the plants have been placed in their permanent quarters. It is advisable to put them rather closely in beds at first, as some of the cuttings may fail to strike. They should be planted sufficiently deep that 2 inches or so will be left above ground.

In making cuttings of Rose stocks, we remove the lower eyes to lessen the risk of suckers; but, in the case of rambling Roses, this is not done, because the sucker is one of the most valuable portions of the plant. Make each cutting very firm in the ground.

Many Teas and Noisettes are struck, under glass, from greener wood obtained from laterals, with a small "heel," or portion of the older wood, attached. Any length from 3 to 6 inches is suitable. A good plan is to keep the cuttings quite close for a time, and partially shaded in the house, after one good soaking has been ap-

This is a Lily which ought to be cultivated more extensively, if only for its noble appearance and the beauty of its pendulous, lemon-coloured flowers. This grand Lily usually takes at least two years to become established, and often succeeds best in a soil composed almost entirely of clay. It has grown here in the same half-shady situation for 15 years, and has given me less trouble than any other variety. Almost as much might be said with perfect expressiveness of *L. pardalinum*, the uniquely coloured Panther Lily of California, and especially of the variety entitled *L. Burbankii*, which I have found the most hardy and prolific of all. *L. Henryi*, which does not, in my estimation too greatly resemble the speciosum family, and assuredly has not their exquisite fragrance, has similar attributes of vigorous growth, floral luxuriance, and what may be termed enduring capability. That, at least, is the result of my experience, though I have been informed that it does not succeed so well in many other localities where it is cultivated with at least equal care. *L. Chalcedonicum*, the brilliantly coloured "scarlet Martagon," also grows and flowers admirably in southern Scotland in ordinary garden loam. *L. auratum*, on the contrary, as a general rule, exhibits its capa-

ORCHID NOTES AND GLEANINGS.

SPATHOGLOTTIS SOUTHERIANA.

This pretty Australian species, described by F. M. Bailey in *Proc. Roy. Soc. Queensland XI.*, 1895, is in flower in Sir Trevor Lawrence's collection at Burford (gr. Mr. W. H. White). The flowers are borne on upright spikes, each being over an inch across and the pedicels and ovaries 2 inches long. The sepals and petals are light rose colour, the labellum, which has the side lobes as large as the middle lobe, a darker shade of rose, the base of the lip and the narrow isthmus being yellowish. The column is purplish rose. It has a general resemblance to *S. plicata*, but the flowers are smaller. The culture of *Spathoglottis* is similar to that of *Bletia*, and includes a cool, dry resting-season after growth and flowering are completed.

WARREA TRICOLOR.

This species, which is now rarely seen in gardens, is in flower with Sir Trevor Lawrence, Bart.

the margins being white. The lip, which is smaller than the other segments, is whitish, spotted and tinged with purple. *S. Lyonii* is a native of St. Annes, Jamaica, being found on the trunks of the trees on the hillside. It grows well if associated with the Mexican *Laelias*.

NOTES ON IRISES.

IRIS LÆVIGATA IN GUERNSEY.

THERE is a general opinion that *Iris lævigata*, or *Kämpferi*, is only suitable for culture as a sub-aquatic, and, in England, it is generally grown by the sides of streams and ponds, or in marshy ground. In Guernsey, it is grown in moist spots, but both Mr. Frank Lilley, of St. Pierre du Bois, and Mr. Chas. Blampied, of S. Martin, have this plant growing in quite dry situations. Mr. Lilley's plants are in a stiff loam, with a southern slope, but sheltered from the winter gales. Mr. Blampied has them on a somewhat sandy loam, open to the full south-west sun. Mr. Lilley keeps his plants thoroughly clean, and the soil is allowed to become rather

flowers measured 9 inches across. The colour is a bright, porcelain blue, with yellow flakes and white central veins—one of the brightest of these blues. Near by, was a bed of Mr. Lilley's *Rose Queen*, a good pinkish-rose colour, with a paler centre, toning off to white, and apparently very floriferous—a delicate-looking flower. Of the single-flowered Japanese varieties, *Taikon* and *Kuroki* were noticeable; they bore longer stems and very wide, round petals. *Kuroki* is of varied colours, of quite bizarre appearance, blotched and splashed with white, pink, purple, blue, and violet. *Taikon* has magenta-violet flowers, lined and blotched with purple. Viscount Hayashi is a good, new seedling, with very large, double flowers, of a rich, warm shade of violet and lined with paler colour. W. S. B.

HOME CORRESPONDENCE.

(The Editors do not hold themselves responsible for the opinions expressed by correspondents.)

ASTER DIPLOSTEPHIOIDES.—The plant figured under this name in the *Gardeners' Chronicle*, July 23, p. 56, is certainly not the true species. It is evidently a form of *A. subcæruleus*, which has been doing duty in gardens for *A. diplostephioides* for many years. The true plant, figured in the *Botanical Magazine*, t. 6718, was raised from seed collected by Mr. Elwes in Sikkim, and plants were grown at Kew till the year 1895, when the species was probably lost to cultivation, as no further plants could be procured anywhere. It grew about 2 feet to 3 feet high, with softly-hairy leaves in a tuft at the base, but very few on the stem. The flowers are large, 3 inches in diameter, with violet-purple rays, whilst the disc is dark-purple or almost black, instead of yellow, as in *A. subcæruleus*. The plant figured on p. 56 has a more stiff and erect habit, while *A. diplostephioides* requires support for the flower-stems. Seeds of the true species were again received from Sikkim about two years ago, and plants flowered in the rock-garden during July of this year. W. L.

FRUIT AND FOREIGN IMPORTATIONS.—There is a note or two in *Southern Grower's* remarks (p. 95), which do not commend themselves to consumers of fruit who represent the greater portion of the community. Because both Black Currant and early Plums have come to us from France, in moderate quantities, *Southern Grower* is inclined to grumble at the importations. Yet, but for these, myriads of purchasers could not have obtained either Black Currants or Plums. What would have been *Southern Grower's* case had there been at home, as sometimes happens, heavy crops of these fruits? Then we should have heard a wail as to the miserable prices obtained. So long as a grower has fruit to sell, and he can, through general scarcity, obtain high prices, all is well. But it may well be contended that, after all, the public is entitled to some consideration, and their interests are served by keeping the market well supplied. A. D.

ROSES AT KING'S WALDEN BURY (see figs. 52 and 53).—One of the well-known features of these gardens is the annual display of Roses. The arches and pergolas have been laden with flowers this season, and they have been much admired. The variety illustrated in fig. 53 is *Blush Rambler*. Several methods are adopted to show the Roses to the best advantage. In one of the rosaries two large beds are raised in the shape of a basket; Oak battens form the sides, and the brim is made of the same material, whilst an arch over the centre represents the handle. Tall Larch supports here and there carry vigorous climbing Roses, which ramble at will. Perhaps the most pleasing are those which represent shower bouquets and umbrellas. In fig. 52 some of these are illustrated. The variety *William Allen Richardson* succeeds well on the south side of the mansion. A. J. H., *Shinfield*.

[Photograph by A. J. Hartness.]

FIG. 53.—ROSE ARCH IN KING'S WALDEN BURY GARDENS.

It is *Phaius*-like in growth, and produces its flowers on stout, upright spikes after the manner of *Phaius grandifolius*. The sepals and petals are similar in width, broadly ovate, the lower sepals being folded at the base into a rudimentary spur, and all the segments are curved forward. The sepals and petals are white with a yellow tinge, all flushed with purple at the backs, the petals bearing obscure purple lines. The lip is of claret colour, with a yellowish base and some golden yellow lines around the fleshy-ridged crest. The column is white. The species is a native of North Columbia, and requires to be grown in a shady intermediate house.

SCHOMBURGKIA LYONSHII.

This is one of the prettiest of the genus, and it has always been a rather rare species. It is of strong growth, resembling *Lælia superbiens* in habit, and bearing stout spikes about 3 feet in length, which are furnished on the terminal part with flowers over 2 inches across and borne on pedicels 3 inches in length. The sepals and petals are pure-white, bearing on the inner portions, irregularly dotted lines of claret-purple,

hard. Mr. Blampied, on the contrary, allows the grass to grow around them to give a little shade to the roots. There seems but little difference in the results: one lot is as floriferous as the other; but I think those at St. Pierre du Bois bore the larger blooms.

Mr. Lilley has been very successful in the raising of new varieties. The white varieties seem to come from Li Hung Chang, the giant duplex form, with almost pure-white blooms over 6 inches across, and with very broad, rounded petals. Some bear just a pale yellow or a lemon pencilling in the centre of the petals, others a yellow hair line, others a faint blush of blue; but all the whites show up well amongst the others, and seem very sturdy. One of the prettiest is a small flower, with dead-white ground, lined with purple, and blue, and gold in radiating veins, and with a soft, plum-coloured centre—an altogether striking flower. General Iho is a new blue, marbled violet and purple, with white veins, a strong, tall spike, and very floriferous. *La Grandesse* is a big flower, white and lemon, with very drooping, broad falls. The largest of all the Japanese Irises is *Baron Komura*. When it was in bloom recently, the second

SWEET WILLIAM PINK.—I have received flowers of Mr. Murison's Mule Pink, which is distinct from anything I have seen, and evidently is allied to the Indian Pink rather than to the Carnation. From what follows, Mr. Murison will see that the connection of the Mule Pink with the Sweet John is not so satisfactorily determined as he assumes. First of all, it is essential to discover to what plant the name Sweet John was applied. Gerarde separates the Sweet William from the Sweet John, which the engravings in his *Herbal* show to be *Dianthus carthusianorum*. Johnson agrees with Gerarde, and though the engravings in Parkinson's *Paradisus* are very crude, they, too, indicate a different species from *D. barbatus*. As a garden plant, the Sweet John seems to have been superseded by the Sweet William, and its name to have been usurped by a section of the latter, so that, in the 18th century, Miller and others esteemed the two to have a common origin. Then, as to Fairchild's Mule, and some other Mules, we have apparently clear evidences of their parentage. Bradley, in *New Improvements in Planting and Gardening* (1717), p. 24, records "in the garden of the ingenious Mr. Thomas Fairchild, of Hoxton, a plant, neither Sweet William nor Carnation, but resembling both equally, which was raised from the seed of a Carnation that had been impregnated with the farina of the Sweet William." In Part II. of the same work Bradley advises Sweet Williams, Indian Pinks, and Carnations to be planted together, in order to obtain crosses. The *Complait Seed-man's Monthly Calendar*, compiled in 1733, contains the following reference to the Mule Pink: "We have several varieties . . . that have leaves like Sweet Williams and flowers of Pinks and Carnations, and were raised from Carnation seeds. Some of these plants are called double Sweet Williams, but as long as they come from Carnation seeds they have as much to do with the Carnation as the Sweet William, so may be called which of the two one will." Gordon, an Edinburgh nurseryman, records a Mule in 1774 which was a cross between a Sweet William and an Indian Pink, and called a "Sweet William Indian Pink." The Indian Pink was sent to Paris about the year 1705, and in a list of plants published in the *Philosophical Transactions*, 1715, Fairchild, at that time, is shown to have possessed it. Miller, in the *Plates of Flowers*, published in connection with his dictionary, mentions 1719 as the date of the first appearance of a double Indian Pink, though he himself did not see one till 1722. It is, to say the least, suspicious that two plants so long cultivated together as the Sweet William and Carnation should have never been known to cross till a year or two after the Indian Pink was admitted to their company, and still more suspicious that, when Miller wanted to classify the Mule, he had to admit it as a "Sweet John" (which it was not), the old engravings of which show it to have only a few flowers in a head, as we know to be characteristic of the crosses with the Indian Pink. So that one cannot help being dubious regarding the parentage of Fairchild's Mule, notwithstanding the remarks of his contemporaries. *R. P. Brotherton*.

POLLINATION AND FRUIT-PRODUCTION IN MELONS. The references to pollination on p. 102 opens up a very wide field to horticulturists in general. During the present summer I have grown over 300 Melon fruits; the first crop in a span house consisted of 24 plants, which produced 97 fine fruits, and all were artificially pollinated with flowers from another plant of the same variety. Simultaneously with this planting, nine lights in a slightly-heated frame, 6 feet by 4 feet, were planted with the same varieties as those in the house, and apart from the usual pinching to induce a given number of stems to each plant, they received no other attention. Fruits were produced very freely upon the lateral growths, and were not assisted in any artificial way, other than what insect agency may have afforded. A crop of 103 good, saleable Melons was thus grown in fibress soil from which a crop of Potatoes had just been lifted. I also have grown this season in frames of the French type, set down in a field without any bottom warmth, good saleable Melons, and, in no case has the process of fertilisation received any assistance. All that would appear to be necessary is the limiting of each plant to a given number of growths, and the removal of the points of these when they have reached a certain

length. Laterals furnish the fruits, and these are thinned to the required number for each plant and distributed evenly. Do all varieties set with the same freedom under the same conditions? I can say so emphatically, but what I cannot yet say is whether they would do so, provided the seeds sown were of the same age in all the varieties tested. It is a fact well known to gardeners that old seeds produce somewhat less vigorous plants, which are also more fruitful than those grown from seed of the previous year and my own results have been the best from seeds kept for three years in a tin box. The effect of fertilisation is of immense importance to the seed grower, for those fruits which are left to swell after their own natural manner produce only seeds that the grower would term flats, such as may be blown away with a puff of wind. I thought perhaps fertilisation might affect the weight of the fruits grown, and have taken the circumference and depth of fertilised and natural productions, but the weight in nearly every instance of the same varieties was practically identical. I have one three-light frame planted with the same variety, with the exception of one plant; the exception is fruiting, but not one of the other plants shows any signs of their fruits swelling, although when hand fertilised there is no difficulty in procuring a crop from this variety, as I have proved this year from another bed. I have seed of a very good Melon, which I shall be glad to send to anyone for experimental purposes, that will produce fruits even if all male flowers are removed before they open, thus preventing any chance of pollination. To demonstrate to the Editors the freedom with which Melons will grow unaided, I enclose a branch of second crop fruits that have set and grown away, while two later fruits of the first crop were maturing. The varieties that prove so free with me under the conditions named are Superlative (a scarlet flesh), Perfection (a green flesh), Hero of Lockinge (a white flesh), and Frogmore Scarlet and Parisian of the Cantaloupe varieties, *Charles Foster*, "The Times" Experimental Station, Sutton Green.

The Week's Work.

THE KITCHEN GARDEN.

By JOHN DUNN, Kitchen Garden Foreman,
Royal Gardens, Windsor.

Carrots.—If a supply of Carrots is required during the winter, a sowing should be made in the pit in which the Spring Carrots were grown. All that is necessary is to turn the old bed to a depth of 3 feet, affording a fresh layer about 8 inches deep on the surface. The soil should be built up quite close to the glass, and it should be made firm by treading. When the young plants are large enough to handle, they should be thinned to 4 inches apart each way, afterwards giving a good watering to settle the soil again. Carrots from seeds sown a month ago will be ready for thinning; after this is completed, apply a dressing of soot, and use the Dutch hoe between the drills. For several seasons past our best Carrots have been obtained from late sowings.

Winter Lettuce.—Seeds must now be sown for raising Winter Lettuces, selecting the varieties All the Year Round, Maximum, and Hardy White Cos. Sow the seeds on a south border, so that the plants may be ready early in November. If a little protection from frost is afforded them, they will remain available for use a long time. Provided the cultivator has a few unheated frames at his disposal, the seedlings may be transplanted directly into them as soon as they can be shifted, allowing the lights to remain off until frost or heavy rains occur. Excessive dampness is frequently the cause of failure amongst winter Lettuces. Allow the plants plenty of room, and keep the soil well stirred with a hoe. At Frogmore, we made frequent sowings of Lettuces in August.

Endive.—Endive is only second to Lettuce as a salad plant. For late autumn supplies, it should be planted on a south border sloping well towards the sun. Protection must be afforded the plants from frost and heavy rains. Plants of the Batavian variety from the previous sowing will now be large enough to put out. Allow a dis-

tance of 15 inches or more between the plants, so that the hoe may be used freely amongst them.

Radishes.—Make weekly sowings of Radishes on a partly-spent hot-bed. There they will grow quickly, which is essential if the roots are to be tender. Another essential is abundance of moisture, as Radishes in dry soil are small, hot in flavour, and generally unfit for use.

Mustard and Cress.—Make frequent sowings of Mustard and Cress in situations protected from strong sunshine and drying winds.

Chicory.—The latest batch is now ready for thinning, and this should be carried out before the plants become drawn. Thin the plants to 9 inches apart.

Late Peas.—Although the summer has been dull, there has not been an extra quantity of rain, and, in many localities, late Peas will be benefited by a good soaking of weak liquid manure. Choose a dull day for applying the liquid, and, if manure is given, see that it is not too strong.

Parsley.—Plants raised in June for a winter supply should have the foliage cut closely to the ground, in order to induce the plants to produce as many short-stemmed leaves as possible. When the tops have been cut off, give a good dusting of soot, and move the soil about the plants with the Dutch hoe. The new growths will stand the winter much better than the foliage which developed in July.

PLANTS UNDER GLASS.

By JOHN DONOGHUE, Gardener to JOSEPH PICKERSGILL, Esq.,
Bardon Hill, Westwood, Yorkshire.

Disbudding Chrysanthemums.—The "taking" of the bud in Chrysanthemums can only be properly carried out after much careful observation and practical experience. In most cases it is necessary to regulate the growth of the plants by stopping the shoots in order that the desired bud may be ready during the last fortnight in August, as buds that are taken at that time usually produce flowers of good quality. In the case of Chrysanthemums for exhibition, the taking of the bud must be regulated by the date on which it is intended to show the blooms. The aim of the cultivator should be to have his plants with well ripened wood and the buds in a proper condition of development before they are brought into the houses. To do this judicious feeding must be practised, avoiding the use of extra strong fertilisers. There are special fertilisers obtainable for the use of Chrysanthemum growers, and, if these are used with discretion, blooms of finer quality and better colour will be obtained. The watering of the plants will need to be done with great care; never apply moisture unless a plant is thoroughly dry, and then let the watering be copious. Three o'clock in the afternoon will be late enough for the last watering, so that there is sufficient time for the surroundings to become dry before evening. Insect pests such as black and green aphids must be combated; the grower should employ insecticides which he has proved to be effectual in former seasons. Stakes that have been placed to the plants should be shortened below the buds as soon as the latter are about the size of Peas.

Plumbago rosea.—These plants should be placed in 6-inch pots to flower. When the pots have become well filled with roots topdress the roots with some fertiliser and give occasional applications of soot water. Plants of the earliest batch may be allowed to flower; they are very showy when in bloom, and will be appreciated from October onwards. Keep the temperature of the house at about 60°, with a night temperature of about 5° lower. The Plumbago does not require much shade during the autumn, and a certain exposure to the sun will assist in ripening the flowering shoots. As a rule the stems are sufficiently stout to support the flowers without a stake.

Zonal Pelargonium.—It is advisable to house the plants early in view of the wet and dull autumns of the last few years. Excess of moisture at the roots through rain causes a luxuriant growth, but it does not become sufficiently ripened to flower satisfactorily, and, being sappy, usually collapses during the winter. When the plants are brought indoors, place them near to the glass and allow plenty of fresh air to circulate about them, as this will assist in the production of short-jointed, well-matured growth.

THE ORCHID HOUSES.

By W. H. WHITE, Orchid Grower to Sir TREVOR LAWRENCE, Bart., Bulford, Surrey.

Phalænopsis.—The large-flowered sorts, such as *P. Schilleriana*, *P. amabilis*, *P. Aphrodite*, *P. Stuartiana*, *P. Sanderiana*, *P. Rimestadiana*, and *P. leucorhoda* have made considerable progress with their new leaves, although in some places, owing to the long deficiency of the natural sun-heat, plants generally are somewhat backward with their growth. A high, sun-heated temperature is always beneficial to them, but the artificial heat, which has been necessary for many months past, is harmful. In ordinary summer weather the ventilators should be opened for an hour or so during the middle of the day, especially the top ones. But if the warmth inside decreases or any draught is felt, then let the lower ventilators be closed, whilst leaving the top ones open. It is advisable to shut the house early in the afternoon, and the floors and stages should be damped, pouring plenty of water immediately under the hot-water pipes. In cases where the glass is coated on the outside with a thin stippling, the blinds may be pulled up early, so that the house will get as much sun-heat as possible. On warm, mild nights the bottom ventilators may be opened slightly at dusk. Keep sufficient warmth in the water pipes to maintain a temperature at night of 70° and 75°. No damping down should be done in the morning until the temperature is rather higher than 70°, with but little or no sun shining on the roof. The chief cause of failure with *Phalænopsis* may be traced to a cool, damp atmosphere and saturated materials at the roots. All the species thrive best when suspended near the roof glass on the north or shady side of the house, where there is plenty of subdued light, but where they are not exposed to direct sunshine. It is best to suspend the plants, for this favours the formation of stout leaves, and it places the plants out of the way of insect pests. Whilst growth is being made and roots are active, the Sphagnum-moss should be kept fairly moist, but never saturate it with water; it takes too long to dry. To keep the moss fresh and growing, lightly damp it with a fine sprayer whenever it appears to be getting dry, at the same time spraying the woodwork of the baskets, to which many of the Orchid roots cling. Do not allow water to remain in the centre of the plants or in the axils of the leaves. Should the Sphagnum-moss about the plants show signs of decay, have it carefully picked out and replaced with fresh moss. Several of the green-leaved species, such as *P. Marie*, *P. Luddemanniana*, *P. tetraspis*, *P. sumatrana*, *P. violacea*, *P. speciosa*, and *P. cornu-cervi*, require more growing space and may be placed in new baskets. Keep them shaded from the sun at all times, for the leaves soon lose their freshness and become shrivelled and unhealthy-looking if exposed even to very strong light. The treatment afforded *Phalænopsis* is suitable for several rare Bulbophyllums, such as *B. virescens*, *B. Ericssonii*, and *B. Binnendijkii*. These plants grow satisfactorily on teak-wood rafts bedded in fresh Sphagnum-moss. Place the plants horizontally on pots or, if convenient, they may be suspended from the roof. Sufficient water should be afforded to keep the moss at all times in a growing condition.

THE FLOWER GARDEN.

By E. BECKETT, Gardener to the Hon. VICARY GIBBS, Aldenham House, Hertfordshire.

The shrubberies.—The present season is the best in which to transplant Hollies. Each plant should be removed with a good ball of earth adhering to the roots, and a thorough application of water should be made as soon as the tree is replanted. Syringings with clear water during dry weather will assist the plants to get a fresh hold of the soil. Yews and other evergreens which have not made much growth since last season may be transplanted again, if desirable, at this time of the year. Attend to the tying of shrubs, especially to the leaders of those intended to form specimens. In the near future it will be necessary to make notes of any improvements it is intended to carry out during next planting season, and of any removals that may be necessary from shrubberies that have become too crowded, either for good effect or for the welfare of the plants. Those that are to be lifted may be marked by tying upon them long pieces of raffia or string.

The summer bedding.—The present season is not a satisfactory one for summer-flowering plants, for these have made a considerable amount of soft, sappy growth. At the same time note should be made of any plants which are remarkable from some standpoint or another, and definite plans should be arranged for the scheme of planting next year, in order that the propagation of the different subjects may be carried out without confusion during the next month or six weeks. In places where large plants of Zonal Pelargoniums are raised each season in 5 or 6-inch pots, it is quite late enough to take cuttings for these. There are various methods of propagating Zonal Pelargoniums, but I prefer to root them in small pots. They require an abundance of ventilation, but at the same time need to be given a place which is sheltered from heavy rains. Plants of Fuchsia, Heliotrope, Swainsonia, &c., that have been cultivated in pots must be carefully attended to in the matter of watering, not allowing them to suffer from drought. In most cases the pots are already full of roots, therefore liquid manure at frequent intervals will be beneficial to them.

Pentstemon.—The Pentstemons are now providing a blaze of colour, and they constitute one of the brightest features of the garden. Plants which have been raised from seed invariably flower a trifle later than those propagated from cuttings. Cuttings of named varieties or of varieties of special merit may be inserted at the present time, or, preferably, directly after the best display of flowers is passed. We usually root ours in 5-inch pots in a fine, sandy compost. We place the pots closely together in an unheated frame, and shade is afforded. If it is intended to save seeds, selected flower-spikes should be marked, and when the seed is ripe and perfectly dry it should be gathered and placed in a dry position.

Lilium.—Care should be taken to select sufficient species to produce as long a display of bloom as possible. Lilliums like a rich soil containing plenty of vegetable humus, and in cases where the natural soil is poor it is necessary to add peat, loam and rotted manure. The bulbs should be planted in the autumn, and, if any of the plants already in the garden require to be divided, the redivision and replanting should also be carried out early in the autumn, say, October. If Lilliums are allowed to remain in one position for too long a period they deteriorate and become weakly. Most of the species require shade during their growth, and they succeed best when placed amongst other plants that protect them from the bright sun and provide them with shelter against winds. Lillium bulbs should not be subjected to atmospheric influences for a greater length of time than is necessary, therefore, planting should not be delayed. Do not plant the bulbs too shallowly, for roots are produced from the stems of the plants just above the top of the bulb, and it is desirable that these roots should have soil to root into.

FRUITS UNDER GLASS.

By B. GOODACRE, Gardener to Sir ERNEST CASSELL, G.C.B., Moulton Paddocks, Newmarket.

Peaches and Nectarines.—Ripening Peaches, perhaps more than any other fruit, depend on light and air to develop their full flavour. Their appearance, too, is greatly improved if the sun is allowed to act directly on them. Prop them well up above the foliage, but take care not to ruck the leaves so as to form a harbour for red spider and other insect pests. It is quite unnecessary, however, to remove the leaves; indeed, were this to be done, it would only be at the expense of next year's crop. Take every care when gathering the fruit. Fruit for the table need only be placed in a cool (fruit) room a few hours before sending to table, but if required to be packed for transit an extra day should be allowed. Although both Peaches and Nectarines can be kept quite a fortnight if gathered when firm, they lose much of their flavour, becoming dead and soapy. An experienced man can tell, by the appearance of the fruit, when it is ready to be pulled, and a careful examination every other day will prevent any from falling. Some people use nets for catching falling Peaches, but a good thick layer of soft new hay will be found to answer the purpose better. Peaches which

are swelling their crops will need plenty of water, and, if they are fed liberally as they commence to colour, this will be sufficient. Do not let the trees become dry at the roots after the crop has been gathered. A good mulching of decayed stable manure will assist in keeping the border moist. Examine the trees carefully, and remove unnecessary shoots, thus allowing light and air to gain admittance to next year's fruiting wood. Syringe the trees occasionally, and, if red spider makes an appearance, add a little Quassia Extract to the water.

Pine Apples.—Pines for early summer fruiting should now have their pots well filled with roots. Any suckers which form on the young plants should be taken away immediately. The supply of water at the root may be gradually decreased, but the plants must not be allowed to become dry. The temperature may be allowed to fall a few degrees at night, as a rest at the end of the present month will greatly assist the plants to throw up their fruit regularly for early summer supply. Late plants now going out of flower will require encouraging by a little extra feeding and copious supplies of water. Take full advantage of sun-heat by closing the pit early in the afternoon. When the fruits commence to colour, treat the plants as advised in previous Calendars.

THE HARDY FRUIT GARDEN.

By A. R. SEARLE, Gardener to the Marquis of NORTHAMPTON, Castle Ashby, Northamptonshire.

Morello Cherries.—These are usually ready for bottling at about this date. Gather the fruits when they are perfectly dry, and lay them thinly on shallow trays for a day or two in a well-ventilated room, which will ensure them being thoroughly dry before use. For bottling, select the darkest-coloured berries, and cut off the stalks quite close with a pair of scissors. The fruits which are not sufficiently good for bottling may be utilised for jam; for this purpose also they must be thoroughly dry. Morello Cherries hang for a long time in a good condition after they are ripe, the fruits being very valuable for cooking purposes late in the year. We gathered Cherries as late as the middle of October last season.

Vines.—The season has been most unfavourable for Grapes out-of-doors. Assist the plants to ripen the bunches by thinning out all unnecessary shoots and stopping those which are retained, so as to expose the bunches as much as possible. The leading shoots may be allowed to extend about 4 or 5 feet, and then be stopped. Mildew is very prevalent this season. Immediately any is detected, dust the leaves with flowers of sulphur. Vines growing in hot or dry positions and carrying good crops of fruit should be given frequent applications of liquid manure. It is not generally recognised that dryness at the roots of vines is often the cause of red spider and mildew appearing on the foliage.

Pears.—There are so few Pears this year that extra care is needed with this crop. Remove all breast wood from the trees, and apply water to the roots as often as is necessary. Varieties that ripen their fruits early should be protected by nets, otherwise the birds will damage them. Once Pears are pecked by birds, wasps and flies soon complete the destruction. The variety Beacon is already ripe in these gardens; other varieties almost ripe are Doyenné d'Ete, Citron de Carnes, Doctor Jules Guyot, Beurré Giffard, and Jargonelle. The fruits of these varieties should not be allowed to remain on the trees until they are fully ripe, otherwise the flavour will deteriorate; this also applies to early varieties of Apples. Pay careful attention to mid-season and later-fruiting Pears. Trees which are carrying good crops should be given applications of liquid manure, or some quickly-soluble fertiliser, washing the manurial properties well into the soil with water. Pears often suffer from lack of moisture at the roots at this season of the year, and the result is seen in small, immature fruits. Not only is this the case, but the fruit-buds that should furnish next year's crop are also affected.

Hoing.—The Dutch hoe should be kept constantly at work, as weeds are unusually plentiful this year. Hoing serves also to check evaporation from the soil at a time when moisture at the roots is essential.

EDITORIAL NOTICE.

ADVERTISEMENTS should be sent to the PUBLISHER, 41, Wellington Street, Covent Garden, W.C.

Special Notice to Correspondents.—The Editors do not undertake to pay for any contributions or illustrations, or to return unused communications or illustrations, unless by special arrangement. The Editors do not hold themselves responsible for any opinions expressed by their correspondents.

Letters for Publication, as well as specimens of plants for naming, should be addressed to the EDITORS, 41, Wellington Street, Covent Garden, London. Communications should be WRITTEN ON ONE SIDE ONLY OF THE PAPER, sent as early in the week as possible and duly signed by the writer. If desired, the signature will not be printed, but kept as a guarantee of good faith.

Local News.—Correspondents will greatly oblige by sending to the Editors early intelligence of local events likely to be of interest to our readers, or of any matters which it is desirable to bring under the notice of horticulturists.

Illustrations.—The Editors will be glad to receive and to select photographs or drawings, suitable for reproduction, of gardens, or of remarkable plants, novelties, trees, &c., but they cannot be responsible for loss or injury.

Newspapers.—Correspondents sending newspapers should be careful to mark the paragraphs they wish the Editors to see.

APPOINTMENTS FOR THE ENSUING WEEK.

TUESDAY, AUGUST 23—
Roy. Oxfordshire Hort. Soc. Autumn Sh.

THURSDAY, AUGUST 25—
Roy. Hort. Soc. of Aberdeen Exh. at Duthie Park (3 days). Exh. at Zeist, Holland, opens.

AVERAGE MEAN TEMPERATURE for the ensuing week deduced from observations during the last Fifty Years at Greenwich—59.9°.

ACTUAL TEMPERATURES:—

LONDON.—Wednesday, August 17 (6 P.M.): Max. 67°; Min. 56°.

Gardeners' Chronicle Office, 41, Wellington Street, Covent Garden, London—Thursday, August 18 (10 A.M.): Bar. 30.1; Temp. 69°; Weather—Bright sunshine.

PROVINCES.—Wednesday, August 17; Max. 66° Cambridge; Min. 60° Iceland N.W.

SALES FOR THE ENSUING WEEK.

MONDAY, WEDNESDAY, AND THURSDAY—
Trade Sale of Dutch Bulbs at 67 & 68, Cheapside, E.C., by Protheroe & Morris, at 10.

WEDNESDAY—
Consignment of Liliun Harrisii Azorean, L. longiflorum, Roman Hyacinths, and numerous other bulbs, at 67 & 68, Cheapside, E.C., by Protheroe & Morris, at 5.

Culture for Show Purposes.

The correspondence which has appeared recently in these columns on the cultivation of vegetables for show purposes, though it has served to ventilate opposed opinions, has not taken into consideration what may be regarded as the larger, and perhaps more fundamental aspect of the question. The nature of this more general aspect may be best developed by an endeavour to answer the question: Why is it that culture for exhibitions is popular with many of our best horticulturists? Now, any attempt to answer this question merely by reference to prizes and other tangible rewards which attend success in exhibition fails, because it does not go to the root of the matter. We do not doubt that such rewards are sought for eagerly and prized highly by the contestants; on the contrary, we should look with some suspicion on anyone who professed himself indifferent to the legitimate rewards which attend upon success. But the prime motive for holding shows and for cultivating exhibition produce, although often unexpressed or even held unconsciously, is to be found in the love of "form" which the people

of this country possess in an extraordinary degree. It is no exaggeration to say that Britons have the faculty of the fancier, and that, it is this faculty, coupled with the sportsman's appreciation for competition, which leads horticulturists to take a pride and pleasure in exhibiting their produce. The faculty of the fancier depends on two mental qualities, a capacity for clear observation and a nice discrimination. The search after novelty of form, colour or other quality, innate in many of our fellow-countrymen, has led to the discovery of new breeds of plants and animals, and to the creation of forms of life which might never have arisen or, at any rate, maintained themselves in a state of nature. Thus it is a significant fact that the first plant-hybrids were raised, not by men of science, but by English gardeners, and the work of Fairchild and others was continued by British gardeners with extraordinary success. So, too, our country is famous throughout the world for its breeds of cattle, sheep, horses, dogs, poultry, pigeons, canaries and other things.

The love of form as we have called this power of fancying is manifested not only by professionals, but also by amateurs, who often devote themselves with success to one special breed of plant or animal. It is so widespread as to be thoroughly characteristic, and it is so much a spur to action that it is not infrequently divorced from considerations of utility. Indeed, our countrymen have had to be reminded more than once of recent years that, in defining "points" for prize purposes, they have, as in the case of poultry, neglected utility almost completely, and, in the case of certain flowers, sufficient importance has not been given to their fitness for garden decoration, whilst, in some cases—the Rose, for instance—fanciers have appeared careless and unappreciative of its most pleasing and characteristic quality, namely, fragrance.

At the same time, it has to be admitted that, as the result of the exercise of this widespread gift, the diversity and value of domestic animals and cultivated plants have been augmented. It is the natural striving for perfection as defined by accepted standards or models which leads horticulturists to vie with one another in the exhibition of their produce.

The most important function of the societies devoted to special branches of horticulture is to see that the standards imposed at the shows are the best that can be devised, being neither too narrow to exclude novelty, nor too wide to include inferior produce; and, above all, in the case of fruit and vegetables, they should take care that the importance of mere size is not exaggerated. The best exhibition vegetables should be the best vegetables for consumption, just as the best exhibition Roses or Dahlias should be specially pleasing in the garden and bouquet. From this point of view we think that *Practical's* original contribution on the subject may do much good. There is some truth in the contention that the quality of size in vegetables is given more encouragement at some of the competitive shows than is desirable, and the correspondence may cause those responsible for promoting the exhibitions to give greater consideration to this question. We say this much, although we are fully aware that many kinds of vegetables are, other things being equal, all the better for

being of considerable size, and, further, that certain kinds, such, for instance, as Celery, Celeriac and Leeks, are never very good unless they are developed to their best.

The best exhibitions afford plenty of object lessons for schedule-makers and those called upon to adjudicate at vegetable competitions, for the general rule is to give the highest prizes for the best, rather than the largest, produce. Indeed, there has been a most gratifying improvement in this respect in recent years. Everyone agrees that Potato tubers of extra large size seldom possess good table qualities, and few will contend that large tubers are the most successful at the competitions; on the contrary, the best prizes are awarded to medium or even small tubers with clear skins, which show that the crop has been cultivated in a suitable soil free from an excess of fresh organic manure.

May we hope that the judging at the vegetable shows to be held this autumn under the auspices of the National Vegetable Society and Royal Horticultural Society will be free from defects, and that the schedule now being compiled for the great International Exhibition, 1912, will leave no room for doubt, but that good quality and variety are the essential points the Committee wishes to encourage?

In regard to the alleged expensiveness and artificiality of show-culture, we do not know that the argument is specially applicable to show vegetables. May not such an objection be urged against many other things, for instance, Grapes, Carnations, Roses, Auriculas, and even poultry and fat cattle? In a competition, those who take the most trouble are those who enter the better into the spirit of the thing. The prevention or correction of abuse, we must again repeat, is to be looked for in the exercise of the judge's discretion and the code of points the societies agree to reward. As well ask a Grape exhibitor how many bunches of fruit he obtained from his vine, the Rose grower how many flowers he had to select from when choosing his exhibition blooms, as require the vegetable cultivator to state how many Pea plants were grown on a particular area or how many pods of Peas were produced by a single plant. All these questions would be perfectly natural in a competition intended in the main, to test the cropping qualities of particular varieties.

We have sympathy for the occasional visitor who is apt to be deceived at the exhibitions by the extraordinary quality of the produce staged for his inspection, and, particularly for any gardener who is required by his employer to provide similar things without having the necessary means for doing so. This is an instance where a little knowledge is dangerous. We have always held that it is those who possess the most knowledge who can hope to get the best information from the shows. But the fact applies to all shows and not specially to vegetable competitions.

At the same time, we think that intelligent visitors may be expected to consider that exhibitions are composed exclusively of highly-cultivated flowers, fruits, or vegetables, and he is foolish indeed who imagines that they can be equalled without the expenditure of extraordinary efforts. Surely the show committees can hardly be expected to save such an one from the results of his own shortsightedness.

THE "BARR" MEMORIAL.—Since the last list of subscriptions to the memorial of the late PETER BARR was issued, further sums have been received from the following gentlemen:—Messrs. C. SMITH & SONS, ANT. ROOZEN, P. D. WILLIAMS, J. C. WILLIAMS, G. VAN DEN HORST, J. & E. PAGE, BRODIE OF BRODIE, J. FAIRCHILD, DE GRAAFF BROS., VAN KONIGBERG, L. BUCKLAND, BARON DE SOUTELLINHO, PULMAN MOOY, BAYLOR HARTLAND, and R. HOOPER PEARSON.

THE NEWEST SWEET PEA.—A cablegram has been received in England this week from Mr. W. ATLEE BURPEE, of Philadelphia, who is at present in California, informing his friends in this country that his fine new lavender-coloured Sweet Pea will be named in honour of Florence Nightingale.

MUNIFICENT PUBLIC BEQUESTS.—Under the will of the late Mr. ARTHUR LLOYD, a director of Messrs. LLOYD, LTD., proprietors of the *Daily Chronicle* and of *Lloyd's Weekly News*, a sum exceeding £120,000 is left upon trust for charitable purposes. The trustees have full discretion in applying the legacy, which is to be used either for the purchase or the contribution towards the purchase of any open space or open spaces and recreation grounds, or the contribution to the funds of any associations, societies, or committees which provide public gardens, parks, or playing fields; or in donations or contributions to the building or enlargement fund of any hospital, or the general funds of any such hospital or hospitals, or the building fund of new hospitals or convalescent homes; or in giving financial assistance to any institute or recreation room, any athletic or other clubs, or philanthropic societies and institutions; or in making provision for clerical and lay help in any particular parish or parishes. And especially in providing financial support for any scheme having for its object or objects the benefit in any form whatsoever of the employés of all branches or departments of EDWARD LLOYD, LIMITED, or any new or other company into which it may be converted, or which, by means of any reconstruction or amalgamation or transfer may represent or be substituted for such company. Deceased gave his trustees the fullest discretionary powers in dealing with this trust, and, as regards the parks or open spaces, &c., they have power to convey such to the County Council or any public or local authority or committee to be held upon such trusts as the trustees of his will for the time being may approve. He also left numerous bequests to employés of the firm and personal friends, and he directed that two years after his decease there should be paid a sum of £1,000 to the Rev. WILLIAM WILKS, vicar of Shirley, Croydon. His late gardener, Mr. ALFRED POPPIN, is left the sum of £200.

DUBLIN SEED AND NURSERYMEN'S ASSOCIATION.—The members visited Messrs. PENNICK'S Dublin nurseries on the 6th inst. This establishment embraces about 10 acres, and is situated some 500 feet above sea-level in the midst of a country noted for its beautiful scenery. A considerable area is planted with fruit trees. There are also many thousands of rose trees, and these were in their full season of flowering. But the objects of special interest were rare and choice trees and shrubs, including *Araucaria imbricata*, 500 feet in height, and furnished from the growing point to the base, with handsome pendulous branches; *Ceratonia Siliqua*, the "Locust Tree," some 10 feet high; *Halesia tetraptera*, the "Silver Bell" or Snowdrop Tree; *Drimys Winteri*, standing some 30 feet high in front of a noble Cedar of Lebanon; *Dacrydium Franklandii*, 15 feet; *Pinus Pinea*, 45 feet; *P. insignis*, 100 feet; *Hydrangea vestita* var. *pubescens*, 15 feet; *Crataegus tanacetifolia*, 20 feet; *Cedrus atlantica glauca*, 45 feet; *Pithe-*

sporum coriaceum, 15 feet; *Rhododendron Keysii*, 6 feet; *Liriodendron tulipiferum*, 30 feet; *Eucalyptus Globulus*, 110 feet; *Podocarpus andina*, 12 feet; *Olea internodia*, 15 feet; *Cytisus Adami*, 20 feet; *Taxodium distichum*, 25 feet; *Viburnum rugosum*, 6 feet; *Cordyline australis*, 20 feet; *Tilia heterophylla*, 20 feet; *Cupressus sempervirens*, 40 feet; *Pinus laricio*, 80 feet; *Sequoia gigantea*, 90 feet; *Escallonia organensis*, 6 feet; *Myrtus Lunna*, 25 feet; *Bossiaea Amhe-stiana*, *Quercus glabra*, *Photinia glabra*, and *Andromeda formosa*.

THE COUNTESS OF SELKIRK'S GARDEN PRIZES.—For a number of years past the Countess of SELKIRK has offered prizes for the best-kept gardens on the estates of her late husband in Kirkcubrightshire. The awards for the present season have just been issued, on a report by Mr. R. SERVICE and Mr. R. COLMAN, the judges. In the district within two miles of the county town, Kirkcubright, the principal prizes for the best climbers and gardens were awarded as follows:—1, Mrs. DORRANCE, Mutchill; 2, Mrs. TAIT, Mutchill; 3, Mr. MCCOUL, The Stell. Beyond two miles: 1, Miss DICKSON, The Doon; 2, Mrs. KELLY, Burnfoot; 3, Mrs. THOMPSON, Cooper's Croft. Home district: 1, Mrs. LITTLE, Howwell; 2, Mrs. HANNAH, Howwell; 3, Mrs. ROSS, Howwell. Testimony is borne in the report to the improvement effected in the gardens within recent years. It is stated that this season there is both an advance in the arrangement and in the cultivation of the gardens visited. Lady SELKIRK takes a great interest in gardening, and her efforts during a series of years to improve the cottage gardens in her immediate neighbourhood have had beneficial results.

PROFIT FROM FRUIT CULTURE.—Whilst numerous complaints continue to reach us of the losses experienced by fruit-growers this season, one report of quite an opposite character is given to us by Mr. GEORGE BUNYARD. His firm sold some Apple trees a few years ago for planting 15 acres of land, and last week Mr. BUNYARD had the satisfaction of seeing the present season's ungathered crop sold to a purchaser for the sum of £1,000, the purchaser to gather the fruits. This works out at about £75 an acre. The trees are standards, and most of them represent the well-known culinary Apple Lord Derby. These facts afford sufficient proof that in seasons of scarcity it is not every grower who suffers loss, and they also give some idea of the prices that the public will have to pay, this season, for English-grown fruits.

VISIT TO LA MORTOLA.—The members of the Société Botanique de France, under the guidance of Mr. ARBUST-NICE and Prof. LUTZ, the secretary of the society, paid a visit to La Mortola on August 5, and were entertained by Lady HANBURY. The society was returning from a fortnight's visit to the Maritime Alps.

EDINBURGH WORKING MEN'S FLOWER SHOW.—The annual show of this long-established institution was held in the Corn Exchange, Grassmarket, Edinburgh, on August 13. The show was declared open by Bailie SMITH ELLIOT, who pronounced it an excellent one and commended the society for the beneficial work it was performing. He spoke of the encouragement given to it by the Parks Committee of the City Council, and the interest shown by the education authorities in the children's section. He referred to the interest of Mr. J. W. McHATTIE, the city gardener, in the window-box section, and his encouragement to exhibitors generally. He also spoke strongly in favour of the Corporation giving even greater encouragement to horticulture, although it had done a good deal in the past, and was continuing its help.

RETIREMENT OF MR. D. MURRAY.—We understand that Mr. DAVID MURRAY, gardener to the Marquis of AILSA, at Culzean Castle, Ayrshire, will retire shortly. Mr. MURRAY has filled the position of head gardener at Culzean for many years, and during that time he has been amongst the best-known of Scottish horticulturists. As a fruit-grower he has won great distinction, and his career as an exhibitor has been a highly successful one. He is, however, a many-sided man, and he entered heartily into the scheme adopted at Culzean for the introduction of the new and choice shrubs and plants, which now form a prominent feature of the garden.

JOHANNESBURG PUBLIC PARKS.—MR. ROBERT PHILLIPS has been appointed Superintendent of the Public Parks, Cemeteries and Zoological Gardens in Johannesburg. Mr. PHILLIPS served his apprenticeship at Ross Priory gardens, Dumfriesshire, where his father was gardener for many years. He was employed afterwards in the Botanic Gardens, Glasgow, under Mr. WHITTON. He emigrated a few years ago to South Africa, and was employed in the Johannesburg Gardens, under the late Mr. STIRSAT. Mr. PHILLIPS, who is 30 years of age, is the younger brother of Mr. JOHN PHILLIPS, of the Golden Acre Nurseries, Edinburgh.

SOCIETIES.

ROYAL HORTICULTURAL.

AUGUST 16.—The usual fortnightly meeting was held on this date in the Society's Hall, Vincent Square, Westminster. There was a good display of flowers, the majority being garden subjects, many large groups of these being almost a repetition of each other. There were also Roses, Sweet Peas, Dahlias, Ferns, and Carnations. The FLORAL COMMITTEE granted four Awards of Merit, all to varieties of Gladioli.

There were fewer exhibits of Orchids than usual, but numerous novelties were presented for award, and the ORCHID COMMITTEE granted one First class Certificate, one Award of Merit, and five Botanical Certificates.

The chief exhibit in the Fruit and Vegetable section was a magnificent group of fruit trees in pots, shown by Messrs. JAS. VEITCH & SONS, LTD., this receiving a Gold Medal. Five varieties of Culinary Peas, which had been under trial at Wisley, received Awards of Merit, and this distinction was also given to a new variety of Melon.

Floral Committee.

Present: W. Marshall, Esq. (Chairman); and Messrs. C. T. Drury, Henry B. May, W. B. Cranfield, James Walker, W. J. Bean, T. W. Turner, R. Hooper Pearson, J. Hudson, J. Douglas, W. Hoare, A. Kingsmill, J. F. McLeod, W. Bam, George Gordon, E. T. Cook, R. C. Notcutt, J. W. Barr, C. E. Pearson, W. P. Thompson, W. J. James, and E. H. Jenkins.

A large group of Montbretias, shown in vases, was put up by SYDNEY MORRIS, Esq., Wretham Hall, Thetford (gr. Mr. G. Henley). The varieties included Prometheus, Ernest Davidson, orange red; Lady Hamilton, clear, deep orange; Lord Nelson, fiery red; G. Henley, a new variety, with colour similar to Lady Hamilton; St. Botolph, Messidor, the palest variety shown; and Westwick, an exceptionally free bloomer. (Silver gilt Medal.)

LEOPOLD DE ROTHSCHILD, Esq., C.V.O., Gunnersbury House, Acton (gr. Mr. Jas. Hudson), showed six new varieties of hardy Nymphaeas; the best were Meteor, a large, claret-coloured variety; Virginal, a clear white; and Newton, a deep suffusion of rose, with exceptionally fine golden centre.

Varieties of Nymphaeas were also shown by the EARL OF WARWICK, Easton Lodge, Duntmow (gr. Mr. H. Lister), the clear, blue flower named after Lord Brooke being remarkably choice.

Messrs. JAS. VEITCH & SONS, LTD., Chelsea, showed miscellaneous greenhouse plants, having a bright exhibit. The beautiful blue of *Exacum macranthum*, mingled pleasingly with the red

Kalanchoe flammea; *Lobelia tenuior* looked equally charming in a bank of the pink *Crowea latifolia*. Cannas also provided a pretty feature, overhung with sprays of the delicate mauve-coloured *Thalictrum dipterocephalum*. There were also standard Fuchsias and varieties of *Abutilon*. As a separate group this firm showed standard plants of *Pelargoniums* and *Salvia splendens*. (Silver Banksian Medal.)

Messrs. WM. WATSON & SONS, LTD., Clontarf Nurseries, Dublin, showed border Carnations. They had a large batch of the new variety named Dublin Pink, a free bloomer, of good size; Lord Carew, a fancy, with bright red stripes; Lady Cory, slaty mauve; Mrs. Peggy Dawson, a yellow-ground fancy, with rich red markings; and Countess of Aberdeen, a yellow-ground Picotee, the petals lightly tipped with red.

A large display of Carnations and early *Chrysanthemums* was set up by Sir DANIEL GOOCH,

were numerous vases filled with an assortment of other kinds. *Rhea Reid*, *Simplicity* (single white), *Souvenir de Marie de Zayas*, *Molly Sharman Crawford*, and *Grass an Teplitz*, being a selection of the best blooms. (Silver Flora Medal.)

Mr. FRANK WOOLLARD, 55-54, Lewes Road, Brighton, showed Roses in variety.

Mr. CHAS. BREADMORE, Winchester, put up an exhibit of Sweet Peas that extended the whole width of the hall at the platform end. There were 130 vases and about 40 varieties. Notable varieties were *Earl Spencer*, orange; *Freda*, white; *Dazzler*, red or "flamed"; *Princess Juliana*, cream; *Countess Spencer*, Nancy Perkin, orange; *Frank Dolby*, lavender; and *Colleen*, rose standard, with paler wings and keel. (Silver-gilt Banksian Medal.)

Messrs. S. BIDE & SONS, LTD., Farnham, Surrey, showed Sweet Peas attractively exhibited. We noticed such sterling sorts as Mrs.

vulgare, having the best crested plumose and serrated varieties, including *P. v. Cambricum*, *P. v. Cambricum Prestonii*, a handsome plumose variety resembling a choice *Nephrolepis*; and *P. v. Barrowii*, also with plumose leafage, but not with such long fronds as the variety *Prestonii*. *Polypodium grandiceps* Foxiae is another beautiful hardy Fern, the densely-crested fronds being of dark green colour. (Bronze Flora Medal.)

Some remarkably fine pot plants of *Campanula pyramidalis*, of both white and blue-flowered sorts, were shown by Col. GEORGE HOWARD TROLLOPE, Fairmile Hatch, Cobham. The huge spikes resembled dense columns of flowers. (Silver Banksian Medal.)

Messrs. KELWAY & SON, Langport, Somerset, showed large numbers of named varieties of *Gladioli*, also choice *Gaillardias* and *Delphiniums*. (Silver-gilt Banksian Medal.)

THE SHREWSBURY SHOW.

FIG. 54.—PART OF A GROUP OF FRUITS, FLOWERS, AND VEGETABLES SHOWN BY MESSRS. SUTTON AND SONS.

Bart., Hylands, Chelmsford (gr. Mr. P. Wilkinson). The blooms were relieved with coloured foliage of shrubs and bunches of *Gypsophila*. (Bronze Banksian Medal.)

Mr. A. L. GWILLIM, Cambria Nursery, New Eltham, Kent, showed tuberous-rooted *Begonias*, a few being named kinds, but the majority seedlings, displayed in batches of distinct colours, which ranged from white to crimson. The display formed a rich bank of colouring, the blooms being good.

Choice Roses were shown by Messrs. FRANK CANT & Co., Colchester. They had large epergnes filled with blooms of one variety, such as *Lyon Rose*, *Papa Gontier*, *Gottfried Keller*, a charming single Rose, the petals bluish-tinted on gold, and *Mme. Melanie Soupert*. Beneath these

A. Ireland, Mrs. Hardecastle Sykes, *Orange King* (new), *James Grieve*, Mrs. Rutzahn, President, *Helen Lewis*, *Harold*, cream, and *Blue Belle*.

Messrs. CARTER, PAGE & Co., 52 & 53, London Wall, filled a long table with varieties of *Dahlias*, principally of Cactus-flowered sorts. They also showed numerous varieties of the Peony-flowered, pompon and single types. Of the Cactus varieties, notable examples were *Nisi Prins*, fiery red with gold base; *Lustre*, dark red; *Daisy Easton*, yellow; *J. H. Jackson*, very dark maroon; and *Manve Queen*; all these being good garden sorts. The single and Pompon varieties embraced most of the best kinds in commerce. (Silver Banksian Medal.)

Messrs. H. B. MAY & SONS, The Nurseries, Edmonton, staged a floor group of *Polypodium*

Mr. WILHELM PFITZER, Stuttgart, Germany, showed varieties of *Gladiolus*, most of them unnamed seedlings. In the centre was a fine white sort of the *gandavensis* type, named *Europa*. (Silver Flora Medal.)

Messrs. GEO. BUNYARD & Co., Maidstone, showed a large group of hardy flowers. The display included *Pyrethrums*, *Gladioli*, *Phloxes*, *Pentstemons*, *Coreopsis grandiflora*, *Delphiniums*, *Spireas*, and other kinds in large batches. (Silver Banksian Medal.)

Messrs. W. WELLS & Co., Merstham, Surrey, showed *Phlox decussata* in considerable numbers, amongst an exhibit of other border flowers. The beautiful rose-pink variety of *Phlox* named *Elizabeth Campbell* is worthy of mention, and they had also fine spikes of the white *Frau*

Antonin Buchner, which received an Award of Merit at the last meeting. *Anthemis Kelwayi* is a bright yellow Composite. Along the front of the display were vases of *Violas* and early blooming *Chrysanthemums*.

Messrs. G. & A. CLARK, LTD., Dover, staged some fine plants of *Campanula Vidallii* in a general collection of hardy flowers. This *Campanula* needs slight protection during the winter. *Spikes of Gladioli* were good, as were *Pentstemons*, *Pyrethrums*, *Scabious*, *Phloxes*, *Veronicas*, and other garden subjects.

Messrs. RICH & CO., Bath, showed 30 varieties of border *Phloxes*. The selection included the best of those in cultivation. Amongst the more notable kinds were *Goliath*, rose with darker eye; *Mme. Paul Duetrie*, blush pink, very large; *Frau Antonin Buchner*, white; *Baron von Dedam*, new, resembling *Coquelicot* but larger; and *Sinbad*, mauve, very large in flower, but dwarf in habit.

The GUILDFORD HARDY PLANT NURSERY made a showy exhibit with hardy flowers, and an adjoining group of a similar character was put up by Messrs. T. S. WARE, LTD., Feltham. (Bronze Flora Medal.)

Mr. MAURICE PRICHARD, Christchurch, Hampshire, filled a large table with border flowers. A batch of *Criann Powellii* and its white variety was prominent. Mr. PRICHARD had also a fine show of *Montbretias*, *Tritomas*, *Delphiniums*, *Phloxes*, *Gladioli*, and other seasonable subjects. (Silver Flora Medal.)

Messrs. PAUL & SON, The Old Nurseries, Cheshunt, also showed a large group of hardy flowers, having a good selection of seasonable subjects. (Silver Flora Medal.)

Mr. FRANK BRAZIER, Caterham, exhibited a floor group of *Phloxes*, *Carnations*, *Sweet Peas*, *Verbenas*, *Violas*, and other garden flowers. (Bronze Banksian Medal.)

Mr. JAMES BOX, Lindfield, Sussex, showed a large group of *Phloxes*, with a row of *Delphiniums*, *Montbretias*, and *Ferns* as an edging. (Bronze Flora Medal.)

Messrs. BARR & SONS, King Street, Covent Garden, London, displayed hardy flowers in variety, such as *Phloxes*, *Gladioli*, *Delphiniums*, *Agapanthus Mooreanus*, *Veronica subsessilis* (very fine), *Liliums*, and *African Marigolds*.

Displays of hardy flowers were also made by Messrs. WHITELEGG & PAGE, Chislehurst, Kent, and Mr. A. J. HARWOOD, St. Peter's Nursery, Colchester.

AWARDS OF MERIT.

Gladiolus primulinus.—Flowers of this pretty yellow-flowered species were shown by Messrs. KELWAY & SON. *G. primulinus* was illustrated in these pages, October 26, 1907, p. 291.

Gladiolus "Europa".—This appeared to us the best white *Gladiolus* in cultivation. The flowers were large, of good form and substance, and as many as six were expanded on the spike at one time. Shown by Mr. W. PFITZER, Stuttgart, Germany.

Gladiolus Gräfin Degenfeld.—This variety is perfectly distinct. The flowers are sulphur or pale primrose-yellow, with exceedingly bright-crimson markings on the lower segments. Shown by Mr. W. PFITZER.

Gladiolus Karl Luz.—A variety of the deepest tone of crimson-maroon, with chocolate-coloured throat. Shown by Mr. W. PFITZER, who exhibited a large number of varieties remarkable for high quality and distinctness from sorts already in commerce.

Orchid Committee.

Present: Harry J. Veitch, Esq. (in the Chair); and Messrs. Jas. O'Brien (hon. sec.), de B. Crawshaw, H. Little, F. J. Hanbury, A. A. McBean, W. Cobb, J. Charlesworth, A. Dye, W. P. Bound, H. G. Alexander, H. A. Tracy, Gurney Wilson, W. Bolton, Stuart Low, W. Thompson, and W. H. White.

Mrs. BISCHOFFSHEIM, The Warren House, Stanmore (Orchid grower, Mr. Taylor), was awarded a Silver-gilt Lindley Medal for a magnificent group of brilliantly-coloured *Disa grandiflora*, composed of about 100 plants. They were cultivated on the special plan adopted at The Warren House, whereby each specimen produces a stout, single growth, with a fine head of large flowers varying from brilliant orange-scarlet to deep red, both foliage and flowers exhibiting great vigour.

Lieut.-Col. Sir GEORGE L. HOLFORD, K.C.V.O., Westonbirt (gr. Mr. H. Alexander), was awarded a Silver-gilt Flora Medal for a group of seven grand specimens of *Vanda cœrulea*, with large spikes of noble flowers, the largest bearing 16 blooms; two of the plants had two spikes on each. All the blooms were of a beautiful blue tint and had broad segments, the best being the Westonbirt variety (see Awards). The base of the group was composed of about 30 finely-flowered plants of the fine type of *Cypripedium Maudie* raised at Westonbirt, and a good plant of *Laelio-Cattleya Colmaniana magnifica*.

Messrs. SANDER & SONS, St. Albans, were awarded a Silver Flora Medal for a very extensive and varied group, in which hybrid *Cattleyas*, *Laelio-Cattleyas*, and *Odontoglossums* were prominent. *Vanda cœrulea* showed up well in the centre of the display, and *Vanda Marguerite Maron*, *Peristeria elata*, some good hybrid *Cypripediums*, *Cycnoches chlorochilon*, *Sophrone Cattleya Chamberlainiana*, and other *Sophrone-Cattleyas* and *Odontodas* were also noted.

Messrs. STUART LOW & CO., Bush Hill Park, Enfield, were awarded a Silver Flora Medal for an interesting group of *Odontoglossums*, *Cattleyas*, *Brasso-Cattleyas*, and other Orchids. Interesting species remarked were the pretty, *Sigmatostalix Elie*, *Notylia Barkeri*, *Oncidium bifrons*, *Odontoglossum Wallisii*, *Masdevallia calura*, *M. ephippium*, *M. Peristeria*, and other *Masdevallias*. Of *Dendrobium*, *D. chesingtonense* var. I. M. Black was conspicuous, its orange-yellow flowers having a reddish disc to the lip. This firm also showed the fine natural hybrid *Cattleya Le Czar* "Low's variety." For others see Awards.

Messrs. CHARLESWORTH & CO., Haywards Heath, exhibited a selection of rare species, which included *Eulophia guineensis*, the white *Mormodes luxatum punctatum*, which has small purple spots on the segments; *Anguloa Ruckeri superba*, *Schlimia trifida*, a grand specimen of *Aerides Lawrenciae* with four spikes, a good plant of *Houlletia Brocklehurstiana*, *Cryptophoranthus Dayanus*, with about 300 of its curious flowers; and various other pretty species.

H. S. GOODSON, Esq., Fairlawn, Putney (gr. Mr. G. E. Day), staged a small group, which included the pretty *Odontoglossum Goodsonii*, *O. Solon*, *O. Uro-Skinneri album*, *Anguloa uniflora eburnea*, two plants of *Cattleya Crashleyi* differing much in colour, and the handsome *Laelio-Cattleya St. Gothard*.

Sir TREVOR LAWRENCE, Bart., K.C.V.O. (gr. Mr. W. H. White), exhibited a selection of rare species, several of which received awards.

DE B. CRAWSHAW, Esq., Rosefield, Sevenoaks (gr. Mr. Stables), showed a good dark form of *Odontoglossum Queen Alexandra* and *O. Thwaitesii* (*Harryanum* × *ardentissimum*), the pretty flowers being marked like a blotched form of *O. ardentissimum*.

Messrs. J. & A. A. McBEAN, Cooksbridge, staged a neat group of well-grown *Odontoglossums*, and with them two plants of the new *Odontodia Graireana*, with cinnabar-red-tinted sepals and petals; also *O. Bohnhoffia*, good *Laelio-Cattleya callistoglossa*, and *Cattleya Warszewiczii*.

Mrs. NORMAN C. COOKSON, Oakwood, Wylam (gr. Mr. H. J. Chapman), showed *Cattleya Oakwoodensis* (*Warneri* × *Hardyana*), *Odontoglossum Pescatorei* Cookson's variety, with well-formed white flowers, bearing dark purple blotches; *Cypripedium Chapmaniae* and *C. Sybil*, both pretty hybrids of *C. Fairrieanum*.

Mr. E. V. Low, Vale Bridge, Haywards Heath, staged a small group, in the centre of which was a fine plant of *Cypripedium T. Ansonii*. They also exhibited *C. Mary Beatrice* and *C. Juno Drewett's* variety: *Laelio-Cattleya Nysa superba*, *Cattleya Atalanta*, *Brasso-Cattleya Mrs. J. Lee-mann*, and a delicate form of *Oncidium Mantinii*.

Messrs. JONES, HOWES & CO., Elmton Nurseries, Kenilworth, showed a well-grown plant of *Cattleya O'Brieniana alba*.

AWARDS.

FIRST-CLASS CERTIFICATE.

Vanda cœrulea Westonbirt variety, from Lieut.-Col. Sir GEORGE L. HOLFORD, K.C.V.O. (gr. Mr. H. G. Alexander).—Probably the finest form of *Vanda cœrulea* ever shown, the flowers being 5 inches in diameter, perfectly circular in outline, and with equally broad segments heavily veined with deep indigo-blue, the lip being dark violet.

AWARD OF MERIT.

Oncidium Mantinii Lowii, from Mr. E. V. Low, Vale Bridge, Haywards Heath.—A distinct and beautiful citron-yellow form, with obscure olive-brown markings on the sepals, petals, and front of the lip; the flowers are unusually large.

BOTANICAL CERTIFICATES.

Bulbophyllum exaltatum, from Sir TREVOR LAWRENCE, Bart., K.C.V.O. (gr. Mr. W. H. White).—A South American species, bearing long slender scapes, furnished with small flowers; the sepals are marked with dark spots, the fringed lip being purple.

Polytachya paniculata, Rolfe, from Sir TREVOR LAWRENCE.—A singular and pretty species from Uganda, with curiously flattened pseudo-bulbs and ornamental growths bearing upright, branched spikes of pretty, small, orange-red flowers.

Theodorora gomzoides, from Sir TREVOR LAWRENCE.—A dwarf species, bearing drooping racemes of greenish flowers with white labellums.

Cypripodium Andersonii, from Messrs. STUART LOW & CO., Bush Hill Park.—A well-known, strong-growing species, bearing stout spikes of bright yellow flowers.

Stanhoppa sacata, from Messrs. STUART LOW & CO.—A showy species, with sepals and petals yellowish, spotted with purple, the fleshy labellum having the hypochile developed into a deep pouch, orange tinted, the front lobe and fleshy middle lobes being approached to the column.

CULTURAL COMMENDATION

to Mr. Bristow (gr. to Mrs. TEMPLE, Leyswood, Groombridge), for a specimen of *Cypripedium Wiertzianum*, with 3 to 4 flowers on each spike.

Fruit and Vegetable Committee.

Present: G. Bunyard, Esq. (in the Chair); and Messrs. W. Bates, J. Willard, A. Dean, H. Parr, G. Hobday, A. R. Allan, C. Foster, H. Markham, E. Beckett, J. Jaques, O. Thomas, W. Poupard, J. Vert, and G. Keli.

The superintendent, Mr. S. T. WRIGHT, showed three red seedling Tomatos which had been grown at Wisley for trial. They were all finely fruited, but awards were withheld until names had been given them.

S. H. SCOTT ELLIOTT, Esq., Dumfries, sent a sample of Potato Midlothian Early, grown under electrical influence. The tubers, which had been cooked, were found to be similar to ordinary tubers of that variety.

LEOPOLD SOLOMONS, Esq., Norbury Park, Leatherhead, sent fruits of a yellow Peach, which was recognised as the variety Thames Bank.

Messrs. BUNYARD & CO., LTD., Maidstone, showed a Nectarine of an unusually deep colour. It came originally from New Zealand, and is named *Konstange*. The Committee desired to see fruits on another occasion.

Messrs. JAMES VEITCH & SONS, Chelsea, staged a magnificent group of fruit trees in pots, in all about 100 trees. Peaches included *Thos. Rivers*, *Marquis of Downshire*, *Dr. Hogg*, *Belle Bance*, *Prince of Wales*, *Late Devonian*, *Duchess of York*, *Bellegarde*, *Nectarine and Royal George*, the variety named last being shown as an espalier. Of Nectarines, there were *Goldoni*, *Stanwick Elruge*, and *Early Orange*; *Plums*, *Brandy Gage*, *Green Gage*, *Jefferson*, *Transparent Gage*, *Dunmiston's Superb*, *Oullin's Golden Gage*, and *Kirke's*. All the trees, though not over large, were carrying very heavy crops. Besides these, there were finely-fruited Figs, including *Negro Largo*, *Violette Sepor*, *Osborn's Prolific*, *White Ischia*, *Brown Turkey*, and *Bonjassotte*. *Grise*, *Pears* were represented by *Marguerite Marillat*, *Louise Bonne of Jersey*, *Dr. Jules Guyot*, and *Conference*. (Gold Medal.)

AWARDS OF MERIT.

Melon Early Favorite (Windsor Castle × *Beechwood*).—This variety was raised and grown in the Society's gardens at Wisley. It was an oval, green-fleshed fruit.

The following Peas having been grown at Wisley under trial were granted Awards of Merit:—*Satisfaction*, *Yorkshire Hero*, and *Windsor Castle* (SUTTON & SONS), *Exhibition* (J. CARTER & CO.), and *Magnum Bonum* (BARR & SONS).

SHROPSHIRE HORTICULTURAL.

Exhibition at Shrewsbury, August 17 and 18.

THE 36th annual show of the Shropshire Horticultural Society took place on Wednesday and Thursday last in the Quarry Grounds, Shrewsbury, amidst all the enthusiasm and interest which usually characterise the Shropshire exhibitions. We have written so many times of these annual exhibitions, that there appears nothing to remark that has not been said on former occasions. We have eulogised previous displays, and we may praise the most recent show, for it afforded a first-rate illustration of the finest products of British horticulture.

Taken collectively, it can hardly be said to be better than that held last year, but it is extremely high praise when we say that it was, at the least, equal to any show which the Shropshire Society has held. It is difficult, and it will be always difficult, to improve upon such a standard as visitors associate with Shrewsbury. The utmost that the committee can do is to introduce novelty, in some form, from year to year. On the occasion under notice their attempt in this direction took the form of a modification of the group classes. There have always been two classes for groups of miscellaneous plants arranged for effect: in the one case, flowering plants were excluded; in the other, they might be mixed with the fine foliaged plants. The former class was retained, as usual, this year, but the latter was discontinued, and in its place a new class for a display of plants and flowers was substituted, with a view to obtaining floral effects showing some new features. The net result was that the displays were much brighter than any groups have been, but they still leave some room for improvement when exhibitors appreciate the discretion allowed them in the choice of material and in general arrangement. The details will be found below.

Turning to the fruit exhibits, it may be said that the Grapes were certainly not better than usual, nor could this be expected in such a comparatively sunless season. Indeed, since the Marquis of Hastings's last exhibit at Shrewsbury, his produce has never been equalled. Other fruits were excellent, and the competition in the various classes was exceedingly satisfactory.

Hardy flowers were better than they have ever been, if we except Sweet Peas, and vegetables were equal to their former high quality.

It will facilitate convenience on another occasion if the judging is commenced at 9 a.m. instead of 10 o'clock. The public is admitted to the tents at 11.30, and experience shows very conclusively that in present conditions it is not possible to complete the adjudication of the more important classes by that time.

Messrs. Admitt and Naunton, the secretaries, who have served the Society so long and so well, are still at the helm, and we are sure they may be trusted to arrange this matter satisfactorily.

As showing the increasing interest taken in this provincial horticultural exhibition, it may be stated that a series of photographic films for cinematographic displays in places of amusement was taken by the firm of Messrs. Pathe.

DECORATED FRUIT TABLES.

This popular class is for a collection of 50 dishes of ripe fruit in not fewer than 10 distinct kinds, to be staged on separate tables, measuring 10 feet 6 inches by 4 feet 6 inches. The varieties of fruit to form each separate dish or other receptacle is left to the exhibitor's discretion, but not more than 14 bunches of Grapes are allowed in not fewer than four varieties (to include black and white), and not more than four varieties of any one kind of fruit, nor more than two dishes of any one variety, only one variety to be shown on a dish, but not more than four dishes of any one kind of fruit. Each collection might be decorated with flowering and foliage plants in pots not exceeding 5 inches diameter, also cut flowers and foliage (including Orchids) shown in glasses, ware, baskets, or boxes.

The judging of the five exhibits staged in this class commenced at 10 o'clock a.m., and at lunch time—1.30—the prize tickets were still undisplayed. When it is pointed out that the public are admitted to the show at 11.30 a.m., it has scarcely to be stated that judging was proceeding in the presence of a considerable crowd of people. It is not possible (as experience has shown) to point these "dishes" and get the class judged by 11.30. The committee is not likely to entertain the idea of shortening the time the exhibition is open to public inspection. Therefore, the only thing to be done is to start the judging earlier in the day. We hope this will be done. Further, there were some criticisms last year in respect to the points awarded by the judges to each dish. Whether, as a result or not of that discussion, the schedule for the present season reads as follows:—"The points awarded to each separate dish and table will be marked on cards and placed on each table after being judged." This was not done, as will be seen on a perusal of the following figures, in which the points for Apples, or Grapes, or Peaches are so lumped as to be valueless. This matter seems all the more regrettable since the judges have informed us that they furnished to the committee a return of the points awarded for every particular dish. The following particulars are all that could be taken after the publication of the awards, owing to the crowding of the visitors. The 1st prize was awarded to the Duke of WESTMINSTER, Eaton Hall, Chester (gr. Mr. Barnes), and the published table of points was as follows:—Apples, 25½ points; Apricots, 5 points; Figs, 6 points; Grapes, 54 points; Melons, 27 points; Nectarines, 27 points; Peaches, 25 points; Pears, 24 points; Plums, 5 points; beauty and arrangement, 10 points; total, 211½. The 2nd prize was awarded to the Earl of HARRINGTON, Elvaston Castle, Derbyshire, who gained 200½ points; the 3rd prize to the Duke of PORTLAND, Welbeck Abbey, Notts., for 193½; the 4th prize to J. DRAKES, Esq., for 189½; and the 5th prize to Lady HENRY SOMERSET, for 177 points.

COLLECTIONS OF FRUIT.

The most important class in this section was one for a collection of 12 dishes of fruit, distinct varieties, not fewer than nine kinds and not more than two varieties of a kind. Black and white Grapes to be distinct kinds of fruit, and two bunches of each variety. Each exhibit was to occupy a space of 6 feet by 4 feet 6 inches. The 1st prize offered was £10, the 2nd prize £6, 3rd prize £4, and 4th prize £3.

As many as seven exhibitors entered this somewhat difficult contest, especially difficult to those having gardens of a limited extent, for the produce has to be first class even to win a prize of any sort. The best collection was one from Mr. S. BARKER, Worksop, and it was extremely well deserving of the highest award. The Grapes exhibited included the varieties Muscat of Alexandria, Muscat Hamburgh, and Madresfield Court. Of these we preferred the fruits of Madresfield Court, for not only were the bunches large and of good, though not perfect shape, but the berries were large, plump, and grandly coloured. Muscat of Alexandria was too small in berry to be of the highest merit, and they were uneven in size, whilst the colour was not extra good. Muscat Hamburgh was exceedingly well coloured, and one bunch was of capital weight and moderately good form, but the bunches were uneven and failed to match each other as exhibition Grapes are expected to do. Amongst the other kinds of fruit were highly finished, rather small fruits of Humboldt Nectarine, excellent fruits of Goshawk and another Peach, Coe's Golden Drop Plum, Washington Apple, Negro Largo Fig, Pitmaston Duchess Pear, and Royal Jubilee Melon. Taking them together the collection was deserving of great commendation. The 2nd prize was gained by LORD BELPER, Kingston Hall (gr. Mr.

W. H. Cooke). In several respects this exhibit was quite equal to that we have just noticed. The Peaches and Nectarines were particularly good, especially Nectarine Spencer and Peach English Galande. The specimens of Gascoyne's Scarlet Seedling Apple were quite exceptional fruits, being of very large size and rich colour. Marguerite Marillat Pears were large, but scarcely ripe. Large Early Apricots were excellent, and Brown Turkey Figs of moderate quality. The Grapes included Gros Maroc, Muscat of Alexandria, and Madresfield Court. Gros Maroc were small, excellently coloured bunches, Madresfield Court long, tapering, but rather thin bunches of well-finished Grapes; and Muscat of Alexandria, fair-sized examples, of moderately good form and finish. A fruit of "Eminence" Melon completed the exhibit. 3rd, LORD BIDDULPH, Ledbury Park (gr. Mr. H. Cotton), who showed Grapes Gros Maroc, Muscat of Alexandria, Black Hamburgh, and Duke of Buccleuch. The Peaches, Nectarines, Apples, Pears, and Apricots were very fine in this exhibit. 4th, Mrs. F. NEED, Malvern (gr. Mr. J. Jones). The prizes for the floral decorations in this class were awarded as follow: 1st, LORD BIDDULPH, who used Orchids; 2nd, Mr. S. BARKER; and 3rd, Mr. W. E. HYDE, Sheffield.

In the class for 9 dishes, there were three exhibits, and the best of these was one shown by CAPTAIN HEYWOOD-LONSDALE, Shavington Hall (gr. Mr. J. Mills). He had small bunches of highly-finished Grapes in the varieties Muscat of Alexandria and Madresfield Court, Nectarine and an unnamed Peach, Pitmaston Orange and Elruge Nectarines, Charles Ross and Rival Apples, and a scarlet-fleshed Melon. The exhibit was decorated with a few pink Carnations and Selaginella sprays, and the 2nd prize was gained for this floral decoration. The 2nd prize for fruit was won by F. RIBBY, Esq., Haidwicke Grange, Shrewsbury (gr. Mr. W. Taylor). This exhibitor lost much in his Grapes, having selected the varieties Gros Colman and Foster's Seedling, whilst the fruits of Foster's Seedling were not only small in berry, but extremely deficient in colour. Pretty Nectarines were shown in the variety Pitmaston Orange; the other dishes were Princess Victoria and Bellegarde Peaches, Worcester Pearmain and Beauty of Bath Apples and Royal Jubilee and Cantaloupe Melons. This exhibitor gained the 1st prize for the floral decorations. The 3rd prizes for fruit and floral decorations were awarded to Mrs. SWANN, Halston Hall (gr. Mr. Roberts).

GRAPES.

Twelve bunches of Grapes in four or more distinct varieties, but not more than four bunches of any one variety.—Each bunch was to be judged on its individual merits, and the points awarded marked on cards and placed on each table after being judged. A maximum of 11 points might be given to Muscat of Alexandria. A maximum of 10 points to all other Muscats (black or white) and Black Hamburgh, and nine points to all other Grapes.

The bunches were to be staged on boards (singly if possible) and the whole arranged on a table space 8 feet by 4 feet 6 inches, in two tiers, 2 feet 3 inches wide.

For the purpose of this competition, Bowood Muscat, Charlesworth Toquay, and Tynningham Muscat could not be shown as distinct varieties with Muscat of Alexandria. Gros Maroc and Cooper's Black were also considered synonymous.

Superior cultivation and finish were considered of the greatest importance.

Each collection was decorated; flowering and foliage plants, in pots not exceeding 5 inches in diameter, were allowed, also cut flowers (including Orchids), and foliage, shown in glass, ware, or loose, allowed at the exhibitor's discretion.

There were six exhibitors, and the best exhibit was staged by J. DRAKE, Esq. We reproduce the

table, showing the number of points awarded by the judges to the several bunches:—

No. of Bunch.	Variety of Grape.	Points Awarded.	Possible No. of Points.
1	Gros Maroc (judged as Black Hamburg)	9	10
2	Muscat of Alexandria	9	11
3	Madresfield Court	9	10
4	Muscat of Alexandria	8½	11
5	Madresfield Court	9	10
6	Canon Hall Muscat	9	10
7	Madresfield Court	9	10
8	Muscat of Alexandria	8½	11
9	Gros Maroc	8	9
10	Gros Maroc	8	9
11	Muscat of Alexandria	8½	11
12	Madresfield Court	9½	10
Totals		105	122

It will be seen that in no case did the judges award the maximum number of points for any particular bunch. Madresfield Court more nearly approached to this than any other variety, and we fully agree with the conclusion arrived at. Each of the specimens was of capital size, form and colour, whilst the size of the berries was excellent, especially in the case of bunch numbered 12 in the table. The Muscat of Alexandria were large bunches, being amongst the best in this respect, but the size of the berries left something to be desired, whilst the colour in the different portions of the bunch was unequal. The single bunch of Canon Hall Muscat was deserving of commendation, but the berries should have shown better colour. Gros Maroc, in each instance, was very good.

The 2nd prize was gained by Lord BELPER, whose bunches were very much smaller than those shown in the collection already noticed, whilst Nos. 9 and 10 (Muscat of Alexandria) were very small and badly coloured. We reproduce the table, although it has to be stated that, in comparing the two exhibits, the pointing in Lord BELPER'S collection appears to be excessively high:—

No. of Bunch.	Variety of Grape.	Points Awarded.	Possible No. of Points.
1	Gros Maroc	9	9
2	Muscat of Alexandria	9	11
3	Madresfield Court	8	10
4	Madresfield Court	9	10
5	Muscat of Alexandria	8½	11
6	Muscat Hamburg	6½	10
7	Muscat Hamburg	7½	10
8	Madresfield Court	10	10
9	Muscat of Alexandria	8½	11
10	Muscat of Alexandria	8½	11
11	Madresfield Court	9½	10
12	Muscat Hamburg	7	10
Totals		101	123

3rd, the Earl of HARRINGTON, Elvaston Castle, Derbyshire (gr. Mr. J. H. Goodacre). In this collection two bunches were awarded the maximum number of points, namely Madresfield Court and Black Hamburg. In neither case should the highest number have been given; in the first, because the bunch left something to be desired in the matter of size, and in the second, because the berries were not so even in size as we expect to see them in a bunch described as "perfect." Still, the collection was an excellent one, and the number of points awarded was 99½ out of a possible 124; 4th, Lady HENRY SOMERSET, who obtained 95½ points out of 123; 5th, H. ST. MAUR, Esq., with 95 points; 6th, Mr. W. A. COATES, Glan Conway, with 89 points. An extra prize was given to a collection shown by Mrs. F. NEED, Malvern (gr. Mr. T. Jones), who gained 86½ points.

The awards for decoration in this class were given as follows:—1st, Mr. PARKER; 2nd, Mrs. NEVE; 3rd, Lady HENRY SOMERSET.

Collection of four bunches.—In this class there were five exhibits, and the 1st prize was awarded to Lord HARLECH, Brogyntyn (gr. Mr. T. Lambert), who staged Muscat of Alexandria and Madresfield Court. The Muscat of Alexandria were long, heavy bunches, but one of them lacked colour, and the size of the berries was not satisfactory. The Madresfield Court were better in finish; 2nd, Mr. J. BARKER, Workop; 3rd, E. BEWLEY, Esq., Dublin (gr. Mr. T. Cave).

The following classes were for two bunches of one variety:—

Black Hamburg.—In this class there were seven competitors, and the 1st prize was awarded to Lady HENRY SOMERSET, who had first-rate bunches of large berries of handsome colour; 2nd, J. BRUNTON, Esq., Stourport (gr. Mr. H. Wilson), who had larger bunches but smaller berries; 3rd, Lord TREVOR, Brynkinalt (gr. Mr. W. Dawes). The class for a single bunch of this variety was won by Lady HENRY SOMERSET, whilst J. BRINTON, Esq., was 2nd.

Black Muscat varieties.—The variety Madresfield Court was awarded the 1st prize in the class for Black varieties of Muscat. They were shown by Col. FRANCE HAYHURST, Middlewich (gr. Mr. A. H. Hall), and the bunches were amongst the best in the show; 2nd, G. E. LOMAX, Esq., Huyton, Liverpool (gr. Mr. E. Jones), who had, apparently, Black Hamburg, but the fruits were unnamed; 3rd, J. BRINTON, Esq. There were five exhibitors.

Madresfield Court.—There were only three exhibits of this handsome Grape, but the pair of bunches from J. DRAKES, Esq., Market Rasen (gr. Mr. W. Parker), were extremely good in size and colour, the only fault consisting in the rather small size of the individual berries. 2nd, Col. FRANCE HAYHURST, who had much better berries, but smaller bunches. Many judges would have awarded them the 1st prize. 3rd, S. BARKER, Esq.

Black Alicante.—Six exhibitors staged pairs of Black Hamburg, and those who gained the 1st prize for Col. HAYHURST were very fine specimens, being particularly heavy and well-coloured; 2nd, G. E. LOMAX, Huyton, Liverpool (gr. Mr. E. Jones); 3rd, H. ST. MAUR, Esq., Newton Abbot (gr. Mr. G. F. Richardson).

Any other Black Grape.—The variety Apple Towers, shown by J. DRAKES, Esq., gained the highest distinction. These specimens were very fine indeed in all respects. The 2nd prize was awarded to Alwick Seedling, shown by J. STONE, Esq., Roby, Liverpool (gr. Mr. D. McKelvie); and Gros Colman was 3rd, shown by Mr. W. FAULKNER, Birkenhead.

Muscat of Alexandria.—In this class for the most popular Grape, there were five exhibitors. J. DRAKES, Esq., showed extraordinarily large, tapering bunches of only moderate-sized berries of fair colour. The 2nd prize was again awarded to much handsomer berries, of extra large size, but smaller in bunch, shown by H. ST. MAUR, Esq.; 3rd, Col. MELLOR, Tan-y-Bryn (gr. Mr. C. Price). In the class for single bunches of the same variety there were seven exhibitors. The 1st prize was won by J. DRAKES, Esq., with a very long, tapering bunch of well-coloured berries of moderate size; 2nd, Lord HARLECH, with a heavy, good bunch, of moderately good shape, and 3rd, the Duke of WESTMINSTER, Eaton Hall, Chester (gr. Mr. N. F. Barnes).

Any other White Grape.—Two very fine bunches of Chasselas Napoleon, shown by H. E. ATTENBOROUGH, Esq., Daventry (gr. Mr. A. Child), gained the 1st prize in the class for any White Grape, excluding Muscat of Alexandria; the 2nd prize was awarded to Buckland Sweetwater, shown by G. E. LOMAX, Esq., and the 3rd to Chasselas Napoleon, shown by Col. FRANCE HAYHURST.

LOCAL CLASSES FOR GRAPES.

There were five classes for Grapes grown in the county of Salop. In these, the prizes were gained as follow: For *Black Hamburg*: 1st, Duke of SUTHERLAND (gr. Mr. G. Adams); 2nd, Lord TREVOR. *Madresfield Court*: 1st, Lord HARLECH; 2nd, Lord TREVOR. *Any other black Grape*: 1st, Lord HARLECH; 2nd, Dr. RAMBAUT BICTON (gr. Mr. Jones). *White Muscats*: 1st, Lord HARLECH, with Muscat of Alexandria; 2nd, Capt. HEYWOOD-LONSDALE, (gr. Mr. J. Mills), with the same variety. *Any white Grape, Muscat of Alexandria excluded*.—1st, Lord HARLECH, with Foster's Seedling.

OTHER KINDS OF FRUITS.

Peaches.—These fruits and Nectarines were shown in first-rate examples. The 1st prize for eight Peaches was won by Lady HENRY SOMERSET, who showed Bellegarde. 2nd, Mr. S. BARKER, with extra-fine fruits of Belle de Doné; 3rd, A. HERBER PERCY, Esq., Hodnet Hall (gr. Mr. Catt). There were 13 exhibits in this class.

Nectarines.—There were 12 exhibits of eight Nectarines, and the best fruits were the variety Pineapple, shown by Lady HENRY SOMERSET; 2nd, Executors of Lady ASHBURTON, Romsey (gr. Mr. Hall); 3rd, the Marquis of NORTHAMPTON, Castle Ashby (gr. Mr. A. R. Searle).

Apricots.—Of 10 exhibits of Apricots, the best was shown by Mr. A. LANGSTON, Wychbold, who had the variety Large Early; 2nd, Capt. HEYWOOD-LONSDALE; 3rd, Major A. H. O. LLOYD, Seaton Knolls (gr. Mr. Pritchard).

Melons.—There were 14 green-fleshed Melons, the best fruit being shown by the Marquis of NORTHAMPTON. There were 15 scarlet-fleshed fruits, and the 1st prize was gained by Lord BELPER with "The Manchester." The best fruit amongst 14 white-fleshed Melons was shown by Mrs. F. ALDERSON, Welsh Frankton (gr. Mr. Davies).

Gage Plums.—Among seven exhibits of Gage Plums, 12 fruits to a dish, the best was from the Marquis of NORTHAMPTON, who showed Jefferson; 2nd, Duke of WESTMINSTER.

Purple or red Plums.—The Marquis of NORTHAMPTON won the 1st prize with the variety Kirke's, and the Duke of WESTMINSTER the 2nd prize.

Cherries.—The best Cherries were shown by Col. FRANCE HAYHURST.

Six dishes of hardy fruits.—This class was confined to Shropshire exhibitors. Capt. HEYWOOD-LONSDALE won the 1st prize in this class, showing red and white Currants, Cherries, Gooseberries, Loganberries, and Apples; 2nd, A. HERBER PERCY, Esq.

GROUPS OF PLANTS.

The competition in the class for a group of miscellaneous fine foliage plants, in or out of bloom, occupying a space of 250 square feet, was as keen as usual, and the high quality of the exhibits was fully maintained. There were four exhibits. Messrs. JAMES CYPHER & SONS, Cheltenham, gained the 1st prize for a very fine group of choice and well-grown plants. Occupying prominent positions were some choice Orchids, such as Cattleyas, Lelias, Oncidiums, Vandas, Odontoglossums and Disas. These, together with well-coloured *Cedruus*, a fine *Kentia Forsteriana*, and 1 *Lilium*, were very effectively arranged. The whole forming a pleasing group.

Sir G. H. KENDRICK (gr. Mr. J. V. Macdonald) was awarded the 2nd prize for a group in which the outstanding features were some well-grown *Codiaeums* and spikes of *Phakenopsis amabilis*. *Nandina domestica* was used very effectively in the foreground, and a pleasing background was surmounted by a fine *Phoenix Palm*. The 3rd prize went to Mr. W. VAUSE, Leamington. Prominent among this group were specimens of *Isora Duffii*, graceful sprays of *Oncidium* and *Lilium speciosum*. An extra prize was awarded to Mr. W. R. MANNING, Dudley, for a lightly-arranged group, surmounted by a fine plant of *Kentia Forsteriana*. This exhibitor made a free use of *Francoa ramosa*, and the group also contained Cattleyas, Lelias, *Odontoglossums*, and other varieties.

A NEW CLASS.

A new class was provided for a display of indoor and hardy flowering plants and flowers (cut and growing), the whole to occupy a space of 250 square feet. The cut flowers were to be arranged with any kind of foliage and by the aid of arches, stands, hanging baskets, bamboo devices, fitted with tubes or other receptacles for holding water, all at the discretion of the exhibitor. Foliage plants (not Evergreens) were allowed in the display. Flowers grown from Bulbs were also allowed. In awarding the prizes the judges were to take into consideration the quality of the plants and flowers, and the general effect of the exhibit.

This class brought four competitors, the exhibits showing considerable diversity in detail and in arrangement. As a new class, it may be declared a success, the plants showing good cultural skill and the groups artistic arrangement. Plants in this class were limited to those grown in pots, not exceeding 10 inches in diameter.

Messrs. CYPHER & SONS won the 1st prize. At the summit of their exhibit was a good *Kentia Palm* some 10 feet in height, which added to the general effect. Generally speaking, the arrangement was after the style of the premier group in the previous class.

The cut flowers gave a uniform colour effect to the whole, and the plants in the vases being conspicuous. The covering plants used Orchids, pre-eminently the variety Cattleyas, Laelias, Dosa grandiflora, Odontoglossums and Oncidiums. *Fragaria vesicaria* was also displayed to good advantage. In the background Liliums and cut Carnations stood out well, whilst the Dutch Iris were blended into the other subjects with much effect. Brightly coloured Cuttings, notably the pendulous and broad leaved varieties, with *Alcornoque* terminalia and *Caladium argenteum*, all added to the attractiveness of the group. One fine plant of *Papyrus antiquorum* was afforded a prominent place. Along the front edging were several specimens of *Netteta depressa*, with plants of Lily of the Valley and a few very fine plants of *Nandina domestica*. The arrangement consisted of three arches, as previously mentioned. It was, in many instances,

by a richness of colouring and general bright character. The finish in both the 1st and 2nd prize groups was all that could be desired. Messrs. ARDINGHLE & SONS, of Sheffield, who were awarded the 3rd prize, had a distinct arrangement, in which cut flowers greatly predominated. The background was too upright and formal, forming, so to speak, a wall or screen, from which were suspended five baskets of Carnations, two of scarlet and three of pink varieties. The group work consisted of a water design, with a miniature bridge, with Water Lilies floating in the water, and on the bank there were several examples of *Arundinaria Falconeri*. Carnations were used towards the front too freely in stands of pyramidal form, and there were also two suspended baskets of a white variety. The weak point in this group was a lack of finish throughout. The background was surmounted by an in-

Mr. W. VAUSE, with similar kinds; 3rd, Mr. SWANN, Halston Hall (gr. Mr. C. Roberts), with greater variety. There were four entries in the class for 12 stove and greenhouse plants in 10-inch pots. Lord HARLECH, Brogyntyn (gr. Mr. T. Lambert), and Mr. MANNING having a close contest for the 1st prize, which was given in favour of Lord HARLECH. He had neat, well-flowered examples of *Clerodendron Balfourii*, *Allamanda Hendersonii*, *Rondeletia speciosa*, *Ixora Duffii*, and various *Codiaeums* and *Dracaenas*. Lord HARLECH led for six stove and greenhouse plants, his *Gloriosa superba* being well flowered; 2nd, Mr. J. FARRANT, Cleveland, Shrewsbury. In the class for a group of miscellaneous plants, in or out of bloom, occupying an area of 100 square feet, restricted to exhibitors in the county of Shropshire, there were two displays.

THE SHREWSBURY SHOW.

FIG. 55.—PORTION OF MESSRS. DUFFIE AND CO.'S EXHIBIT.

differing in size, the cut flowers from the first group were all in the same class, and arranged in a similar manner. The 2nd prize was awarded to Messrs. E. KINRIE, HILTON, gr. Mr. J. V. M. J. The arrangement was very attractive, but the work was not so well finished as the 1st prize group. In the class for 12 miscellaneous plants in 10-inch pots, Lord HARLECH showed best of three in the class for 12 miscellaneous pot plants. The 1st prize was awarded to Mrs. SWANN, Halston Hall (gr. Mr. C. Roberts), for a moderate display that needed brighter flowers. Lord HARLECH showed best of three in the class for 12 miscellaneous pot plants.

The 1st prize was awarded to Mrs. SWANN, Halston Hall (gr. Mr. C. Roberts), for a moderate display that needed brighter flowers. Lord HARLECH showed best of three in the class for 12 miscellaneous pot plants. The 1st prize was awarded to Mrs. SWANN, Halston Hall (gr. Mr. C. Roberts), for a moderate display that needed brighter flowers. Lord HARLECH showed best of three in the class for 12 miscellaneous pot plants.

conspicuous example of a light Palm. Had it been crowned with light, pendulous Bamboos, it would have been far better. Mr. W. VAUSE was awarded the 4th prize. The foreground of his group was good, but the background was not sufficiently definite in arrangement. It would add greatly to the interest of the exhibitors in the future, to see a similar class, well being arranged as to face all ways. To make this class really effective, more space is needed. Messrs. CYPHER & SONS again excelled in the class for 12 stove and greenhouse plants in pots 10 inches in diameter. Besides *Statice*, *Rondeletia*, *Clerodendron* and *Ixora*, they had neat examples of *Alcornoque intermedia*, *Aralypha hispidula*, *Schubertia*, *Dracena Sanderiana*, *Allamanda Williamsii*, and *Davallia p. lantha*; 2nd,

SPECIMEN PLANTS.

The large-trained specimen plants made a notable feature in the plant tent. There were three exhibits of 15 stove and greenhouse plants in bloom. Messrs. JAS. CYPHER & SONS, Cheltenham, had no difficulty in winning the 1st prize, showing by far the choicest and largest specimens. They had superb plants of *Statice procusa* and *S. intermedia*; also *Rondeletia speciosa*, *Ixora Shawii*, *I. Duffii*, *Clerodendron Balfourii*, a large plant of *Codiaeum Countess*, and others; 2nd, Mr. W. VAUSE, Leamington, whose

best examples were *Rondeletia speciosa* major and *Erica amula*; 3rd, Mr. W. R. MANNING, Dudley.

Messrs. CYPHER & SONS also led in the class for six specimens, their *Statives* being again of large proportions and well bloomed. *Anamanda* was also shown finely; 2nd, Mr. W. VAUGHAN.

LORD HARTELL easily beat his two rivals in the class for six *Dracenas*, being followed by E. VAUGHTON, Esq.

There were two exhibits of six *Caladiums* and both were good. Mr. VAUGHTON was placed 1st for compact, well-coloured specimens; 2nd, J. STONE Esq., Roby, Liverpool (gr. Mr. D. McKelvie).

In the class for four exotic Ferns, there were four competitors. E. VAUGHTON, Esq., Handsworth (gr. Mr. C. Kelland), being awarded the 1st prize, having the largest plants, principally tree Ferns—*Dicksonias*; 2nd, Capt. HEYWOOD

as a magnificent one, and they well merited the 1st prize which was awarded them. In the centre were magnificent blue plants of the new variety *Lady Tweedmouth*, and the plants being pleased to exhibit. There were also plants of *Duchess of Cornwall* and *King of Mines* (scarlet). Mrs. Peter Jones exhibited Miss Ethel Gill, pale salmon, an exquisite shade and a grand blue variety, *Lady Ferris*, white, W. Sparholt, yellow, and W. Marshall, scarlet.

Some good *Begonias* were seen in the class for six plants in equal numbers of single and double varieties. Messrs. BLACKMORE & LANGDON were the 1st prize, having grandly bloomed plants including *Mme. Clara Butt*, *Lutches*, *Edith*, *Mr. William*, and unnamed single; 2nd, J. HAMMOND, Esq., 39, Castle Street, Shrewsbury, with smaller blooms, but well-grown plants.

and Mr. King Edward are a few of the best seen. 2nd, Messrs. M. CAMPBELL & SON, High Brompton, with a good display from Mr. A. R. BURNETT, King's Norton.

In a class for a smaller collection of *Begonias* four single varieties were exhibited. Mr. C. ALLEN, High Leigh, was the 1st prize, having the largest plants. The new variety named after Edith Waters was the best seen. *Begonia* was unequalled as a single, whilst *Edith* was as good as ever.

Mr. C. H. HERBERT, Acock's Green, Birmingham,

THE SHREWSBURY SHOW.

FIG. 56.—MESSRS. WEBB AND SON'S NON-COMPETITIVE EXHIBIT, AS ARRANGED IN THE FRILL TENT.

LONSDALE, Shavington Hall (gr. Mr. J. Mills); 3rd, Mr. W. R. MANNING, Dudley.

Four *Fuchsias* were best shown by Mrs. JOWETT, Huyton, Liverpool (gr. Mr. E. Bridger), in a class represented by moderately good plants; 2nd, G. MITCHELL, Esq., Belle Vue (gr. Mr. J. Howells). There were seven exhibits in this class.

Mrs. JOWETT also led for six double-flowered *Pelargoniums*, and R. TAYLOR, Esq., Abbey Foregate (gr. Mr. H. Clift), excelled in the similar class for single varieties, and was placed 1st in the local classes for three double-flowered and three single-flowered *Pelargoniums*.

Messrs. BLACKMORE & LANGDON, Bath, had no competitors in the class for a group of tuberous-rooted *Begonias* in pots, occupying a space of 15 feet by 4 feet. Their group, however,

Mr. HAMMOND led in the local class for *Begonias*, in competition with four other exhibitors, the other displays being only in *Geraniums*.

Gloxinias were poor. There were three exhibits in the class for 12 plants, shown by FARRANT, E. BENEY Esq., Rayham, Dublin (gr. Mr. T. Cave), and G. BURR, Esq., Oatlands (gr. Mr. A. Jones), who won prizes in the name of their names.

CARNATIENS.

Mr. C. H. HERBERT, Acock's Green, Birmingham, showed grandly in the class for a collection of *Carnations*, the blooms being of good quality, but staged less attractively. He exhibited large specimens and a few small, single variety, including *White*, *Queen of the South*, *Blond*, with the *erogias*, *De la Reine*, *Goldfinch*, *Azures*, *Surrey*, *St. Germain*, *Holly*

ham, was placed 1st for 12 vases of *Carnations* and *Poinsettias*.

ROSES.

Some good *Roses* were seen in the class for a collection of flowers in an area of 6 feet by 4 feet. Four exhibitors competed, and the groups being adjacent to each other, they made a show of blooms. The 1st prize was awarded to Messrs. GUNN & SONS, Oldham, the 2nd to Mr. M. BRATLEY, Peterborough, and the 3rd to Messrs. STEPHEN TREVEYER & SONS, Cardiff. The plants in the premier stand were *White*, *Queen of the South*, *Blond*, *De la Reine*, *Goldfinch*, *Azures*, *Surrey*, *St. Germain*, *Hollyham*, *White*, *Queen of the South*, *Blond*, *De la Reine*, *Goldfinch*, *Azures*, *Surrey*, *St. Germain*, *Hollyham*.

Messrs. ALLEN, High Leigh, Shrewsbury, exhibited in the class for 12 vases of *Carnations*

GARDNER

John Stuart Mills, Ulrich Brummer, Brilliant (a grand bloom), Mme. Eugene Verdier, W. E. Lippiatt, Leslie Holland, Bessie Brown, Mrs. Stewart Clark, Her Majesty and Capt. Hayward, of outstanding quality; 2nd, Mr. HUGH DICKSON, Belfast.

These firms reversed positions in the class for 13 blooms, distinct, Mr. HUGH DICKSON's collection embracing notable specimens of W. E. Lippiatt, Caroline Testout, Hugh Dickson, Lyon Rose, Star of Waltham, George Laing Paul, and Chas. Lefebvre.

SWEET PEAS.

The largest class for Sweet Peas was for 18 distinct varieties. The 1st prize included the Eckford Challenge Cup, valued at 25 guineas. There were nine entries, but three were disqualified as not being in accordance with the conditions of the schedule. One of these exhibitors showed Rosie Adams and Minnie Christie mixed; another had a vase of Apple Blossom Spencer mixed with a different sort, whilst the third showed Tom Bolton and Bluebell together. Mr. J. HAYCOCKS, Wrexham, is to be specially commiserated for his oversight, as his flowers were a grand lot. The 1st prize was won by Mr. T. JONES, Raabon, who showed superbly. He had Dazzler, Queen of Norway, Sycra Lee, Mrs. C. Foster, Audrey Crier, Mrs. C. W. Breadmore, Marjorie Linzee, Earl Spencer, Clara Curtis, George Stark, Etta Dyke, The King, Mrs. H. DICKSON, Minnie Christie, Elsie Herbert, Mrs. H. SYKES, Tom Bolton, and John Ingman. 2nd, G. H. F. ROBERTSON, Esq., Gresford (gr. Mr. E. Jones), with George Herbert (very fine), Mrs. H. SYKES, Helen Lewis, Mrs. Rutzahn Spencer, Nancy Perkin, Etta Dyke, and others. 3rd, Mr. J. FLETCHER, Auchenheath, Lanark.

In the class for 12 varieties, distinct, there was good competition amongst seven exhibitors; one exhibit was disqualified. A fine exhibit put up by Mr. R. HALLAM, Radcliffe-on-Trent, was placed 1st, the colours being bright and the spikes and blooms large. The varieties were Mrs. W. J. UNWIN, Nellie Jenkins, Paradise Ivory, Tomant Spencer, Elsie Herbert, Edna Unwin, Nora Unwin, Evelyn Hemus, King Edward (Spencer), Constance Oliver, Mrs. Harcastle Sykes, and Helen Lewis. 2nd, Mr. F. J. HARRISON, Ulverston, with smaller but refined flowers, Countess Spencer, Constance Oliver, Elsie Herbert, and Sunproof Crimson being some of the choicest.

No fewer than 15 competed in the class for six varieties, distinct, the premier stand being shown by Mr. J. H. EMMETT, Earlestown, Warrington. The varieties were Maggie Stank, Mrs. Rutzahn, Nora Unwin, Asta Ohn, Mrs. C. W. Breadmore, and Olive Ruffell, the last-named resembling Constance Oliver. 2nd, Mr. F. J. HARRISON, Ulverston, with Etta Dyke, Marjorie Willis, Asta Ohn, Paradise Ivory, Evelyn Hemus, and King Edward (Spencer). 3rd, Mr. E. H. SHORTING, The Lawns, Broseley.

Dinner tables decorated with Sweet Peas were very numerous, but the displays were in most cases replicas of each other, pink Sweet Peas and trails of Selaginella being employed in nearly every case. The 1st prize was won by Miss JONES, Wem, who arranged Audrey Crier, with a few coloured leaves of Ampelopsis, sprays of Selaginella, and Asparagus.

ARRANGEMENTS OF CUT FLOWERS.

There is always much interest in the florists' exhibits at Shrewsbury, and this interest is well founded, for the exhibits are quite above the commonplace at exhibitions. We can only refer briefly to some of the more interesting features. The first class was for one bride's bouquet and two bridesmaids' bouquets, their arrangement to be limited to a space of 3 feet 6 inches frontage by 4 feet, 6 inches width. The 1st prize was awarded to Mr. J. KNIGHT, nurseryman, Wolverhampton, whose bride's bouquet was composed of Odontoglossums and Lily of the Valley, and the bridesmaids' bouquets of pink Carnations; 2nd, Mr. W. J. GARDNER; 3rd, THE KING'S ACRE NURSERY CO., Hereford.

The best bride's bouquet was shown by Mr. W. J. GARDNER, and it was composed of mixed Orchids, such as Odontoglossums, Phalenopsis, white Cattleyas, and Cypripediums; 2nd, Mr. ADSHEAD; 3rd, MESSRS. BOTTOMLEY & BURTON, Elland, Yorkshire.

Mr. ADSHEAD had the best hand bouquet in a beautiful arrangement of Orchids; 2nd, Mr.

W. J. GARDNER; 3rd, THE KING'S ACRE NURSERY CO. In a similar class, from which Orchids were excluded, the 1st prize was gained by Mr. W. J. GARDNER, who employed Gloriosa in several species; 2nd, Mr. ADSHEAD, with an arrangement of yellow Roses. Mr. W. J. GARDNER had the best featherweight bouquet, and THE KING'S ACRE NURSERIES were awarded the 2nd prize in this class. Mr. W. J. GARDNER had the best basket of cut flowers, and THE KING'S ACRE NURSERIES the best hand basket of cut flowers (Orchids excluded). In the class for a stand of cut flowers for table decorations, not to exceed 18 inches in diameter at the base, the best exhibitor was Mr. W. GARDNER, Altrincham and Hale, who employed Gloriosa superba. Mrs. B. VERNON, Bowden, who was placed 2nd, showed an arrangement of mixed Gloriosas, Anthuriums, Françoas, &c.

HARDY FLOWERS.

The class for a collection of perennial flowers on spaces 10 feet 6 inches frontage, brought forth a very magnificent bank of the best hardy flowers now in season. The exhibits were arranged in the big fruit tent, and during most of the day a very good light fell upon the flowers, which produced an effect of floral splendour seldom equalled. There were seven collections, and some of these were almost of equal value, so fine were the selections. The 1st prize, however, was awarded to Messrs. GUNN & SONS, Olton, Birmingham, whose display was remarkable for the beauty of outline and the pleasing tones that appealed to the eye as the visitor approached the exhibit. The centre was characterised by a first-class bunch of the rich purple *Allium descensum*, which had a very fine effect. *Campanula pyramidalis*, *Lilium anatium*, *Chrysanthemum maximum*, *Montbretia Germania* were a few of the principal features. 2nd, Mr. F. BARNES, Frome, Somerset; 3rd, MESSRS. HARKNESS & SON, Bedale, Yorkshire; 4th, MESSRS. WM. ARTINDALE & SON, Sheffield. The other exhibitors were MESSRS. GIBSON, Bedale, and Mr. R. T. WEST, Llandaff.

There were also some good collections in the class for 18 bunches in not fewer than 12 varieties. Messrs. W. ARTINDALE & SON, won the 1st prize, notable bunches being *Silene laciniata*, *Phlox Sylphide*, *Scabiosa caucasica*, *Chrysanthemum maximum*, *Astilbe Davidii*, and a red *Gladiolus*. 2nd, F. BORSKELL, Esq., Market Bosworth (gr. Mr. G. Hollis).

A keen competition resulted in the class for 12 bunches, F. ALDERSON, Esq., Welsh Frampton (gr. Mr. G. Davis), being awarded the 1st prize, and Mr. BORSKELL the 2nd prize.

An outstanding collection of *Gladioli* was seen in the class for 24 varieties of this border flower. The exhibitors were Messrs. G. MAIR & SON, Prestwick, N.B., and the 1st prize was given them. Especially good were *Triomphe de Caen* (white), *Gargantua* (rosy-carmine), *Dr. Olmsted* (red and white), *Rajah* (yellow, tipped with rose), and *Amiral Corvera* (rosy-buff).

Although out-of-season, *Chrysanthemums* were seen in fine form, especially the winning stand in the class for 12 early-blooming varieties, shown by Mr. W. A. BALLARD, Leicester, such sorts as *Nina Blick*, *Soleil d'Octobre*, and Mme. Desgrange being as fine as they are seen in October.

There were eight exhibits in the class for 12 bunches of annuals, and the variety of subjects was most pleasing. There could be no two opinions as to the finest group, the exhibitor being A. E. HUMPHREYS OWEN, Esq., Berriew (gr. Mr. O. Oakley), whose flowers included *Lavatera alba*, *Godetia Schaminii*, *Cacalia coccinea*, a fine, scarlet flower; *Zinnia elegans*, *Salpiglossis*, of superb quality; *Stocks*, *Calliopsis nigra speciosa*, and *Marigold Orange King*. 2nd, W. H. BANKS, Esq., Kington (gr. Mr. G. H. Bamfield).

The exhibits in the class for a collection of Cactus or decorative Dahlias, or both, on a frontage for each exhibit of 8 feet 6 inches, were staged in the big fruit tent. There were four exhibits, and the 1st prize was awarded to Messrs. KEYNES, WILLIAMS & CO., Salisbury, who staged a very effective exhibit that gained a good deal of its merit from the inclusion of a considerable number of first-class seedlings; 2nd, Mr. W. CAMPBELL, High Blantyre; 3rd, Mr. J. KNIGHT, Wolverhampton.

Mr. JOHN SMELLIE, Busby, Glasgow, was well to the fore in the class for 24 blooms of Show or Fancy Dahlias, having large, clean, even-

sized, well-coloured blooms of popular sorts; 2nd, Messrs. W. CAMPBELL & SON, High Blantyre.

Equally good were the Cactus-flowered varieties shown by MESSRS. KEYNES, WILLIAMS & CO., Salisbury, their blooms being the finest Dahlias of this type in the show. MESSRS. BOTTOMLEY & BURTON, Elland, Yorkshire, won the 2nd prize, having larger but less refined flowers.

Mr. H. PEERMAN, Nantwich, showed best in the classes for Dahlias, from which trade growers were excluded.

VEGETABLES.

The Society's class was for 12 dishes, and the prizes offered were £10, £7, £4 and £2—a total of £23. This class brought but four entries. The Hon. VICARY GIBBS, Elstree (gr. Mr. E. Beckett), showed in his usual fine style, and was an easy 1st prize winner with superb samples. He had Onions, Celery, Leeks, Tomatos, Peas, Potatos, Turnips, Cucumbers, Carrots, Cauliflowers, Runner Beans, and Parsnips. Mr. J. HUDSON, Leicester, was placed 2nd, having good Potatos, Celery, Tomatos, Peas, Runner Beans, Cauliflowers, and Onions. 3rd, Sir T. HESKETH, Bart., Towcester.

The trade classes for vegetables, which were dropped last year, again found a place in the schedule. On this occasion the number of entries in the respective classes generally were satisfactory, and the finest vegetables in the show were found in these classes.

Messrs. Sutton & Sons' prizes.—These numbered six, and were of the total value of £25 4s. The class was for a collection of nine dishes. The 1st prize was won by the Duke of PORTLAND, Welbeck Abbey (gr. Mr. J. Gibson), whose exhibits were of exceptionally high quality. The subjects comprised Cauliflowers, Pink Celery, Prizetaker Leeks, Supreme Potatos, Al Runner Beans, Eclipse Tomatos, Centenary Peas, Ailsa Craig Onions, and new Intermediate Carrots. Mr. J. HUDSON, Leicester, was placed 2nd, having excellent Tomatos, Onions, Potatos and Peas; 3rd, Captain HEYWOOD-LONSDALE, Shavington Hall (gr. Mr. Mills); the Misses HOWELL, Berriew, were placed 4th. There were 10 collections in all.

Messrs. Webb & Sons' prizes.—There were seven of these, of the total value of £18 10s., there being four entries. The Hon. VICARY GIBBS, Aldenham House, Herts. (gr. Mr. E. Beckett) was placed 1st for a superb lot such as was worthy of that famous grower's high reputation. The collection of nine dishes comprised Early Mammoth Cauliflowers, Champion Leeks, Webb's White Celery, Sensation Tomatos, Exhibition Runner Beans, Quite Content Peas, Bountiful Potatos, Ailsa Craig Onions, and Prizewinner Carrots. 2nd, Mr. J. HUDSON, with capital Potatos, Carrots, Cauliflowers and Peas. Sir T. F. HESKETH, Bart., Towcester (gr. Mr. Hallatt), was placed 3rd, and Mr. W. C. GERMAN, Wellington, 4th.

Messrs. Tibbans' prizes.—There were three in number, of the total value of £18. The class brought only three entries. The Marquis of NORTHAMPTON, Castle Ashby (gr. Mr. A. R. Searle), was well 1st, having excellent produce, including Cauliflowers, Leeks, Celery, Peas, Carrots, Tomatos, Potatos, Round Beets, Parsnips, Marrows, Onions, and Runner Beans; 2nd, H. TATHAM, Esq., Kendall Hall (gr. Mr. Gaiger), who had excellent samples; 3rd, A. E. HUMPHREYS OWEN, Esq. (gr. Mr. Oakley).

Messrs. Jas. Carter & Co.'s prizes.—This firm offered six prizes of the total value of £17 10s.; unfortunately, there were only two entries. Mr. GAIGER was awarded the 1st prize for excellent Celery, Cauliflowers, Peas, Tomatos (Duke of York), Intermediate Carrots, Ailsa Craig Onions, and fine giant pink Celery; 2nd, Mr. E. DEARIN, Hale Hall.

Messrs. Robert Sydenham's, Ltd., prizes.—These numbered five, being of a total value of £15 10s. The class was for collections of eight dishes. Mr. W. JONES, Newtown, was easily 1st, with fine Cauliflowers, White Celery, Leeks, Excelsior Onions, Ne Plus Ultra Runner Beans, Duke of Albany Peas, Scarlet Intermediate Carrots, and Windsor Castle Potatos; 2nd, Mr. E. DEARIN; 3rd, the Rev. J. DAVIES, Stackpole Rectory; and 4th, Lord WILLOUGHBY DE BROKE, Compton Verney. There were five entries in Messrs. Sydenham's class.

Mr. E. Murrell's prizes.—This nurseryman offered seven prizes, in two classes, of the total amount of £13 10s.—one for a collection of nine dishes; the other for six dishes. In the larger class, Mr. H. PUGH, Newtown, was placed 1st, having choice Celery, Carrots, Cauliflowers, Tomatos, and Potatos; 2nd, C. LOGAN, Esq., Wellington; 3rd, Mr. S. SCOTT, Betton Grange. In the class for six dishes, Mr. T. SANDERSON, Wellington, was 1st, having capital examples.

NON-COMPETITIVE EXHIBITS.

Messrs. JAS. VEITCH & SONS, LTD., Chelsea, showed a group of stove foliage plants, relieved with clumps of flowering subjects, in the centre being a bank of Orchids. Nepenthes on tall stands served to break the contour of the group, these plants being of grand quality. In the body of the group were imposing specimens of Heliconia illustris, Maranta Veitchii, Tillandsia Massangeana, Dracena Brantii, D. Victoria, D. Sanderiana, numerous Codiaums, and other choice foliage subjects, all of superb quality, and disposed in the most effective manner.

Messrs. JOHN PEED & SON, West Norwood, set up a group of Caladiums, relieved with Adiantum Ferns. It was arranged as a bank around one of the tent poles, the top being crowned with Palms. The foliage was not especially large, but the colours were intense, notable examples being Golden King, Duke of Teck, Alexander III., C. E. Able, fastuosum, Mrs. Cresswell, and Mme. J. R. Box.

Messrs. WM. ARTINDALE & SON, Nether Green, Sheffield, had a pretty variety of the scarlet Silene laciniata, named "Purpurea."

A selection of choice Roses was displayed by Messrs. ALEX. DICKSON & SONS, LTD., Newtownards, the blooms being marvellously fresh. Lyon Rose, Dean Hole, Mrs. David Jardine, Mrs. Charles C. Harrison, bright rose; Harry Kirk, Nita Weldon, and Gloire de Chidane Guineuse are a few of the best in the exhibit.

Messrs. HOBBIES, LTD., Dereham, Norfolk, had a semi-circular group of Roses arranged in one of the recesses in the large fruit tent. There were a few weeping standards in pots, and cut blooms of most types of Roses. In another portion of the same tent Messrs. HOBBIES had a pretty exhibit of Dahlias, varieties of the Cactus and Pæony-flowered types being alone represented. Some of the Pæony-flowered sorts, as King Leopold and Merveille, were very pretty.

Mr. EDWIN MURRELL, Nurseryman, Shrewsbury, showed a collection of Roses, herbaceous Phlox, Violas, &c.

Messrs. WM. CUTBUSH & SON, Highgate, London, N., and Barnet, Herts, showed a fine group of Carnations, Roses, Coleus, and a few stove plants.

Messrs. H. B. MAY & SONS, The Nurseries, Edmonton, staged a collection of greenhouse Ferns, also crested and plumose varieties of British species. The beautiful Nephrolepis exaltata var. Marshallii, the most attractive of its class, was shown well, also Pteris luedens, with large, sagittate fronds.

Mr. H. N. ELLISON, West Bromwich, also showed Ferns in many varieties.

Mr. WM. ANGUS, Penicuik, showed plants of Disa grandiflora and blooms of Chrysanthemum maximum.

Messrs. SUTTON & SONS, Reading, showed a miscellaneous exhibit (see fig. 54), which illustrated many of the specialities of this firm. There were excellent Parsnips, Carrots, Cauliflowers, Turnips, Leeks, Cucumbers, Tomatos, Runner and French Beans, Peas, Melons, and other produce. These exhibits were interspersed with such flowers as Gladioli, Liliums, Gaillardias, Sweet Peas, and Montbretias, the general effect being exceedingly good.

Messrs. WEBB & SON, Wordsley, Staffordshire, were represented by a miscellaneous exhibit, in which fruits, flowers and vegetables were intermixed to produce a good effect (see fig. 56). There were Melons, Tomatos, Cucumbers, Beans, Peas, Carrots, Parsnips, Potatos, Beets, Cauliflowers, and Onions. The flowers included Sweet Peas, Carnations, Lilies, and Astilbes.

A fine group of fruits, flowers, and vegetables was exhibited by Messrs. DICKSON & ROBINSON, Manchester, Tomatos, Cucumbers, Dahlias, Carnations, Liliums, Antirrhinums, Chrysanthemums, Phloxes, and numerous others being shown finely.

Messrs. YOUNG & CO., Hatherley, Cheltenham, exhibited a group of Carnations, well grown and shown.

A large assortment of Roses was displayed by Messrs. W. & J. BROWN, Peterborough, and another group of these flowers was shown by Messrs. JARMAN & CO., Chard, who had also Sweet Peas, Pelargoniums, Dahlias, Centaureas, Apples, and a few vegetables.

Messrs. DOBBIE & CO., Edinburgh, showed a group of Sweet Peas, which consisted of the best varieties in commerce, and a few seedlings. In addition to the Peas, this firm showed a beautiful arrangement of new varieties of Cosmos, Scabious, and Antirrhinums. Messrs. DOBBIE seldom stage an exhibit that does not contain any Potato; on this occasion there were 30 dishes of excellent tubers of selected varieties (see fig. 55).

Immediately on entering the large group tent, the eye rested on a very elaborate arrangement of Sweet Peas, exhibited by Messrs. JONES & SONS, LTD., Shrewsbury. Pillars on the exterior of the exhibit were decorated with climbing Roses, and connecting these pillars were festoons of Sweet Peas, whilst underneath, a very gorgeous effect was produced by a groundwork of Sweet Peas and Carnations.

In the tent devoted to Sweet Peas trade displays of these flowers were made by Mr. ROBERT BOLTON, Wotton, Carnforth; Mr. H. ICKFORD, Wem; and HUGH ALDERSEY, Esq., Alderley Hall (cf. Mr. T. Pearson).

Messrs. ROBERT SYDENHAM, LTD., Birmingham, also made a pretty exhibit of Sweet Peas in metal stands, and other exhibitors of these flowers were Messrs. W. H. SIMPSON & SONS, Birmingham; Messrs. ISAAC HOUSE & SON, Westbury-on-Trym; Mr. J. STEVENSON, Wimborne; Mr. C. BREADMORE, Winchester.

Mr. A. W. THORPE, Lichfield, showed early flowering varieties of Chrysanthemum, including several novelties. Mr. AMOS PERRY, Enfield, had banks of dark and light blue Delphiniums, with a background of Artemisia lactiflora, and in the centre a pool with Nymphaeas. The Delphiniums were remarkably fine.

Messrs. KELWAY & SON, Langport, Somerset, showed superb spikes of Gladioli, having 200 varieties. Snowdon is a new white variety of much merit.

Mr. W. L. PATTISON, Shrewsbury, contributed an exhibit of Violas.

Mr. ALBERT MYERS, Sutton Lane Nurseries, Shrewsbury, had a very bright exhibit of Zonal Pelargoniums, with a few plants of Coleus at the back.

Messrs. DICKSONS, LTD., Chester, showed a good collection of hardy flowers arranged in the form of a bank in the fruit tent. This miscellaneous collection had at its side an exhibit of Sweet Peas contributed by the same firm. The Pea flowers were excellent in colour and size.

Messrs. ISAAC HOUSE & SON, Coombe Nurseries, Westbury-on-Trym, showed a group of hardy flowers, in which many pretty varieties of Pyrethrum were shown in excellent condition, together with other kinds, particularly Delphiniums and Pentstemons.

An extensive exhibit of hardy plants from Messrs. BAKERS, Wolverhampton, contained a very small water-garden in the centre, decorated with Nymphaeas in flower, and a few bog plants. Crinum Powellii and the variety alba, Rudbeckia Golden Glow, varieties of herbaceous Phlox and a considerable collection of Sweet Peas were noticed amongst the hardy flowers. Messrs. BAKERS also showed varieties of the Pæony-flowered Dahlia as a separate group.

Messrs. PRITCHARD & SONS, Shrewsbury, showed some pretty bowls of Alpines, also Ferns, Sweet Peas, Campanula isophylla, and, as a separate group, a collection of early-flowering Chrysanthemums.

Messrs. HEWITT & CO., Solihull and Birmingham, had a good display of garden flowers, including Sweet Peas, Carnations, Roses, and border perennials.

Messrs. GINN & SONS, Olton, Warwickshire, set up numerous varieties of border Phloxes, the beautiful Viola cornuta, and other hardy flowers.

Messrs. SEAGRAVE & CO., Norfolk Market Hall, Sheffield, showed Pansies and Violas, with a border of Roses, Carnations, and hardy perennials.

Messrs. JOHN FORBES, LTD., Hawick, showed their superb strain of Pentstemons, also border Phloxes, Pansies, Violas, and Carnations.

Messrs. R. WALLACE & CO., Colchester, put up a large collection of the newer Montbretias; varieties of Liliums—L. tigrinum splendens being remarkably good; Gladioli, Pyrethrums, Phloxes, and other garden flowers.

Messrs. WEBB & BRAND, Saffron Walden, showed their specialities in Hollyhocks, all of the rosette type and finely coloured.

Mr. R. F. FELTON, Florist, Hanover Square, London, showed several florist's exhibits, particularly a basket of flowers, which was specially pleasing owing to its beautiful outlines. Most of the flowers were Orchids, including Oncidium, Cattleyas, Odontoglossum and Cypripedium, but a few other flowers were intermixed, including a species of Thalictrum.

Messrs. THOS. RIVERS & SON, Sawbridgeworth, staged well-fruited pot trees of Peaches, Nectarines, Plums, Cherries, Pears, Apples, Figs and Oranges, with baskets of gathered fruits of the same, the display being finished with a drapery of greenery along the front. The Peaches were especially good, small trees of Kestrel and Peregrine in particular being well cropped. Trees of Cox's Orange Pippin Apple were also finely fruited.

The KING'S ACRE NURSERIES, LTD., Hereford, contributed a collection of fruit trees in pots quite equal to the exhibits of this nature the firm have sent to Shrewsbury for some years past. The specimens were well-cropped, healthy-looking trees. In addition, these Hereford Nurseries showed numerous Roses, Eremuri, and other hardy flowers.

Messrs. STORRIE & STORRIE, Glencarse, Perthshire, showed varieties of Gooseberries, some as pyramidal-trained pot plants. These were interspersed with Iceland Poppies of a choice strain, Coleuses, Streptocarpuses, and Celosias.

Messrs. BARR & SONS, King Street, London, had a collection of 60 dishes of vegetables, all of capital quality, including Cauliflowers, Cabbages, Cos and Cabbage Lettuces, Turnips, Peas, Marrows, Potatos, Tomatos, Carrots, Beet, Radishes, and Onions; altogether a most interesting group.

Messrs. CLIBRANS, Manchester, had a choice display in the vegetable tent, and covered a broad table with a very inclusive and attractive collection. Aldenham Pink Celery was a prominent feature, as also were the numerous Tomatos, Carrots, Peas, Runner, Butter and Dwarf Beans, Cucumbers, Turnips, Potatos, Marrows, and, not least, the fine clean examples of Widdingsstadt Green Cabbage so fine for summer use.

AWARDS OF MERIT.

Carnation "*Mrs. Angus*."—A border variety shown by Mr. WM. ANGUS, Penicuik, N.B.

Sweet Pea "*Tortoise Shell*."—Shown by HUGH ALDERSEY, Esq., Alderley Hall, Cheshire.

Cosmos "*White Queen*" and "*Scabious* (Dobbie's strain)."—Shown by DOBBIE & CO., Edinburgh.

Gladioli "*Delicata*" and "*Snowdon*."—Shown by Messrs. KELWAY & SON, Langport.

Messrs. STORRIE & STORRIE, Glencarse, N.B., received Awards of Merit for an improved strain of Coxcomb and for their Excelior strain of Iceland Poppies.

AWARDS

LARGE GOLD MEDALS.

Messrs. Jas. Veitch & Sons, Ltd., Chelsea, S.W.; Thos. Rivers & Sons, Sawbridgeworth; and King's Acre Nurseries, Ltd., Hereford.

SMALL GOLD MEDALS.

Messrs. Clibrans, Altrincham; R. Wallace & Co., Colchester; Bakers, Ltd., Wolverhampton; Kelway & Son, Langport; Hobbies, Ltd., Dereham; Sutton & Sons, Reading; Edwin Murrell, Shrewsbury; Webb & Sons, Stourbridge; Jones & Sons, Ltd., Shrewsbury; Alex. Jackson & Sons, Ltd., Newtownards, Co. Down; W. and J. Brown, Peterborough; and Robt. Bolton, Carnforth.

SILVER-GILT MEDALS.

Messrs. John Peed & Sons, Roupell Park Nurseries, S.L.; Hewitt & Co., Solihull; Gunn & Sons, Olton, Birmingham; H. N. Ellison, West Bromwich; Simpson & Son, Birmingham; Dicksons, Ltd., Chester; Isaac House & Sons, Bristol; Wm. Cutbush & Sons, Highgate, N.; Jarman & Co., Chard; Dickson and Robinson, Manchester; Young & Co., Cheltenham; Henry Ickford, Wem; Tom B. Dobbs & Co., Wolverhampton; Pritchard & Sons, Shrewsbury; and Wm. Artindale & Sons, Sheffield.

SILVER MEDALS.

Messrs. Webb & Brand, Saffron Walden; Amos Perry, Enfield; H. B. May & Sons, Edmonton; John Forbes, Ltd., Hawick; Seagrave & Co., Sheffield; Barr & Sons, Covent Garden, London; Storrie and Storrie, Glencarse, Dundee; A. W. Thorpe, Lichfield; Jobbe & Co., Edinburgh; Albert Myers, Shrewsbury; Felton & Son, Hanover Square, London, W.; J. Stevenson, Wimborne; and C. W. Breadmore, Winchester.

BRONZE MEDALS.

Messrs. Robert Sydenham, Ltd., Birmingham; Wm. Angus, Penicuik, N.B.; S. R. Crompton, Marchfield; W. L. Pattison, Shrewsbury; Hugh Aldersey, Esq., Alderley Hall, Cheshire.

ROYAL BOTANIC.

AUGUST 10.—The 71st annual meeting of the Fellows was held at Regent's Park on this date. Mr. Pembroke Stephens, K.C., occupied the chair.

In moving the adoption of the report, the chairman said that a remarkable improvement had taken place in the position of the society. That had been due to hard work on the part of the council during the last 12 months, and amongst those who had worked the hardest were some who had joined the council only recently. The number of Fellows in 1909 was 1,570, while the number now was 1,834.

Some debenture-holders had surrendered their debentures, and the council had offered them life fellowships. In June last year the debenture debt of the society was £24,234, now it was £14,714. In consequence of the surrender of the debentures the society had also saved £1,236 18s. 9d., accrued interest and a sum of £250 14s. 9d., which was an annual charge in respect of interest.

The current liabilities in 1909 were £3,050; in 1910 they were £572. In whatever aspect they looked at the society they could see solid and substantial progress. Their debt was decreasing; the members were increasing in numbers; in current debt they were paying their way, and they were still, he was thankful to say, in possession of their beautiful gardens. One gentleman had written a long letter to the council, full of criticisms and statements, and he (the speaker) would not be using too strong a word if he said mis-statements.

Preceding, the speaker announced that King George had become a patron of the society.

Mr. C. Barclay Holland seconded the motion for the adoption of the report, which was agreed to without further discussion.

The following retiring members of the council were re-elected:—Mr. A. F. G. Leveson-Gower, Captain John Sparks, Messrs. Montague Hutton, William Wallace, Ernest Callard, Sir William Dunn, M.P., Mr. James C. Marshall, and Dr. G. Granville Bantock.

LAW NOTES.

WILLIAM WOODWARD.

"Excessive interest on borrowed money, losses in crops and shortness of capital" were alleged as the causes of failure of Wm. Woodward, nurseryman, Mythop Nurseries, and 2 Clifton Square, Lytham, near Preston, who appeared for public examination at the Preston Bankruptcy Court on the 5th inst. The official receiver stated that debtor had declared that for three years prior to 1909 he was making an average profit of £500 a year, but that last year, his trading resulting in a loss, he closed down. He commenced business on his own account in 1905 with £2000 cash capital and £200 borrowed. In October, 1908, he took into partnership Mr. C. R. Barratt, who

brought into the concern £1,500. The partnership was dissolved in December, 1909, by Mr. Barratt going out, the debtor agreeing to pay him £350, and to take over all the assets and liabilities. Debtor only paid Mr. Barratt £100. The sum of £2,000 of the present liabilities was stated to be in respect of the outstanding debts of the partnership. Debtor said he paid £1,100 for the nurseries. He had borrowed money of moneylenders since the dissolution of partnership. All the borrowed money had gone into the business. There had been a loss on a Tomato crop in 1909 of £540. He had borrowed £200 to pay out his partner, but had paid him £100 and placed the balance in the business. If his assets realised what he anticipated, he would be solvent. The examination was adjourned until September 2.

Obituary.

JAMES MILLER.—The sudden death of Mr. James Miller, gardener, Irvine, took place on August 9. Mr. Miller was employed at Riversleigh House, Irvine, and left home as usual at a little before 6 o'clock in the morning. He arrived at the gardens, and he was engaged in watering at about 7 o'clock. Some time afterwards, on going into the vinery, Mrs. Brecknidge found him lying in a tank containing about 18 inches of water. Medical aid was summoned, but life was found to be extinct. Mr. Miller had for some time been subject to attacks of faintness, and it is surmised that he had been seized with one of these when drawing water from the tank. He was 65 years of age.

DANIEL SPILLANE.—Mr. Daniel Spillane, for more than 40 years gardener and superintendent for Samuel C. Lawrence, Esq., Medford, Mass., died on July 12, in his 68th year. Deceased was born in Cork, Ireland.

APHIS ON PEACH TREES: *J. P., Carlisle.* The foliage is badly infested with black aphid. Fumigations with nicotine compounds will destroy the pest.

APPLE COX'S ORANGE PIPPIN: *B. H. B.* This variety is usually most satisfactory in fruiting. We suspect the trouble is to be found in a too-luxuriant development of growth at the expense of the fruit. If this is the case, root-pruning should be done in November.

AQUILEGIAS: *T.* There is no trace of any insect or fungus parasite on the specimens sent.

BOOKS: *N. A., Lawns and Greens,* by T. W. Sanders, F.L.S., or *Lawns,* by Sutton & Sons, Reading, will be suitable for your purpose. Either work can be obtained from our publishing department. Price 1s. 2d. each, free by post.

CELERY: *J. S.* The Celery leaves are attacked by the fungus *Septoria Petroselinii* var. *apii*. In some seasons this is a serious disease, causing withering or "scorching" of the foliage. Spraying with Bordeaux mixture (4 lbs. bluestone, 4 lbs. quicklime, 50 gallons water), if carried out *before* the damage has been done, will save the foliage, and is quite safe to use.

COLOGYNE CRISTATA: *T. B., Skipton.* This Orchid usually flowers from the axis of the young growths before the pseudo-bulbs are formed, but occasionally the inflorescence is produced at the top of the pseudo-bulb. We have seen plants of *Cologyne cristata* with the inflorescence at the apex of a fully-formed pseudo-bulb; and this sometimes occurs in *Odontoglossum crispum*.

CYANIDING MACHINE: *J. W.* The cyaniding machine illustrated in the *Gardeners' Chronicle*, March 31, 1906, p. 202, is made by Mr. F. C. Edwards, 12-15, Warehouse Hill, Leeds, who is the patentee.

GRAPES DISEASED: *Sussex and W. J. M., Isleworth.* The berries are affected with "spot" disease. Spray the bunches with liver of sulphur at the rate of one ½-ounce in two gallons of water, after first removing the diseased

fruits. Do not allow any of the specific to wet the paint on the woodwork, as it will cause it to turn black.

JACOBINIA CARNEA: *S. F. and S.* This greenhouse plant belongs to the natural order Acanthaceae, which includes a number of excellent genera for greenhouse and stove decoration that meet with but little appreciation in these days, for the reason that the flowers, though ornamental and even brilliant in their colours, are more or less unsuitable for use in a cut state. *Jacobinia*, or *Justicia carnea*, as it is sometimes called, is a native of tropical America, and was introduced to this country in 1827. It is an erect-growing plant, and few species are more easy of cultivation. Propagation can be effected by cuttings. By pinching the plant several times in its early stages of growth, good specimens can be obtained in 6 or 7-inch pots, with five or six, or even more, thyrsiform inflorescences of flesh-coloured flowers. *J. chrysostephana*, a yellow-flowered species, has been shown frequently at the R.H.S. meetings in recent years. It is a very old plant, but is not cultivated in private gardens nearly so generally as one would expect to see it, were it not for the craze for cut blooms which has caused the neglect of a number of beautiful flowering plants.

MEALY BUG ON VINES: *W. W.* We do not advise the use of vaporisers for the destruction of mealy bug at this stage. You must look carefully over the vines once a week till the crop is cleared, using methylated spirit to destroy the insects. This can be applied by means of a small paint brush. When the crop is cleared, thoroughly wash the rods with strong soft-soapy water, and, after the winter pruning all the loose bark must be removed from the rods, when they should again be washed with the mixture already mentioned. Repeat this operation two or three times till the vines commence to grow. The house and trellis must also be thoroughly cleansed, and the walls lime-washed. The surface of the border should be lightly forked up, and all the loose soil cleared away, replacing this with freshly chopped loam.

MICE IN THE GARDEN: *J. McA.* As you find poisons are of no avail in your efforts to exterminate these pests, your best plan is to employ one of the specifics that spread disease amongst them, such as the Liverpool Virus.

MILDEW ON VINES: *W. W. B.* To destroy mildew you should dust the affected parts with flowers of sulphur. Choose a fine morning for this operation. The sulphur can easily be removed, after the berries have commenced to colour, by syringing the bunches with clean rain water.

MUSCATS SHANKED: *L. J.* The berries on that portion of the bunch which has shanked will not ripen—they should be cut off the bunches forthwith. Although there are many causes of shanking, the principal one is some check to the root system. Drought or excessive wet will cause shanking. Your border may be water-logged through bad drainage; if this is the case you must renovate it during the winter and see that good drainage is supplied. If the subsoil is cold and retentive place a thin layer of concrete over it to prevent the roots from entering. Muscats need a rich rooting medium, and the border should be made very firm. It is best to confine the border to the interior of the house, where the roots can be better kept under control. Sudden fluctuations of the temperature must be prevented. In the spring and early summer care should be taken to warm the water before applying any to the roots or using it for syringing purposes.

NAMES OF PLANTS: *W. D. B.* 1, *Polygonum Baldschuanicum*; 2, *Achillea millefolium*; 3, *Linaria cymbalaria*; 4, *Acer campestre*; 5, *Plumeria bicolor*; 6, *Polygonum persicaria*.—*W. A.* 1, *Echinops sphærocephalus*; 2, *Eryngium planum*; 3, *Eupatorium ageratoides*; 4, *Buddleia variabilis*; 5, *Olearia Haastii*.—*Flower Show.* *Tamarix pentandra*.—*A. H., Cromer.* 1, *Erica multiflora*; 2, *Teucrium fruticosum*; 3, *Erica vagans*; 4, *Lonicera involucreta*; 5, *Spiraea discolor*; 6, *Erica stricta*.—*W. T.* 1, *Centaurea macrocephala*; 2, *Poterium canadense*.—*Mrs. Davnport.* *Selinum tenuifolium*, *Lavatera* sp. Send better specimens. Both are perennials.—*E. M. B.* 1,

Lomaria spicant; 2, *Pedicularis sylvatica*; 3, *Potentilla Tormentilla*; 4, *Polygala vulgaris*; 5, *Achillea Ptarmica*; 6, *Stachys palustris*; 7, *Leontodon autumnalis*.—*G. L.* We do not undertake to name varieties of Roses.—*J. W. P.* The Carnations are seedlings which have been raised from a good strain. No. 1 is a pretty white-ground Fancy; 2, purple medium-edged white-ground Picotee; 3 and 4, Fancies, of no great merit; 5, a pretty rose Self for border culture; 6, is not Hayes' Scarlet. This variety was sent out from Great Bookham by Mr. J. Douglas 15 years ago, but it has been superseded by such varieties as Robert Berkeley and Cardinal.—*T., Bury.* *Clarkia pulchella* fl. pl.—*Constant Reader.* *Catalpa bignonioides*, often called *Catalpa syringæfolia* in gardens.—*F. T.* 1, *Xylobium squalens*, figured in *Botanical Magazine*, t. 2955, as *Maxillaria squalens*; 2, *Calanthe veratrifolia*.—*H. T. S.* 1, *Asplenium polyodon*; 2, *Pteris crenata*; 3, *Cheilanthes fragrans*; 4, *Polypodium alpestre*.—*W. P.* *Odontoglossum constrictum*.—*J. W.* Both *Lælia crispata*.

PEACHES DECAYED: *W. L.* The fruits were too much decayed for us to determine the cause of their failure. Send specimens in an earlier stage of the disease.

PEACHES SPLITTING: *F. D.* This is usually the result of an excess of moisture at the roots, but it may also be caused by imperfect maturation of the wood in the autumn. Mealy bug may be killed by dilute methylated spirits applied with a stiff brush to the affected parts.

PEARS CRACKING: *A. C. Roby.* The cracks in the fruits are the result of a fungus—*Fusicladium pirinum*. During the coming winter, spray the trees with a solution of sulphate of iron, drenching the branches thoroughly. Next spring, when the leaves are expanding, apply dilute Bordeaux mixture, and repeat the application when the flowers are expanding, and again when the fruits have set.

POTATOS DISEASED: *S. L.* The tubers are badly affected with warty disease. Burn all diseased tubers and the haulm after the crop is harvested, and do not use the land for a similar crop for the next two or three years. Obtain next season's seed-tubers from a healthy stock. This disease is notifiable under the new Pest and Diseases Order of the Board of Agriculture and Fisheries (see *Gardeners' Chronicle*, May 21, 1910, p. 377).

SCALE ON SALSIFY FOLIAGE: *R. P. K. & Sons.* The leaves are covered with the White Rust fungus (*Cystopus candidus*). A slight attack of this on the leaves does not, as a rule, affect the growth of the roots, and spraying is not usually necessary. Certain weeds belonging to the Natural Order Cruciferae—particularly Shepherd's Purse—are attacked by this fungus, and should be destroyed, as this disease is not specialised in its parasitism, and can pass from one kind of plant to another. If it is desired particularly to keep the Salsify leaves free, spray them early in the season with Bordeaux mixture (4 lbs. bluestone, 4 lbs. quicklime, 50 gallons water).

SEEDLING BEGONIA: *G. S.* Your seedling possesses several good points, the colour of the flowers being pleasing and the trusses large and of fine shape. But there are similar varieties already in cultivation, and, unless we had these before us for comparison it would be difficult to say if your example exhibits any advance.

THRIPS ON ROSES: *T.* Nicotine is the best specific for destroying thrips. Spray the plants with tobacco water, or one of the proprietary nicotine compounds on the market.

TOMATOS FAILING TO COLOUR AT THE BASE: *D. T.* The hard, yellow portion at the base of the fruit is due to a lack of potash in the soil. Afford the plants some manurial compound containing this constituent.

VARIOUS LEAVES FOR EXAMINATION: *W. T. S.* There appears to be no specific disease present on any of the specimens sent; the injury appears to be due to some error in culture.

A JOURNEY TO JAPAN.

I.

MARSEILLES, PORT SAID, AND SUEZ.

I LEFT the Royal Albert Docks, London, on February 19, on board the "Sado," bound for Yokohama, my intention being to break the journey at various tropical ports of call, my immediate objective being Ceylon. I was well prepared for study in tropical and sub-tropical climates, and equipped with introductory letters to residents in India and the Far East. My object was to see as much of the world as possible, to study plants and flowers, and horticultural art on every possible occasion.

The "Sado" called at Marseilles one week after leaving London, and I spent a few hours in this Mediterranean port, paid a visit to Park Borely, and to the immediate surroundings of this picturesque place.

At the time of my visit, there was little suggestive of a southern climate. The tramway employes were wrapped in their heavy fur coats, suitable for a Russian climate, and only the height of the sun, the Palms in the gar-

dens, the large-leaved, evergreen Magnolias, and the succulents growing on sunny rocks afforded signs that the country has a winter temperature nearly always above, and never for more than a few hours below, freezing point, and is characterised by much heat in summer. The Almonds were flowering already, so was Prunus Pissardii, and the Willows were showing their early, soft-green foliage, so much appreciated in gardens.

In Park Borely, the Chinese Primulas just planted out in beds, were in full flower, and Primula obconica, which had been left outside all winter, was showing new signs of life. Iris unguicularis, Euphorbia Charicias, and Othomopsis cheirifolia—the yellow, African species of this genus of the Compositae—besides some Jonquillas, were flowering in the botanical part of the park; whilst Erythrina, Dracaena indivisa and some Phoenix were well preserved against frost by thick wrappings of straw and a layer of mould on the roots.

Chamerops excelsa and C. humilis, Cocos australis, Pritchardia filifera, and Dasylirion gracile were just as healthy-looking specimens as may be seen anywhere in the Mediterranean region without protection.

When our ship left the harbour, the bare rocks could be seen from a point far out to sea, surrounding the town, which is situated on hills, and spreads out far along the foot of the mountain. Within and around the town, between the houses and on the slopes of the near hills, the ground is mostly covered with Pines, and so the place presents a peculiar sight, with its extended shore and the rough mountains to the east and at the back. The shore to the west is not very high above the sea-level, but all the bare rocks and mountains look at sunset like transparent white clouds, with a wonderful bluish tint, much like far-away mountains of the high Alps, covered with everlasting ice and snow.

We were soon on the open sea, passed Sardinia and Corsica by the Strait S. Bonifacio next morning, and came in sight of the Straits of Messina.

The picturesque hills of the Calabrian coast and the Sicilian shore show the barracks built for the survivors from the earthquakes, and from the ship could be seen the broken walls of many magnificent buildings.

Port Said was reached on the Sunday at noon, a week after we left Marseilles. The sun was shining, but the southern wind was not very warm. The Arabs wore heavy coats. The new European quarter near the seashore is increasing, and gardens surround every house. The streets in the business part of the European town are partly planted with trees, mostly Albizzia (Acacia) Lebbeck. (Lebbeck is the Arabian name of the tree.) It is a fine evergreen tree, with large, bean-like seed-pods, fully ripe now. Only on very dry places does it lose its leaves; in better situations it forms a fine and a very large tree, all along the Mediterranean coast of Africa, spreading shade all the year round, and displacing deciduous trees, which are not proof against the powerful sun. Casuarinas, Tamarix, Ficus elastica, and Poinciana are planted in the gardens, and on the Lesseps Square even a green lawn was to be seen. Other gardens are at the Canal office buildings, and also outside the town, around the waterworks, where there are plantations of Date Palms just beginning to push out their flower-shoots. The Date Palm, Phoenix dactylifera, in many varieties, is the tree of the country, and approaching Port Said by ship, the Palms are to be observed even before the low shore is sight. Eucalyptuses and Mimosas are most remarkable features, but were not flowering yet. Phyllostachys, Sugar Cane, Bananas (Musa),

Roses, Lantanas, Hibiscus, Acalypha hispida were amongst the commoner plants; but I must not forget that wonder of flowers, the Bougainvillea. No words can describe the beauty and effect of their violet or purple-coloured blossoms when densely massed together. Not a sign of a leaf could be seen; but flowers!

Pieces of Sugar cane are chewed by old and young folk alike. This was observed particularly in the Arabian market, where the densely packed crowd deals in a great variety of merchandise, mostly old and dirty, and including goats, fowls, rabbits, and eggs, boots and clothes, fruits and vegetables, all in a most undesirable state. Good vegetables are grown in a few well-enclosed gardens at the far end of the Arabian town, and there is also a nursery, where trees for street-planting are cultivated; but, to reach this part, one has to walk through the most dirty town that can be imagined, and only the early time of the year and the cool wind from the south made it possible to pass along the broad or narrow, level or rough places called streets.

The Arabian houses are of varying heights; some look well, but most of them are huts, or more like stables half broken down. Children, goats, and fowls are very plentiful in the streets, but what they live upon is difficult to say.

Our ship having coaled, we passed through the canal in 24 hours. The ship had to stop several times to give way to others, which came in strings of two or three behind each other. The Arabian side of the canal, bare of all plants, consists of sand, and, in the distance, sand, bare rocks, and hills.

All along the Egyptian side, is the fresh water canal bringing water from the Nile. It was laid in order to provide the country along the ship-canal with fresh water, and has done much good. The country is densely covered with many thousands of prosperous farmers, and large plantations of Date Palms. To observe them from board ship requires good glasses and a high position, too, as the sand dug out of the canal is piled high on its sides. The signal stations along the canal are well planted with the different plants and trees already mentioned. The water is pumped by the aid of wind.

Suez was seen at last, backed by very large and numerous plantations of Date Palms. Port Twenk, situated at the end of the canal, and well planted with trees and flowers, was passed, the pilot and the accompanying Arabs—the latter having helped to moor the ship when we had to stop—left us with their boat. We were in the Gulf of Suez, and would soon pass the Red Sea. Colombo was to be our next port. Bougainvilleas had greeted us last at Port Twenk, and I wondered which would be the first flower to greet us at the next port? *Fr. Henkel, Darmstadt.*

(To be continued.)

NEW OR NOTEWORTHY PLANTS.

FRUITS OF ANTHURIUM ACAULE.

ALTHOUGH this fine Aroid is not infrequently met with in gardens, yet, so far as my knowledge of it extends, it does not often produce ripe fruits in this country. Ninety years ago Loddiges wrote (*Bot. Cab.* t. 483) that the flowers "sometimes perfect their seeds in this country," so that his experience of it was probably the same as my own. A plant cultivated by Sir Frank Unsp, at Friar Park, Henley-on-Thames, has this month, for the first time, ripened a fine spike of fruit. The spike, which measured

about 18 inches long and $1\frac{1}{2}$ inches through at the base, was covered with white berries. Unfortunately the specimen became decayed and covered with mildew before it could be figured, so that no illustration of it has been prepared. This is to be regretted, as a figure of the fruit of this species would help to abate the confusion which has occurred in recent monographs between *A. acaule*, *A. Huegelii*, and *A. Hookeri*. All three are stemless species very similar in appearance, and each has a large rosette of leaves. They are not always correctly named, and the specimen cultivated by Sir Frank Crisp was grown under the name of *A. Hookeri*, but that species, I believe, is no longer in cultivation. The following notes upon the three species may be useful.

development. The spathe and spadix are produced long before the plant is fully grown, and vary in dimensions according to its size. In adult specimens, the stalks are 2 feet to $2\frac{1}{2}$ feet long, the reflexed, strap-shaped green spathe is 5 inches to 7 inches long and $\frac{3}{4}$ inch broad, and the spadix is 10 inches to 12 inches long and $\frac{1}{2}$ in. thick, becoming, when in fruit, as much as 18 inches long and $1\frac{1}{2}$ inches thick at the base, and tapering upwards like a rat's tail. The colour of the inflorescence is greenish in some plants and dark violet in others; when the anthers are discharging their pollen, the spadix is sweetly scented, the perfume of the form with the violet-coloured spadix being stronger than that of the greenish form. The fruiting spadix is thickly

A. Huegelii.†—This species is also a native of the West Indies, and very like *A. acaule*, but the spadix, although also long and tapering, does not, I believe, attain to such large dimensions. The great distinction, however, between *A. Huegelii* and *A. acaule* is in the berries, which, in the former species, are pear-shaped, being much broader at the apex than at the tapering base. The lower half of the berry is white and the upper purple, whereas in *A. acaule* it is entirely white and spherical.

A. Hookeri.‡—This Anthurium is a native of Demerara, and is a smaller, less leafy plant than *A. acaule*, with differently-shaped leaves, more tapering at the base, more spreading and differently curved veins, and a short, blunt

FIG. 57.—THE 1ST PRIZE EXHIBIT IN THE NEW "GROUP" CLASS AT SHREWSBURY FLOWER SHOW, SHOWN BY MESSRS. JAMES CYPHER AND SONS.

(See page 146, ante.)

A. acaule.*—This was one of the first of the numerous Anthuriums to be cultivated in this country. It is a native of the West Indies, and, according to Loddiges, was introduced in 1790. When fully grown, it forms a grand foliage plant of 5 feet to 6 feet in diameter. It is stemless, with a large rosette of ascending and spreading leaves 3 feet to 4 feet long and 10 inches to 15 inches broad above the middle, narrowing downwards, with a stout petiole 3 inches to 5 inches long. Younger specimens are much smaller, as the plant is several years before attaining its full

* *Anthurium acaule*, Schott, *Prodr. Aroid.*, p. 476, syn. *Pothos acaulis*; Loddiges, *Botanical Cabinet*, vol. v., t. 183; Hooker, *Exotic Flora*, vol. ii., t. 122.

covered with white, exerted berries nearly $1\frac{1}{3}$ inch long, cylindrical in shape, and scarcely or not at all thicker at the apex than at the base. Schott describes the berries of *A. acaule* as "obconoid, scarlet," and this statement is repeated by Engler in *De Candolle, Monogr. Phanerog.*, vol. 2, p. 137-8, but, in his later monograph, *Engler, Pflanzenreich, Arace-Pothoidae*, p. 69, no mention is made of the colour of the berries, possibly because the previous description had been found to be incorrect, for I can find no warrant for Schott's statement that they are red, and believe that he must have mistaken for *A. acaule* the fruit of some other species.

cylindrical (not long and tapering) spadix, which in the type is about 2 inches long and $1\frac{1}{3}$ inch thick, but may attain proportionately larger dimensions. This plant is unquestionably distinct from *A. Huegelii*, with which Engler has wrongly united it and given under the name of *A. Hookeri* a description of *A. Huegelii*. In my opinion *A. Hookeri* is identical with the plant more recently (1893) described by Engler as *A. cubense*. N. E. Brown.

WOBURN PLACE.

THIS beautiful place at Addlestone, Surrey, is the property of E. G. Mocatta, Esq., and the gardens are under the charge of Mr. Thomas Stevenson, so well known in Sweet Pea and Chrysanthemum circles. Most horticulturists who visit Woburn Place in summer are attracted thither by the Sweet Peas, though they soon realise that Mr. Stevenson is much more than one of the best Sweet Pea growers in the country. The glasshouses available for fruit cultivation are not numerous, but a special feature is made of Peaches and Nectarines. These are exceedingly well done, the trees being pictures of health, and all in capital bearing. The varieties most favoured are Hale's Early and Early Rivers Peaches and Lord Napier Nectarine. Belle-garde and Barrington, mid-season sorts, are specially excellent, whilst Sea Eagle and Princess of

Rose garden, which only requires another year or two to make it one of the most charming of small Rose gardens; already the weeping standards and climbers are features. Directly in front of the house, the lawns and flower-garden extend for seven acres. The beds are not crowded together; and are filled with bold masses of colour, which show up well on the wide expanse of grass. The grass is kept perfectly, and the beauty and charm of the whole place is enhanced by the preservation of the natural contour of the land and the avoidance of straight lines and dead levels.

As Mr. Stevenson ranks among the three or four best Sweet Pea growers in Britain, a description of his methods may be appreciated. About 300 running yards of Sweet Peas are grown, the height of the plants, in mid-July, being from 8 feet to 10 feet, the former being the height of the spring-sown plants, the autumn-sown ones being 2 feet taller, besides being in

other. The plants are put out singly, being shaken quite clear of the pot soil, letting the roots down as far into the soil as they will go. Planted in any other way, Mr. Stevenson says, the plants would collapse if drought subvened. A few twigs are placed alongside the plants to support them in their early stages. The method of staking is as follows:—Heavy posts are inserted at the ends of the rows, and wires strained on them, extending the length of the rows. Two thin bamboo canes are inserted at each plant, about 6 inches apart. These canes are 12 feet long, and are tied securely to the wires. From each plant, two leaders are trained up the canes, and they are allowed to flower from the very outset. The tying is done regularly once a week, the ties being thus, in the growing season, about 6 inches to 8 inches apart. In dry weather, copious supplies of water are given, and the ground is mulched between the rows,

FIG. 58.—WOBURN PLACE, ADDESTONE, THE RESIDENCE OF E. G. MOCATTA, ESQ.

Wales promise great things for later use. Six hundred Chrysanthemums are grown, including the most recent in Japanese and single-flowered varieties. Many of the plants have only recently been stopped (July). Most growers usually stop their plants much earlier than Mr. Stevenson does, but, after all, it is results that tell, and these are invariably attained at Woburn Place. Last season, Mr. Stevenson won outright the King's Cup offered for Chrysanthemums at Windsor, besides forty 1st prizes at other leading shows.

The out-door vegetable and fruit garden extend to about two acres, and the wild-garden to five acres. In the latter is exemplified the advantage of natural over artificial stone-work on the banks of a stream. Where natural stones have been used, most of the plants seem at home and happy; but the reverse is the case where artificial stone has been employed. Adjoining the house, is a

better bloom and producing their flowers on longer, and stouter, stems. They have been in bloom since the end of May, having begun to flower when little over 2 feet high.

The ground is trenched 2 feet to 3 feet deep in winter, incorporating plenty of manure, and a good supply of leaves at the bottom of each trench. With the top spit, some bonemeal and soot are mixed. The nature of the soil is heavy clay, which, under certain conditions, bakes as hard as brick. Mr. Stevenson makes no secret of his methods. Nothing would make him happier than that thousands should grow Sweet Peas as well as he does. In October, he sows his seeds in pots in a cold frame. He winters the plants in the same frame, taking care never to allow them to get too wet. In March, as soon as the ground is in good condition, they are planted out in double lines 1 foot apart.

The double rows are 5 feet apart from each

which keeps the heavy clay soil from getting "puddled."

Everyone who has seen Mr. Stevenson's flowers has been impressed by their superb quality, but for the benefit of those who have not seen them, it may be said they are invariably four and five-bloom sprays of large flowers on stiff footstalks 12 to 13 inches long, according to the variety.

Speaking of varieties, Mr. Stevenson says the Pea which has given the best results this year is Mrs. Hugh Dickson. Other outstanding varieties in his collection are Sun-proof Crimson, Clara Curtis, Etta Dyke, Lavender George Herbert, Mr. C. W. Breadmore, John Ingman, Anglian Blue, Princess Victoria, Countess Spencer, Earl Spencer (which is absolutely perfect under shade), Black Knight (Spencer), Silas Cole, Asta Ohn, Mrs. A. Ireland, and The Marquis.

Among novelties not yet on the market, a

variety which was certificated at the Royal Horticultural Society under the name of Prince of Orange, but which has since been named Thomas Stevenson, is "xxx." It seems ahead of all others in its particular colour-class, having a wonderful standard of rich orange, with a trace of rose in the wings. As grown this season, it has not scorched in the sun. It will be introduced by Mr. Sydenham. Henry Eckford (Spencer) is a pale form of Cole's Earl Spencer, and, for all decorative work, it will be most excellent. The flower is large and attractive.

For exhibition purposes, Mr. Stevenson believes in cutting his blooms early and young, and standing them for hours in plenty of water in a cool shed before packing them for the journey.

Mr. Mocatta takes a keen personal interest in all departments of the garden, and Mr. Stevenson is thus fortunate in having a gentleman for his employer who is in full sympathy with all his efforts to excel. W.

NOTES FROM A "FRENCH" GARDEN.

THE favourable weather of the past fortnight has suited the Melons grown under cloches. It is advisable, if not done already, to place the frames and lights over the earlier batch of plants. Ample ventilation should be given during the day time, but the lights should be partially closed at night. The growth of the plants is very luxuriant, especially those which are carrying only one fruit and from which all the extra wood and foliage have been removed to encourage the swelling of the fruit.

The Cucumbers planted at the end of June as a succession crop to the first batch of Melons are in full bearing. The lights must not be removed or the tips of the young fruits will damp off.

As the Melons are cleared, the frames should be removed and the ground hoed for the benefit of the Cauliflowers.

The Lettuces sown early last month have been planted 9 inches apart in beds 4 feet 3 inches wide. The ground is kept damp by watering either early or very late in the day; it is done at these times to prevent the leaves from becoming spotted.

The Cos Lettuces, Grey of Paris, sown at the same period, are planted 18 inches apart each way; this will allow room for the cloches to be placed over them late in September.

If a succession is required, a few seeds of Lettuce, Little Gott, may now be inserted. A mat is placed on the seed bed to keep it sufficiently damp without watering, and is removed as soon as the seedlings appear. This batch is planted under the cloches at the end of September and is marketed about the middle of November.

The last batch of ordinary and Batavian Endive has just been planted in its final quarters. The growth will be hastened by applying frequent and light waterings till September 10 or 20, in order to obtain fine specimens before the wet weather sets in.

It is a suitable time to sow the Spring Cabbage, Ox Heart in frames or in a well sheltered corner out-of-doors. The plants should be sufficiently strong for transplanting at the end of October in heavily-manured ground in a favoured position. Seeds of Spring Onion, Little Parisian, should be sown broadcast on a well prepared seed-bed. This forms a good market crop either sold as green Onions early in April or as fully-grown bulbs in May. They are generally planted on the old Melon beds after the Cauliflowers are cut early in October.

The Carrots and Celery planted on the old manure beds must receive heavy and frequent waterings, to have them sufficiently early, so that the old beds may be broken up late in October.

Carrots must be well thinned to obtain good and strong foliage, which is a great help when bunching the roots for market. *P. Aquaticus*.

NOTICES OF BOOKS.

FRUIT-GROWING IN ARID REGIONS.*

ACCORDING to the statement on the title page, this is an account of approved fruit-growing practices in the inter-mountain country of the Western United States, comprising the States of Colorado, Montana, Idaho, Utah, Nevada, and in northern Arizona and New Mexico, with applications to adjacent regions. One of the

formed the basis of experiment station bulletins, and the substance of most of them has been given at short horticultural courses.

The prevailing opinion that fruit could not be grown in the arid region was fostered locally by the disastrous failures of many of the early attempts at tree growing. The early pioneers were men without experience in the art of irrigation, for, in the Eastern States from which most of them emigrated, it is not needed or practised; hence their lack of

FIG. 59.—WOBURN PLACE: VIEW IN THE PEACH HOUSE; THE VARIETY BARRINGTON IS SEEN IN THE FOREGROUND.

authors, Mr. Wendell Paddock, is a professor of horticulture, and the other, Mr. Orville B. Whipple, a field horticulturist, both in the Colorado Agricultural College and Experiment Station. From the nature of their work, they have spent much time in orchards in the various districts. In a general way, this book should be of value wherever fruit is grown under an irrigation system. Several of the chapters have

* By Wendell Paddock and Orville B. Whipple. 6s. net. Published by Macmillan & Co., London. Crown 8vo. Price, in cloth binding, 6s. 6d. net.

success. The Mormons were the first to grow fruit in the arid section. The authors give the history and development of the fruit industry in Colorado, the next State to take up the business. In 1862, Henry Lee, of Denver, sent from Iowa City to his brother, William Lee, then, as now, living on his farm in Jefferson County, 125 Apple, Pear, Peach and Plum stocks, and, from this small beginning, the fruit industry has grown to very large proportions. In 1902, the total shipments by rail from these fruit districts amounted to 1,956 tons; in 1908

they amounted to 6,493 tons—an increase of 4,500 tons in six years, and, for 1908, an increase of more than 1,700 over 1907.

In preparing the land for planting, water is largely employed for levelling, the water being led to the top of the high ground or knolls, and then allowed to trickle down, carrying the soil with it. In other cases, furrows are ploughed out, and water is run in them as high as possible. This soaks into the soil, and lowers the level several feet in the course of three to four years. Water is usually supplied by "power" companies working in association with those who own the land. Mr. Redmayne is of opinion that much benefit might be derived from the construction of dew ponds.

There are interesting chapters on planting and

INFLUENCE OF EARTHWORMS ON SOIL.

DARWIN first suggested that wherever the common earthworm (*Lumbricus*) finds the conditions of existence, it exerts a most important influence in the formation of the humus surface soil layer, and the limitation imposed upon these conditions by the subsoil has doubtless a great deal to do with the sharp demarcation we often find between it and the surface soil.

The food of earthworms is humus matter; to obtain this, they have to assimilate large quantities of earth which is obtained from the subsoil, and contains, generally, only about one per cent. or less of humus. The earth, while passing through the alimentary canal of the worm, is subjected to the action of its digestive juices,

and water in their burrows, and the chemical effects arising from the digestive process and the final return of their own substance to the soil are of great value. Their habit of drawing after themselves leafstalks, blades of grass, and other vegetable remains into their burrows, is another means of improving both the physical and the chemical properties of land. The uniformity, lack of structure, and loose texture of the surface soil, especially of forests as compared with subsoil layers of corresponding thickness, is doubtless largely due to the work of earthworms.

Another important point is that, in soil thrown up by earthworms, the humus formed under their influence is always of a neutral character and never acid. The work of earthworms is especi-

FIG. 60.—WOERN PLACE: RHODODENDRON CATAWBIENSE VAR. FASTUOSUM FL. PL. ON THE LAWN.

pruning the Apple, Pear, Quince, Plum, and other trees, fertilisers and shade crops, all differing in some ways from our own methods on account of the need for irrigation during the warm season. Anyone interested in fruit-growing in an arid climate will learn much from a perusal of the book, and it should prove especially helpful to settlers in parts of S. Africa, Australia and India.

The articles on insects and insecticides have been adapted from the writings of Professor C. P. Gillette, entomologist of the Colorado Station. The discussion on live-stock on the fruit farm was prepared by Professor H. M. Collrell, superintendent of the Farmers' Institute in Colorado.

which dissolve out the humus and render the mineral particles more soluble to the carbonic acid water of the soil. It is then excreted at the surface of the soil as worm casts, such as may be seen by thousands on the surface of the ground during or after rain.

Darwin calculated from actual observation that in humid climates, in a soil fairly stocked with these worms, the earth thus brought up may amount to from one-tenth to two-tenths of an inch annually over the entire surface. He further estimated that in this manner ten tons of dry earth, per acre, annually pass through the bodies of earthworms and are brought to the surface.

Apart from the mechanical effect worms achieve in loosening the soil, the entering of air

ally effective in loamy soils and in humid regions. In the arid regions of the earth, and in sandy soils generally, the life conditions are unfavourable to the worms, and the perviousness elsewhere brought about by their labours already exists naturally in most cases.

It is stated by Mr. E. T. Seton (*Century Magazine*, June, 1904) that the earthworm is practically non-existent in the arid regions between the Rocky Mountains and the immediate Pacific coast from Manitoba to Texas. In the Pacific coast region, however, it is abundant, and does its work effectively.

It has been calculated that an acre of ordinary agricultural land contains about 50,000 earthworms. The effect of their combined labours in

reducing the soil to a finer condition, as we have seen, is great, whilst they also enrich the surface soil in nitrogen. In old pastures, the production of a close, compact sward is largely due to the fine earth which is brought to the surface by earthworms, to be afterwards crumbled down and levelled by the action of wind and sun.

When earthworm casts are being constantly swept up and carried away from lawns, cricket grounds, and putting-greens, the surface soil gradually becomes exhausted of fertility, the grasses die out, and mosses take their place. *J. J. Willis, Harpenden.*

FRUIT REGISTER.

STRAWBERRIES AT ENGLEFIELD GARDENS, READING.

GIVON'S Late Prolific is one of the best varieties for a dull, wet season, although it does not succeed equally well in all gardens. The soil here is of a medium texture, and seems to suit this particular variety. It can be planted closer than most sorts, as the foliage is not so vigorous as some. It is a free-setting variety, the berries being large, well-shaped, and of bright colour, but they are rather soft, and, for that reason, do not travel well. Kentish Favourite also does well in these gardens, but the fruits, like those of British Queen, do not colour at the tips. The berries are of moderate flavour, and travel fairly well. Scarlet Queen, though an old variety, is still our best mid-season Strawberry, and is good in wet seasons. It possesses a fine flavour, is bright in colour, medium in size, with firm flesh, so that the berries do not bruise in transit. Bedfordshire Champion is a satisfactory cropper, but the berries are soft in the flesh, rather uneven in size, and of medium flavour only. The berries ripen about the same time as Royal Sovereign, being only a few days later. It is not a good variety for a wet season. Royal Sovereign is still the best all-round variety we cultivate, but there are others as useful for furnishing fruits for preserving, such as Vicomtesse Hericart de Thury and La Grosse Sucrée, these being of finer colour. The Strawberry season may be prolonged by planting a bed of Royal Sovereign under a north-west wall. This will not be necessary where a succession can be kept up by later varieties. Royal Sovereign should be planted wider apart than most sorts, as it is a vigorous grower. As soon as the fruits are gathered, all runners, dead leaves, weeds, &c., should be removed and burnt, but the foliage should not be trimmed too severely. A dressing of slacked lime and a good mulch of decayed farmyard manure should be placed well up to the crown of the plants. If choice fruits are required, the plants should not be allowed to remain after the second or third year. Plants which have not been severely forced may be planted out for fruiting the following season. They produce fruits of a good size, although the crop is not a very large one. Where Strawberries are forced in large quantities, a fresh piece of ground should be planted every two years, to provide the necessary runners. All flowers should be pinched off these plants as they develop. The varieties Pineapple, Epicure, and Commoisson have been planted this summer for trial. Waterloo has not proved a success up to the present. The perpetual fruiting varieties will provide fruits at the end of the season. Two desirable kinds are Laxton and St. Antoine de Padone, the former being perhaps the better. The early flowers of these should be pinched off, and no fruits allowed to develop until late in the season. Runners of these placed in pots in August, if kept growing, will produce a supply of fruits in the winter months. *J. B. Woods, Englefield Gardens, Reading.*

REMARKS ON THE CONDITION OF THE FRUIT CROPS.

(See Tables and Summaries, *ante*, pp. 77-82.)

(Continued from page 136.)

4, MIDLAND COUNTIES.

OXFORDSHIRE.—Apples, Pears and Plums are very scarce, there being only a few fruits on the lower branches, or where the trees are sheltered from wind. Wall fruits are average crops except Apricots and Sweet Cherries. Strawberries and Currants were both excellent crops, but Gooseberries were not equal to the average. Of Damsons we have none. The soil here is mainly a strong clay, but in some places it is gravel. *P. W. Pearce, Eynsham Hall Gardens, Witney.*

7, ENGLAND, N.W.

LANCASHIRE.—The fruit crops generally are much below the average. Strawberries promised a good and large crop, but the excessive and cold rains, just as the berries were ripening, caused almost all of them to rot on the plants. Gooseberries were an exceptionally light crop, there being scarcely a fruit on some of the trees; the trouble was caused by cold weather when the bushes were in bloom. Bismarck Apple is again one of our best cropped varieties. Our soil is a heavy, retentive loam, with a sub-soil of marl or clay. *E. F. Hazelton, Knowsley Gardens, Prescott.*

—The fruit crops are disappointing: there was a splendid show of blossom, but very few Apples, Pears or Plums set. Gooseberries, Red Currants and Raspberries are average crops. Many Strawberries were spoiled by the rains. The garden is exposed to cold east winds in early spring, and the soil is a heavy, cold clay, lying close to the river. *Thomas Wyton, Abbeystead Gardens, near Lancaster.*

WESTMORELAND.—The fruit crops in this district, with the exception of Pears, are very promising. The following varieties of Apples are well cropped: New Northern Greening, Lane's Prince Albert, Annie Elizabeth, and Stirling Castle. The foliage is healthy, which is largely due to spraying in winter. Strawberries (Royal Sovereign) have been very plentiful. Bush fruits, especially Black Currants, are abundant and good. The soil is light and gravelly, and, naturally well drained, which suits the heavy rainfall of the district. *W. A. Miller, Underley, Kirkby Lonsdale.*

—There was an abundance of blossom on the fruit trees, but cold, east winds, together with frost at the end of April and the beginning of May ruined the prospects of a good fruit year. Such varieties of Apples as Tower of Glamis, Mère de Ménage, Scotch Bridget, King of the Pippins, Annie Elizabeth and Malster are carrying satisfactory crops. Strawberries have been a good crop, although many of the berries were spoiled by the constant rains. Of Raspberries, only Superlative is carrying an under average crop. Some of the canes of Baumforth Seedling, Fastoli and Fillbasket have not broken into growth owing to the severe winter. Black Currants are the best crop amongst small fruits. The garden and orchard are situated low, and are on the limestone. *J. Moorhouse, Dalton Hall, Euxton.*

CORNWALL.—An abundance of fruit blossom has been in many cases followed by surprisingly poor crops of fruit. Apples and Pears, whether growing as bush trees, or trained against walls, are equally a failure. Of other wall fruits, Cherries, Peaches and Nectarines have abundant crops. Currants, Raspberries and Gooseberries bear enormous crops of good quality fruits. Strawberries, which usually fruit freely in these gardens, were a partial failure; this was largely due to the inclement weather just as the first fruits commenced to colour. The cause of the

failure of the Apple and Pear crops is somewhat obscure; frosts occurred on only three nights in May, and 4° was the most registered. But the weather during the blossoming period was far from general, and insects were few, and these were probably the causes why so few fruits set. Outdoor Figs are very promising. *A. C. Bartlett, Pencarrow Gardens.*

DEVONSHIRE.—Considering the wet and comparatively sunless summer of last year, we have little to complain of as regards the hardy fruit crops in this district. The trees are not nearly so blighted as they were last season, and small fruits are abundant. Strawberries have been a heavy crop, but many of the berries rotted during the last week in June and early the following week. Figs are plentiful, whilst Peaches and Nectarines are both heavy crops. Our soil is a good, deep loam resting on the old Devonshire red sandstone. *James Mayne, Bicton Gardens, East Budleigh.*

—Apples, Pears and Plums promised well when in bloom, but owing to cold winds and frosts the fruits did not set. A few varieties of Cider Apples are well cropped. Peaches and Nectarines were badly affected with leaf-curl, but aphid have not been so prevalent as last year. Strawberries and Raspberries have given abundant crops, but other small fruits are scarce. Our soil is a sandy loam. The season has been cold and wet, with very little sunshine for this locality. *J. Wilson, Killerton Gardens, Exeter.*

—The fruit crops in this district vary greatly. In sheltered gardens, I have observed good, average crops of most kinds. Apples in some orchards have an average crop, but in the majority of orchards and gardens they are much below the average. Heavy hailstorms and gales prevailed when the Pear and Cherry trees were in flower. Gooseberries and Strawberries have been very plentiful. Late Strawberries were not so fine as the early ones, the plants having suffered somewhat from drought. Speaking generally, the trees and crops of most kinds are very satisfactory. *Geo. Baker, Membrand, near Plymouth.*

GLOUCESTERSHIRE.—Apples are under the average, but better than last year. We have good crops on trees of Lord Derby, Ecklinville Seedling, Tower of Glamis, Frogmore Prolific, Lane's Prince Albert, The Queen, Winter Hawthornden, and Domino. Last year, caterpillars were very plentiful. Because of this, the trees were grease-banded in September and some thousands of the wingless female moths were caught. There was a wealth of blossom on trees of Pear, Apple, Plum and Cherry. The farmers in this locality have few apples in their orchards. Our soil is a friable loam overlying the old, red sandstone. *John Bunting, Tortworth Gardens, Falfield.*

—Pears are a fair crop, and have every appearance of being of good quality. Apples are plentiful on some trees, whilst other trees have not a single fruit. Both Plums and Apricots are very scarce. Small fruits of all kinds are very satisfactory. Strawberries have been particularly good; Givon Late Prolific and Laxton's Latest both furnished excellent berries. Our soil is a loam resting on limestone, and requires good cultivation. *F. Walton, Stanley Park Gardens, Stroud.*

—Late spring frosts again destroyed the prospects of a good fruit year. Nectarines and Peaches set freely, but they were damaged by heavy hailstorms and frost during the second week of May, and this notwithstanding the trees were well protected with nets. *Arthur Chapman, Westonbirt, Tetbury.*

—Apples, Pears, and Plums are very small crops. Some Apple trees which were laden with blossom have not a single fruit. Pears are a little better than Apples. Small fruits are record crops, especially Black Currants. The bushes also are very clean. *W. H. Berry, Higham Gardens.*

8, ENGLAND, S.W.

HEREFORDSHIRE.—Strawberries were an extremely heavy crop, but many berries were spoiled by the wet weather. Plums are extremely scarce, and there are few Gooseberries, except in sheltered positions. Peaches, Apricots and Nectarines are thin crops. Black Currants were moderate, but Red and White Currants were both heavy crops. Morello Cherries are the most plentiful of all stone fruits. Peaches, Nectarines and Apricots promised well when the trees were

in bloom and set fair crops, but the cold east wind caused most of the fruits to drop. The soil is a cold clay with a clay sub-soil. *Thos. Watkins, Newport Hall Gardens, Eardisley, R.S.O.*

— Apples are a good, all-round crop in this district, and the trees are clean and healthy. Pears are good and clean and a full crop. Plums are rather scarce, but the trees are healthy. Cherries of the dessert sorts were not plentiful, but Morellos are a fair crop. Small fruits are an average crop. Black Currants were damaged by frosts while the bushes were in bloom. Strawberries have proved a light crop, but the quality was good. Our soil is a sandy loam on sandstone rock. *Thos. Spencer, Goodrich Court Gardens, Ross.*

— I do not remember the fruit crops being so generally bad before. Of small fruits, Gooseberries and Strawberries have furnished full crops, but the Strawberries were considerably damaged by wet weather. Pears and Peaches are light crops, but the fruits promise to be of good quality. Some Apples, more particularly of cider varieties, have fair crops, but generally, Apples are very scarce. The Plum, Cherry and Apricot trees are almost bare of fruits. Our soil is of a heavy nature, and the situation is low. *T. Coomber, The Hendre Gardens, Monmouth.*

SOMERSETSHIRE.—All fruit trees had an abundance of blossom, but in the case of Apples, Pears, Plums, Damsons and Cherries the crops are very poor. In some places the Gooseberry crop is almost a failure, but we have a good number in these gardens. Black Currants with us are scarce, whilst in some gardens there are good crops. Many of the Strawberries rotted from the excessive wet; two of the best to withstand the rains were Viscountess Haricart de Thury and Waterloo. Many Plums and Morello Cherries dropped during the stoning period. Plants growing in our soil, which is a shallow one overlying the blue lias, have a tendency to develop a sickly yellow colour in the foliage, but heavy dressings of dung and feedings with fertilisers help to keep the crops in good health. *Geo. H. Head, Kingsdon Manor Gardens, Taunton.*

WORCESTERSHIRE.—The fruit crops in different districts are very variable. We have a fair number of Apples on most trees, the fruits being clean and good. During the past two seasons, we have systematically sprayed the trees both during the winter and spring, and the trees consequently are healthy and clean. I adopt the Woburn system of spraying, and I strongly advise other gardeners and fruit growers to do the same. Pears are a small crop but clean. Plums are plentiful in this garden, although below the average in many others; we have had to thin these fruits very freely. Cherries are our worst crop. Peaches and Nectarines are average crops. Gooseberries and Black Currants have been very satisfactory. The Black Currant bushes are examined occasionally, and buds affected with "mite" are closely picked off and burned. Red Currants are not quite so good, having suffered from the effects of a very heavy hailstorm. Our soil is on the new red sandstone formation. *A. Young, Witley Court Gardens, near Worcester.*

— Apple, Pear and Plum trees blossomed with great freedom, but frosts in late April ruined the crops. Strawberries also promised well, but owing to heavy and constant rains, the fruits ripened very slowly, and most of the best berries decayed. Our soil is a heavy loam resting on sandstone. *Ernest Avery, Finstall Park Gardens.*

— The hardy fruit crops are extremely disappointing after such a good display of bloom. Nearly all the best dessert varieties of Apples and Pears are complete failures. The sunless and cold season of 1909 caused the flowerbuds to be imperfectly developed, and it was noticed, when the trees were in flower, there was an almost entire absence of pollen. In large plantations, consisting solely of Cox's Orange Pippin Apple or other high-bred varieties which are known to be constitutionally weak in pollen-producing, the absence of fruits is most pronounced. This shows how necessary it is to plant a number of inferior varieties amongst such choice sorts for the purpose of providing pollen, a practice we adopted some two years ago, and which will be extended. Cherries are a failure. Peaches, Nectarines and

Apricots on walls have satisfactory crops, especially where root-lifting has been constantly practised, as this induces surface rooting and better ripened wood. Strawberries have been abundant, but many berries were damaged by rain. Our soil is a strong clay loam on marl and difficult to work in a wet season. *William Crump, Madresfield Court Gardens, Malvern.*

— All fruit trees blossomed well with the exception of Nectarines, but the fruits set badly, so that the crops generally are very indifferent, Apples only being up to the average. Trees of Ecklinville Seedling, Sterling Castle, Cillini, Keswick Codling, Bramley's Seedling, Annie Elizabeth, Worcester Pearmain, Pineapple Russet, and Cox's Orange Pippin are carrying good crops; other varieties of Apples are under the average. Pears were badly damaged by the frosts and cold winds in May. Only one variety, Backhouse's Beurré, is carrying fruit worthy of note. Plums are a fair crop, the variety Victoria being especially good. Peaches also suffered from the late frosts, but we have a satisfactory crop, although they did not require thinning. The wood of Peaches and other fruit trees did not mature last season, and I am afraid this will be the case again this year. All small fruits were good, Strawberries especially. But bush fruits did not keep so long as usual owing to the heavy rains in the early part of July. Cherries were under the average, but of good quality. Our soil is a medium to light loam, with a gravel sub-soil. *A. C. Lchane, Sherborne Gardens, Malvern Wells.*

WALES.

DENBIGHSHIRE.—Considering the unripened condition of the wood, owing to the wet and sunless autumn of 1909, fruit trees generally blossomed well. But cold winds prevailed when the blooms were expanding and most of the fruits were destroyed. Strawberries promised well up to June 23, but after that date heavy rains caused the berries to rot, resulting in one of the worst Strawberry seasons on record. Our soil is a light loam with a sandy sub-soil. *J. Martin, Bryn Estyn Gardens, Wrexham.*

— The fruit crops in this district are a failure. Apples and Pears flowered well, but the fruits did not set owing to the unripened condition of the wood. Plums would doubtless have set a fair crop, were it not for the numerous bullfinches, which I am not allowed to destroy. Because of this, the Plum crop is a failure. Our soil is a heavy clay, overlying a subsoil of clay. *J. A. Jones, Chirk Castle Gardens, Ruabon.*

GLAMORGANSHIRE.—Apples, Pears and Plums are only average crops, although at one time there was every prospect of heavy crops of these fruits. But cold nights and winds during April and the early part of May, in conjunction with the wet and sunless summer of last year are the causes of the deficiency. Peaches, Nectarines, Strawberries and all small fruits are very plentiful and good. Our soil is a light loam, the sub-soil being gravel. *R. Milner, Margam Park Gardens, Port Talbot, South Wales.*

— The Apple crop generally in this district is very deficient. Pears are an average crop and of good quality. Plums are a failure. Peach and Nectarine trees are looking well, being free from blight, and the fruits are very good; Raspberries are an excellent crop, and Strawberries were good, the berries being very fine. The soil here is a rather heavy loam on a rocky sub-soil. *C. T. Warrington, Penllergar Gardens, Swansea.*

MERIONETHSHIRE.—Large fruits, such as Apples, Pears, and Plums, are very scarce. Small fruits are well up to the average, and the quality generally is good. Strawberries were damaged by the constant rains, many of the berries rotting. Loganberries and Raspberries are heavy crops. The fruit trees are remarkably free from aphid this season. Trained Apple trees were bare of blossom, whilst unpruned trees had a wealth of flowers, and fruits on the latter have set fairly well. Our soil is of a moderately light character, with a gravel sub-soil, and crops suffer badly during periods of drought. *J. S. Higgins, Rhûg Gardens, Corwen.*

PEMBROKESHIRE.—The crops of Apples, Pears, and Plums are almost a failure in this district. The weather was wet and stormy when the trees

were in bloom. Apple trees on walls are carrying a good crop, but fruits are very scarce on pyramid and standard trees. Pears also are a failure on pyramid trees, but we have a few fruits on the wall trees. Plums, including Damsons, are a total failure. The trees were too heavily cropped last year to expect a good fruit season this year. *George Griffin, Slebeck Park Gardens, Haverfordwest.*

— The cold spring adversely affected the fruit crops generally. Many Apple trees developed very little blossom, and flowers which did appear failed, in some instances, to set; consequently there are few Apples in this district, many Apple trees in these gardens being without a single fruit. Pear trees blossomed freely, but the fruits set badly and are scarce; Peaches on south walls are exceedingly good, both in quantity and quality; the trees were well protected whilst they were in bloom. Plums, with the exception of Green Gage, are an average crop. Sweet Cherries are plentiful and of good quality, but Morello Cherries are scarce. Among small fruits Gooseberries are plentiful and good; Currants and Raspberries are plentiful; Strawberries were an abundant crop, although many berries were spoiled by the rains. Royal Sovereign has been very fine, and Givon's Late Proflic produced grand fruits. The soil here is a light loam, resting on slate stone. *W. J. Baldwin, Clyffe Gardens, Bonmouth.*

RADNORSHIRE.—The fruit crops in this district are very much under the average, especially Apples. Small fruits are not extra plentiful, but we have a fair crop, Raspberries being the most plentiful. Early Strawberries promised well, but the greater part of this crop was ruined by the wet weather. Nuts are a poor crop, with the exception of one Walnut tree, which is loaded with nuts. The soil here is a good, deep, medium loam, resting on the red sandstone. *J. MacCormack, Maesluch Gardens, Glosbury, Hereford.*

— The cold spring seriously affected the Pear and Plum crops, whilst bullfinches destroyed the greater portion of the Apple blossoms, where unprotected. The Strawberry crop was a very heavy one, but the rains caused much of the fruits to rot; the berries were large, but deficient in flavour. Currants, Gooseberries, and Raspberries were plentiful. *C. M. Nicson, Ail-y-bryn, Knighton.*

(To be concluded.)

THE ROSARY.

THE ROSE SEASON.

It is pleasing to be able to report such a generally favourable season. I have not seen a trace of the blackish-brown thrip, often so destructive during autumn and late summer. In some seasons, this insect has quite spoilt our lighter-coloured varieties, its effect being far more noticeable upon these than upon the dark-coloured flowers; indeed, upon some of the latter it could frequently pass undetected.

A few varieties that are especially good now are Mme. Ravary, Le Progrès (perhaps the best yellow bedder), Melaine Souper, Sénateur Mascraud (a grand yellow Rose and very distinct), Molly Sharman Crawford, Maman and White Maman Cochet, Medea, Lady Roberts, Georges Nabonmond, Peace, Betty, Corallina, Mue, Antoine Mari, and Marie van Houtte, in the Tea and Hybrid Tea sections; Captain Hayward, C. J. Grahame, Victor Hugo, Earl of Dufferin (an erratic and shy bloomer here), Mrs. R. G. Sharman Crawford, Grand Mogul, Commandant Felix Faure, Mrs. John Laing, Ulrich Branner, and that never-failing Rose, Frau Karl Druschki, among the Hybrid Perpetuals.

Some of the newer Wichuraianas are good late bloomers, especially Delight, Paradise, and Mimichaha. Perhaps I should not class the last-named as newer, but many do not seem to know this grand variety, if I am to judge by my correspondence. It is a far better-shaped flower than most of its class, whilst the trusses are very large in size and of fine pyramidal form. With us, it supersedes Dorothy Perkins, lasting fresh

longer, and also continuing in flower after that variety is past. We have had some curious reversions in Dorothy Perkins and its various sports. Rose sports are always liable to revert. A plant of Augustine Guinoisseau has one-half of its shoots carrying fair examples of La France, and a plant of Sir Roland Hill has just produced a really good flower of Charles Lefebvre, from which, of course, it sported. Many examples of this reversion have probably been noticed by other growers.

It will need unusually bad weather to prevent a good autumnal display of Roses this season. In fact, many varieties promise to be at their best about mid-September. Roses with few petals are liable to expand in hot weather before they are developed, and, at any warm period, their beauty is fugitive; but not so in the cooler nights and days of autumn, when such as Georges Naboumand, Peace, Betty, Melaine Soupert, Corallina, Mme. Hoste, Killarney, and Lady Waterlow retain their form much longer. The last-named is one of the most lasting and decorative of Roses, and is particularly good in autumn. It is beautiful as a semi-climber, and also as a standard, whilst I have never noticed the foliage affected by mildew or red rust. A Rose that is in flower from first to last is Zephyrin Drouhin, a Hybrid Bourbon, introduced in 1875. This is the variety spoken of as thornless. The flowers are large, and only a little more than semi-double; the petals are silvery-pink, the same shade throughout. It is a very lasting Rose, and fragrant. It also retains its foliage well, and seems exempt from mildew. Like Gruss an Teplitz, it makes a good dwarf hedge if not over-pruned. A. P.

The Week's Work.

THE ORCHID HOUSES.

By W. H. WHITE, Orchid Grower to Sir TREVOR LAWRENCE, Bart., Burford, Surrey.

Dendrobium.—In large collections, some of the *Dendrobiums* will be completing their growth. This may be ascertained when the terminal leaf on the pseudo-bulb has finished growing. Such plants should be placed by themselves at one end of the house, and afforded less water at the roots for a few weeks. Increased ventilation should be afforded, if it can be given without affecting those plants still actively growing, as this will assist the plants to ripen their shoots, for which reason they may also be gradually exposed to more sunshine during the early part of the morning and, in the afternoon, by drawing the blinds up a little earlier. It is not always advisable to remove the plants to cooler quarters immediately they appear to have finished growing, for, about this time, the old roots again become active, not only lengthening but also sending out many rootlets. It is mainly by means of these new roots that the plants are sustained during their flowering period. It is also not advisable to entirely withhold water, as this will be likely to cause a check to the plants, causing them to almost immediately start into growth instead of remaining dormant until after the flowering season. *D. Wardianum* and its hybrids have a special tendency to start growing actively again soon after the previous season's growth is completed. In order to retain a vigorous and healthy constitution, it is necessary that the plants should form only one set of growths each year. These should be well ripened, therefore the drying and resting of the plants should be gradual. When they are properly matured, the plants should be removed to a cool greenhouse, where they are less shaded, and the atmosphere is drier and not so close; but care must be taken to select a position free from draughts or cold winds. Allow the plants to pass gradually from moderate shade to full sunshine, so that the new pseudo-bulbs may soon become hard and plump. The leaves of some varieties will turn yellow, and these should be allowed to remain until they fall naturally. In houses that are devoted to the cultivation of *Dendrobiums*, the obtaining of proper conditions from the growing to the resting stage is a comparatively easy matter, for, when the growth of the plants is ap-

proaching completion, the warmth in the hot-water pipes may be slightly reduced every few days, the amount of ventilation increased, the plants gradually inured to more light and sunshine, and the amount of water used for damping lessened until it is discontinued altogether. Careful judgment should be used in watering the plants when growth is complete. The inexperienced grower should not depend entirely upon the appearance of the compost; owing to exposure to light and air, the surface of the soil may become dry, whilst underneath it is quite wet. After one thorough watering has been afforded, it is good practice to examine the plants every day, and, immediately the newly-formed pseudo-bulbs show signs of shrivelling, and the compost appears thoroughly dry, to again afford water. Plants that are still actively growing must be afforded liberal treatment until the pseudo-bulbs are completely formed. Those of the nigro-hirsute section, such as *D. Lowii*, *D. formosum*, *D. Jerdonianum*, *D. cariniferum*, *D. curneum*, *D. bellatulum*, *D. velutinum*, *D. seulle*, *D. Donnesiae*, *D. Draconis*, *D. infundibulum*, and *D. Jamesianum* do not require such full exposure to light and air as those of the deciduous and semi-deciduous types. When at rest, these should be kept shaded from strong sunshine and afforded sufficient water to keep the pseudo-bulbs plump and the leaves fresh. Plants of *D. formosum*, *D. Lowii*, and the distinct, free-flowering hybrid *D. formoso-Lowii* that are in bloom should be well supplied with water till the flowers fade. These plants produce their flowers at the apex of the current year's growths, the blooms remaining a long time fresh. The following *Dendrobiums* belong to the evergreen or raceme-flowering section:—*D. thrysiflorum*, *D. densiflorum*, *D. Griffithianum*, *D. Schroderi*, and *D. Farmeri*. They will now be in the middle of their growing season, and must therefore be generously treated. When growing freely, they form many large roots, which delight in a good depth of compost. Any plants that are pot-bound may be shifted into larger pots. They grow well in properly-drained *Osmunda* fibre and *Sphagnum*-moss, preferring the cooler temperature of the Cattleya or intermediate house to that of the East Indian house. *D. Falconeri* and its fine variety *giganteum* should be suspended to the roof of the Cattleya house, in a position where at the present time it is not subjected to strong light. Afford the plant liberal treatment and syringe overhead several times each day with tepid rain water.

FRUITS UNDER GLASS.

By E. GOODACRE, Gardener to Sir ERNEST CASSELL, G.C.B., Moulton Paddocks, Newmarket.

Melons.—Fruiting plants must be given a generous treatment in order that the Melons may attain to a fair size. Watering must be attended to regularly, as any neglect in this matter renders the fruits liable to splitting. A little extension of the lateral growths above the fruit will help to keep the roots active and the plants in a healthy, growing condition. For a late crop, a batch may be planted now. In the cases of both the earliest and latest crops, it is a good plan to grow the plants in 10-inch or 12-inch pots, for, when the roots are more under control, the growth is sturdy and fruitful. Make up a hot-bed in the usual manner, and plunge the pots to the rims. Allow each plant sufficient room to develop without overcrowding, and train the growths rather thinly on the trellis, so that the shoots may obtain plenty of light. Red Spider is frequently troublesome on late Melons, as fire-heat has to be employed to assist the fruits to ripen. An occasional spraying with some suitable insecticide will keep the pest in check. Make the most of the sun's heat whenever possible, maintaining a temperature of 80° to 85° by day, with a decrease of about 10° by night. Two fruits to each plant will be a fair crop; if more are allowed to develop, the Melons will be rather small. Regular supplies of liquid manure will be necessary, as the plants become established, and when the fruits are set, a top-dressing of fresh compost may be given occasionally. Apply collars, as previously recommended for pot trees, to retain these additions of fresh soil.

Perpetual and Alpine Strawberries.—These may now be moved from the partly-shaded position which they have been occupying, and placed

in full sunshine. Stand the pots well apart, so as to give the plants the full benefit of light and air. The flower-spikes should not be removed after this date if ripe fruits are required in September. In order to maintain a supply of berries well into the autumn, it is advisable to start several batches of the plants at intervals of a few weeks. Directly the fruits are set, gentle forcing may, if necessary, be practised, to have ripe fruit at an early date, but the best late Strawberries are gathered from plants which have been grown without fire-heat. Support the flower trusses with a forked twig, and, if the weather is cold and wet, give the plants the protection of a cold frame, from which they should be transferred to shelves in a cool, airy house, or staged in heated pits, when the fruits are about to ripen. Pay careful attention to watering, and give the plants an occasional sprinkling of some approved fertiliser.

Strawberry layers.—Runners which were potted some time ago are now well established in their fruiting pots. Remove any offsets that may form and spread the plants out as they require increased space. To avoid worms getting into the pots, it is advisable to stand them on a hard bottom of ashes. The position chosen should be fully exposed to the sun, and the plants must receive every encouragement to produce strong, well-ripened crowns.

THE APIARY.

By CHLORIS.

Removing stored honey.—When a rack of sections or shallow frames is full and the cells sealed completely, or the outside ends partially so, raise the rack. If difficulty is experienced in doing this because they are fastened by propolis, use a screwdriver at one corner, and then raise the sections or frame with a screwing motion. To clear the comb of bees without danger to the sealing, place below the rack a board of the same dimensions, having in the centre a "Porter Bee Escape," and if the operation be performed in the evening, the honey will be ready for removal next morning. If the bees are carelessly handled, the cappings of honey will be perforated by them in their desire to gorge themselves with honey. The sections will then drip and their value be depreciated. Remove the honey at once from the apiary to a place of safety, such as a closed room. In taking the sections from the rack, remove the wedges, and be careful not to bruise the face of the combs.

Grading and preparing sections.—In order to secure the best prices, grade the sections and clean the woodwork of all brace combs and propolis. This operation must be performed with perfectly clean, dry hands, using a sharp knife for scraping. If the hands are not dry and clean they may soil the white wood. The full and perfectly sealed sections should form the first grade. Those sections in which the honey does not quite fill the entire space, but are otherwise perfect, will form the second grade, whilst those that are not so perfect will form the lowest class. The most imperfect sections may be stored for next year, and will form bait sections to induce the bees to enter and fill the empty sections as soon as they are put on.

Extracting honey.—See that the machine for this purpose is perfectly clean and well oiled. A little care is necessary in oiling the machine, for if too much be used it will work out of the bearings and may find its way into the honey. As soon as the combs are removed from the hives the honey should be extracted, because it is warm from the hive, and when cool sets and will not leave the combs freely. When preparing the frames for the extractor, remove the metal ends, and with a warm knife, holding the frame obliquely, remove the cappings. By holding the frame in an oblique position the cappings fall free of the comb. Reverse the frame, and uncap the cells on the other side. Most machines will take two combs at once. It is not necessary to work the machine rapidly. A moderate pace is best, as then the combs are not injured. When all the combs are empty the cappings may be placed in a cheesecloth bag and suspended to drain in the machine. The combs may be replaced in the racks and returned to the hives for the bees to clean out. Never leave newly-extracted combs about the hives, as this will start the bees robbing the honey from other hives than their own.

PLANTS UNDER GLASS.

By JOHN DONOGHUE, Gardener to JOSEPH PICKERSGILL, Esq.,
Bardon Hill, Westwood, Yorkshire.

Souvenir de la Malmaison Carnations.—Layers that have been prepared and treated as advised in a previous calendar will now be ready for potting-up singly into large 60-sized pots. Where the stems can be traced without disturbing the other layers, it is an excellent plan to sever them from the parent plants a few days previous to the potting. Care must be taken when lifting the layers from the beds to retain a fair amount of soil about the roots. The potting compost may consist of loam, leaf soil, and sand, in equal parts. When the plants are potted afford water and place them evenly on an ash base in a cool frame, as near to the glass as possible. Shade them from bright sunshine during the hottest part of the day. Immediately root-action has commenced, abundant ventilation should be afforded to ensure strong, sturdy, short-jointed growths. Extreme care must be exercised in affording water, which should not be given until the plants are well on the dry side. If aphid is detected, fumigate without delay, employing some nicotine compound.

Perpetual-flowering Carnations.—An abundance of bloom is now available from plants which were planted out as advised previously. Plenty of good cuttings can be obtained, and, where space permits, a quantity should be rooted in the usual manner. These will furnish good specimens for another season. The winter-flowering varieties grown in pots have filled their pots with roots, and may with advantage be afforded a top-dressing of some approved fertiliser. Where a deep, span-roofed frame is available, the plants may be placed therein to shelter them from the rain until they are finally placed into their winter quarters.

Caladium.—The plants should be exposed to full sunshine to assist the tubers to ripen. Gradually reduce the amount of moisture at the roots. When the tubers are sufficiently ripened, the pots should be placed on their sides in a suitable place for the winter.

Tuberous-rooted Begonia.—The flowering season of these plants may be considerably prolonged if they are afforded applications of diluted liquid manure alternately with clear water.

Gloxinia.—To raise a batch of plants for early spring flowering, seeds should be sown now in shallow pans. Seedlings should be placed upon shelves near to the glass, in a stove temperature, during the autumn and winter months. As the old plants pass out of bloom, they should be ripened similar to Caladiums, but under slightly cooler conditions.

THE FLOWER GARDEN.

By E. BECKETT, Gardener to the Hon. VICARY GIBBS,
Aldenham House, Hertfordshire.

Lathyrus latifolius.—The Everlasting Pea is most valuable for furnishing a supply of cut bloom. Plants should be established in isolated clumps in various positions in the front of the shrubberies where they will need little attention beyond staking. *Lathyrus latifolius* is suitable for covering trellises, arbours, and similar structures, providing a beautiful display of bloom during the late summer and autumn. Propagation is easily effected by division of the root-stock when the plants are dormant; plants may also be raised from seeds. The white and pink varieties are most commonly met with; the best white sort is White Pearl, whilst grandiflorus produces fine crimson-coloured blooms.

Climbing plants.—Most climbers have made luxuriant growth this season, and the training of the shoots, especially of those that are not self-climbing, has entailed a considerable amount of work. The species of ornamental vines have grown exceptionally freely this year. Their chief beauty will be seen when the leaves colour in the autumn. To have the foliage in the best condition, the plants must be well supplied with moisture whilst they are growing freely; they will also be benefited by applications of liquid farmyard manure, which should be well diluted. When the leaves commence to assume their autumn tints they will require much less moisture than during their season of active growth. Clematis *Jackmannii* and its numerous varieties is making a fine show at the present time. It forms a handsome subject when trained to a stout stake in isolated parts of the shrubbery. All

climbers should have the superfluous growths removed and, in the case of Rambler Roses, the old flowering shoots should be cut out, tying in neatly the young shoots which will furnish next season's display.

Lavender.—The bushes are now in full flower, and the spikes will soon be ready for cutting, which should be done on a dry day. Lavender is easily increased by means of cuttings, which must be inserted in cold frames, keeping the lights closed until roots have formed. This old garden plant is very effective when massed in beds or interspersed with other shrubs, and it forms an excellent dwarf hedge by the sides of the kitchen or flower-garden paths. The shoots require clipping annually to keep the plant in a proper shape; this should be done directly after the flowers are over. There are several varieties, which differ slightly in habit; the most interesting is *Lavandula spica alba*, the white Lavender, which is equally as hardy and possesses all the other good qualities as the ordinary variety.

The herbaceous border.—All the untidy shoots and dead flowers should be removed, so as to make the border as attractive as possible. The strong-growing perennials will need constant attention in staking and tying. Delphiniums may be easily raised from seeds, but if it is desired to increase the stock of any particular variety, cuttings taken from young growths at the base of the plants should be inserted in sandy soil, and kept close and shaded for a time. The herbaceous Phloxes may also be increased by cuttings inserted now. Pyrethrums may be lifted and divided, potting suitable pieces into 5-inch pots. It will be necessary to keep these in a moist, close atmosphere until they have recovered from the disturbance, but after that fresh air may be admitted freely. The various subjects that are being propagated in frames will need constant attention in such matters as syringing and ventilation; when they have rooted they should be removed to cooler and airy situations.

THE HARDY FRUIT GARDEN.

By A. R. SEARLE, Gardener to the Marquis of NORTHAMPTON, Castle Ashby, Northamptonshire.

Orchard trees.—Trees of Apple, Pear, Damson, and late varieties of Plum carrying good crops of fruit, will be benefited by a copious watering with liquid manure. If this is not obtainable, place a good dressing of well-decayed farmyard manure over the roots, first breaking the surface with the fork. After this is applied, give a good watering by means of the hose pipe or water cart, so as to wash the constituents of the manure into the soil. The water should be applied immediately after the manure has been spread, otherwise the latter will become dry and hard. The soil for several feet around the stems of orchard trees should be kept free from weeds and grass; where the turf has been allowed to encroach, it should be cut back. Keep the grass mown fairly short with the scythe if the orchard is not used for grazing. If sheep or cattle have access to the orchard, make sure that the tree-guards are in good order, or the animals will damage the trees by gnawing the bark.

Plums on walls.—Fruits of early varieties of Plums are ripening fast, and means should be taken to protect them from the birds, as well as from mice and earwigs. Mice are often a source of trouble where stone fruits are ripening, and traps should be set constantly, though cats serve as the best check. Wasps, up to the present time, do not appear to be so numerous as in some seasons, but they may be troublesome later. Choice dessert fruits may be protected from wasps by small muslin bags, or by enclosing the whole tree with wasp-proof netting.

Plums for a succession.—The most prolific and best early dessert varieties of Plums grown here are Oullin's Golden Gage, Blue Rock, Angelina Burdett, Brandy Gage, Denniston's Superb, and Early Transparent Gage. These varieties provide a good succession from the first week in August until early in September. For succeeding those dessert varieties enumerated above, to maintain a good supply of Plums till the end of the season, the following sorts may be recommended:—Jefferson, Kirke's, Lawson's Golden Gage, Reine Claude Violette, Reine Claude du Comte Hathem, Reine Claude de Bavy, Coe's Golden Drop, Late Transparent Gage, and Late Rivers. Culinary varieties of Plums suitable for providing a succession from the end of July until

the end of October include Early Prolific, Czar, Diamond, Belgian Purple, The Sultan, Prince Engelbert, Victoria, Pond's Seedling, White and Red Magnum Bonum, Monarch, Grand Duke, President, and Primate. The two last-named are excellent late sorts and worthy a place in any collection. As each tree is cleared of its crop, the foliage should be given a thorough cleansing with clear water, which should be applied with some force by means of a garden engine or hose. If any insect pests are present, apply soluble paraffin mixed with water, according to the directions which accompany the preparation.

THE KITCHEN GARDEN.

By JOHN DUNN, Kitchen Garden Foreman,
Royal Gardens, Windsor.

Cauliflower.—Seeds should be sown on a sheltered border, and in not too rich a soil, to produce a supply of plants for next season's earliest batch. At Frogmore, we make a sowing on some date as near to the middle of September as possible, but, in more northern parts, the seeds should be sown a fortnight earlier. In order to have sturdy plants, the border must be made quite firm before the drills are drawn. These should be at least 9 inches apart, sowing the seed thinly. When the seedlings are large enough, they should be potted in 60's pots and placed in cold pits on a bed of ashes. The lights should be kept off the frames until frost appears, and then they should only be placed on at night-time, to be removed again in the morning. A suitable potting soil is old loam from a spent Melon bed. The planting should be done firmly, as this will assist to keep the plants stocky. Some growers do not favour autumn sowings of Cauliflowers, but it will be found that autumn-sown plants produce much finer heads than those raised in heat in the spring. We grow the following varieties for this batch:—Early Market, Magnum Bonum, Walcheren, and Early London. These are all good varieties, and will be ready for cutting in the order of their names.

Onion.—Spring-sown Onions should be taken up as soon as the foliage begins to decay. The bulbs should be laid in rows thinly, and they should be turned daily until ripe enough for storing in the Onion loft. Bulbs with thick "necks" should be selected for present use.

Globe Artichokes.—Plants from which the heads have been gathered should have the old stems and foliage removed, afterwards forking up the soil and applying a good soaking of liquid manure. In young plantations the plants are throwing up their growths, and will be benefited by a supply of manure water; these will provide a succession well into September.

Colewort.—The ground in which Coleworts and other winter greens are growing should be hoed frequently; in dry weather liberal supplies of water should be afforded these crops. Any blank spaces should be filled up from the reserve plants. Apply a good dressing of soot about the stems previous to earthing up the soil, which should be done in all exposed positions, before the crop is too far advanced.

Turnip.—Proceed with the thinning of this crop as quickly as possible, and dust the foliage in the early morning with soot or fine wood-ashes to keep the Turnip fly in check. There is still time to make another sowing on a sheltered border, if the crops already planted are not sufficient to furnish a supply of Turnips throughout the winter. Make this sowing on a sheltered border, and select some quick-growing variety for the purpose.

Scarlet Runner.—Plants intended for furnishing a late supply of Runner Beans, should have their tops pinched out as soon as they reach the tops of the stakes, in order to produce as many side shoots as possible. If the position is an exposed one it will be advisable to secure the stakes to a wire run from end to end of the rows. Water the plants frequently with manure water.

Cardoon.—The plants should be tied and earthed up as soon as they are large enough. Gather the leaves closely together and wind hay-bands closely around them prior to packing, the soil tightly about them.

Radish.—Make frequent small sowings of this salad. The roots will be much larger and more succulent than those sown earlier in the season, provided that sufficient water is afforded to keep the plants growing freely.

EDITORIAL NOTICE.

ADVERTISEMENTS should be sent to the PUBLISHER, 41, Wellington Street, Covent Garden, W.C.

Special Notice to Correspondents.—The Editors do not undertake to pay for any contributions or illustrations, or to return unused communications or illustrations, unless by special arrangement. The Editors do not hold themselves responsible for any opinions expressed by their correspondents.

Letters for Publication, as well as specimens of plants for naming, should be addressed to the EDITORS, 41, Wellington Street, Covent Garden, London. Communications should be written on one side only of the paper, sent as early in the week as possible and duly signed by the writer. If desired, the signature will not be printed, but kept as a guarantee of good faith.

Local News.—Correspondents will greatly oblige by sending to the Editors early intelligence of local events likely to be of interest to our readers, or of any matters which it is desirable to bring under the notice of horticulturists.

APPOINTMENTS FOR THE ENSUING WEEK.

TUESDAY, AUGUST 30—
Roy. Hort. Soc. Coms. meet.

WEDNESDAY, AUGUST 31—
Glasgow and West of Scotland Hort. Soc. Sh. in St. Andrews Halls, Glasgow (2 days). Carlisle Fl. Sh. (2 days). South Shields Fl. Sh. (2 days).

AVERAGE MEAN TEMPERATURE for the ensuing week deduced from observations during the last Fifty Years at Greenwich—58.9°.

ACTUAL TEMPERATURES:—
LONDON.—Wednesday, August 24 (6 P.M.): Max. 72°; Min. 58°.
Gardeners' Chronicle Office, 41, Wellington Street, Covent Garden, London.—Thursday, August 25 (10 A.M.): Bar. 30.0; Temp. 65°; neither—Overcast.

PROVINCES.—Wednesday, August 24; Max. 65° Cambridge; Min. 58° Yorkshire.

SALES FOR THE ENSUING WEEK.

MONDAY, WEDNESDAY, THURSDAY AND FRIDAY—
Dutch Bulbs in all varieties, at 67 & 68, Cheapside, E.C., by Protheroe & Morris, at 10.

Trees. The recent publication of the fifth volume of "The Trees of Great Britain and Ireland" brings this work to its penultimate stage. Though designed originally to occupy five volumes, the authors have found it necessary to extend it to six. The chief characteristics of the work are the thoroughness with which every detail has been carried out, and the determination of the authors not to accept statements unsubstantiated by evidence. The bane of a certain type of garden literature is the fact that it is written by people who have but an imperfect knowledge of their subject. They possess sufficient of the literary faculty, but are compelled to obtain their facts second-hand mostly from books and periodicals—with the result that their statements are marked not infrequently by inaccuracies from which a first-hand knowledge would have saved them. It is the more gratifying, therefore, that Messrs. Elwes and Henry's work bears on every page direct evidence of original study and observation.

The general scheme of the work has been described in these pages already (see *Gardeners' Chronicle*, December 1, 1906, p. 372, and April 18, 1908, p. 248). It deals chiefly with timber-producing trees known to be hardy in one or more localities in the British Isles. The present volume is devoted to three genera, and the letterpress alone fills some 330 pages. Two of these genera represent, perhaps, the most important groups of cultivated forest trees, namely, the Oak and the Pine; whilst the third, the Cypress, furnishes

our gardens and parks with some of their most attractive evergreen ornaments.

It is many years since the hardy Oaks were exhaustively monographed in the English language, the difficulty and magnitude of the undertaking having deterred perhaps those capable of carrying it out. The Pines constitute a less difficult subject, and both they and the Cyresses have been dealt with in recent works, but nowhere in such a comprehensive and thorough manner as in the present volume.

In a genus which presents so many difficulties as are to be found in *Quercus*, the clear differentiation of the species is of the greatest importance, for it is essential in any attempts which are made to bring about a uniformity of nomenclature. This ideal may prove to be impossible of attainment in this genus, but, nevertheless, the ideal must be pursued. A common defect in botanical literature consists in the evasion of the real points at issue. Even Linnæus himself is not above the suspicion of having shelved a particularly troublesome problem. Messrs. Elwes and Henry appear never to have been content to leave a problem unsolved. Whenever difficulties have been encountered, and they have been very numerous, determined efforts have been made to overcome them, and the efforts have usually proved successful. There is no better evidence of this than the key to the identification of the species given under each genus. On a former occasion, we referred to the great value of these keys. They are the results of careful and detailed study, and, within our own experience, they have proved to be of very great value.

The authors have based their botanical distinctions on vegetative characters alone, rejecting the characteristics of flowers and fruit. Whilst this system of classification must have added to the difficulty of making a working key, it is all the more applicable to everyday use, for, as every arboriculturist knows, many species of Oak fruit rarely, or not at all, in this country. In such a comprehensive genus as *Quercus*, it may not be possible to identify every individual species with absolute certainty; at the same time, by means of the key, the student can narrow down the problem to two or three species, and the final determination can be made by consulting the more detailed descriptions. The elucidation of the species of *Quercus* is helped considerably by numerous outline drawings of the leaf and a portion of the shoot.

The Pines are not only fewer than the Oaks, but are susceptible of easier subdivision by reason of the varying number of needles (leaves) contained in a bundle.

Considering their small number, perhaps no group of hardy trees has presented such confusion in nomenclature as the true Cyresses—as distinct from the *Chamaecyparis* group. The present authors recognise nine species, clearly define their limits, and provide a key to their identification.

The illustrations are admirable half-tone reproductions from photographs. Some represent the trees in their native habitats, and others illustrate remarkable examples in British gardens. The first picture, for instance, illustrates a magnificent trunk of *Pinus Lambertiana* as seen in California; whilst others represent the fine examples which are to be found in such places as Eastnor, Goodwood, Dropmore, Castlewella,

Tortworth, and others whose names are familiar to our readers.

There is some ground for regret that popular, or rather, English names are used exclusively for the titles of the pictures. Some of them are so unfamiliar that we suspect that they are the inventions of the authors rather than "popular" in the true sense of the word. Such names as "Japanese White Pine" for *Pinus parviflora*, and "Algerian Oak" for *Quercus Mirbeckii*, will necessitate for most people a reference to the letterpress in a separate volume to ascertain to which trees they have reference. If English names were desirable, we think their adoption would have been made more likely had the botanical names been printed with them.

The notes on such subjects as cultivation, value of timber, history, and other miscellaneous matters represent the more popular side of the work, and they will secure for it much appreciation from the tree-loving public as distinguished from those whose interests are chiefly botanical.

A circular issued in March last by Mr. C. G. Hopkins, of the University of Illinois Agricultural Experimental Station, deals with the subject of European Practice and American Theory concerning Soil Fertility.

Mr. Hopkins, impressed by the low average of the yield of Wheat in America as compared with that obtained in England, Germany, and other European countries, addressed to the leading agricultural authorities of the chief European countries a letter enquiring of them what, in their opinion, were the causes which have led, during the last 80 to 100 years, to the great increase in yield of Wheat and other cereal crops. The circular in question contains the replies which Mr. Hopkins received from England, France, Germany, and the Netherlands.

Though complete unanimity of opinion was not to be expected, there is a remarkable agreement that the increase of yield has been due, in the first place, to the use of artificial manures and the increased employment of farmyard manures. This is the responsible opinion of the authorities of Holland, France, and of several of the leading agriculturists of Germany. It is also substantially the view of Mr. A. D. Hall, of Rothamsted. Several of the above States estimate that no less than 50 per cent. of the increase has been due to the use of artificial manures, or to artificial manures together with farmyard manure.

Next in order of importance comes better tillage and better cultivation.

As a general rule, the experts attribute only 10-15 per cent. of the increase to selection of improved seed; though one of the authorities consulted, Professor Gerlach, of Bromberg (Germany), attributes a larger share of the increase to selection than to any other cause.

In his attempt to persuade the agriculturists of America to pay more attention to the use of chemical manures—particularly of phosphates and of lime—Mr. Hopkins will have strong support from the European authorities whom he has consulted.

* *The Trees of Great Britain and Ireland*, by H. J. Elwes, F.R.S., and A. Henry, M.A. Vol. v. (Privately printed.)

ROYAL HORTICULTURAL SOCIETY.—The next meeting will be held in the Society's Hall on Tuesday, August 30. At the three o'clock meeting a lecture on "The Effect of Overhead Electrical Discharges upon Plant Growth" will be delivered by Mr. J. H. PRIESTLEY, B.Sc.

NATIONAL HORTICULTURAL SOCIETY OF FRANCE.—At a recent meeting of this society Lieut.-Colonel PRAIN, Director of the Royal Gardens, Kew, and M. CHARLES PANAERT, Editor of the *Revue de l'Horticulture Belge et Etrangere*, were elected corresponding members.

MR. MAURICE FULD.—This gentleman, until recently manager of the firm of Messrs. W. W. RAWSON & Co., Boston, U.S.A., has joined the

WART DISEASE OF POTATOS.—We are requested by the Board of Agriculture and Fisheries to remind growers of Potatos that it is their duty, under the Destructive Insects and Pests Order of 1910, to report to the board all outbreaks of wart disease in counties in which no officer has as yet been appointed by the local authority to receive reports. The penalty for neglecting to report the outbreak is £10. The presence of disease should be again reported this year notwithstanding the fact that it may have existed and been reported last year. A leaflet describing warty Potatos may be obtained on application to the Secretary, Board of Agriculture and Fisheries, 4, Whitehall Place. Letters so addressed need not be stamped.

LOUIS VAN HOUTTE.—M. LE TEXNIER, a well-known French writer on historic and literary matters relating to horticulture, is publishing in the columns of our contemporary *Le Jardin* a series of articles dealing with the life and labours of this eminent Belgian nurseryman.

GARDEN LITERATURE.—In the current number of the *Journal of the National Horticultural Society of France* we notice an essay entitled "Some Old English Gardening Books Translated from the French," by Mr. HARMAN PAYNE. The period covered is from 1516, beginning with the *Croque Herbal* by PETER TREVERIS, to 1759 with MILLS' translation of DUHAMEL DE MONCEAU'S work.

FIG. 61.—WOBURN PLACE: THE ROSE GARDEN.

staff of Messrs. HENRY F. MICHELL & Co., Philadelphia. Mr. FULD is secretary and founder of the New England Dahlia Society, founder and treasurer of the American Gladiolus Society, and Editor of the *Dahlia News*.

Figs.—According to Mr. AARON AARONSOHN, Director of the Jewish Agricultural Experiment Station at Haifa, Palestine, the Arabs in Biskra and Egypt cut off the tips of the immature Figs in order to make them ripen. It is said that, three days after this is done, the cut Figs become twice as large as those uncut and develop a much better taste.

URBAN ALLOTMENTS. A vegetable and flower show arranged by the allotment holders renting plots from the West Ham Town Council was held in the Public Hall, Canning Town, on August 20. According to *The Times*, the Corporation charges 5s. a year for a 16 rod plot, and have 585 allotment holders whose gardens are mostly on disused gravel pits, which were subsequently used as dust shoots and have to stand 20 years or so before they can be utilized for building purposes. "Triangle Camp," which was seized by the unemployed a few years ago, is one of the allotments, and the products of this piece of ground took most of the prizes.

CRUICKSHANK BOTANIC GARDENS, ABERDEEN.—These gardens, which have been so serviceable in the teaching of botany at the Aberdeen University, under the curatorship of Dr. JAMES W. H. TRAIL, are to be laid out afresh on an adjoining piece of land purchased by the Cruickshank trustees. The existing gardens, which were formed some 11 or 12 years ago, are not the sole property of the trustees, part being held on lease from a neighbouring proprietor, the tenure being a short one. As soon as practicable, the bulk of the most valuable plants will be transferred to the newly-acquired land, which is not so flat as the site of the present gardens.

THE POLLINATION OF GREEN FLOWERS BY INSECTS.—It is very generally held that only brightly-coloured flowers attract insects, and secure by their visits the advantages of cross-pollination. Professor PLATEAU, however, who does not share this opinion, published as long ago as 1897 a list of no fewer than 79 plants which, though possessed of green or greenish flowers, are, nevertheless, "entomophilous." Since then Professor PLATEAU has extended this list considerably, and in a contribution to the Belgian Royal Society of Botany (Bull. Soc. Roy. Botan. Belgique, xvi, p. 339, 1909) includes among green-flowered entomophilous plants the Orchid *Listera ovata*. Though visited by many insects—Diptera, Coleoptera, and Hymenoptera—the insects which are responsible for cross-pollination are generally incheucorns, which, on arriving at the flower, alight on the lower part of the labellum, and following the nectariferous furrow from below upward, end usually by getting the pollinia fixed firmly to their heads or other parts of their bodies. In such cases, visits to other flowers of *Listera ovata* result in cross-pollination. Professor PLATEAU concludes from his long-continued observations, that colour counts for little or nothing in securing the visits of insects which effect cross-pollination.

PROF. W. BATESON.—Prof. BATESON, F.R.S., Director of the John Innes Horticultural Institution, has taken up his residence at Manor House, Merton Park, Surrey.

THE VALUE OF SEA-WEED AS MANURE.—An amusing instance of the "law's delays" and of the loss which follows from the attempt to decide by cumbersome legal methods, a relatively simple question is given in *Nature* for August 4. It appears that, according to a report in the *North British Agriculturist*, three farmers were deprived of their rights to gather sea-weed on the fore-shore at Rosyth when the Admiralty resumed possession of the shore. The liability of the Admiralty to compensate was not disputed, the value of seaweed for manurial purposes being the subject of the controversy. According to experts and practical men, this value was placed at sums varying from 1s. to 9s. 3d. per ton. Finally the arbitrator "split the difference," and allowed compensation on the basis of 4s. 9d. per ton.

THE LATE M. CALVAT'S CHRYSANTHEMUMS.—We understand that the large collection of seedling and other Chrysanthemums forming the stock of the late ERNEST CALVAT have been placed under the care of M. RÉMY, the well-known grower, of Grenoble.

FATAL ACCIDENT TO A GARDENER.—The death of Mr. MEAKIN, gardener to REGINALD LODER, Esq., Madewell Hall, near Market Harborough, occurred under distressing circumstances on the 15th inst. Mr. MEAKIN fell from a ladder whilst pruning a Pear tree and broke his neck, death being instantaneous. He was 53 years of age, and had been gardener to Mr. LODER for about 11 years; he had been previously in the service of Mr. LODER's family nearly all his life. Mr. MEAKIN leaves a wife and six children.

CAMBERWELL PUBLIC PARKS.—Mr. JAMES CHRISTIE has been appointed superintendent of parks, gardens, and street trees under the borough of Camberwell. Mr. CHRISTIE served his apprenticeship under his father at Ragley, afterwards continuing his studies and practice at the Edinburgh Botanic Gardens. Later, he was employed in the gardens of Baron ROTHSCHILD, at Ferrières, Paris, and afterwards at Hyde Park, London. For the last four years, Mr. CHRISTIE has been employed as sub-foreman at Kew Gardens.

FORESTRY AT ABERDEEN UNIVERSITY.—A four-weeks course of lectures for foresters has just been started under the auspices of the Aberdeen and North of Scotland College of Agriculture and the University of Aberdeen. This period of the year has been selected as the time when foresters can most conveniently attend, and it is interesting to note that the expenses of the foresters are being paid by the respective proprietors of the estates on which they are engaged. There was a representative attendance at the opening meeting under the presidency of Dr. GEORGE ADAM SMITH, Principal of the University of Aberdeen. Mr. SYDNEY J. GAMMELL, of Drumtochty and Countesswells, one of the governors of the College of Agriculture, and the president of the Aberdeen, Banff and Kincardine shires branch of the Royal Scottish Arboricultural Society, speaking on behalf of the governors of the College of Agriculture, offered the students a warm welcome. The class is conducted by Mr. WILLIAM DAWSON, B.Sc. In addition to lectures, excursions will be undertaken to woods, nurseries, saw mills and other places in the neighbourhood of Aberdeen, and work in the laboratory will include the identification of specimens by means of the microscope as well as the naked eye.

THE RESISTANCE OF POLLEN OF FRUIT TREES TO FROST.—From experiments made by EWERT, and published in the *Zeitschrift für Pflanzenkrankheit* v, xx., p. 65, 1910, it appears that the pollen of fruit trees is capable of enduring an exposure to very low temperatures: in certain varieties of Apple, as much as 17° C. Since fruit trees are injured by exposure to much less severe cold, it is suggested that the most promising method of obtaining frost-proof varieties is, as we suggested recently in a leading article, by raising parthenocarpic varieties.

EXHIBITION AT PRAGUE.—An important horticultural exhibition will be held at Prague from September 3 to October 15. In addition to the general decoration of the exhibition, for which autumn flowers will be largely employed, two gardens will be formed, one of them representing a tropical region, and the other decorated with architectural subjects and objects of the fine arts. The portion of the exhibition devoted to fruit will be opened on September 28, and exhibits are expected from Bohemia, Moravia and Silesia. Exhibits from districts of Bohemia will be arranged according to their situation and climate. Other subjects of interest will include the classification of fruits and the best methods of packing fruits. The culture of vegetables, for which Bohemia and Moravia are distinguished, will be worthily represented. Other branches of horticulture to be represented are those pertaining to nurseries and parks. There will be models of gardens and nurseries of Bohemia, a school garden, and a commercial nursery. Science and the fine arts will be represented in all sections of the exhibition. A congress of Austrian gardeners will be held from September 27 to 30.

THE PEA CROP IN THE U.S.A.—The indications of a deficient seed crop in the United States were remarked in the gardening Press of that country some time ago. It is now reported that the worst fears of the seed farmers will be realised. Although the exact figures cannot as yet be given, it may be confidently stated that the crop will be at least as short as that of 1909. This will be most unwelcome news to the seed trade, as well as to the canners of the country, for practically no seeds of culinary Peas were saved over from last year, and a good crop this year would have been readily absorbed by the trade. Wisconsin has suffered more severely this year from drought than Michigan.

NATIONAL DAHLIA SOCIETY.—The early exhibition will be held at the Crystal Palace on September 8, 9. There will also be a later show at the Royal Botanic Gardens, Regent's Park, on September 20, 21.

INTERNATIONAL HORTICULTURAL EXHIBITION, 1912.—It has been decided that this exhibition will be held in the grounds attached to the Royal Hospital, Chelsea. The area leased to the exhibition authorities, including the Ranelagh Gardens, is approximately 20 acres, and nearly 16 acres will be directly available for the accommodation of the exhibits. There are many fine specimen trees, which will add greatly to the beauty of the show and facilitate the artistic arrangement of the flowers. Entrance to the grounds can be effected from the Thames Embankment on the one side and from Bridge Street on the other. The grounds are accessible from all parts of London.

A HARDY PLANT SOCIETY.—A meeting of persons interested in hardy plants was held at the George Hotel, Shrewsbury, on the 17th inst., when it was resolved unanimously:—"That a National Hardy Plant Society be formed for the encouragement, the extension, and the improvement of hardy plant culture, whether for the garden, for decorative purposes, or for exhibition, and for the improvement of their nomenclature." A Provisional Committee was appointed with Mr. MACSELF as chairman. Mr. FRANK BOUSKELL was elected as secretary. Mr. J. S. BRUNTON as treasurer, and Mr. R. T. WENT as vice-chairman. The following Provisional Committee was appointed:—Mr. W. IRVING (Kew), Mr. S. ARNOTT (Dumfries), Mr. J. ARINDALE (Sheffield), Mr. G. GIBSON (Bedale), Mr. F. EAMES (Frome), Mr. W. E. CLARKE (Whitchurch, Cardiff), Mr. G. G. BLACKBOURNE (Kingsacre Nurseries), Mr. R. W. HOSIER (Messrs. BAKERS, Wolverhampton), Mr. G. C. MUDGE (Messrs. Barr), Mr. E. G. QUICK (Covent Garden), Mr. C. E. OSBORNE (Hereford), Mr. D. ROBERTS (Messrs. DICKSON'S, Chester), Mr. N. WALKER (Bedale), Mr. J. C. HOUSE (Westbury-on-Trym), Mr. W. J. ROBERTSON (Worcester), Mr. A. J. WOMMACETT (Messrs. HEWITT'S, Solihull), and Mr. J. HARKNESS (Bedale). It was decided to hold the next meeting at Edinburgh on September 7, on the occasion of the Royal Caledonian Horticultural Society's autumn show.

PUBLICATIONS RECEIVED.—*The Science and Practice of Manuring*, by W. Dyke & J. Wright. (London: The Loekwood Press.) Price 1s.

NURSERY NOTES.

NOTES FROM FELTHAM.

I know of nothing more interesting than to spend a few hours at Messrs. James Veitch & Sons' Feltham nurseries, where house after house is filled with plants that will be seen on the exhibition table, or those that have already passed that stage, and are now being carefully looked after until their crops of seeds are gathered.

My last visit was made in the middle of August—perhaps not the best time to go—but even then there was much to see. Among the specialities, the different forms of *Streptocarpus* stood out prominently, one house being devoted to plants passing out of flower, but bearing a fine crop of seed pods. Another house was occupied with a made-up bed, in which thousands of seedlings were planted, and these were just commencing to produce their earliest flowers. Many of them were very beautiful, and, great as is the number of present varieties of *Streptocarpus*, these seedlings show decided breaks away from those already in cultivation.

Begonias of the winter-flowering section, in which there are now such charming varieties raised by Mr. John Heal, were astonishingly

numerous, varying from tiny cuttings to established plants approaching the flowering stage. This section of Begonias is by no means the only one represented, as varieties of the tuberous-rooted class are grown in large numbers. Not the least interesting plants amongst the Begonias were some of the original species whence the garden varieties have been obtained. Crosses are still made between these species and the best of the newer garden forms, in the hope of getting further novelties possessing superior qualities. The strong-growing warm house Begonias, such as President Carnot, are also largely grown at Feltham.

House after house and frame after frame were filled with Carnations ranging from recent layers to large, established plants in 6-inch pots.

Rhododendrons of the Javanese section are still grown at Chelsea, as they resist the London atmosphere better than the hairy-leaved *Edgeworthii* hybrids. These last are grown at Feltham, where there is also a vast number of *R. Veitchii*

(*Excelsior*) which was given an Award of Merit by the Royal Horticultural Society.

Abutilons were represented by a goodly number of flowering examples, but comparatively few varieties are grown. The best in their colours were *Boule de Neige* (white), *Golden Fleece* (yellow), *Rosaflorem* (rose), and *Red Gauntlet* (crimson). A distinct variety is *Triomphe*, sent out a few years ago by Mons. Lemoine, of Nancy. It has large, widely-opened flowers, which, though not double, have an increased number of petals. The flower-stems are short but stout, and the blossoms stand out in a partially horizontal manner, instead of being decidedly drooping, as in the ordinary forms. The colour is pink. From its stiffer habit, this variety is less pleasing, at least, to my mind, than most of the others.

Fuchsias are grown in three different ways—as dwarf bushes in 5-inch pots, as tall plants for clothing roofs or rafters, and lastly as standards. There was a good stock of the newer hybrid kinds raised in Germany, which have made con-

to the extent they were formerly, but still many of the best are kept in stock. The most pleasing feature in this class was a large batch of *Crowea latifolia* (syn. *saligna*), the Willow-like shoots being laden with charming, pink-coloured blossoms.

Bougardias are cultivated in great numbers. The plants are grown in batches, and the earliest were just coming into bloom.

Many Lilliums, particularly *L. auratum*, *L. longiflorum*, and *L. speciosum* in its several varieties, are grown, and they are extremely useful for various decorative purposes.

The large number of flowering plants grown as standards caused me some surprise. The plants treated in this way included Fuchsias, Heliotropes, Pelargoniums, particularly the members of the Zonal and Ivy-leaved sections, and the scented-leaved variety *Clorinda*, *Plumbago capensis*, *Aloysia citriodora*, *Streptosolen Jamesonii*, *Salvia splendens*, Abutilons and others.

Considering that Lapagerias are not usually

FIG. 62.—FIRST PRIZE GROUP OF HARDY FLOWERS SHOWN BY MESSRS. GUNN AND SONS AT SHREWSBURY SHOW. (See p. 150 ante.)

anum, the Moulmein species with magnificent, pure-white flowers.

Gloxinias filled three large houses. The occupants of two of them were ripening their seeds, but the third house, filled with this year's seedlings, was still a blaze of colour.

Hippeastrums are grown at Feltham in considerable numbers, although the general collection is still at Chelsea. The clearer atmosphere of Feltham enables the bulbs to be ripened off sooner than in London; consequently, they can be flowered earlier.

Kalanchoe flammula, which was first distributed by Messrs. Veitch 10 years ago, has flowered in successive batches since last May. Most of the plants were ripening seed, but late specimens were still affording a good display of blossom. Other species and hybrids of *Kalanchoe* are cultivated, and the propagator was busy at the moment with the new variety of *Kalanchoe kewensis*

considerable headway in this country within the last few years.

Cannas continue to be treated as a speciality. Mr. Weeks, who had charge of the soft-wooded plants at Chelsea for many years, and who now occupies the same position at Feltham, pointed out a variety which in his opinion is the very finest-flowering *Canna* in cultivation. This is *William Saunders*, the flowers of which are of an intense bright-crimson colour, and of more substance than is to be found in most of the *Cannas*. From this circumstance the flowers remain fresh for an unusual length of time. Other particularly good varieties noted were *Duc Ernest* (deep scarlet, bronzy leaves), *Gaekwar* of *Baroda* (yellow, heavily spotted crimson), *Venus* (deep rose, yellowish border), *King Humbert* (orange apricot), *Hesperides* (brilliant orange), and *Roseleur* (rosy carmine).

Hard-wooded greenhouse plants are not grown

planted in great quantities, and that, once planted, they may be regarded as permanent, it surprised me to see a house given up to layering them. Beside these, there was quite a large batch taken off from the stock plants last season, many of them being ready to shift into larger pots or to be planted into permanent quarters.

Other plants noticed at Feltham included those following:—*Amphicome Emodii*, an *Juncarvillea*-like plant with rose and yellow-coloured flowers; *Aristolochia gigas Sturtevantii*, a well-known, large flowered species; *Callicarpa purpurea*, whose profusion of flowers augured well for a good display of berries later on; *Calceolaria Chirami*, then ripening its seed; *Dipladenia boliviensis*; *Erlangea tomentosa*, a good winter-flowering plant; *Jacobinia chryso-stephana*, an old but much-neglected plant; *Lobelia tenuior*, one of the showiest of the *Lobelias*, both for baskets or pots; *Mussaenda erythrophylla*, an interesting

plant from the Congo district, with insignificant flowers, which are subtended by leaf-like, rosy-scarlet bracts; *Oxyptalum* (*Tweedia*) *erruleum*, a twining *Asclepiad* from South America with bell-shaped flowers of a peculiarly changeable shade of blue; *Solanum Wendlandii*, so well shown at the last Holland Park exhibition; *Thunbergia fragrans*, a beautiful, white-flowered climber; and *Tydaea Robert le Diable*, one of the deepest-coloured of all the *Tydaeas*.

Out-of-doors there was a good collection of *Dahlia*s, planted out in order to prove their value for garden decoration.

A large expanse of ground is given up to the culture of annuals, and a splendid show they made, the quality of the flowers and the immensity from roques in the beds affording proof of the rigid selection exercised in the saving of the seed.

There were some acres of hardy fruit trees and thousands of trees in pots, but these cannot be noticed in detail at this time. *W. Trulove.*

THE FERNERY.

BRITISH FERNS OF THE FUTURE.

WHEN we compare the wonderful and beautiful varieties of British Ferns with those which were in existence half a century ago, the question naturally arises whether such advance can be continued on the same scale, or whether sooner or later the possibilities will be exhausted. At the time referred to, judging by the published catalogues of the period, really fine symmetrical and constant varieties were very few, and consisted mainly of wild finds, that is, finds which had only been propagated by offsets and not by spores, so that practically all the specimens extant of the particular type were identical. The rest of the varieties on the market consisted largely of irregular and defective types, which had resulted from injudicious sowing of erratic forms, a number of which, experience has shown, are far more apt to propagate themselves spontaneously than are the better types. This fact led to their introduction as early-raised market plants, whose value was then apparently determined by their curious character: the greater their eccentricity the higher the price. The number of these eventually so far exceeded that of the "thoroughbreds" that a revulsion of taste was inevitable, and, for decades, the popular idea of British Fern varieties, if any idea was formed at all during the period of depression, was that they were more ugly than beautiful, and hence unworthy of attention. Meanwhile, however, the handful of enthusiasts who, by their own discoveries and selective culture, had become acquainted with the finer varieties, were more and more encouraged by the results they had attained, and by degrees worked up collections of most beautiful, thoroughbred types, which in time eclipsed, in charm of plume dissection, or ornate tasselling, or frilling, anything which could be found among exotic varieties. Every now and again, too, altogether unexpected results occurred among the spore sowings, new strains coming to light in this way which surpassed their predecessors in delicacy and grace, and it also became clear that the possibilities of combining such charms by hybridising were fully demonstrated, both by systematic cross-fertilisation and chance results of mixed sowings. Now, in our opinion, it is this last phase of Fern culture which widens the horizon of future possibilities. So little comparatively has it been worked out that we may count the recognised crosses upon our fingers, and in this connection the example of *Polypodium Schneideri*, a successful cross between the two different species of *Polypodium*, *P. glaucum*, a large growing, tender exotic and *P. vulgare cornubiense* (*elegantissimum*), a beautifully-divided form of the hardy, common *Polypody*, indicates an immense field of utility in the direction of decorative plants. True, it may be argued that we cannot legitimately claim such results as British Ferns proper, but if it is our British Fern of an abnormal but beautiful type, which imparts its particular charm to a purely normal exotic, we are surely entitled to claim the major part of the merit involved, especially if the results be, as it is largely in *Polypodium Schneideri*, and might be entirely in less tender species, the production of nearly or quite

hardy plants possessing the charm both of the exotic form and that of the home variety. We recommend this field to the particular attention of exotic Fern growers, whose possession of warm greenhouses gives them special facilities for experiments, which can take the simple form of persistently sowing spores of fine British varieties with those of allied exotic species on the offchance of a cross. But, apart from such experiments, there are innumerable British varieties of one and the same species which would be greatly enhanced in beauty could the charm of another variety be added. We will take the common *Polypody* forms as a type. *P. v. cornubiense* has already been crossed with *P. v. bifido-multifidum* so as to obtain a crested *cornubiense*. *Cornubiense*, however, is an erratic Fern, and persistently transmits its erratic character to its offspring even, as we see in *P. Schneideri*, when crossed with another species. *P. v. pulcherrimum*, however, is a thoroughbred tripinnate form, and a successful cross between this and *P. v. cristatum* or *P. v. grandiceps* Fox or Forster could not fail to form a handsome combination unlike anything we possess. To revert to exotic blood there are, on the other hand, a number of simple fronded, exotic *Polypodium*s, which, if they could be induced by the gentle influence of *pulcherrimum* to bear tripinnate fronds instead of simple or pinnate ones, would be far more ornamental than they are at present. In another genus, the *Polystichum*s, we have numerous exotic forms, some like *P. setosum*, perfectly hardy and very distinct from our native species, though viewed by some botanists as a form of *P. aculeatum*, which could be improved by crossing with some of the finely-crested *plumosum*s or *cristatum*s. As there is no doubt that many of the exotics are very closely allied indeed to our home species; the chances in this direction are very great. *P. setosum* is a fairly common market plant here, and we strongly advise, in connection with it, the procedure advocated above. In the *Spleenwort* family, too, a race, as a rule, peculiarly constant to the normal type, we have marked exceptions to this rule in the crested forms of our native *Asplenium trichomanes* and *Scelopendrium vulgare*. Fortunately for such experiments, difference in size forms no bar to crossing, and, in the initial stages, the growths vary little in their dimensions. Hence we have no such obstacles to crossing as are involved in the fine adaptations of size of pollen grains to length of style incidental to flowering plants. The main obstacles to the cross-breeding of Ferns consist, apart from wide generic differences, in differences in the rapidity in germination of the spores. A little study, however, may enable this to be overcome by sowing the spores at different times. In any case, the field of experiment is large, the difficulties to be overcome but trifling, whilst any results obtained must be valuable, since, even though crossing resulted in failure, the progeny of such good forms as should only be used, would have their commercial value. *Chas. T. Drucry, V.M.H., F.L.S.*

HOME CORRESPONDENCE.

(The Editors do not hold themselves responsible for the opinions expressed by correspondents.)

SEEDS OF LILIIUMS.—As long as my supply holds out, I shall be pleased to give a pinch of seed of any of the following species to any amateurs among your readers who may be interested in the culture of Lilies; I shall be glad to hear from anyone who has had *L. auratum* in cultivation in the open for more than 10 years:—*L. cordifolium* var. *Glehnii*, *L. dalmaticum*, *L. Hanssonii*, *L. Henryi*, *L. Humboldtii magnificum*, *L. Kelloggii*, *L. Kramerii*, *L. Marhan*, *L. Martagon*, *L. Martagon album*, *L. parvum*, *L. parviflorum*, *L. pomponium*, *L. Parryi*, *L. pardalinum*, *L. philadelphicum*, *L. rubellum*, *L. Szovitzianum*, and *L. tenuifolium*. *A. Grove, Kentons, near Henley-on-Thames.*

QUEEN WASPS.—On p. 39 in the issue for July 16 Mr. W. Francis Eakin states "that the wasp pest is likely to be felt acutely this season as there were so many queens in the southern districts." Here, both in gardens and on the commons, queen wasps have been extremely numer-

ous, but I have noticed on several occasions that when there is a plague of queen wasps in the summer there is a scarcity of wasps in the autumn. Why this is so, I am unable to say. I am of the opinion that the weather and the gardener are not the only agents destructive to wasps. *G. H. H. Wassell, Heath End House Gardens, Baughurst, near Basingstoke.*

JUDGING AT LOCAL FLOWER SHOWS.—Two years ago I staged a collection of eight varieties of vegetables at a local flower show, in an open class, and was awarded the third prize. I considered I should have been placed first, but I was informed by one of the judges that my Leeks were out of season. I also exhibited at another show this year, when I was told the same thing. Surely it is to a gardener's credit to produce things out of season, when they are more appreciated by his employer. These shows were held in the middle of July, yet Leeks and Celery are seen at the Temple Flower Show six weeks earlier. *Kingston Hill.*

SAXIFRAGA FLORULENTA.—Those of us who have cultivated, or attempted to cultivate, *Saxifraga florulenta* will have read Mr. Farrer's illuminating notes on the plant (see p. 118) with the deepest interest. I gather from the note that Mr. Farrer has experienced the same difficulty as others in inducing it to flower. In cultivation, at least, the name of *florulenta* is an appropriate one. But I imagine that most of us have attempted to grow this species in a position in which the greater number of the silvery *Saxifragas* thrive, i.e., on the flat, or nearly so. From what Mr. Farrer says, a vertical position suits it best, and may, indeed, be necessary. The plants which survived longest with me were in almost complete shade, and on the stony slope of a rockery facing almost due east. Here they made good rosettes, but never developed a flower during their four or five years existence. The rosettes are so handsome as almost to reconcile one to their non-flowering, especially as the blooming would entail the death of the individual rosette and the necessity of saving and sowing the seeds if the stock is to be maintained. One includes it for convenience, among the "silvery" *Saxifragas*, but this term hardly suggests what Mr. Farrer so justly calls "the rich, glassy-green rosettes." *S. Arnott.*

SWEET PEAS AT SHREWSBURY.—I am the exhibitor referred to in your report of the Sweet Pea classes (see p. 150) as having *Minnie Christie* and *Rosie Adams* in mixture. . . My flowers that were said to be *Rosie Adams* were two-days-cut *Minnie Christie*, and upon reflection the similarity which these flowers would bear to *Rosie Adams* is not saying much for that variety. Those who will take the trouble to make the experiment by cutting flowers of this variety on two separate days and comparing them on the third day will quickly discover there is a great difference in shade. We had to cut as we did on account of the unfavourable weather. The only right and fair way to judge the difference between varieties so close together is to take their differences in form; we can always find a distinction here. *Geo. Jitkens, Wrexham.*

ARGEMONE GRANDIFLORA (see p. 138).—Having seen this Mexican cornfield weed growing and flowering freely in southern gardens, I, for several seasons attempted its cultivation as an annual in a northern urban garden, with, however, but indifferent success. The plants grew away vigorously, but failed to flower satisfactorily, probably by reason of the excessive rainfall and lack of bright sunshine. The plants, when at their best, were injured by early frosts, which sear but do not kill. It would appear to be essentially a plant for a warm, sunny situation, and under such circumstances, when massed, and flowering freely, with a dark background, would appear very effective. *Fred. W. Jeffery, Callander, N.B.*

DODDER. I have observed an unusual quantity of Dodder (*Cucuta Epithimum*) this year in Hampshire and Dorset, and also in Co. Kerry, where it is a much scarcer plant than in England, and would be interested to know if any reader can suggest some reason for its great abundance, especially on Heath and Gorse; and if any other species, such as *C. Trifolii*, has been noticed in special abundance this year? *H. S. Thompson.*

SOCIETIES.

**ROYAL HORTICULTURAL
Scientific Committee.**

AUGUST 16.—*Present*: Mr. E. A. Bowles, M.A., F.L.S., F.E.S. (in the Chair); Messrs. J. Fraser, G. Gordon, J. Douglas, A. Rolfe, and F. J. Chittenden (hon. sec.).

Dimerous Iris.—Mr. W. FAWCETT, B.A., F.L.S., sent a flower of *Iris Xiphium* having all its parts in twos instead of threes. This type of variation from the normal in *Iris* is fairly common, but is often confined to one or two whorls instead of all four. The stem also bore a bud, but, in that, the parts of the flower were in threes.

Sporting in Carnations.—Mr. J. DOUGLAS, V.M.H., called attention to the variation in colour met with in *Carnation*, "Rhoda," which, when it was first sent out, was marked with lavender and red on a white ground. It had this year sported in two or three places to a lavender-ground flower. He remarked upon the frequency with which sudden colour sports appeared in more than one locality, in the same plant, at the same time. Several other instances were remarked upon by other members of the Committee.

Salices.—Mr. J. FRASER showed specimens of *Salix alba* (the *Bat Willow*) and called attention to the form of the serration of the leaves; though the latter vary in size, the serrations are always of similar form. He showed also *S. fragilis britannica*, which has irregular serrations to the leaves, and the hybrid, *S. viridis*, in which the foliage is intermediate between the other two. In the hybrid, the leaves are dark green above, and their under surfaces are whiter than those of *fragilis*; the serrations are intermediate in form and more regular than in *fragilis*.

Spotting of Calanthe foliage.—Plants of *Calanthe* vars. were shown badly attacked by a spot disease. So far as has yet been definitely ascertained, the spotting is not caused by a fungus or other organism, and appears not to be infectious. It seems rather to be due to some cultural defect, perhaps to spraying with cold water.

NATIONAL VEGETABLE

TRIALS OF ONIONS AND POTATOS.

Seventy-two stocks were sent for trial as autumn-sown Onions by 19 distinct seedsmen, whose names were mentioned in the *Cabbage Trial Report*. The respective stocks of seeds were divided equally, and sent to the care of Mr. W. Poupert, Marsh Farm, Twickenham, and Mr. C. Foster, *The Times* Experimental Station, Sutton Green, Surrey, under numbers only. The seeds were sown in drills 12 inches apart on August 20, 1909, and, in each case, space was left for transplanting some of the bulbs of each stock. Owing to the mild autumn weather, the plants made an unduly rapid growth, which, in the spring, resulted in some of the plants "bolting." This was more marked, however, on the warm, sandy soil at Sutton Green, especially in those that were transplanted. The primary estimate of the merits of the various stocks was made from the Twickenham trial.

The final inspection of the Onions was made by a large committee on July 19, when the following awards were made:—

AWARDS OF THREE MARKS.

Messrs. James Carter & Co., *Record*; Messrs. Daniels Bros., *Golden Rocca*; Messrs. Dickson, Brown & Tait, *Excelsior*, *Giant Rocca*, and *Red Italian*; Messrs. Dickson & Robinson, *Premier* and *Giant Tripoli*; Messrs. Pearson & Sons, *Trebons* and *Red Italian Tripoli*; Messrs. Sutton & Sons, *A1*; Messrs. James Veitch & Sons, *Cranston's Excelsior*; Messrs. Webb & Sons, *Giant White Tripoli*; Messrs. Hurst & Sons, *Ailsa Craig*, *Red Italian Tripoli*, and *Giant Rocca*; Messrs. Vilmorin-Andrieux et Cie., *Vanguard* (very early white); and Messrs. Watkins & Simpson, *Wroxton Globe*.

AWARDS OF TWO MARKS.

Messrs. Daniels, *Allan's Reliance*; Messrs. Dickson and Robinson, *Flat Mammoth*; Messrs. Dickson (Belfast), *Wroxton Globe*; Messrs. Pearson, *Ailsa Craig* and *Giant Rocca*; Messrs. Sutton & Sons, *Perfection*; Messrs. James Veitch & Sons, *Giant Zittau*; Messrs. Vilmorin, *Short Pale*

Red; Messrs. Watkins & Simpson, *Cranston's Excelsior*; and Messrs. W. W. Johnson, *Giant Lemon Rocca*.

The following, while not so well bulbed, were regarded as excellent or true stocks; Messrs. Austin & McAslan, *Trebons* and *Excelsior*; Messrs. James Carter, *Tennis Ball* and *Early Wonder*; Messrs. Daniels, *Improved White Spanish*; Messrs. Yates (Evesham), *Giant White Tripoli*; Messrs. Watkins & Simpson, *Ailsa Craig*; Messrs. Vilmorin, *Blood Red*; Messrs. Hurst,

to be *Ailsa Craig*, *Cranston's Excelsior*, *Wroxton Globe*, *Record* and *Trebons*; and, of the *Italian* or *Tripoli* section, *Giant Rocca*, *Lemon* or *Golden Rocca*, and *Red* and *White Italian Tripoli* are the best.

TRIAL OF EARLY POTATOS.

This trial was conducted at *The Times* Experimental Station, Sutton Green, Surrey. The tubers were planted on April 20 in rows 30 inches apart, the sets being 18 inches apart in the rows. The soil is a deep sand, and was very moderately

FIG. 63.—GLADIOLUS GRAFIN DEGENFELD: COLOUR PRIMROSE-YELLOW WITH BRIGHT CRIMSON MARKINGS.

Award of Merit at the Royal Horticultural Society, August 16. (See p. 117.)

White Italian Tripoli; Messrs. Webb, *Giant Rocca*; Messrs. James Veitch, *Main Crop*; Messrs. Sutton, *Globe* and *Improved Reading*; Messrs. W. W. Johnson, *Globe*; Messrs. Dickson (Belfast), *Long Keeper*; Messrs. Dobbie, *Golden Globe*, *Giant Rocca*, *Trebons* and *White Tripoli*; and Messrs. Dickson & Robinson, *Paragon*.

It is thus seen that the best of the more globular and keeping Onions for autumn sowing seem

manured, the culture being that of the open field. The inspection by members of the committee took place on July 29, several roots at each end of the respective rows being lifted for examination. Generally, the crops were excellent and clean, but in few cases were the tubers large.

AWARDS OF THREE MARKS.

Messrs. R. Veitch & Sons, *Emter*, *Lady*

Llewelyn; Messrs. Pennell, Lincoln, Sharpe's Victor; Messrs. G. Fuller & Sons, Reading, Sharpe's Victor; Mr. J. W. Cross, Wisbech, Sharpe's Victor; Messrs. C. Sharpe & Co., Sleaford, Sharpe's Express; Mr. J. F. Williamson, Mallow, Sharpe's Express; Messrs. R. Sydenham, Birmingham, Sharpe's Express; Messrs. Dobbie & Co., Edinburgh, Alpha; Mr. A. Dickson, Belfast, Mile-Cross Early; Mr. G. Sharpe, Perthshire, Cragie Early; Messrs. James Veitch & Sons, Chelsea, New English Beauty; Messrs. Webb & Sons, Worsley, First Crop; Messrs. Sutton & Sons, Reading, May Queen; Mr. A. Dickson, Belfast, May Queen; Messrs. James Carter & Co., Hallow, Advance; Messrs. Dobbie & Co., Edinburgh, Midlothian Early; Messrs. Scarlett & Co., Edinburgh, Midlothian Early; Mr. J. F. Williamson, Mallow, Midlothian Early; Mr. Harris, Blackpill, Seedling White Kidney; and Messrs. Hogg & Robertson, Dublin, New Coloured Kidney (Hebron Type).

AWARDS OF TWO MARKS.

Messrs. Scarlett & Co., Edinburgh, Eclipse; Messrs. Hogg & Robertson, Dublin, Seedling No. 2 and Seedling No. 3, Yellow-fleshed Kidney.

Epicure (Messrs. Sutton & Sons, Reading) both from Scotch-grown and own-saved seed planted in the trial, gave in each case a superb crop of fine ware tubers.

New English Beauty, of the Ashleaf type, gave a remarkable crop of tubers, though not large.

First Crop and Lady Llewelyn very closely resembled each other from seed.

MANCHESTER AND NORTH OF ENGLAND ORCHID.

JULY 21.—As usual at this time of the year, the exhibition was a small one.

W. R. LEE, Esq., Heywood (gr. Mr. Woodhouse), exhibited *Miltonia vexillaria* var. *Lambeauiana*, a fine large white form, one of the best varieties in cultivation. A First-class Certificate was awarded it. *Miltonia vexillaria* var. *Plumpton Glory*, also received a First-class Certificate. *Odontoglossum* × *ardentissimum* "Imperial Purple" was remarkable for the richness of its colouring.

Col. J. RUTHERFORD, Blackburn (gr. Mr. Lupton), staged a good group, in which some well-grown plants of *Cattleya Gaskelliana* alba were prominent; a Cultural Certificate was awarded to a specimen with 15 blooms. A new and very pretty plant in this group was *Odontoglossum* × *Rossii* (O. *Rossii* × O. × *Adriane*). This plant and *Odontoda* × *Graireana* (*Cochlioda Nozolina* × *Odontoglossum Rossii*) were given Awards of Merit.

J. H. CRAVEN, Esq., Keighley (gr. Mr. Corney), exhibited *Miltonia* × *Bleuana* Beeche's var. and *M. vexillaria* var. *Lambeauiana*, which received an Award of Merit and First-class Certificate respectively.

Mr. J. BIRCHENALL, Alderley Edge, exhibited the new *Stanhopea Rodigasiana*, for which a First-class Certificate was awarded.

Mr. J. ROBINSON, Altrincham, exhibited a good form of *Cattleya Warszewiczii*.

Messrs. SANDER & SONS, St. Albans, staged a group of plants, including several hybrids *Odontoglossum*s.

Messrs. STUART LOW & CO., Messrs. KEELING & SONS, and Mr. W. SHACKLETON were other exhibitors.

The next meeting will be held on September 8. P. H.

SHINFIELD AND GRAZELEY GARDENERS.

The revival of the summer flower show, under the auspices of the above society, was amply justified. It was held in the grounds attached to the residence of Lieut. Col. Cavensham Simonds. In the vegetable classes, Mr. A. BRADFIELD and Mr. MILES secured the chief honours. There was a keen competition in the class for a decorated window-box, the 1st prize being awarded to Mr. C. GOODRIDGE. In the fruit classes Mr. O. C. BANBURY obtained chief honours. The success of the show was in a great measure due to the chairman of the society, the Rev. F. T. Lewarne, and the energetic secretary, Mr. Wilfred Kernutt.

WESTON-SUPER-MARE HORTICULTURAL.

AUGUST 9.—The Weston-super-Mare Horticultural Society held a show on this date in the Grove Park, after an interval of eight years.

The outstanding features included a beautiful group of miscellaneous plants staged by Messrs. JAS. CYPHER & SONS, Cheltenham; fruit and vegetables, and the exhibits in the decorative classes.

In the class for a collection of stove or greenhouse plants, Messrs. J. CYPHER & SONS were easily first.

The same firm also led in the class for a group of miscellaneous plants. Mr. WM. BROOKS, Whitecross Nursery, Weston, was 2nd in this class, staging some exceedingly fine plants.

In the class for a collection of Orchids, Messrs. J. CYPHER & SONS were again successful, followed by Mr. WM. BROOKS.

Zonal Pelargoniums were shown well. The 1st prize was awarded to Mr. WM. BROOKS, the 2nd to Mr. H. CORNELIUS, Weston.

Mr. B. C. SHEPHERD, Bridgwater, won the 1st prize for a collection of Begonias.

For foliage plants, Messrs. CYPHER won the 1st prize, followed by Sir WM. HOWELL DAVIES, M.P., and Mrs. BERNARD, Bridgwater.

The classes for Roses were contested keenly, some exceptionally good blooms being staged. The principal winners in this section were Mr. J. MATTOCK, Oxford, THE KING'S ACRE NURSERY CO., Hereford, and Mr. J. CROSSLING, Penarth.

Sweet Peas were also shown well. Mr. A. GERHOLD, Penarth, won the 1st prize in the premier class, being closely followed by Mr. J. E. A. GIBBS, Dinas Powis, Glamorgan-shire; 3rd, Mr. C. E. PIERSON, Burnham.

In the decorative classes, the best shower bouquets were shown by Messrs. HODGE & CO., Cardiff, who also exhibited the finest "bride's bouquet," and another bouquet made with Sweet Peas.

For a collection of fruit Mr. G. A. GIBBS, Tyntesfield, was a good 1st; and Mrs. J. R. BRAMBLE 2nd.

In the Grape classes Mr. GIBBS secured the 1st prize in every case. Sir W. HOWELL DAVIES and Mr. J. WEBBER, Minehead, each won two 2nd prizes for Grapes.

The 1st prize for a collection of vegetables was won by Mr. B. C. SHEPHERD, Bridgwater; 2nd, Mr. J. W. SPENCER, Wolve.

Trade exhibits were few in number. Mr. H. ECKFORD, Wem, was awarded a Gold Medal for Sweet Peas; and a similar award was given to Mr. J. CROSSLING, Penarth, for a display of Roses.

Silver Medals were awarded THE KING'S ACRE NURSERY CO., Hereford, and Mr. J. MATTOCK, Oxford, for collections of Roses; Mr. C. J. ELLIS, Weston, for miscellaneous plants; Messrs. A. A. WAITERS & SON, Bath, for hardy flowers; and Messrs. JARMAN & CO., Chard, for cut flowers.

THE ROYAL ENGLISH ARBORICULTURAL.

IRELAND was this year selected by the society for its annual meeting and excursions, this being the first visit which the society has paid to the island. Dublin served as the headquarters for the greater part of the programme, and Waterford for the latter part of the visit.

On Monday the 15th, a visit was paid to Viscount Moink's estate at Charleville, which was reached by a drive from Bray through the beautiful Dargle Ravine. In the park and pleasure grounds at Charleville, great numbers of fine trees were noticed, particularly an avenue of *Cedrus Deodara*, planted in 1852, several specimens being about 75 feet high, also the Silver Firs, *Pinus insignis* and *P. excelsa*. *P. insignis*, sown in 1868 and planted out in 1872, are exceptionally fine, one tree measuring over 100 feet in height. There were also some fine examples of *Abies Webbiana*. In the gardens proper, is a Yew hedge about 9 feet high and the same distance through; one side of this hedge was draped with *Tropaeolum speciosum*.

Powerscourt adjoins Charleville, and here Lord Powerscourt, who displays considerable interest in forestry, personally welcomed the society, and, with the gardener, Mr. W. Owen, and the forester, Mr. J. Laird, conducted the party in the inspection of the estate.

The general meeting was held in the evening at the Evesham Hotel, under the presidency of

Mr. H. J. Elwes, in the regrettable absence of Sir Hugh Beevor, Bart., when the officers were elected, the president elect being Mr. E. R. Pratt, of Dordham, Norfolk.

Tuesday's programme was again a very full one, and proved most interesting, a visit being made to the famous Vale of Avoca district.

Ballyarthur Woods, the property of Col. R. E. Bayly, were inspected, and measurements taken of the largest trees. Insect pests were searched for and their habits discussed.

Leaving this estate by the Woodenbridge Hotel, the members proceeded by way of Moore's immortalised "Meeting of the Waters" to the Avondale Forestry School and Station, maintained and managed by the Agricultural Department for Ireland. The party was conducted by the local secretary of the society, Mr. A. C. Forbes, through the nursery, museum, laboratories and experimental plots of this interesting pioneer establishment.

TAUNTON FLOWER SHOW.

AUGUST 11.—The 43rd annual show was held on this date. Although such an important exhibition, recent shows have not been successful financially, and hence the committee decided this year to revert to the practice of holding it on one day only. Owing to this fact, many traders who usually attend did not put in an appearance; but, fortunately, those who were present excelled themselves, and provided a splendid display.

As at other important shows this year, Messrs. J. CYPHER & SONS, Cheltenham, carried all before them in the plant group classes; they were also awarded the 1st prizes in the following classes:—For 12 stove and greenhouse plants in flower; for six stove and greenhouse plants in flower; for six foliage plants; for a collection of Orchids; for a collection of new foliage plants; for a collection of stove plants; and for a collection of greenhouse plants.

In the other open classes the principal awards were as follow:—Eight varieties of Begonias; 1st, Mrs. BERNARD, Bridgwater. Pelargoniums: 1st, The Hon. H. G. GORE-LANGTON, Hatch Beauchamp, in both classes.

In the cut-flower section, Roses were of splendid quality, and every class was keenly contested. In a class of 36 varieties, Messrs. PERKINS & SON, Coventry, were placed 1st, followed by THE KING'S ACRE NURSERY CO., Hereford.

Messrs. PERKINS also won the 1st prize for 18 varieties, beating Messrs. JARMAN & CO., THE KING'S ACRE NURSERY CO. being placed 3rd.

THE WEST OF ENGLAND ROSE FARM, Henlade, near Taunton, led for Tea Roses, THE KING'S ACRE NURSERY CO. being placed 2nd.

In the classes for Dahlias, Messrs. CRAY & SONS, Frome, practically swept the boards, winning four 1st prizes.

The Hon. H. G. GORE-LANGTON was placed 1st for a collection of cut stove and greenhouse flowers; 2nd, Col. E. C. A. SANDFORD, Wellington. The best double-flowered Begonias were shown by Rev. D. J. PRING, North Curry, and this exhibitor excelled for single Begonias.

The decorative classes proved a great attraction, chief interest being centred around the class for a dinner table decorated with fruit and flowers. All the competitors used Orchids, with greenhouse flowers and foliage. The 1st prize was awarded Mr. C. J. ELLIS, Weston-super-Mare, Somerset; 2nd, Sir WM. HOWELL DAVIES, M.P., Stoke Bishop, Bristol; 3rd, F. J. COLE, Bath.

In a similar class, limited to lady exhibitors, the 1st prize was won by the Misses HILL, Bridgwater.

It was a subject of comment that the Committee had appointed lady judges, and the awarding of the prizes did not give general satisfaction.

Sweet Peas were finely shown. The principal class was keenly contested, the 1st prize going to A. H. COWAN, Bishop's Hull. Mr. Henry Eckford's prize for Sweet Peas was won by Mr. FREEMAN ROPER, Chard; Messrs. R. Sydenham & Co.'s prize by Mrs. H. F. YOUNG, Bristol; and Messrs. Webb & Son's prize by the Right Hon. Earl of Devon, Exeter.

The prizes for Asters were, in most cases, awarded to Mr. J. H. HARRIS, Taunton.

Mr. F. EAMES, Frome, showed the finest Gladioli, and Mr. C. WALL, Bath, the best border and Fancy Carnations.

In the class for tree or perpetual-flowering

Carnations, Messrs. YOUNG & Co., Cheltenham, were placed 1st.

In the open fruit classes, Major G. A. GIBBS, M.P., Flax Bourton, Gloucester, was a prominent prize-winner, his exhibits in nearly all cases being superb, and he won the prize, given by the Mayor of Taunton, for a collection of fruit.

The best Black Grapes, Hambro excluded, were shown by the Executors of the late Lady ASHURTON. Major G. A. GIBBS showed the best White Muscats; and the Right Hon. Lord Justice FARWELL had the finest white Grapes other than Muscats.

The best Melon was shown by Major G. A. GIBBS, M.P.; the best Peaches by G. DAPPURN, Esq., Weston-super-Mare; the best Apricots by R. NEVILLE GRENVILLE, Esq., Glastonbury; and the best Nectarines by Lord Justice FARWELL.

R. BLACKMORE, Esq., Ilminster, staged the choicest dessert Pears and culinary Apples; and R. T. SOMMERVILLE, Esq., Creech, had the best dessert Apples.

VEGETABLES made a grand show, the quality all round being magnificent.

For a collection, Mr. B. C. SHEPHERD was awarded the 1st prize, followed by the Earl of DEVON.

In Messrs. Carter & Co.'s class for a collection Mr. SHEPHERD was again placed 1st. The 1st prize winners in other nurseryman's classes for a

Large Silver Medals were awarded to Messrs. R. VEITCH & SON, Exeter, for plants and cut blooms; and to Mr. HENRY ECKFORD, Wem, for Sweet Peas.

Small Silver Medals to Mr. F. ADAMS, Taunton, for floral designs; Messrs. RICH & Co., Bath, for herbaceous flowers; and THE KING'S ACRE NURSERY CO., Hereford, for Roses and other flowers.

Bronze Medals to Messrs. GODFREY & SONS, Exmouth; Mr. A. E. RICHARDS, Taunton; and Messrs. BARR & SONS, King Street, Covent Garden, London.

STIRLING AND DISTRICT HORTICULTURAL.

AUGUST 13.—The society's third and last excursion for the season took place on the above date, to Boquhan, the residence of Stephen Mitchell, Esq. The gardens are noted for the special culture of Sweet Peas, Dahlias, and vegetables, and these, with the glass structures, herbaceous borders, and pleasure grounds, attracted much attention. The beautifully-wild and romantic glen, which has been likened to the Trossachs, was also visited. The party numbered 70.

BRITISH GARDENERS' ASSOCIATION.

AUGUST 20.—On this date the members of the London branch were, by the courtesy of Sir Henry Tate, Bart., invited to inspect the gardens at Downside, Leatherhead. The party was conducted by the gardener, Mr. W. Mease, through the grounds, which are about 80 acres in extent, and situated on the side of a hill with a S.W. aspect. An Italian garden has been formed recently in front of the mansion, and this has added much to the beauty and interest of the grounds. The view from the terrace is very beautiful, the grounds merging almost imperceptibly with the surrounding country of wood and cornfield. After tea the glasshouses and fruit and kitchen gardens were visited.

Obituary.

H. A. TRACY.—It is with great regret that we record the death of Mr. Henry Amos Tracy, proprietor of the Orchid and Bulb Nursery, Amynd Park Road, Twickenham, where he had been established for many years. Mr. Tracy, who was 69 years of age, was one of the most popular men in the trade; he enjoyed excellent health until two or three years ago, when he had an attack which affected his eyesight and hearing. For a long time his condition caused anxiety to his friends, but he appeared to be recovering his former health and was present at the last meeting of the Orchid Committee of the Royal Horticultural Society, of which body he had been a member for some years past. On the evening of Thursday, August 18, at about 7 o'clock, while in his garden, he was stricken with paralysis. He never recovered consciousness, and passed away about 11 p.m. the same night. During the many years he had been in business, many rare and new plants passed through his hands, one of the most noteworthy being *Cymbidium Tracyanum*. He was one of the first to import and offer at low prices *Odontoglossum crispum* and other popular Orchids, *Lilium auratum* and other Japanese plants, placing them within the reach of amateurs of small means. He was a man whose word could always be relied upon, and his sudden end will be regretted by business friends not only in Great Britain but in Europe and the Colonies. The business will be carried on under the management of Mr. Sidney Flory, a nephew, who has been associated with the firm since a boy.

FREDERICK WILLIAM FLIGHT.—The death of Mr. F. W. Flight took place on Monday, August 15, in his 76th year. Mr. Flight had a long connection with horticulture, and was one of the founders (in 1883) of the Winchester Horticultural Society. He was chairman of the executive committee from the commencement until his death. In his charming garden at the Cornstiles, Twyford, Winchester, he cultivated Roses, Chrysanthemums, and Carnations largely,

and was a frequent exhibitor of these flowers at southern shows, where he met with much success. Mr. Flight raised several new Roses, including the dwarf Rambler, Mrs. F. W. Flight, and also several good Carnations. For 27 years, Mr. Flight exhibited Chrysanthemums, his favourites being those of the Incurved section. He exhibited Chrysanthemums largely at the Winchester shows, where he received many awards.

SIMEON MARSHALL.—The death of this well-known landscape gardener occurred on the 20th inst., at his residence, the Manor House, Brafferton. Mr. Marshall, who was 74 years of age, was a native of Yorkshire, his birthplace being Rastrick, in the Halifax district. In common with other boys of the working classes of his time, he received little schooling, except what he gained from night schools which he attended after his day's work. In the late 'fifties, he was engaged as gardener at Stockeld Park, Wetherby. Mr. Marshall left Stockeld Park in 1861, and entered the nursery of Messrs. James Backhouse & Son, York, as a temporary hand, until a suitable situation could be obtained; but the late Mr. James Backhouse, who was a shrewd business man, placed him on the permanent staff, first as manager of the glasshouses, and later in the landscape department. He was one of the first to take Orchids in flower to Messrs. Stevens' auction rooms

THE LATE H. A. TRACY.

THE LATE SIMEON MARSHALL.

collection were (Messrs. Sydenham, Ltd.), Mrs. SOUTHCOMBE; (Messrs. Sutton & Sons), Mrs. BERNARD; (Messrs. Ed. Webb & Sons), Mrs. BERNARD; and (Messrs. R. Veitch & Sons, Exeter), Mr. B. C. SHEPHERD.

Some choice produce was also seen in the amateur classes for vegetables.

NON-COMPETITIVE EXHIBITS.

Messrs. J. CARTER & Co., High Holborn, London, were awarded a Gold Medal for a collection of vegetables.

Messrs. J. KELWAY & SON, Langport, Somerset, staged an imposing array of choice Gladioli, which included new and up-to-date novelties. (Gold Medal.)

Small Gold Medals were awarded to Messrs. ISAAC HOUSE, Westbury-on-Trym, Bristol, for a collection of Sweet Peas; to THE WEST OF ENGLAND ROSE FARM, Henlade, near Taunton, for a choice collection of Roses; and to Mr. H. CLARKE, of Taunton.

Silver-gilt Medals were gained by Messrs. MASSEY, of Spalding, Lincolnshire, who staged a magnificent collection of Potatoes; Messrs. W. & E. T. COUSINS, Taunton, for a display of floral designs, well arranged, with a background of *Campanula pyramidalis* and white Hydrangeas; Messrs. JARMAN & Co., Chard, for cut blooms; Messrs. ROWLAND ADAMS, Bath, for Roses, &c.; and the ALPHA EXTINGUISHER, LTD., Ross, Hereford.

in London, and, on one occasion, had the misfortune to be seriously injured in a railway accident at Abbots Ripton. Several times he undertook journeys to America on behalf of his employers. Amongst the numerous places he had out or developed were Hutton Hall, Gainsborough; Thornbridge Hall, Bakewell; and Toulstone Lodge, Tadcaster. Some few years since, he severed his connection with Messrs. James Backhouse & Son, and commenced business on his own account as a consulting landscape gardener, and was engaged in several important undertakings at the time of his death. He was a kind-hearted man, full of sympathy for others. He was twice married, but had no family; his second wife survives him. The funeral took place at Acomb on Tuesday, August 16.

RICHARD BUCKLAND LOWE.—We regret to record the death, on August 14, at the age of 60 years, of Mr. Richard Buckland Lowe, head gardener to the Earl Brownlow, Ashridge Park. Mr. Lowe was for several years a member of the Floral Committee of the Royal Horticultural Society. He was head gardener at Belton from 1879 till 1882, when he removed to Ashridge. He filled the office of secretary of the Ashridge Estate flower show from the time of its inception in 1899. The funeral took place at Little Gaddesden on the 17th inst., the mourners including the Earl Brownlow and Humphrey Talbot, Esq. Mr. Lowe leaves a widow and three children.

JAMES McBEAN.—The death of this well known Orchid nurseryman took place on Sunday, August 21, at his home at Cooksbridge. Mr. McBean, who died peacefully whilst asleep, was head of the nursery and Orchid establishment of Messrs. J. & A. A. McBean, at Cooksbridge, near Lewes. Mr. McBean was born on October 22, 1840. He always pursued an active life, and many years ago founded the nursery business at Cooksbridge. When *Odontoglossum crispum* were becoming popular, he discerned the value of this flower for florists' purposes, and commenced to cultivate it on a moderate scale for the supply of cut blooms. His son, Mr. A. A. McBean, later took charge of that branch of the business, with such success that the culture of *Odontoglossum crispum* became a speciality of the firm, and many fine spotted varieties, which flourished at this establishment, brought world-wide fame to its owners. For some years, the late Mr. McBean suffered from heart trouble, and, on his son becoming a partner of the firm, he retired from the personal supervision of the nurseries, so far as the details of management were concerned. Of late years, the nursery has also engaged in the raising of *Odontoglossums* and other Orchids with great success, and in this work the late Mr. McBean took a special interest.

LAW NOTES.

CLAIMS FOR COMPENSATION: "SMALL HOLDINGS ACT."

The Board of Agriculture and Fisheries call attention to the provisions of the Small Holdings Act, 1910, which came into operation on the 3rd instant.

Section I of the Act is as follows:—

1.—(1) Where a council, or a landlord at the request of a council, terminates a tenancy of land by notice to quit, with a view to the use of the land or any part thereof by the council for the provision of small holdings, the tenant upon quitting shall be entitled to recover from the council compensation for the loss or expense directly attributable to the quitting which the tenant may unavoidably incur upon or in connection with the sale or removal of his household goods or his implements of husbandry, produce, or farm stock on or used in connection with the land:

Provided that no compensation under this section shall be payable—

(a) unless the tenant has given to the council a reasonable opportunity of making a valuation of such goods, implements, produce, and stock as aforesaid; or

(1) if the claim for compensation is not made within three months after the time at which the tenant quits.

In the event of any difference arising as to any matter under this section the difference shall, in default of agreement, be settled by arbitration.

(2) The Board of Agriculture and Fisheries shall, out of the Small Holdings Account, repay to a council any compensation paid by the council under an award or with the consent or approval of the Board, and also any expenses which, in the opinion of the Board, have been necessarily or reasonably incurred by the council in relation to any claim for compensation under this section.

(3) This section shall apply where a tenancy is terminated after the commencement of this Act, whether the notice to quit is given before or after such commencement.

In view of the fact that compensation paid under this section will be repaid to the Council out of the Small Holdings Account the Board desire to indicate the procedure that in their opinion should be followed in dealing with claims.

The Council should in all cases avail themselves of the opportunity which must be afforded by the tenant of making a valuation of the household goods, implements of husbandry, produce or farm stock proposed to be sold or removed, and for this purpose should make arrangements which will secure the prompt inspection of the goods, &c., by a valuer or other qualified person. The time for doing this before the sale or removal may be insufficient to enable the matter to be brought before the Council or their Committee, and an officer of the Council should therefore be authorised to make the necessary arrangements as occasions arise.

If the tenant has satisfied the condition set out

in paragraph (a) the actual claim will be in time if it is made within three calendar months after the time at which the tenant quits. The Board do not think it is essential that the claim should include all particulars or state the total amount claimed, but the Council should ask for this information, and in case of refusal they should warn the tenant that the refusal may affect the costs of any arbitration that may be necessary (see Small Holdings and Allotments Act, 1903, section 53 (1) and Agricultural Holdings Act, 1903, Second Schedule, paragraph 15).

If the Council on investigating the claim are satisfied that the amount claimed is reasonable, or if they propose to offer a sum in settlement, they should in the first instance inform the Board of their views and supply all information bearing on the question necessary to enable the Board to determine whether their consent should be given. If the Council think that the matter should go to arbitration, they should either try and agree with the tenant upon an arbitrator by submitting to him the names of two or more arbitrators to whose appointment they would assent, or they may at once apply to the Board to appoint an arbitrator.

Compensation under the Act is only payable where the tenancy is terminated by a notice to quit, and will, therefore, not be payable where the tenancy is terminated (a) by arrangement with the tenant or (b) by its acquisition or extinguishment under the procedure for compulsory

THE LATE JAMES McBEAN.

acquisition. In the latter case compensation is payable under the Lands Clauses Acts as modified by the Small Holdings and Allotments Act, 1903.

Section 2 of the Act is as follows:—

Where a tenancy has been terminated before the commencement of this Act, and the tenant proves to the satisfaction of the Board of Agriculture and Fisheries that he has incurred any loss or expense for which he would have been entitled to compensation under the foregoing section of this Act if the tenancy had terminated after the commencement of this Act, the Board may, out of the Small Holdings Account, pay to the tenant such compensation for such loss or expense as they think just: Provided that no compensation under this section shall be payable if the claim for compensation is not made before the first day of November nineteen hundred and ten.

The claim must be sent to the Board before the 1st November next, but the amount and detailed particulars of the claim may be submitted subsequently to the Board.

The Board are of opinion that in order to avoid any question in the future as to whether or not a notice to quit has been given by a landlord at the request of the Council, the officers of the Council should be instructed that no such request should be made except in writing and upon express instructions from the Council or the Small Holdings and Allotments Committee.

MARKETS.

COVENT GARDEN, August 24.

[We cannot accept any responsibility for the subjoined reports. They are furnished to us regularly every Wednesday, by the kindness of several of the principal salesmen, who are responsible for the quotations. It must be remembered that these quotations do not represent the prices on any particular day, but only the general averages for the week preceding the date of our report. The prices depend upon the quality of the samples, the way in which they are packed, the supply in the market, and the demand, and they may fluctuate, not only from day to day, but occasionally several times in one day.—Eds.]

Fruit: Average Wholesale Prices.

Table with columns for fruit types (Apples, Bananas, Blackberries, etc.), quantities, and prices in s.d. and s.s. format.

REMARKS.—Trade in best Potatoes is a little better than the last few weeks, but the demand for ordinary tubers is about the same. Edward J. Newborn, Covent Garden and St. Pancras, August 24, 1910.

COVENT GARDEN FLOWER MARKET.

At this season of the year prices are generally in favour of the buyers, supplies all round being in excess of demands. Roses are a leading feature and those of best quality with long stems usually make good prices.

POT PLANTS.

Many of the growers have finished for the season; their stands are empty, and trade is very uncertain. Already some good Chrysanthemums are seen; those which have been grown in borders and afterwards potted are not so valuable as those which have been grown in pots from the start.

THE WEATHER.

THE WEATHER IN WEST HERTS.

Week ending August 24. Warm, wet and gloomy.—The days during the past week have been as a rule seasonable in temperature; while the nights, with one exception, proved warm.

Vegetables: Average Wholesale Prices.

Table with columns for vegetable types (Artichokes, Aubergines, Beans, etc.), quantities, and prices in s.d. and s.s. format.

REMARKS.—There is a good supply of French Pears of good quality. Some good samples of Plums are also arriving from that country. English Peaches are plentiful, but Nectarines are scarce and in demand.

GARDENING APPOINTMENTS.

- List of gardeners and their appointments: Mr. H. J. CHOLLS, as Gardener to Lord ABERDARE, Duffryn, Mountain Ash, Glamorgan.

The Editors will be glad to receive, for consideration, large photographs of horticultural subjects, suitable for reproduction as Supplementary Illustrations in this Journal.

ADDRESSES: A. S. B. Fruit, Flower, and Vegetable Trades' Journal, 1, Mitre Court, Fleet Street, London, and Fruit Grower, Fruiterer, Florist and Market Gardener, 1, 2, and 3, Salisbury Court, Fleet Street, London.

BROCCOLI WITH "CLUBBED" ROOTS: T. H. C. The plants are badly attacked by the "slime-fungus" (Plasmidiophora Brassicae), which causes this "club-root" or "finger-and-toe" disease.

CONSTRUCTING A PERGOLA: J. A. Thompson. The width of the pergola should depend to a great extent on its length. For a long one in a field such as you desire the width should be fully 12 feet.

CORRECTION.—Owing to a printer's error the height of Araucaria imbricata in Messrs. Penning & Co.'s Dublin Nursery (see p. 143) was given as 500 feet instead of 50 feet.

CULINARY PEAS: H. B. The Peas are attacked by four distinct insect pests, viz., the Pea thrip, which attacks the blossoms and pods; the Pea midge (Diplosis pisi), the maggots of which are present in the pods; the Pea moth (Grapholitha pisana), the larva of which live in the Peas; and the Pea leaf-miner (Agromyza sp.), which "mines" in the foliage.

CYANIDING GLASSHOUSES: A. A. and Henri. This can be done by the use of either potassium cyanide or sodium cyanide, but it is preferable to use the latter. Hydrocyanic gas is liberated when sulphuric acid is poured on to the cyanide of soda.

Table for New Potatoes with columns for variety (Kents, British Queen, etc.), quantity, and price.

fumes might escape. The horticultural sundriesmen supply outfits and material for the purpose, and a useful cyaniding machine can be obtained from Mr. F. C. Edwards, 12-15, Warehouse Hill, Leeds.

DIMENSIONS FOR A TENNIS COURT AND A CROQUET GROUND: *B. R. K.* A tennis court for the single game is 27 feet wide and 78 feet long; and for the double game 36 feet wide and 78 feet long. The posts for supporting the net should be placed 3 feet beyond the sides. The service lines run parallel to the

DIAGRAM OF A TENNIS COURT.

The lines A B and B A indicate a double court for three or four players; S S, S S, a single court for two players; A A and B B are the base lines; C C and C C, service lines; H H, half-court line; N N, net.

net, and are 21 feet distant from the same. The net should be 3 feet high in the centre, and 3 feet 6 inches at the posts, which are put 3 feet outside the line, to allow of the net dropping.

Croquet Ground.—In order to obtain uniformity in laying out a croquet ground the Croquet Association has drawn up the following regulations. The ground should be rectangular, 35 yards in length by 28 yards in width, with a defined boundary. A flag shall be placed at each corner, and corner spots, 3 feet from both boundaries, shall be accurately defined. Points on the boundary 3 feet from each corner flag shall be marked by white pegs, not exceeding three-quarters of an inch in diameter, and 5 inches above the ground. The haulk shall also be defined. The hoops shall stand 12 inches out of the ground, outside measurement, and be firmly fixed. The crown shall be straight and at right angles to the uprights, which shall be not less than 3½ inches or more than 4 inches apart (inside measurement) from the ground upwards. The turning on the winning pegs shall be of wood, of a uniform diameter above the ground of 1½ inches. They shall stand 18 inches out of the ground and be firmly fixed. Measurements:—Setting No. 1: Pegs in centre line of ground 7 yards from nearest boundary; hoops in centre line of ground 7 yards from peg and 7 yards apart; corner hoops 7 yards from nearer peg and 7 yards from the nearest boundaries. Setting No. 2: The winning peg equi-distant from the corner; hoops in centre line of ground 7 yards from peg; corner hoops 7 yards from the nearest boundaries. In laying out a croquet ground it is essential to have sufficient room outside the lawn (35 yards by 28 yards) to allow of the roller or mower being turned. This is necessary to avoid unduly wearing the most important part of the turf, viz., that where the "yard line" is situated. You will find four different plans of a croquet ground, each in accordance with the rules of the Croquet Association, in the issue for May 22, 1909.

GLADIOLUS AND MONTBRETIA UNHEALTHY: *A. Robinson.* There is no evidence of any insect or fungus parasite in the roots, which are quite healthy. The leaves appear to have withered (possibly under unfavourable weather conditions) and then to have been attacked by various saprophytic fungi.

GRAPE DISEASED: *R. E. W.* There is no fungus which causes a disease to Grapes present on those sent. The only fungus on the Grapes is the common "mould" (*Penicillium*), which has obtained an entrance into the Grapes after they have been injured (and probably cracked). The unripe Grapes appear either to

have been injured through some wrong cultural treatment, or possibly defective nourishment.

HYDRANGEA WITH YELLOW LEAVES: *J. S.* There is no disease in the shoots sent. The yellowing of the foliage must be due to some wrong cultural conditions.

LARGE GOOSEBERRIES: *B. Wynn.* The variety London is one of the largest Gooseberries grown. In our "Record" book there is an entry for this variety with a weight of 37 dwts. 7 grains. It was grown by Mr. John Flower at Cheadle, in Staffordshire, in 1852. There are other entries for this variety of 35 dwts. 12 grains, shown by Mr. Gibson, Nottinghamshire, in August, 1844, and 51 dwts. 13 grains, shown by Mr. Saul, Garstang, 1842. Leader (25 dwts. 10 grains), Thumper (26 dwts.), Catherine (32 dwts. 2 grains), and Maccaroni (35 dwts. 6 grains) are other large kinds. Your berries were crushed in transit. With regard to your other question London City (light green), Antagonist (cream white), Beauty (red), Broom Girl (yellow), Eskender Bey (large red), Green London, Ganner (dark yellow), and Leveller (yellow) are a selection.

LEAVES DECAYING: *H. Hughes.* There are no signs of fungus or insect pests on the leaves sent. There is a deposit of a paint-like nature on the leaves, indicating that the plant has been sprayed with some fluid; but it is impossible to say whether this is causing the injury without knowing further particulars.

MELONS FOR MARKETING: *J. J. K.* The following varieties are suitable for market purposes: they are good growers, and their fruits which are handsome in appearance and of first-rate quality, set freely. Hero of Lockinge, a popular and handsome variety, with white facing evenly laid on a rich golden ground; the flesh is pale in colour, almost white, rich and melting in flavour; the individual fruits average about 3 lbs. each. Earl's Favourite: This is a green-fleshed Melon, weighing from 3½ lbs. to 4½ lbs. each. The flesh is deep, pale green, melting, very juicy, and of rich flavour. Blenheim Orange is a very attractive, scarlet-fleshed Melon. It is a good grower and free setter, the fruits being heavily netted. The flesh is melting and uniformly thin-skinned. Other good varieties for market are Best of All, The Countess, and Scarlet Gem. A good, yellow loam, of heavy rather than light texture, best suits the requirements of Melons. If not sufficiently rich in plant-food, an 8-inch flower-potful of Peruvian guano, or some other approved fertiliser, should be added to every bush and a half of loam. Mix the soil and manure well together, and place it in the form of hillocks, about 2 or 2½ feet apart, on the border or bench. Set the plants before they become pot-bound at the roots, making the soil quite firm about the latter in planting, and afford water to settle the soil. Maintain a moist atmosphere until the plants are flowering, when the conditions should be drier, with a little ventilation if the weather permits. If the plants are to be trained to trellises fixed about 12 inches from the roof, they should be allowed to make a growth of 3 feet before being stopped. This will result in the production of fruit-bearing growths at the sides. The female flowers should be pollinated about mid-day. As soon as sufficient fruits have set for a crop, remove the superfluous ones, leaving those of a similar size evenly distributed over the plants. Pinch the shoots at two points beyond the fruit. Five to six fruits, according to the vigour of each plant, may be left for a crop. As the roots push through the hillocks or mounds, they should be top-dressed with a layer about 2 inches deep of the same compost as they are planted in. Continue to make such additions, as required, until the intervening spaces are filled up nearly level with the top of the mounds. Keep the soil about the roots uniformly moist until the fruits begin to colour, when less moisture will be needed both at the roots and in the atmosphere. When the fruits are swelling, an occasional surface-dressing of artificial manure immediately before water is applied will be beneficial. During the summer and autumn months fresh air should be admitted to the house when 30° has been registered. When the houses are closed for the night, plenty of

clean, tepid water should be distributed over the plants and in the house, and the temperature may be allowed to reach 90° or 95°.

NAMES OF FRUITS: *James Kidd.* Apple Joanetling.—*J. W. B. Kerry* Pippin.—*J. Snaell.* Duchess of Oldenburgh (syn. Peach Apple); Peach Dymond Goshawk, a hardy variety and a free setter.

NAMES OF PLANTS: *F. A. N.* 1. *Spiraea Menziesii*; 2. *Veronica longifolia*; 3. *Rudbeckia laciniata* fl. pl.; 4. *Sidalcea malvaeflora*.—*A. J. NATIONAL SWEET PEA SOCIETY'S TRIALS: *H. C.* Write for particulars to the Secretary, Mr. Charles Curtis, 2, Adelaide Road, Brentford, Middlesex.

NECTARINES: *W. E.* The Nectarines are attacked by a fungus, possibly the Brown Rot fungus (*Sclerotinia fructigena*). The spawn (mycelium) of the fungus is apparent, at the first indication of "rot," at the point of the fruit. Remove all fruits as soon as they show signs of the disease and burn them. Cut out and burn any dead wood on the Nectarines or adjacent Peach trees. Do not allow any rotten fruits of Peaches, Apples, &c., to be near the Nectarines, as "Brown Rot" disease spreads from one kind of fruit to another.

PEACH FOR EXAMINATION: *W. L., York, and Rosacea.* The fruit was damaged in transit, and when it reached us was in a condition of pulp. Send other specimens, better packed, and enclose also some of the foliage.

VINE LEAVES: *Hollywood.* There is no disease on the vine leaves sent. A sudden change of colour in a few leaves on a vine takes place not infrequently in certain seasons, and does not indicate disease.

THE COTTIAN ALPS.

THE Cottian Alps lie on the Western side of the great plain of Piedmont—a series of rather arid and undistinguished granite ridges, dominated unexpectedly by the tremendous cone of Mt. Viso, among the grandest of European mountains. The valleys, however, lie low; and, after the plateau of Mt. Cenis, it is somewhat disappointing to find oneself only at some 3,000 feet above the sea, and, therefore, with another 4,000 feet to climb before reaching the zone of interesting plants.

However from Bobbio (which in French has the pleasant name of "Bobbie") it is not long before one begins to notice characteristic species. The valley is full of vineyards, and the Chestnut climbs its slopes. Above these, the granite hills rise rugged, sere, and sunburnt, split deep by gaunt combes, which here have the same name in French; for French is the language of all these valleys of

the Vaudois; and these are the very "alpine mountains cold" on which so long lay unavenged the scattered bones of "the slaughtered saints." The bones, though, have long been picked up, and the slaughtered saints have ultimately triumphed, in so far as their descendants now peacefully possess the faith and the valleys for which their predecessors died. Nor are the Alpine mountains about here aptly to be described as "cold" in July. Indeed, the heat is fierce as one climbs above the Chestnut groves into the grim combes and chines above Bobbio. First of all, the woolly-white trans-alpine form of *Sempervivum arachnoideum* is seen on the dark granite boulders here and there; and then, in shady hollows of every rock and wall, *Campanula Elatines* abounds. This curious, beautiful plant appears intensely saxatile, nor does the greyish down on its foliage leave one under any doubt as to its hatred of surface moisture. It lives in impenetrable crannies of wall and cliff, and though it seems to prefer a shady aspect, may often also be found in sunny places, if the precipice so hangs that the plant is not liable ever to be clogged by rain. In early July, the flowers were not open this year, but the inflorescences were developed, and it was interesting to see how closely they followed the line of the rock, almost like the boughs of the species of *Cotoneaster* often sold as *C. pyrenaica*.

On all the most sun-baked cliffs, *Lilium bulbiferum* was gorgeous. *Dianthus* made showers of pink, and in one corner I came on an outlying colony of *Androsace imbricata*. This had evidently seeded down from its main habitat, which ultimately I discovered—a stark and torrid precipice along whose minutest lines of cleavage this most impregnable of plants was growing in dense, ash-white cushions. Accustomed as one is to seeing this species as a high alpine, it was a surprise to me to find it, for the first time, at so low an altitude. Higher than these rocks, begins the zone of the special rarity to which the Cottian Alps have given a name. *Primula cotta* inhabits, apparently, tight crevices in the granite cliffs at some 5,000 feet. The flower had passed when I saw it, therefore, I can only record that it appears a species very tolerant of the sun, and completely saxatile in its requirements. Even in this, the only district which possesses it, *P. cotta* is painfully local in its distribution. I was told that I should see abundance of it on a neighbouring pass, and, when I got there, found to my horror, nothing but *P. marginata*.

That same pass is the sole Italian station for a plant which occurs only on these borders, here and there, at high altitudes, but several times on the French side of the frontier, to this on the Italian. Elsewhere through all the mountain ranges of the world, it is vain to search for *Saxifraga valdensis*. Even if the search be extended to English gardens, a presumptuous little form of *S. cochlearis* minor will be pointed out, masquerading under an august name, but never the unrivalled *S. valdensis*. This brilliant plant inhabits rotten granite cliffs exposed to sunlight more pitiless than I have ever known courted by any other Silver Saxifrage. These cliffs are curtained and swathed with *Campanula Allionii*, which also grows at their feet; but one has eyes only for the Saxifrage, forming

dense, tight, hard balls of grey between the disintegrating slabs of the rock, and, in early July, just preparing its ruby-red, glandular flower-stems. Among all its kindred, *S. valdensis* stands out as distinct a species as it is a rare and lonely one. No form of *S. cochlearis* has any real resemblance to it, and Maw's classical quotation of *S. valdensis* as occurring with *S. lingulata* and *S. cochlearis* on the cliffs above Tenda, is almost certainly a slip of the pen, for *S. casia* or *S. diapien-sioides*. But of this, more later, perhaps. As compared with the Silver Saxifrage of the Maritime Alps, *Saxifraga valdensis* is a high-alpine plant. It is restricted almost entirely to this one range of cliffs at about 7,500 feet. Higher than this, it does not seem to occur; and, though I found one plant in the valley far below, it was obviously a sad and sickly exile from its proper place.

Higher up, at the summit of the Pass, there is a station for *Gentiana Rostanii*. This, however, was under snow when I climbed the Col, and even *Campanula stenocodon* could only be defined by its leaves in the highest stone slopes. As one descends, *Primula marginata* and *P. graveolens* abound; dwarf and probably brilliant forms of *Dianthus neglectus* are preparing their buds amid the dwarf alpine turf. But it must be confessed that the Cottian Alps make no display compared with the gorgeous splendour of the Mt. Cenis. Perhaps the Mt. Cenis offers no fair standard of comparison: its richness, both of interest and display being so pre-eminent; but, anyhow, the purely granite Alps are, as a rule, I think, rather disappointing to a gardener. They enshrine, it is true, here and there, a first-class rarity, such as *Primula cotta* or *Saxifraga valdensis*, and, therefore, one has irresistible reasons for visiting them. But their general exhibition is apt to be monotonous and poor: even *Viola calcarata* was sparse above Bobbio. On the Mt. Cenis it almost hid the hills.

The local *Anemone* to my surprise, was *A. alpina*, but far inferior in glory to the bushes and bosquets of it that I had just been seeing in the Graians. On one high shoulder, however, *A. narcissiflora* shone in white snow-drifts from afar. Higher up *Saxifraga retusa* glowed incandescent among the brown, dank herbage, only just abandoned by the snow, and yet a little higher up began *Douglasia* (*Androsace*) *vitaliana*, though starved in aspect, after the comely clumps and cushions in which I had lately been revelling. But *Anemone vernalis* was as rare here as any jewel. In the Northern Alps, on such a place, it would have abounded. Over all this slope, I only succeeded in discovering one shabby little plant. On the other side of this high ridge, the hill fell away terrific, in cupped cliffs and combes most awe-inspiring to descend. Here was a profusion of *Aquilegia alpina*, just preparing to flower, and the shaded crags were hung with *Primula graveolens* in glorious blossom. Next I discovered *Tulipa celsiana*, and in a little while, appeared the object of my expedition—that coveted rarity, *Fritillaria delphinensis*, growing in the steep grass-slope among Tulips and *Narcissus Anemone*. A dark, dainty and delicate beauty is sombre *Fritillaria delphinensis*, but I will be honest and confess that I did not find it so distinct in glory from *F. Meleagris* as to make it worth the 7,000 extra feet of climbing that its discovery entails. *Reginald Farrer.*

NEW OR NOTEWORTHY PLANTS.

PECTINARIA ASPERIFLORA.

THERE are probably very few plants in the world of which it can be said that they produce flowers that are unattractive, and at the same time beautiful. Such a statement would seem to be a contradiction of terms, yet it applies with perfect truth to the flowers of *Pectinaria asperiflora*, a rare member of the *Stapelia* group of *Asclepiads*. This plant consists of a cluster of globose, oblong or cylindrical, leafless stems $\frac{1}{2}$ to $\frac{3}{4}$ inch thick, producing at their tips small, drooping and somewhat globose flowers rather less than $\frac{1}{4}$ inch in diameter. Besides being

small and pendulous, the lobes of the flower are close together and united at the tips, leaving only small fissures between them, so that the inside of the flower cannot be seen; outside, it is slightly rough and dull purplish in colour, quite unattractive, without any pretence to beauty. But if the lobes are separated and the flower carefully split open and laid out flat without pressure, the whole interior is seen to have a rough surface of frosted-white, beautifully dotted with crimson, very charming even to the naked eye. If, however, a flower thus flattened out is placed under a microscope of low power, especially a binocular one, and magnified 15 to 20 diameters, the extreme beauty of the inner surface thus seen is astonishing, nothing at all approaching it being known to the writer. The whole surface

is thickly covered with columnar processes, each of which is studded with other spreading, spike-like processes, forming a kind of miniature forest, all glistening, frosted-white, and spotted with crimson, forming the most exquisite piece of floral beauty. This is further enhanced by the very ornamental structure of the purple-brown corona. As before stated, it must be seen to realise how wonderfully beautiful it is. The question arises—What is the purpose of all this loveliness? Certainly, not to please mankind nor to attract insects, since it cannot be seen from the outside. Nor would it seem indispensable to the flower, since the other known species of the genus are without such complex structure. All the species are doubtless dependent for their fertilisation upon the entrance of minute insects

[Photograph by John Gregory.]

FIG. 67.—CATTLEYA RHODA "FAIRLAWN VARIETY."
(First-class Certificate at the R.H.S. meeting on Tuesday last.) (See p. 189.)

through the fissures between the lobes, but we can hardly credit that the interior has much interest for them, nor do I find that they feed upon it. Its significance is one of nature's unsolved problems.

Another species, *Pectinaria Pillansii*, seems only to develop its flowers underground, as all the mature or expanded flowers observed by Mr. N. S. Pillans, who discovered it, were developed under the soil, whilst the buds which formed above ground did not attain full size, nor did the lobes separate to form fissures for the entrance of insects as did those which were buried. This would seem to imply that it is fertilised by some minute insect that lives underground. This is, I believe, the only recorded case of a plant fully developing its flowers beneath the soil. There are several cases in which cleistogamous flowers, or flowers that have been fertilised in the air, push their seed vessel into the ground to develop. But that is not the same thing, since these flowers of *P. Pillansii* are quite normal, not cleistogamous, and are borne and expanded underground. The fruit is at present unknown. *N. E. Brown.*

REMARKS ON THE CONDITION OF THE FRUIT CROPS.

(See Tables and Summaries, ante, pp. 77-82.)

(Concluded from page 159.)

9, IRELAND, N.

DUBLIN.—An unusual amount of hail which fell during the time the trees were in bloom, and the low night temperatures during May and early June, were the causes of a partial failure in some of the fruit crops. The few fruits which set are swelling well, and all trees are making unusually

NOTES ON LILIES.

LILIUM ODORUM.

WHETHER *L. odorum* (see fig. 68) is considered as a distinct species or a variety of *L. Brownii* there can be no doubt that it is a lovely plant and well worth taking a deal of trouble about. In the writer's experience, it is altogether easier to manage and keep than *L. Brownii*, coming into bloom year after year during the first week of August with unvarying regularity, and increasing steadily as the years go by.

True, *L. odorum* has not the delicate grace of *L. Brownii*, being altogether of a sturdier build, nor is the bloom so long in the trumpet, so beautifully proportioned, or so deeply coloured on the outside, but the plant has the advantage of quite commonly throwing up two or three stems, each of which often carries three flowers and occasionally four or five, whereas apparently *L. Brownii* can very seldom be coaxed into producing more than one or two stems with a solitary flower on each; the latter Lily, too, is not generous in the production of offsets, while *L. odorum* or *japonicum Colchesterense*—to give the plant the name by which it is known at Kew—is lavish, almost as much so indeed as *L. Henryi*, which is saying a great deal.

As the photograph shows, the leaves are shorter and a good deal broader than in the typical plant; they clothe the stem from head to foot, while in the case of *L. Brownii*, as with some other Oriental species, the lower part of the stem is bare of leaves, for reasons that are obvious, though why *L. odorum* should be different in this respect is not clear.

The plant seems to do better in a lime-free mixture of leaf-mould, coarse grit and charcoal than in more earthy soils, and, like most stem-rooting Lilies, benefits by the association of *Andromeda*s or some other dwarf growing shrub the roots of which do not spread about and draw the moisture out of the ground as much as do those of other dwarf shrubs, for instance, some of the *Veronica*s or the *Daphne*s.

In the writer's experience, the bulbs may be planted quite 9 inches deep, and, if packed carefully with silver sand, they may be dug up as clean as a new-laid egg; bulbs imported from Japan, having had their roots prematurely shorn off in accordance with the detestable practice pursued by the bulb merchants of that country, do not usually survive after their first season, but, in dying, they can usually be relied upon to leave behind a number of offsets. These should be nursed for a year or two before being allowed to take care of themselves, and will generally flower in their third year.

Once started in the right way, the plant seems able to look after itself to better purpose than many of the Lilies hailing from the East, and soon grows a yard and more high.

So far as the writer is aware, the Lily does not commonly produce seed in this country, either in the open or under cover. But, as already mentioned, reproduction is provided for by the large crop of bulblets, so that the want of seed is immaterial; anyone growing Lilies must have noticed that in many species the absence of seed is counterbalanced by the production of offsets or bulbils, and, in illustration,

FIG. 68.—LILIUM ODORUM, SYN. JAPONICUM COLCHESTERENSE: FLOWERS PALE YELLOW, OUTSIDE STREAKED WITH REDDISH-BROWN.

L. tigrinum, *L. Maximowiczii*, *L. Leichtlinii*, *L. Wallaceii*, *L. Henryi*, and *L. sulphureum* may be mentioned. None of these Lilies seeds in the ordinary way in Britain, but all produce quantities of bulbils or else offsets. The flowers of *L. odorum* are exquisitely fragrant, reminding one of *L. Washingtonianum*, and last fairly well if the plant blooms in a shady place.

The specimen from which the photograph was taken was beginning to go off, and for that reason the blooms will be seen to be slightly shrivelled. *A. Grove.*

strong growth. *A. Campbell, St. Ann's Gardens, Clontarf, Co. Dublin.*

MAYO.—Late frosts injured the fruit blossoms, but it is a rather singular circumstance that in exposed positions there are Gooseberries, whilst in gardens sheltered by walls there is none. Perhaps this is because, in sheltered situations, the bushes were earlier in flower and the blossoms were damaged by the frost. *R. Savage, Bullisk, Bullina.*

MEATH.—All bush fruits are exceptionally good. In sheltered orchards, we have a good crop of Apples, but in exposed fruit gardens the

trees were stripped of their fruits by a thunderstorm early in June. Late Strawberries were very satisfactory, and gave over an average crop. Gooseberry bushes in this district are becoming scarce, owing to the American mildew, but where the disease has not put in an appearance the crop is good. *J. B. Parr, Dunsmuir Castle Gardens.*

TYRONE.—The fruit crops are, on the whole, fairly satisfactory. Apples are above the average, both in quantity and quality. Pears are about half a crop. Cherries are very bad, but as they are not largely grown about here the loss is not serious. Strawberries rotted on the plants instead of ripening. We have not been troubled to any serious extent this season by insect or fungus pests. Aphid was much later than usual in putting in an appearance, but I note an invasion of black fly on the Cherries within the last week or two. American blight, which is occasionally very troublesome here, is not much in evidence up to the time of writing. The heavy rainfall and the latter half of June being hot caused a luxuriant growth on most trees, giving rise to fears, should the season continue damp and unfavourable, as to the proper maturation of the wood. *Fred. W. Walker, Sion House Gardens, Sion Mills.*

WEST MEATH.—Our fruit crops are deficient, which I attribute to badly-ripened wood and to the cold weather whilst the trees were in blossom. Of small fruits, Gooseberries, Raspberries and Black Currants are slightly over the average, but Red Currants are scarce. Strawberries were of good size, but the fruits lacked flavour, owing to the wet weather. Our soil, which is rather shallow in places, is inclined to be heavy and rests on a clay sub-soil. *Geo. Bogie, Pakenham Hall Gardens, Castlepollard.*

10. IRELAND, S.

ATHLONE.—The fruit crops in this district are remarkably good, especially small fruits, of which we have an abundance. But the wet weather did great damage to the Strawberry crop, and slugs have been especially numerous. I know of no remedy to cope with this pest, which is very troublesome to Strawberries. *J. Murray, Moydrum Castle Gardens, Athlone.*

CORK.—Apples, Strawberries, Raspberries, Currants and Plums are all good crops. Some Apple trees are slightly blighted, owing to the cold winds and frosts. The Codlin moth has again made its appearance. *Maurice Colbert, Ahern, County.*

KILDARE.—Although the weather was favourable when the fruit trees were in blossom, yet the fruits did not set well. Much of the bloom was very weak, owing, no doubt, to the unfavourable summer and autumn of 1909. Cherries dropped freely at the stoning period, and are the worst crop for many years past, especially Morellos. *Fredk. Bedford, Straffan House Gardens, Co. Kildare.*

WATERFORD.—The fruit crops generally in this part of Ireland are much under average, though Apples and Pears promise to be of good quality. The trees blossomed most profusely. Small fruits, with the exception of Gooseberries, are average crops. Plums on walls are a good average crop, but on orchard trees they are scarce. Our soil is of a heavy, retentive nature and of poor quality. *D. Crombie, Curraghmore Gardens, Co. Waterford.*

CHANNEL ISLANDS.

GUERNSEY.—All fruit trees blossomed freely, but the flowering was earlier than usual. This may in part account for a scarcity of fruits, for seldom have the crops been as light as this year. Apples generally are deficient in numbers. Pear trees on south walls have a moderate number of fruits; trees growing under other conditions are poorly fruited. Stone fruits are universally deficient. Strawberries produced a good display of bloom, and the berries set satisfactorily, but many were spoiled by the cold, wet weather. *Chas. Smith & Son, Caladonia Nursery, Guernsey.*

JERSEY.—The fruit crops generally are very bad. The trees flowered well, and many fruits set, but they were almost all destroyed by cold winds. Many trees of Peach, Cherry, Apple and Pear were almost killed by the cold winds. The Strawberries were a splendid crop, but many berries were spoiled by the constant rains. Small fruits are very fair crops. *T. Sharman, The Imperial Nursery, St. Helier's, Jersey.*

A JOURNEY TO JAPAN.

(Continued from page 153.)

CEYLON, THE RUBY ISLAND.

I REACHED Colombo on March 18. Here I purchased Willis's *Handbook of Ceylon* and a *teepee* (a Pith hat, made of the very light wood of the Pith tree) to protect myself from the strong rays of the sun. Dr. Willis, who is the Director of the Royal Botanic Garden, Peradeniya, has written a most useful book about this highly-interesting country, dealing with the people and their customs, the plant life of the island, its products, and, in fact, most things pertaining to Ceylon. Dr. Willis is not only Director of the Peradeniya Garden, but also of the other gardens of the country, besides being the Government botanist.

The season was the driest of the year; the south-west monsoon had not yet set in, the grass was burnt by the sun, the empty Rice fields were dry, and the ground was cracked, waiting for rain, before being ploughed again, with superstitious observances and the most primitive means. The Rain Tree (*Pithecolobium Saman*)

largely imported from China, as Ceylon does not produce a quantity sufficient to supply local needs, the east of the island being too dry for this crop and the centre and south very mountainous. The number of labourers imported from South India for plantation work is enormous, and these consume vast quantities of this cereal.

The official *Guide* of the Royal Botanic Garden, Peradeniya, by Mr. H. F. Macmillan, is a most valuable work, containing many useful notes and excellent illustrations; but, although it should be read by all visitors, its price is rather high. This garden is often referred to by people visiting it as "The Paradise." It is the Paradise of the wealthy. The visitor from Europe feels quite at home amongst the wonderful Palms, the shady, flowering trees and shrubs, and vast meadows. It may be described as a very large edition of Kew Gardens and the Palmengarten at Frankfurt-on-Main, excepting that glass roofs are not necessary here, where it is warm and moist, even more so than in bothouses at home. The gardens are well kept. Nearly all the flowering and foliage plants of our conservatories and glass-houses do well here, some being cultivated in the shade, and others in the full sunshine. Ferns

FIG. 69.—PITHECOLOBIUM SAMAN, THE RAIN TREE.

(see fig. 69), was just flowering at Colombo. Erythrinæ were opening their first blossoms, Bougainvilleas were at their brightest, and Hibiscuses blooming in all colours everywhere.

Having decided to stay in the low country on my return, I went up to Peradeniya the next morning after landing, secured lodgings at the rest-house there, and commenced studying the plants in this most beautiful botanic garden.

Director Willis, Mr. Macmillan, the able curator, and others of the staff received me most cordially, allowing me the use of the herbarium, library, and laboratory, besides an inspection of the wonderful collection of living plants. I was all the more grateful to them for their various duties being extensive, the time they gave me was at no little cost to themselves. The work done by those engaged in Government service in the garden embraces a larger field than their actual apparent duties. Everything that affects horticulture, botany, and agriculture is carefully looked after. Coconut Palms, the Tea and Cocoa plants, and the Para Rubber tree are cultivated on an extensive scale, besides Rice and Plantains (Bananas), and the different fruits and vegetables on which the natives live. Rice is

and Selaginellas, Maranthas, Dracenas, Crotons, Acalyphas, with all their garden varieties, and beautiful Caladiums were noticed. Gardenias, Tabernaemontanas, Jasminums, and the many flowering trees, as well as the scent of the various fruits, fill the air with a delicious perfume.

Palms and Bamboos grow luxuriantly; the latter cannot be surpassed anywhere. *Amherstia nobilis* is an ever-flowering tree of great beauty, the large, red flowers being borne on long racemes all the year round. *Poinciana regia* is pushing out a scarlet mass of flowers over its light-green leaves. The Cannonball Tree (*Leucaena* sp.) (see fig. 70) has its stems covered with thousands of large and strange-looking flowers, and hung amongst them are fruits looking like big, round, heavy cannonballs of olden times. But looking more dangerous still is the Jack tree (*Artocarpus integrifolia*), the stems of which are covered with larger and heavier, green fruits, as well as on the stronger branches over one's head. But these are only some of the most prominent subjects. There are hundreds and more of not less interesting plants in flower and fruit. Nearly 150 acres are planted with interesting, valuable, and useful plants,

including tropical trees and Palms of all kinds. Animal, bird, insect, and reptile life abounds, all of harmless nature. The great Sand river which surrounds the garden on three sides affords wonderful views over its banks, the near hills being covered partly with plantations of Tea, Coconut Palms, and Para Rubber.

The trees in the gardens of the natives are largely planted as a shelter for their poor huts; their gardens are thickly covered, chiefly with

stem is straight like an arrow, just covered with a fine bunch of sappy-looking leaves, with bundles of flowers and fruits at the top. The stem of the Coconut Palm, unlike this plant, which always has a straight trunk, curves naturally.

The great Talipot Palm flowers only after 40 to 90 years, when it develops an enormous mass of small flowers about 40 feet high, the flower-spike being the largest of any plant

observed that these are everywhere. In the fine and large flower-garden are *Chrysalidocarpus lutescens*, better known under the name of *Areca lutescens*, in a most luxuriant state; *Cyrtostachys Renda*, the sealing-wax Palm (of which there are large quantities of seedlings), is most conspicuous with its coral-red leaf-stalks. This Palm is very rare in Europe; but it grows well in the Nymphaea house at Kew. The various species of *Calamus* abound near the trees, climbing to great heights. The Toddy Palm is largely met with in the gardens of the natives.

Creepers, Lianes, and epiphytic Ferns abound on most trees, *Philodendron*, *Monstera*, *Rhaphidophora*, and *Pothos* being the most conspicuous. Orchids are also grown out of doors, but succulents are under shelter to protect them from the heavy rains. There are also native species of *Nepenthes*, and a small collection of water plants, including *Aponogeton monostachyon*.

The Paradise garden is not only of great beauty and interest to gardeners, but also of much value commercially. A great number of the chief economic plants grown in the island have been originally introduced by and sent out from this garden and its connections. It is laid out in the style of a luxuriant park, amid lovely surroundings. A long, straight, main road leads to the centre. There are other drives, leading to all parts, and paths traverse the wilder portion, known as the arboretum, which is planted naturally with magnificent trees. Jack-trees, with their heavy masses of fruit prevail; the timber is suitable for making furniture. Creepers and Ferns cover the trees, and a portion of the garden is left to follow Nature's own course. Bamboos line the stream and lake. The main drive and the flower-garden are planted with beautiful flowering and foliage plants. There are beds of *Caladiums* and *Cannas*, bordered with *Alternantheras*; there are also *Roses*, and pergolas with fine creepers spanning the roads. Conservatories, covered only with trellises and creepers, form shady and lofty houses for Orchids, Ferns, and tender foliage plants. Fine trees and Palms stand in vast meadows, and cattle graze in the wilder parts of the gardens. It is impossible to describe in a short report the manifold impressions to be gained, the richness of the garden, the various botanical and technical collections, the nurseries, trial ground, and experiment station, besides the Museum.

Fr. Henkel, Darmstadt.

(To be continued.)

THE ROSARY.

CULTURAL HINTS FOR SEPTEMBER.

The first blooming of the Hybrid Perpetuals is now nearly over, but the Teas and Hybrid Teas are furnishing abundant blooms, which are this season of splendid colour and seem to improve as the weather becomes cooler. The flowers and buds are gaining in substance, and according to present appearance, the trees promise to flower well for another two months or even more. The flowering of other sections of Roses has been very fitful, owing to the changeable weather, but the growth generally is up to the average quality, all that is needed being warm, dry weather to ripen the shoots. Those who intend to purchase Roses in the autumn would do well to visit the nurseries at this season to make a selection. They will also be better able to compare the habit, vigour and freedom of flowering of the old with the newer varieties. For town gardens sorts should be specially selected that will withstand the smoky atmosphere. Some of the most suitable are the hybrids of the Bourbon and China Roses, such as *Coupe d'Hebe*, *Paul Ricaut*, and *Blairi No. 2*, also the Pink and Crested Moss, *Cabbage Provence*, and the Japan or *Ruzsa*. Among climbers that do fairly well in towns are *Dundee Rambler*, *Felicite Perpetue*, *Liane Davoust*, *Mme. d'Arblay*, and *Sweet Penzance Briar*. A few of the hardiest Hybrid Perpetuals do well

FIG. 70.—THE CANNON-BALL TREE, *LECYTHIS SP.*

Coconut Palms, Jack trees, Bananas, Papaw, and along nearly all their hedges grows the straight-stemmed *Areca-nut Palm* (*Areca Catechu*). The Coconut and the very useful *Palmyra Palm*, which is grown largely in the north, are the most valuable Palms of the country. The *Areca-nut Palm* grows more like a weed, and is greatly prized by the natives, as its fruit supplies the bulk of the material of the mutual "chew" of the eastern inhabitants. The

known. The tree dies soon after the seeds are ripe (see Supplementary Illustration, June 25). There is a large avenue of this Palm at Paradise, and another of the *Palmyra Palm*. There are avenues, too, of *Oreodoxa regia* and *O. oleacea*, the *Cabbage Palm*, as well as of the rare and peculiar, fan-shaped *Didymosperma distichum*, and some others of smaller size. Avenues are also planted with the best flowering trees. To finish my account of the Palms, it must be

for a time, but, as a rule, they need to be renewed every second or third year; these embrace John Hopper, Ann Alexiff, Duke of Edinburgh, Ulrich Brunner, General Jacqueminot, Senateur Vaisse and Louis Darzens (white). Standard Roses are very short-lived and cannot be recommended. The showery weather has caused the sap to be still active, especially in the De la Grifforie stock, which is a late grower. Advantage can be taken of this to insert early in the month buds of the following climbers which do well on this stock:—Noisettes: W. A. Richardson, Lamarque, Climbing Niphotos, Aimée Vibert; and T. and H. Teas: Cheshunt Hybrid, Belle Lyonnaise, Maria Henrietta, Reve d'Or, and Gloire de Dijon. Any buds that failed to grow on dwarf or standard stocks can still be made good by budding afresh. In standard Briars, insert the fresh bud as near to the dead bud or as close to the axil of the stock and shoot as possible, and in dwarfs, on the other side of the stock below the ground line. If the early buds on the standard Briars begin to start, shorten back the shoots some 6 inches or 8 inches from the bud; this will have the effect of hardening and maturing the growth. The dormant buds often make the best heads, as they break stronger and are unimpaired by an inclement spring.

Cuttings inserted now will root freely under a frame in a half-spent hot-bed or under French cloches plunged on benches in a cold house. Short, stubby, jointed shoots taken off with a heel are the best. Remove two or three of the bottom leaves and insert firmly in small, well-drained pots filled with sandy soil and leaf-mould, with a layer of pure sand on the top. Give a good watering and shade the cuttings from bright sunshine. If the condensed moisture is excessive, remove the cloches or frames for a few hours. These plants often prove hardier in constitution than those struck in strong bottom heat in early spring.

Keep the hoe well at work on the beds and borders to destroy the weeds and prevent the ground from becoming caked. All kinds of Roses, though much cleaner now, have suffered this season from insect pests, and should, for the next two months and after being housed, be watched for mildew, red spider, and aphid; there is no better or simpler preparation than black sulphur, soft soap, tobacco and quassia in solution. Use $\frac{1}{2}$ lb. quassia to 1 lb. of each of the others in 6 or 8 gallons of hot water according to the strength required; the preparation is perfectly harmless. The quassia chips can be strained and the extract added to the other ingredients. Spray well under and over the foliage at a temperature of 95° during the evening and wash the specific off early next morning with clean water.

The pot Roses of the Hybrid Tea, Tea and Noisette types propagated during autumn and spring will now be crowded with flower-buds and be invaluable for furnishing a supply of cut bloom during the autumn and winter months. This can best be effected by making a temporary frame for their protection over the beds, using lights placed a foot higher than the plants, with the sides and ends open; this will induce the buds to open cleaner and be of a better colour.

Finish repotting the spring-forced Roses of the Tea family that have been stood outside. The H.P.s can be dealt with later. The plants after potting can be stood outside again until they are re-established, housing them in October and November for winter and spring flowering. Any ill-placed or weakly growths in the centres of standard and dwarf Roses should be removed. During dull and showery weather suckers form freely, especially on Briar stocks; all these should be promptly removed. Owing to the rainy season, the budding, so far, has been exceptionally successful, and at present there are scarcely any failures. Early in the month, the buds of trees

growing decorative varieties may still be inserted on late-growing stocks, which at present are full of sap.

Planted-out Roses under glass, mostly of the Tea and China sections, since being lightly pruned back and well mulched after their first blooming, are now showing promise of a good autumn display of flowers. Keep the plants well syringed and free from insects while the bright weather lasts, giving all the ventilation possible both night and day. Keep the borders loosened with the fork and give an occasional dusting of slacked lime on the surface to keep down grubs and sweeten the soil. With the resources the Rose-grower now has at his command, it is possible, with good management, to have cut Roses practically the year round. *J. D. G.*

NOTICES OF BOOKS.

THE STORY OF MY OLD-WORLD GARDEN.*

THIS book deals with the laying-out and planting of a suburban garden of small area. The author shows how he succeeded in making a charming garden, filled with interesting plants of many species, for spring, summer and autumn effects. In the heart of London, and other great cities and towns, the garden may consist perhaps of only a few boxes or pots placed on a balcony, a roof or window sill of a many-storied building. But even here, Pelargoniums, Marguerites, and Nasturtiums will open their beautiful blossoms, flourishing in surroundings apparently inimical to good development. In suburban London, away from the network of exchanges and offices, and where there are few, if any, deleterious factories, there are many thousands of small houses which have a greater advantage in possessing a little area at the back—some air space. Such plots have, as a rule, a boundary of brick wall or wooden palings. These are sometimes clothed with common Ivy or Virginian Creeper. Such smaller garden enclosures do not vary much in appearance; they are usually badly kept, and the walks run parallel with the walls or fences. Still farther out, where 17th and 18th century houses once stood, are villas, detached and semi-detached, each with bits of garden measuring half-an-acre or less in extent. Beyond, even in the best of country gardens there is the same poverty of design, and lack of artistic ideas—a square grass plot straight walk of gravel, formal shaped flower-beds, and absurd tile edgings. If the picturesque style is attempted, and arches and standards are introduced, these are inevitably in iron, and usually galvanised, from which every kind of plant shrinks, while they cling lovingly to the bent boughs of a natural support.

An old-world garden would look far better, and can be planned and carried out with just a little more thought, time and trouble, and at smaller expense than the usual commonplace villa garden. A pleasant garden of the old fashion can be made in a single season. The secrets of its success are, firstly, the adoption of an original design, and, secondly, the employment of appropriate accessories. A small garden, say, of 55 feet by 45 feet, has its own distinct advantages; the owner of such a diminutive plot can construct it in the autumn of one year, and complete and enjoy it during the following summer, that is, if he does the light work himself, and has a knowledge of gardening.

With the object of making his new garden look like an ancient one, the author-owner sought in his locality, in the builders' yards, for old materials, and was fortunate enough to obtain that which he wanted at reasonable prices. These consisted of several tons of paving slabs, cobblestones, paving sets, brick ends, tiles and broken flints once used in some old houses or chapels. With these and similar things he built low re-

* *The Story of My Old-World Garden in a London Suburb*, by G. Helyard Swinstead, R.L., with 50 original designs and photographs by the author. Price 10s. 6d. Royal 4to. (London: Bailes and Scotsbrook.)

taining walls, laid a rough sort of mosaic as a substitute for gravel for the walks; made a platform on which to set up an ancient sundial, and formed floorings in the arbours. How it was all done with the assistance of a jobbing gardener of the usual type, is related and illustrated in his delightful book. The figures, photographs, afford as much guidance as the text, and go far to prove what pleasing effects can be produced by unlikely materials, together with flowering plants, trees and shrubs, when imagination is freely thrown in as well.

PLANT NOTES.

GILIA CORONOPIFOLIA.

WHEN seen from a little distance, plants of this half-hardy biennial have very much the appearance of a group of delicately-foliaged and unusually bright scarlet-flowered *Lobelia cardinalis*. Although generally recommended solely as a pot plant, it is an excellent subject for summer bedding where it can be given a well-drained soil, in a sunny position screened from rough winds. Seeds should be sown at the present time in well-drained pans or boxes of sandy soil, and be placed in a cool frame to germinate. As soon as the seedlings appear, they should be given abundance of light and air, otherwise losses occur through damping-off. Transplant the seedlings into boxes of soil similar to that in which they were raised, pressing the soil firm. As soon as the young plants are a couple of inches high, they should be potted singly into 3-inch pots. For this shift, a fair proportion of loam should be added to the soil, and thorough drainage is still essential. The plants should be wintered in a cool, airy house, where, even if they are not in flower, they will be highly ornamental, so beautiful is the finely-cut foliage. Throughout the winter, care must be exercised in watering, but at no time should the plants be allowed to become dry at the roots. When the season for bedding-out arrives, the plants, having been duly hardened, should be planted out in such a position as that previously denoted, taking care not to crowd them: a space of fully 15 inches from plant to plant being necessary. Scarlet is not a difficult colour to harmonise with other shades, and when the inflorescence is from 3 feet to 4 feet high, with plenty of foliage beneath, it becomes an easy matter to select another suitable subject for a groundwork. Except in very cold districts, these plants may be expected to commence to flower fairly early in July, and, as in the case of *Lobelia cardinalis*, side shoots prolong the flowering period after the main stem has completed its blooming. *A. C. Bartlett.*

ORCHID NOTES AND GLEANINGS.

THE LYTHAM HALL COLLECTION.

THE sale of the fine collection of Orchids formed by J. Talbot Clifton, Esq., is announced to take place at Messrs. Protheroe and Morris's Central Auction Rooms, 67 and 68, Cheapside, London, in two portions, the first portion on September 22 and 23, and the second part on September 29 and 30. The collection, which comprises about 6,500 plants in 2,500 varieties, is one of the most remarkable and varied in existence, many extremely rare and some unique plants being contained in it. There are also about 200 white Cattleyas and as many albinos of other species as could be procured, besides a fine selection of Vandas, Aroides, Phalanopsis and Angreacums. The best plants have secured many awards at the Royal Horticultural Society's and the North of England Orchid Society's meetings. Paintings of about 100 species and varieties by Miss M. Walters Anson will be on view at the sale.

MALVASTRUM.

THIS is a large and extensive genus, consisting of about 60 species, of which there are only five or six in cultivation. Most Malvastrums are natives of South America, although a few species are found in the Western United States. Malvastrum is closely allied to Sphaeralcea, and some species have been placed by different authorities in both genera. Like most members of the Mallow family, the Malvastrums have very attractive, brilliantly-coloured flowers. The plants are not difficult to cultivate: they prefer rather dry and sunny positions, being liable in wet heavy soils to damp off in the winter. The following five species are in cultivation:—

M. campanulatum (see fig. 71).—This was first discovered in the Chilian Andes by Mr. McRae, in the year 1825. Plants first flowered in the garden of the Royal Horticultural Society in June, 1839. It was at that time treated as a greenhouse plant, but is quite hardy in sheltered, sunny positions. The stems are more or less procumbent, about 1 foot long, and bear deeply-lobed leaves, while the light-purple flowers, nearly 1 inch in diameter, are disposed in a loose terminal raceme. The plant shown in fig. 71 is growing in a sunny position; it commenced to flower in June, and kept up a succession till the end of August. Malvastrum campanulatum is figured in the *Botanical Magazine*, t. 3814, and its synonyms are *Malva campanulata* and *Malva purpurata*.

M. coccineum.—This is a dwarfier-growing plant, being not more than 6 inches to 12 inches high, producing silvery, canescent foliage, and leafy racemes of brick-red or scarlet flowers. The flowering period ranges from July to September. The species has been in cultivation since 1811, and is a native of Western North America, where it is found growing on plains and dry prairies. Malvastrum coccineum is figured in the *Botanical Magazine*, t. 1673, under the name of *Cristaria coccinea*.

M. Gilliesii.—This Chilian plant is of more or less procumbent habit, with branching stems and palmately-divided, hairy leaves. The bright-red flowers, which are 1 inch or more in diameter, are produced freely all through the summer. The plant is very liable to damp off in winter, for which reason it should be either well protected, or wintered in a frame in a pot. It is sometimes known as *Modiola geranioides*.

M. lateritium.—A rapidly-growing perennial, and one of the hardiest of the family. The plant is very useful for covering dry, sunny banks. The stems are quite prostrate, creeping along the ground, with an abundance of three to five-lobed leaves of large size. The brick-red flowers, each 1½ inches in diameter, are produced freely on long stalks, and show well above the leaves. The plant provides a good display during the whole of the summer. It is a native of Buenos Aires, and was introduced to gardens in 1840.

M. Munroanum.—In the *North American Flora*, Asa Gray places this species under Sphaeralcea. It grows from 1 foot to 2 feet high, having procumbent, branching stems. The canescent leaves are variously lobed, while the attractive rose-red or scarlet flowers are produced in long, terminal racemes. This handsome species was discovered by Douglas on the dry plains of British Columbia, in 1826, and it was named by him in compliment to Mr. Munro, the superintendent of the Royal Horticultural Society's gardens at Chiswick. In common with all the foregoing species, it should be grown in sandy or gravelly soil, and will flower abundantly from June to October. In a rich soil it produces more leaves than flowers, and the leaves lose their fine, silky down. Propagation may be effected by seeds and cuttings. *Malva Munroanum* and *Sphaeralcea Munroana* are synonyms. A figure of the plant in the *Botanical Magazine*, t. 3537, is given under the former name. W. I.

SPRINGFIELD PARK, UPPER CLAPTON.

IT was about four years ago that the London County Council acquired the residence and the grounds attached thereto, known as Springfield Park, at Upper Clapton. The greater part of this residential-suburb is situated on a ridge, at a considerable elevation above the surrounding country. Springfield Park grounds, which form the termination of the ridge, overlook the wide marshland at the base, and afford spacious views in the direction of Walthamstow and Epping Forest, with Buckhurst Hill as the more prominent distant point in the prospect. From the grounds surrounding the mansion, the land slopes rapidly to the marshy meadows below it; and former owners had done much in the matter of tree and shrub planting to facilitate its conversion to a charming "open space" for the use of the inhabitants of this the most out-lying suburb of North-east London. The land immediately at the bottom of the hilly ground was also taken over by the Council, but whether this formed part of the park originally, I did not ascertain on the occasion of a recent visit to the place. The land was too wet for the

vate ownership; the same remark holds good for many of the trees, which have suffered greatly in places from overcrowding.

Mr. G. T. Dodson, the present superintendent at Springfield, may be trusted to do what is required in these respects.

The floral decorations of the grounds are receiving close attention at his hands, flower-beds being found at all the salient points. The now old-fashioned ribbon border seems to be still one that meets with much favour from the visitors; next to these should be mentioned the mixed bed and the herbaceous border, with its bare spaces filled with ten-week Stocks, Zinnias, especially telling being the Haageana varieties; Malope grandiflora, Coleus and Antirrhinums, chiefly those having crimson or other decided-coloured blooms.

A few nicely-designed carpet beds were noticed, but the season has not favoured some of the more tender plants employed.

I observed some pleasing combinations of Violas and other subjects, viz., the variety Mrs. Chichester with *Poa trivialis* variegata, and edgings formed by the variegated variety of *Veronica Andersonii*. This last named is readily kept tidy

FIG. 71.—MALVASTRUM CAMPANULATUM: FLOWERS, LIGHT PURPLE.

purposes of a public park, and with the intention of raising the water level, so as to admit of it being utilised for cricket, lawn tennis, bowls, &c., 62,000 cartloads of earth have been deposited on it and levelled, so as to form a dry surface. It will be fit for playing games upon next year, the grasses with which it was sown having made good growth.

Among the arboreal features of the park, I noted grand specimens of the Turkey Oak, *Quercus Cerris*; the purple-leaved Beech, of which tree there are many perfect specimens; Sweet or Spanish Chestnut, Tulip trees, huge Thorns, Sweet Bays, of a size seldom observed; Robinia Pseud-acacia, many fruitful standard Apple and Pear trees, whose crop in 1909 amounted to 60 bushels; a few specimens of *Taxodium distichum*, *Cedrus atlantica*, *C. Libani*, and *C. deodara*. Clumps of the old, named varieties of *Rhododendron hybridum*, and *R. ponticum*; also Ghent Azaleas and *Azalea mollis*, which, in their season, fill the air with the fragrance of their blossoms. Many of the bushes of these last are 8 feet to 10 feet in height. Like those found in old pleasure grounds generally, they need more attention than has been afforded them under pri-

as an edging plant, and does not grow more than 9 inches in height in a season.

Fuchsias are utilised as pillar plants or in groups on the lawns, and with good effect in even this sunless, cool summer. The varieties included elegans, Charming, Mrs. Roberts, Western Beauty, Marinka, a variety with a crimson corolla and sepals, free in flowering; Arabella, like Rose of Castile, but a better flower, and Ballet Girl.

A long border of Violas was very bright, even when seen from afar. The plants were grown in blocks of one variety only. The following were among the finer colours:—William Neil, pale rose, distinct; Duchess of Fife, C. B. Riding, Blue King, Lady Dundonald, Bullion, and Lilacina.

The park possesses several entrances, near to which the best floral effects were massed. At one of these is an example of the ribbon border, consisting of *Pelargonium bicolor* and a Zonal variety, Pentstemons, and *Calceolaria floribunda*; opposite to this bed was another of bushes of Fuchsia in mixture, tall *Plumbago capensis*, *Campanula pyramidalis* in blue and white varieties, *Abutilon*

Thompsonii and other varieties, Franca, Lobelia cardinalis and Fuchsia Meteor.

Another border was planted with Pentstemon Norma, a scarlet bloom having a white throat; P. Victoria, a very fine scarlet flowered variety; P. Major Sexby, Helianthus, Dahlias, Sweet Peas of fine quality in the flowers, shrubby Phloxes, and Pentstemon Newbury Gem, a dwarf plant bearing scarlet flowers of a slender form.

A bed of H.P. Roses has done well this year, although the land hereabouts is too light for the Rose. It had an edging of Montbretias showing flower-spikes in plenty.

The park possesses a small lake of serpentine shape, but seeing that there is such a big expanse of water in the immediate foreground, it appears somewhat out of place. F. M.

The Week's Work.

THE ORCHID HOUSES.

By W. H. WHITE, Orchid Grower to Sir TREVOR LAWRENCE, Bart., Burford, Suirey.

Dendrobium.—Among *Dendrobiums* now in bloom, the rare *D. Hookerianum* (chrysolis) is the most conspicuous; its rich, golden-yellow flowers have a dark purple-blotched centre and fimbriated lip. This species is, in many respects, different from the majority of the others in the genus; the flowers are developed on spikes, which arise from the pseudo-bulbs whilst the growths and leaves are quite fresh and green, and the younger shoots still growing vigorously. The inflorescences appear on the growth formed during the previous summer. The plant is continually growing, for long before one growth is completed another has made considerable progress. For many years, this *Dendrobium* was, by many, considered to be far more difficult to manage than its congeners, but suspended to the roof of the Cattleya house, in an ordinary flower-pot, and given a shallow layer of *Osmunda* fibre to root into, it grows freely and satisfactorily. Another rare and distinct *Dendrobium* which is nearly always in bloom is *D. glomeratum*. This species and *D. subclausum* thrive best when suspended to the roof of a cool, intermediate house. All three species require to be kept fairly moist at the roots at all seasons. *D. superbum*, and its rare and lovely varieties *Burkii*, *Dearei*, and *Huttonii*, also such tall-growing species as *D. Dalhousieanum*, *D. fimbriatum*, *D. f. oculatum*, *D. clavatum*, *D. moschatum*, together with the hybrids *D. Dalhousie-nobile*, *D. illustre*, *D. Arthur Ashworth*, and *D. porphyrogastrum* should, by this date, be accommodated in the hottest house, and have liberal treatment till their growth is finished. Such uncommon species as *D. capillipes*, *D. nodatum*, *D. gemellum*, *D. quadrilobum*, *D. macrostachyum*, *D. burserum*, *D. bicameratum*, *D. amethystoglossum*, *D. crumenatum*, and *D. emulatum* also require plenty of heat and moisture when growing actively.

Miltonia vexillaria.—The present is the best time for repotting *Miltonia vexillaria*, because the new growths that are developing will soon commence to form roots, and, owing to the quantity of water needed whilst the plants are growing freely, the compost becomes partially exhausted. The plant loses naturally a number of its old roots every year; these may be cut off, and the plants supplied with fresh sweet compost. Previous to repotting, it is advisable to closely examine the growths for the presence of small, yellow thrips, which harbour low down in the young growths. If any are detected, dip the plants in some safe insecticide, rinsing them afterwards in clean, warm, soft water. *M. vexillaria* is a shallow-rooting plant, and forms numerous fibrous roots, which push their way just over and under the compost; for these reasons, a rather wide but shallow root run is beneficial to them. The receptacles should be filled with clean crocks to about three-quarters of their depth, and to render the drainage material secure, put a layer of *Sphagnum*-moss over it. The compost may consist of *Osmunda* fibre, *Polypodium* fibre, and *Sphagnum* moss in equal parts. Cut these materials into moderately-fine pieces, mixing them well together and adding plenty of small crocks. Keep the base of the plant on a

level with the rim of the pot, and carefully work the compost amongst the living roots, finishing with a layer of live moss. Rather light potting answers best; the materials should be compressed just sufficiently to make the plant firm, and water should be able to pass through the whole compost as through a sieve. For several weeks after repotting, great care must be taken in watering the plants. For a time, it will suffice to merely sprinkle the surface by means of the sprayer or a fine-rose watering can, the principal object being to induce the surface moss to grow. As the roots lengthen and growth becomes vigorous, the supply of water should be increased. If placed in the coolest part of the Cattleya house and properly attended to, the plants soon become re-established. Carefully shade the foliage from sunshine till the plants are well rooted in the new soil. The late-flowering varieties, as *M. v. rubella*, *M. v. superba*, *M. v. Leopoldii*, although their flowers are smaller than those of the type species, are well worthy of culture. This being their flowering season, they should be staged in the intermediate house, but when growth recommences, the same treatment as advised for *M. vexillaria* will suit them. The distinct hybrid *M. Bluana* and its variety *nobilior* are now forming their new pseudo-bulbs, and copious root-waterings are necessary. Both varieties should be grown in the same house as the *M. vexillaria*.

Heating apparatus.—At this season, the hot-water appliances should be thoroughly overhauled and put into order for the winter season. Loose or cracked sockets in the hot-water pipes should be made good, valves and air taps loosened and oiled, and overflow and feed pipes put in good order. Replace the firebars where necessary and clean out the flues around and over the boilers; the fire and ashpit doors should also receive attention. If it becomes necessary to empty the boilers and hot-water pipes, the plants in the houses should be kept on the dry side while such work is going on, and if any of the plants appear likely to suffer from dryness, only one-half the usual quantity of water should be afforded.

THE FLOWER GARDEN.

By E. BECKETT, Gardener to the Hon. VICARY GIBBS, Aldenham House, Hertfordshire.

Propagating summer bedding plants.—This most important item in the routine of flower-garden management must be proceeded with without delay during the next week or so. In procuring the necessary cuttings, do not disfigure the plants more than is absolutely necessary. Pelargoniums are required in most places in the largest numbers, and cuttings of these may be removed at intervals. The growth of the plants this year is very soft, and doubtless more failures than usual will result. A capital plan is, after the cuttings are made, to lay them out thinly on a dry bottom in a sunny position, so that they may become wilted. The shoots should be inserted firmly in a good, open compost, containing plenty of road grit for preference. Some growers prefer to use pots and others boxes, but this is, I think, immaterial. Neither is a frame necessary to accommodate the cuttings, as I have seen excellent results obtained by standing the boxes on the garden walks, but, should wet weather set in, they should be protected by garden lights. Cuttings of the Ivy-leaved section may also be treated in the same manner as the *Zonalas*. The Cape species of scented Geraniums that I recommended in an earlier Calendar for bedding purposes have made excellent growth, and if cuttings of these are taken and placed four or five together in a 5-inch pot, in a cold frame, they will soon root, if kept in a moderately close atmosphere. Cuttings of the various Fuchsias and Verbenas may also be treated in the same manner. For the propagation of the more tender subjects, such as *Swainsonia*, *Salvia*, *Mesembryanthemum*, *Streptosolen*, *Plumbago capensis*, and *Heliotrope*, I prefer to root them in a heated frame or pit, where the plants may be kept near to the glass or on shelves in a warm house. For general purposes, a 5-inch pot will be found a useful size. Therefore, a quantity of these may be prepared by having them well washed, dried and crocked. Prepare a compost of moderately fine soil. Fill the pots, making the soil firm, and on the top place a good sprinkling of silver sand. Make certain that the base of the cutting rests on a firm base and is solid in the pot, when a good

watering should be afforded by means of a fine rose. Many plants may be increased with rapidity in the spring; therefore, it is only necessary to keep a few stock plants of these through the winter. Plants that may be treated in this manner are *Mesembryanthemum cordifolium variegatum*, *Iresine*, *Alternantheras* in variety, *Salvia*, *Ageratum* and *Verbena*. *Lantanas* may also be similarly treated. It is an excellent plan to lift a few of these latter plants when the bedding is cleared. Pot them into 4½-inch pots, and stand them in a cool, shady position for a few days. Winter the plants in a warm frame or greenhouse, and, if they are introduced into a little heat in the New Year and kept well syringed, they will furnish a quantity of cuttings that will root readily in a warm pit. Plants of *Lobelia* may also be treated in the same manner, though a stock of this plant can be easily raised from seed. Cuttings of all plants require constant attention. See that the surroundings are kept sufficiently moist and do not neglect ventilation; remove at once any decaying growth. When they are rooted, place them in a cooler structure, and do all that is possible to promote a hardy growth. Endeavour to keep the flower-beds as gay as possible during the few remaining weeks of summer by constantly removing dead flowers and foliage, and maintain a neat appearance in their surroundings to render the flower-garden as attractive as possible.

THE HARDY FRUIT GARDEN.

By A. R. SEARLE, Gardener to the Marquis of NORTHAMPTON, Castle Ashby, Northamptonshire.

Peach.—After the fruits of the earliest varieties of wall Peach trees have been gathered, the trees should be given a thorough syringing with some insecticide; in addition to this, the foliage should be sprayed with clear water during fine weather, as this will assist to keep the leaves clean and healthy until they fall. Varieties that are ripening their fruits must be frequently examined, and the Peaches gathered before they are over-ripe, otherwise they will lose much of their flavour. The fruits should be gathered immediately the stalks part easily from the stem, and if not required for immediate use, stored in a well-ventilated fruit room. Continue to pinch all the lateral growths, and tie back any leaves that prevent the sun's rays from reaching the fruits, for plenty of air and light will assist them in developing a good flavour. Any shoots intended to be removed after the crop is gathered may be shortened at this stage; this will assist the fruits to swell and admit more air and light to the growths that will furnish next season's crops. Earwigs are specially numerous this season, and trapping must be persevered with, otherwise they will cause much damage to the ripening fruits.

Apricot.—When the trees are cleared of their fruits they should be given a similar spraying to that recommended for Peach trees. After the fruits have been gathered remove any branches or useless shoots, which is a better practice than adopting severe pruning in the winter as the cut surfaces will heal more quickly now and hard pruning of the dormant wood is liable to result in gumming. Trees that are not making satisfactory growths should have their roots examined early in October, furnishing some fresh compost consisting of good loam, lime-rubble, and bone-meal. After this is applied, make the border thoroughly firm again, and give it a good soaking of water. Trees making extra vigorous growth should be root-pruned about the same time.

Strawberry beds.—Continue to pinch off the runners as they appear and keep the soil between the plants well stirred with the hoe. The showery weather has been favourable to the growth of Strawberries, especially young ones that were planted early. There is still time to plant fresh runners, selecting strong ones, taking care when the weather is dry to keep them well supplied with water. It is our practice here to plant, at a distance of 12 inches apart each way, a batch of Strawberries for furnishing runners in the following season. These will provide early plants for pot culture, and for new beds early in the season. The flower trusses are picked off these stock plants, and only the strongest runners are allowed to develop. Before planting, the ground should be well manured, deeply dug and made quite firm again.

FRUITS UNDER GLASS.

By B. GOODACRE, Gardener to Sir ERNEST CASSEL, G.C.B., Moulton Paddocks, Newmarket.

Pot trees.—The annual repotting or top-dressing of fruit trees in pots may be commenced whenever the growth is completed and before the leaves have all fallen. This work should always be done in good time, particularly in the case of trees which are to be forced early in the following year. It is not necessary to repot the trees oftener than once every two or three years. In the case of those in extra large pots, the same receptacles may be used again after cutting and trimming off some of the old soil and roots. Young trees may be afforded fresh pots of one size larger than those they have occupied. See that both pots and crocks are thoroughly clean; cracked pots may be strengthened by a wire hoop, otherwise the ramming of the soil may cause them to burst. The compost should consist of good fibrous loam with the addition of a small proportion of clean leaf-soil, lime rubble, soot and bonemeal. A few half-inch bones may be placed over the crocks. The compost, as well as the ball of soil about the roots, should be in a fairly dry condition, for it is important that the new compost be rammed firmly, and if at all wet this operation causes it to become pasty and waterlogged. Once the work is commenced, let it be done without delay, as the roots should not be exposed to the drying influences of sun and wind. The clay rims which were fitted to the pots in the early part of the season may be cleared away, also some of the young surface roots. In filling the pots, leave sufficient room for a good supply of water, and the centre of the ball should be slightly lower than the sides, otherwise the water may drain to the sides of the pot, leaving the middle part dry. Those trees which are to be top-dressed may be turned out of the pots, and the old drainage replaced with clean material. Newly-potted trees may be stood in the open, and the pots plunged to their rims. If hot, dry weather prevails, a gentle syringing late in the afternoon will help to preserve the foliage until it is matured and ready to drop naturally. Later in the season when frosts threaten, a layer of long litter may be spread over the ground to protect the roots and pots.

PLANTS UNDER GLASS.

By JOHN DONOGHUE, Gardener to JOSEPH PICKERSGILL, Esq., Bardon Hill, Weetwood, Yorkshire.

Fittonia.—Autumn-raised plants of *Fittonia* are useful for furnishing a groundwork to other subjects of the stove or for planting in hanging baskets. Cuttings inserted around the edges of small pots or shallow pans root readily. *Fittonias* revel in warm, moist conditions, and should never be allowed to suffer from dryness at the roots.

Pancreatum.—The plants are passing out of bloom, and their ripening must be proceeded with gradually. The amount of moisture applied to the roots must be gradually reduced and a lower temperature maintained, but they should not be allowed to become so excessively dry as to shrivel. Expose them to full sunshine and plenty of fresh air. After the foliage has withered, place the pots on their sides, but examine them occasionally to see if water is necessary.

Clerodendron Balfourii.—As the plants pass out of bloom, prepare them for their resting stage, taking care to have the wood thoroughly well ripened. The young shoots must not be allowed to flag. The weaker and useless ones are best removed, as this will allow the others to have all the light and air possible. When the shoots are properly matured place the plants in a temperature of 50° to 55°.

Cyclamen.—Seeds may now be sown for raising next season's stock of plants. If shallow pans are available, these are most suitable and may be filled to within half an inch of the surface with a finely-sifted compost, consisting of, in equal parts, loam, leaf-soil (Oak), and Bedfordshire sand. It is essential that the pans should be thoroughly cleansed and dry previous to filling them with the soil, and an abundance of drainage material is also essential. The *Cyclamen* is frequently slow in germination, and ample drainage will prevent the soil from becoming sour. After the soil in the pans has been watered and allowed to drain for a few hours, the seeds should

be sown thinly and covered lightly with some fine soil. Place a sheet of glass over the pans; stand the seed pans in a frame or pit having an atmospheric temperature of about 60° and keep the frame close. After the seedlings have been somewhat hardened by gradual exposure to the light, they may be afforded a position near to the glass. *Cyclamens* succeed best when grown in an even temperature of about 55°; ventilation must be afforded carefully, so as to prevent cold winds from injuring the foliage. *Cyclamens* which were raised about this time last year are looking extremely well. They may now be given a light top-dressing of some chemical fertiliser and an occasional watering with soot-water. They may be removed to their winter quarters any time during September. Extreme care must be exercised in applying moisture, as the young flower-buds are very liable to damp off. Watering is best done before noon, and the surroundings must be kept drier during the evening. *Aphis* and *thrips* are very injurious to *Cyclamens*, and it is advisable to fumigate the house occasionally.

THE KITCHEN GARDEN.

By JOHN DUNN, Kitchen Garden Foreman, Royal Gardens, Windsor.

Potatoes.—No time should be lost in harvesting the Potato crop, as the weather has been unfavourable and, where disease sets in, the tubers will be seriously affected. In this district, the haulm has withered earlier than usual, and some varieties are already badly affected with late blight. *Potatoes* should be placed in an airy shed for a few weeks before their removal to the clamp or Potato shed for the winter. This will permit of their examination occasionally with a view to removing diseased tubers. It is often more convenient to store them in sheds, as they can be examined in rough weather, when outside work cannot be performed. After lifting the crop burn all the diseased tubers together with haulm.

French Beans.—Seeds should be sown in pots for a batch of French Beans to furnish a supply of pods at the end of October and throughout November. Pots with a diameter of 7 inches should be three parts filled with heavy soil made moderately firm, covering the seeds to the depth of about 1 inch. Place the pots on a bed of ashes in the open until the approach of cold weather, when they should be removed to some light and airy structure. Syringe the plants daily during fine weather to keep red spider in check.

Cabbage.—Plants from the earliest sowing will now be ready for transplanting in a sheltered position. If the ground has been manured for a previous crop, it will not be necessary to further enrich it, but the surface should be broken up with a digging fork. Plant in drills made 18 inches apart, making the soil firm about the roots, and afterwards furnish liberal supplies of water, until the plants are growing again freely. Should slugs be troublesome, dust the ground with hot lime late in the evening or very early in the morning. The main planting of Cabbage should be made about September 20.

Celery.—This crop will need considerable attention to produce the best results. Before earthing up the plants, the trenches should be soaked with weak liquid manure. The earthing up should be done at intervals, and care should be taken not to allow any of the soil to fall into the centres of the plants. *Celery* that has been already partially moulded will still require water, but this must be applied carefully, so as not to wash the soil into the hearts of the plants. A good system is to make drills on either side at a short distance from the *Celery* and to fill these several times with water, filling in the soil again when the roots have been thoroughly soaked.

Sweet Marjoram.—Some of the plants may be lifted from the border and potted into 7-inch pots. The most suitable compost is a mixture of three parts loam and one part leaf-soil, with a little rough sand to keep the soil open. After the plants are potted, they should be placed in a shady position until the roots are active, when they may be exposed to the sun out-of-doors and remain in the open until frost sets in; during cold weather the protection of a cool pit will be necessary.

Mint.—Mint that was propagated last spring from cuttings should now be cut down and the

roots allowed to remain dormant until required for the forcing pit in November. The roots should then be lifted carefully and placed on a mild hot-bed, where they will soon produce large quantities of young, green shoots.

Sorrel.—Plants intended for forcing should be treated in a similar manner to that advised for Mint.

Carrots.—The April-sown plants will be ready for lifting. The roots should be stored in a cool, dry shed, placing sand amongst them in sufficient quantity to exclude the light and keep them moist. Avoid placing the roots too closely together, as they will be liable to become heated and deteriorate.

Beet.—Early-sown Beet should be stored in the same manner; if Beet is allowed to remain in the ground after the roots have attained their full size, it becomes coarse and unfit for use.

THE APIARY.

By CHLORIS.

Feeding.—Feeding is undertaken in the autumn generally with one of two objects in view, namely, with the idea of stimulating the queen to produce plenty of eggs, for the bees raised now are those which will live through the winter to raise the brood for next season; or to make up the quantity of food requisite for all purposes until the bees can gather a further supply next spring. Too much stores cannot be laid upon the necessity for raising as much brood as possible, because the queen will only lay that number of eggs which can be kept at the requisite temperature, and this can only be done by the brood being covered with bees. When a colony is weak in the spring, progress is greatly retarded, and honey production endangered. With regard to the second reason for feeding, it must be remembered that, for a colony to pass unaided through the winter and spring, the hive should contain about 30 lbs. of sealed food. Some bee experts recommend that when food is given for stimulative purposes, it should be given slowly, and for this reason it is best to employ a feeding bottle with a perforated metal cap, containing about nine holes. The great objection to this method of slow feeding is that it takes the bees a long time to appropriate the syrup, and, consequently, what remains in the feeder gets cold and robs the hive of its heat.

How to feed bees.—Take a piece of wood about 6 inches square and half-inch thick; cut a circular hole in the centre about 2½ inches in diameter, and also make a hole in the quilt about 2 inches square, leaving the fourth side to be turned back as a flap. Over the hole place the wood, so that the two holes coincide. Fill a jam bottle to the brim with syrup and tie over the mouth one or two thicknesses of canvas or muslin. When placing the syrup over the feed-hole in the stand, first place temporarily over the mouth of the bottle a piece of paper to prevent the escape of any of the liquid before the bottle is placed in position. When the bottle requires refilling, use the smoker to drive down the bees from the hole and cover it with a piece of slate or glass. Always heat the syrup to 90° or 100°, and when the bottle is placed in the hives wrap it up warmly with quilts to prevent the escape of the heat.

How to make syrup.—The syrup used at this season of the year should be thicker than that used in the spring or summer. The objections to thin syrup are: it may ferment; valuable heat is utilised in evaporating the extra water; or it may cause dysentery. Boil about five pints of water, add 10 lbs. of cane sugar, a tablespoonful of vinegar and half a tablespoonful of salt. Let it boil a few minutes, taking great care not to allow it to burn, for burnt syrup is very injurious to bees. Always place the food in the hive in the evening, when the bees have ceased work, so as to prevent robbing. Feeding should commence not later than the middle of September, so that all may be completed by the end of the first week in October. This year it will be very important to examine the hives carefully in September to see if the bees require feeding. To those who are unaccustomed to judging the amount of food necessary for a hive, the following is a good guide: there should be about 3 square feet of sealed food, i.e., about two full frames, and six or seven half-filled.

EDITORIAL NOTICE.

ADVERTISEMENTS should be sent to the PUBLISHER, 41, Wellington Street, Covent Garden, W.C.

Special Notice to Correspondents.—The Editors do not undertake to pay for any contributions or illustrations, or to return unused communications or illustrations, unless by special arrangement. The Editors do not hold themselves responsible for any opinions expressed by their correspondents.

Letters for Publication, as well as specimens of plants for naming, should be addressed to the EDITORS, 41, Wellington Street, Covent Garden, London. Communications should be written on one side only of the paper, sent as early in the week as possible and duly signed by the writer. If desired, the signature will not be printed, but kept as a guarantee of good faith.

Local News.—Correspondents will greatly oblige by sending to the Editors early intelligence of local events likely to be of interest to our readers, or of any matters which it is desirable to bring under the notice of horticulturists.

Illustrations. The Editors will be glad to receive and to select photographs or drawings, suitable for reproduction, of gardens, or of remarkable plants, flowers, trees, &c., but they cannot be responsible for loss or injury.

Newspapers.—Correspondents sending newspapers should be careful to mark the paragraphs they wish the Editors to see.

APPOINTMENTS FOR SEPTEMBER.

- SATURDAY, SEPTEMBER 3—
 Soc. Franç. d'Hort. de Londres meet.
- TUESDAY, SEPTEMBER 6—Scottish Hort. Assoc. meet.
- WEDNESDAY, SEPTEMBER 7—
 Roy. Caledonian Hort. Soc. Autumn Sh. in Waverley Market, Edinburgh (2 days).
- THURSDAY, SEPTEMBER 8—
 Nat. Dahlia Soc. Exh. at Crystal Palace (2 days.) London Branch of B.G.A. Excursion.
- MONDAY, SEPTEMBER 12—
 United Hort. Ben. & Prov. Soc. Comis. meet.
- TUESDAY, SEPTEMBER 13—
 Roy. Hort. Soc. Comis. meet. (Lecture at 3 p.m. by Mr. C. Herman Senn, on "The Cooking of Vegetables.") British Gard. Assoc. Ex. Council meet.
- THURSDAY, SEPTEMBER 15—
 Nat. Rose Soc. Autumn Sh. in R.H.S. Hall, Westminster.
- FRIDAY, SEPTEMBER 16—
 Sheffield Chrys. Soc. Early Show (2 days).
- TUESDAY, SEPTEMBER 20—
 Nat. Dahlia Soc. Exh. at Royal Bot. Gardens, Regent's Park (2 days.)
- SATURDAY, SEPTEMBER 24—
 Brussels International Show (Ex. of Fruit and Market Garden Produce) (4 days).
- TUESDAY, SEPTEMBER 27—
 Roy. Hort. Soc. Comis. meet. (Lecture at 3 p.m. by Mr. Arthur W. Hill, on "South America in its Relations to Horticulture.")
- WEDNESDAY, SEPTEMBER 28—
 Nat. Vegetable Soc. Exh. at Roy. Hort. Soc. Hall, Westminster.

AVERAGE MEAN TEMPERATURE for the ensuing week deduced from observations during the last Fifty Years at Greenwich—58° F.

ACTUAL TEMPERATURES:—
 LONDON.—Wednesday, August 31 (6 p.m.): Max. 66° Min. 52°.
 Gardeners' Chronicle Office, 41, Wellington Street, Covent Garden, London.—Thursday, September 1 (10 a.m.): Bar. 30.3; Temp. 65°. Weather—Sunshine.

PROVINCES.—Wednesday, August 31; Max. 61° Reading; Min. 56° Yorkshire.

SALES FOR THE ENSUING WEEK.

- MONDAY, TUESDAY, WEDNESDAY, THURSDAY AND FRIDAY—
 Dutch Bulbs, at 67 & 68, Cheapside, E.C., by Protheroe & Morris, at 10.30.
- WEDNESDAY—
 Trade Sale of *Lilium Harrisoni* and *longiflorum*; Roman Hyacinths and Thousands of other Bulbs in Variety, at 67 & 68, Cheapside, E.C., by Protheroe & Morris, at 1.
- FRIDAY—
 A portion of the "Oakdene" Collection of Orchids, at 67 & 68, Cheapside, E.C., by Protheroe & Morris, at 1.

Under the title of *Agricultural and Botanical Exploration in Palestine*, the United States Department of Agriculture has just issued* the results of Mr. Aaronsohn's investigations into the possibilities of the Orient as a source whence new varieties of plants of economic importance may be introduced into the United States.

* United States Department of Agriculture: Bureau of Plant Industry, Bulletin No. 180. August, 1910.

As Mr. Aaronsohn points out in his introduction, America has already derived a number of valuable plants from Oriental countries; hard Wheats from Russia and Turkey, seedless Grapes and Figs from Smyrna; and he is confident that this list will be extended very considerably in the near future. Nor, having regard to the similarity in climate between such Oriental countries as Palestine and the desert regions of the Western States, would this prediction appear to be unduly optimistic. The sole consideration which would tend to cause this estimate to be accepted with hesitancy lies in the fact that, though the climate of Palestine is characterised by a markedly dry season, the winter temperature is not low. Consequently, though the plants introduced from that region might be expected to withstand drought, they would probably prove susceptible to cold. This, however, is a question which experiment alone can decide.

After a short sketch of the climate of Palestine, the writer proceeds to treat of the vegetation of that country. He points out that, though the extent of Palestine is something like one-twentieth that of California, the number of species which it contains is about the same, namely, 3,000. It is significant that, as Mr. Aaronsohn notes, chalk-loving leguminous plants are well represented in the flora, and that species such as *Medicago*, *Melilotus*, *Trigonella*, *Astragalus*, *Trifolium*, and others are very rich in species. To the nitrogen-fixing powers of these plants is due, in large measure, the fertility of the soil.

Among the plants which Mr. Aaronsohn recommends for introduction into the United States are several species of *Zizyphus*, of which *Z. lotus* is mentioned as bearing a fruit (dôm), which is eaten by the Arabs, and has the taste of dried Apples. He suggests that many of the wild species of *Rosaceæ* will be found useful as stocks in fruit cultivation. The wild Almond, *Amygdalus communis*, which is common in Palestine and Syria, should prove valuable in providing stocks for Almond and Apricots grown on dry and non-irrigable lands, and *Amygdalus orientalis*, possessed of great capacity of resistance both to heat and cold, and growing at altitudes as high as 5,000 feet should make a good stock on poor soils in barren regions.

Of the Palestine species of *Prunus*, the writer mentions *Prunus microcarpa*, *P. ursina* (Bear Plum), and *P. cerasia*. The last-named species possesses a fruit which resembles a Damson in taste and appearance, and is probably, in Mr. Aaronsohn's opinion, the prototype of the cultivated Damson, the name of which is said to be derived from the word *Damasus*.

The species of *Cratægus* to which particular attention is called are *Cratægus azarolus*, *C. orientalis*, and *C. sinaica*. Experiments have shown that these species make excellent stocks for Pears. The last two species have the additional advantage of growing well in dry, calcareous land. Another plant which the writer considers to be a very promising Pear stock is the wild Pear, *Pyrus syriaca*. We draw particular attention to the fact, which Mr. Aaronsohn points out, that some races of this species, which form a shrub of 20 to 30 feet high, grow in very moist localities, and even in almost swampy ground.

We hope that those interested in fruit

cultivation will carry out experiments into the value of some of the stocks which we have mentioned for service in this country.

Both Palestine and Syria are particularly rich in Apricots, which are grafted generally on the Almond. Mr. Aaronsohn obtained eight varieties from Damascus alone, and he makes the notable observation that when they are grown under similar conditions of soil and climate, there are fully two months between the times of ripening of the earliest and latest varieties. Mr. Aaronsohn recommends the introduction and trial of the various plants we have named, and also of oriental varieties of Figs and Grapes. Other sections of the report deal with forage plants and cereals indigenous to the country. In connection with the latter group of plants it is urged that a thorough botanic-agronomic exploration of Palestine and the neighbouring regions should be made without delay.

Though, from the nature of the case, it may be that Mr. Aaronsohn's discoveries and recommendations are not as a general rule likely to be of value for this country, yet it cannot be doubted that they will prove of the greatest importance to other parts of the British Empire, and particularly to South Africa and Australia. We commend, therefore, this excellent bulletin to all who are interested in the improvement of horticulture in the Empire, and, in particular, to the authorities of the countries we have named. There can be no doubt that, with the help of the new knowledge, though we may not cause the desert to blossom as the Rose, many of the waste places of the earth may be won back to fertility.

The most important lesson which we in this country have to learn from the story of the enterprise in horticultural exploration shown by the Americans, is that it lies with us to make similar investigations with the object of ameliorating our own varieties of cultivated plants, and especially of fruit trees. Year after year, we have to record failures, more or less severe, of such crops as those of the Apple. Not infrequently, this failure is due to frost at the flowering period. In other words, it is caused by the incomplete hardiness of our varieties. Here, therefore, is a promising and important field for experimental investigation; the problem being to breed varieties of Apples which, whilst possessing the high qualities of our best varieties, shall prove resistant to low temperatures.

OUR SUPPLEMENTARY ILLUSTRATION represents a plant of the handsome *Sobralia macrantha alba* in the collection of Sir JOHN EDWARDS-MOSS, Roby Hall, Torquay (gr. Mr. LUCKHURST). The plant, when photographed, had 21 flowers; the next day more than 30 were fully expanded, and altogether it has produced about 100 flowers this season. The first white *Sobralia macrantha* was *S. macrantha Kienastiana*, flowered by Consul KIENAST-ZOLLY, of Zurich, in 1838. Since that time the white-flowered form has appeared in other importations, and has been given the more appropriate name "alba," although there seems to be no variation from the original. Sir JOHN EDWARDS-MOSS gives the following particulars of this plant and of other Orchids in his collection:—"The *Sobralias* are staged against the back wall of the Cattleya-house. I bought the plant in 1903, when it had

five or six small stems. It was potted on, and is now so large that we shall probably have to divide it into four next year. It is grown in the best fibrous loam with a little peat and broken crocks added, and the plants are liberally watered whilst making their growths. I gather that a photograph of a specimen of *Cattleya gigas* (Warszewiczii) was also sent with the one of the *Sohralia*. It is generally believed that the formation of a seed-pod on a plant of this species has often the effect of making a mournful end of it. Now, I have found that, as a matter of fact, the joys of maternity stimulate it to increased effort, and this is an instance of a plant carrying a seed-pod and yet sending out an excellent flowering growth with six blooms. On taking up the floor trellis for cleaning purposes, three good, large, seedling Orchids were found on the lower side of the battens. What they are we cannot imagine, but the event is interesting. Our *Odontoglossums* grow remarkably well, part of them in a house under conditions which I should at one time have thought quite unsuitable, and yet they do as well in the Mexican-house, where the temperature runs up rather high during the daytime, as they do in the cooler *Odontoglossum*-house. What helps us here, I think, are the nights, as, being near the sea and at an elevation of 500 feet, they are always cool. In those tropical days last year—August 6 to 15—when the day temperature was very high, on only four nights during the whole summer did the minimum temperature exceed or even touch 60° Fahr. I am sure you will appreciate what an advantage that is for *Odontoglossum crispum* especially." We commend the concluding remark to the notice of other Orchid growers, for, as we have frequently urged in these pages, the ensurance of low night temperatures is one of the most important points in successful Orchid culture.

EDINBURGH WORKING MEN'S FLOWER SHOW.—The committee of this show has awarded five special prizes for exhibits at the show on August 13, these not having been previously announced. They consisted of Silver Medals, given respectively by Messrs. T. SMITH & SONS, Edinburgh; Mr. J. W. M'HATTIE, City Gardener; Mrs. ALEXANDER; Mr. JAS. WHYTECK, and the Society; the recipients being Mr. ROBERT MACKIE, for window flowers; Mr. A. S. GILLILAND, the most successful new adult competitor; JAMES BROWN (aged 10), the most successful former juvenile competitor; JAMES BAIRD (aged 10), the most successful new juvenile competitor; and Mr. J. NISBET, who showed the best window-box exhibit.

FLOWERS AT BATTERSEA PARK.—A particularly notable feature of the summer bedding at Battersea Park is the extensive use made of the different varieties of *Fuchsia*, either as large bushes, dwarf plants, or standards. The present season has been very favourable to their flowering, for in hot, dry summers many *Fuchsia* blooms drop off in the bud stage. Old and tried varieties are chiefly employed, the majority of the newer kinds being unsuited owing to their large, heavy blossoms. Of dark varieties, *Crimson Globe*, *Scarcity*, *Marinka* and *Charming* are among the best, whilst, of light coloured kinds, *Mrs. Marshall*, which has been popular as a market plant for more than 40 years, is still unsurpassed. Of this sort, there are some very fine standard plants associated with the *Violas* referred to on p. 103, which still form one of the most delightful features of the park. Of other *Fuchsias*, the salmon-tinted *Earl of Beaconsfield* and *Mrs. Rundell* show well their value for planting out-of-doors. There is also the old *albo-coccinea*, which was sent out by Messrs. E. G. HENDERSON & SONS, of St. John's Wood, in the 'sixties. In foliage and general appearance, it

resembles the light-flowered forms of the *Mrs. Marshall* type, and like them the sepals are white and the corolla brightly coloured, but the exterior of the tube is reddish, thus giving a parti-coloured appearance to the flower. Of varieties with white corollas, *Mme. Cornelson* is a great favourite, not only at Battersea but in all other parks. It is interesting as being one of the oldest varieties of this colour, having been distributed about 50 years ago. Its only rival is *Ballet Girl*, a larger and bolder flower and of good stiff growth. This variety has of late years been largely employed in gardens not only for bedding but also for greenhouse decoration. The *Lantana* is seen in particularly good form at Battersea, especially *Lantana delicatissima*. There are some splendid examples of this plant, associated with equally fine plants of *Fuchsia Crimson Globe*. It also occurs in several other combinations of flowering subjects. This *Lantana* is everywhere giving great satisfaction during the present season. When fully exposed to sun and air, the flowers are a purplish-lavender tint, but grown under glass they are much paler. The different garden forms of *Lantana* are, generally speaking, less satisfactory this season than usual. Ivy-leaved *Pelargoniums* are on the whole very good. Associated with the *Violas* alluded to are standard plants of several of the bright-coloured kinds, and a few of the pretty pale mauve-tinted *Colonel Baden-Powell*. Large pyramidal plants are freely employed, and, in some instances, associated with dwarfier plants. The varieties chiefly employed are *Mme. Crouse* (silvery-pink), *Souvenir de Charles Turner* (reddish-pink), *Galilee* (deep rose), and *Murillo* (purplish-magenta). A showy bed is planted with *Salvia splendens* "Glory of Zurich," with "dot" plants of *Abutilon Thomsonii* and a bronzy-red *Ricinus*, and an edging of golden-leaved *Pelargonium Verona*.

LEGACY TO A GARDENER.—By the will of the late Mr. THOMAS SUTTON TIMMIS, of Allerton, near Liverpool, a sum of £300 is bequeathed to his gardener, Mr. B. CROMWELL. Visitors to the Shrewsbury Shows will remember that some of the finest specimen plants used to be those exhibited by Mr. TIMMIS. In 1906, the methods of plant culture practised at Allerton were described in these pages by Mr. CROMWELL in his weekly articles on "Plants under Glass."

CANADIAN NATIONAL APPLE SHOW.—An exhibition of Apples will be held in the Exhibition Buildings at Hastings Park, Vancouver, from October 31 to November 5. Prizes to the amount of 25,000 dollars will be offered. The Governor General of Canada, EARL GREY, is honorary president, and Sir THOMAS SHAUGHNESSY president of the exhibition. The secretary is Mr. L. G. MONROE, 7, Winch Buildings, Vancouver.

BANKRUPTCY STATISTICS: FAILURES AMONGST GARDENERS, FLORISTS, AND NURSERMEN.—The Inspector-General in Bankruptcy has now issued his report on the working of the Bankruptcy Act in 1909, from which it appears that the total number of receiving orders during the year was 4,070, with liabilities as estimated by the debtors amounting to £5,804,142. The assets as estimated by the debtors were returned at £2,154,034, and the estimated loss to creditors was £5,036,131. There was a decrease of 236 in the number of receiving orders during the year, but there was an increase of £234,193 in the amount of liabilities, an increase of £50,542 in the amount of assets, and an increase of £277,346 in the estimated loss to creditors, as compared with the preceding year. Taking the total figures for Bankruptcy and Deeds of Arrangement, there were upwards of 7,361 failures, with total liabilities amounting to

£9,714,976, and total assets as estimated by the debtors amounting to £4,186,622, or an estimated loss to creditors of £7,777,412. As compared with the figures for the preceding year, there was a decrease of 567 in the number of failures, a decrease of £1,653,420 in the amount of liabilities as estimated by the debtors, and a decrease of £1,462,243 in the amount of assets, and £762,596 in the estimated loss to creditors. The total number of Bankruptcy notices issued was 5,721, of which 2,860 were by debtors and 2,510 by creditors. The number of petitions withdrawn by creditors was 144, number dismissed was 1,054, of which 767 were in the High Court and 237 in the County Courts. In a comparative table attached to the report showing the total failures under Bankruptcy and Deeds of Arrangement for the past five years, the Inspector-General in Bankruptcy gives the following figures with regard to gardeners, florists, and nurserymen, from which it appears that in 1905 there were 31 failures, with liabilities amounting to £27,065. In 1906 there were 32 failures, with liabilities of £62,345. In 1907 there were 45 failures, with liabilities of £35,467. In 1908 there were 43 failures, with liabilities of £43,811, whilst in 1909 there were 48 failures and liabilities amounting to £32,764. It will thus be seen from the above figures that last year there was a decrease in the amount of liabilities of £11,047 as compared with 1908. Another table attached to the report gives particulars of the liabilities and assets of women who failed in various trades and occupations, from which it appears that in 1909 one woman carrying on business as a market-gardener had a receiving order filed against her, with liabilities amounting to £72 and assets £11. One woman carrying on business as a market-gardener executed a deed of assignment with liabilities amounting to £219 and assets £137, making a total of two failures, with liabilities amounting in the aggregate to £291 and assets £148.

FOOT AND MOUTH DISEASE IN YORKSHIRE.—The Board of Agriculture and Fisheries has made an order revoking, as from Monday, August 29, the Yorkshire (Foot and Mouth Disease) Orders. The effect of the rescinding order is to withdraw all the general restrictions on the movement of animals which were imposed by the Board in connection with the outbreaks of foot and mouth disease in Yorkshire.

DUNFERMLINE ROSE SHOW.—At a meeting of the Carnegie Dunfermline Trust, held in Dunfermline on August 25, the trustees decided to award a Gold Medal to Messrs. DOBBIE & Co., Edinburgh, for their exhibit of Sweet Peas; and a Silver Medal to Mr. JAMES ANGUS, Penicuik, for his group of Carnations, at the recent Dunfermline Rose Show.

GIFT OF NORFOLK PARK TO SHEFFIELD.—Norfolk Park, an estate of about 60 acres, the use of which the Duke of NORFOLK has permitted to the citizens of Sheffield for some years, was on Saturday formally presented to the city. This gift increases to about 160 acres the extent of land which the Duke had given to Sheffield for parks. Mr. H. COVERDALE presented the deed of gift on behalf of the Duke, who was unable to be present; and the Lord Mayor, Lord FITZWILLIAM, in accepting the document on behalf of the inhabitants of the city, expressed hearty thanks to the donor for his munificence. Mr. COVERDALE stated that the Duke thought that, in the event of the estate ever coming into the hands of trustees, they might be advised to cut up the beautiful park for building purposes, and it was in order to avert that risk and to secure the park to the public for ever he decided to offer it to the Corporation.—*Times*.

THE DECORATED DESSERT TABLES AT THE SHREWSBURY SHOW.—With respect to the competition in the class for a decorated dessert table at the recent Shrewsbury Show, readers will remember that our report stated that the published list of points was scarcely satisfactory. The honorary secretaries have since informed us that the judging of the exhibits occupied four hours, which accounted for the delay in making the awards and for the hastily-compiled point-lists. As the pointing in such a class has very great interest for fruit cultivators, we have pleasure in publishing more detailed lists of the 1st and 2nd prize collections, now kindly furnished by the secretaries. These are as follow:—

FIRST PRIZE EXHIBIT SHOWN BY THE DUKE OF WESTMINSTER (Gardener, Mr. N. F. BARNES).
Points Awarded.

Dishes.	Maximum No. of Points for each Dish.	No. of Points Awarded Each Dish.				Total.
		No. 1 Dish.	No. 2 Dish.	No. 3 Dish.	No. 4 Dish.	
Apples ...	7	6½	7	5½	6½	25½
Apricots ...	6	5	—	—	—	5
Figs ...	7	6	—	—	—	6
Muscata of Alexandria ...	11	(1) 9	(2) 8	—	—	17
Other Muscats & Black Hambro' ...	10	(3) 7½	(4) 7	(5) 7½	—	22
Other Grapes ...	9	(6) 8	(7) 7	—	—	15
Melons ...	8	7	7	7	6	27
Nectarines ...	8	8	6½	6½	6	27
Peaches ...	8	7½	6½	7	7	28
Pears ...	8	6½	5½	6	6	24
Plums ...	6	5	—	—	—	5
Beauty of Flower &c. ...	6	—	—	—	—	5
General Arrangement ...	6	—	—	—	—	5
						211½

SECOND PRIZE EXHIBIT SHOWN BY THE EARL OF HARRINGTON (Gardener, Mr. J. H. GODDARD).
Points Awarded.

Dishes.	Maximum No. of Points for each Dish.	No. of Points Awarded Each Dish.				Total.
		No. 1 Dish.	No. 2 Dish.	No. 3 Dish.	No. 4 Dish.	
Apples ...	7	6	6½	7	—	19½
Apricots ...	6	4½	—	—	—	4½
Figs ...	7	5	5½	—	—	10½
Muscata of Alexandria ...	11	(1) 7	(2) 6	—	—	13
Other Muscats & Black Hambro' ...	10	(3) 7½	(4) 9	(5) 9½	—	26
Other Grapes ...	9	(6) 5½	(7) 8½	—	—	14
Melons ...	8	6½	6	5½	5½	24½
Nectarines ...	8	6	6	5½	—	17½
Peaches ...	8	7	6½	6½	7	27
Pears ...	8	6½	6½	6½	6	24½
Plums ...	6	5	5	—	—	10
Beauty of Flower &c. ...	6	—	—	—	—	5
General Arrangement ...	6	—	—	—	—	4½
						200½

We are given to understand that arrangements will be made in future for the judging of this class to commence at 9 o'clock a.m., as was suggested in our report. There is also a proposal that an additional judge shall be appointed to assist the two judges who have hitherto discharged the onerous duties imposed by this particular competition. The points awarded for each dish will be displayed as soon as possible after the completion of the judging.

SCHOOL GARDENING IN SOUTH-WESTERN SCOTLAND.—The annual distribution of prizes to those pupils who have chiefly excelled during the last summer in the practice of amateur horticulture was made by Mrs. McDouall, of Logan, at Port Logan School, in Kirkinaiden, on Monday of last week. After distributing the prizes to the successful competitors, Mrs. McDouall congratulated the latter highly on the wonderful dimensions of the vegetables and the effectiveness of the flowers. In many instances so close was the competition that the judges had considerable difficulty in arriving at their decisions.

HONORARY DEGREES FOR BOTANISTS.—In connection with the visit of the British Association, the University of Sheffield will confer the honorary degree of Doctor of Science on a number of leading representatives of science in this country, including Professor BATESON and Mr. FRANCIS DARWIN.

ASSOCIATION OF AUSTRIAN TREE NURSERYMEN.—The third meeting of this association is to be held on September 4 to 6 at Teplitz, Austria. At the close of the meeting excursions will be made to Eisenberg and Seestadt, in order to visit the nurseries and park of the Duke of Lobkowitz, and to Dresden, Germany, where the more important nurseries of the neighbourhood will be inspected. The chairman of the meeting is Mr. W. KLENERT, nurseryman, of Graz, Styria, Austria.

FLOWERS IN SEASON.—MESSRS. KELWAY & SON, Langport, Somerset, have sent us spikes of some remarkably choice Gladioli, the blooms showing extraordinary size and handsome colouring. The varieties were:—Duke of Richmond (bright rose), Dr. Hastings (a suffusion of light salmon on a pale ground), Prince Henry of York (orange scarlet, a very fine flower), Nonpareil (very large, white and purplish crimson marking), Snowdon (a fine white variety, with mauve-faceted stamens), and Lady Inchiquin (rose pink, splashed with carmine, and a blotch of yellow on the lower segment).

ENGLISH SUGAR BEET.—Sugar Beet grown in England was exhibited for the first time at a stand in the New Corn Exchange on August 22. It was cultivated in the Sleaford district of Lincolnshire, and the six roots on show at the New Corn Exchange were from an excellent crop now being grown as the result of many experiments with Beets of one variety and another for the purpose of producing the kind best suited for the manufacture of sugar. According to *The Times*, the products of these trial growths, which amount to several thousands of tons, have been bought by Dutch sugar refiners at 17s. per ton, delivered in Boston, Lincolnshire. The refiners pay the freight of these roots to Holland, and send them back again in the form of granulated sugar, paying not only the return freight, but the sugar duty of £1 16s. 8d. per ton, and nevertheless make a profit. The object of the cultivators of the Sugar Beet in Lincolnshire, however, is rather to encourage the manufacture in this country of at least a portion of that supply of sugar which is imported from abroad. The roots seemed to be in fine condition. They were said to be double the weight and of equal sugar content to the Beet grown in Germany. The produce of the crop in Lincolnshire is 25 tons to the acre.

WOMEN AS GARDENERS AND FARMERS.—At the recent congress on women's work at the Japan-British Exhibition, the subjects discussed included lady gardeners and lady farmers, this part of the programme being arranged by the Hon. FRANCES WOLSELEY, Head of the Glynde School for Lady Gardeners, assisted by Miss F. WILKINSON, Head of the Swanley Horticultural College. Lady FALMOUTH occupied the chair. Miss JESSIE SMITH read the first paper on lady gardeners. She wisely advised a lady student in gardening to serve, if possible, under an efficient head gardener after leaving college, and before taking up a post. The Hon. Mrs. GELL followed on the subject of openings for teachers in Nature Study. Mr. INIGO TRIGGS next read a paper on "Garden Design." He said the immense advance of late years in domestic architecture made many realise the close connection between the

house and garden, hence the growing demand for expert and well-trained garden designers. Miss DUNNINGTON said that, in jobbing gardening, the possibilities to a girl of originality and imagination are very great. Miss DIXON read a paper dealing with "Market Gardening," a branch which she said called especially for business-like qualities, enterprise, and hard work. Dealing with lady gardeners in the Colonies, Miss TURNER said there was no place there for lady gardeners pure and simple, but if a girl had a knowledge of cooking and washing and could turn her hand to other work, there was opportunity for her, especially in Canada. Miss B. JONES gave an account of gardening in America, and Mrs. SOWERBY read the final paper on "Lady Florists." At the conference on lady farmers, papers were read on the different branches of farming, including poultry-keeping, dairy-making, fruit-preserving, bee-keeping, and pony-breeding.

WESTON-SUPER-MARE FLOWER SHOW.—Mr. C. J. ELLIS, Weston Nurseries, Weston-super-Mare, was awarded the Coggins Challenge Cup, together with two guineas in money, offered for the best exhibit of a group of plants arranged for effect in a space of 75 feet, Mr. W. BROOKS, Whitecross Nurseries, being placed 2nd. The two large classes for groups of plants were staged along the centre of one of the tents, and in reporting the show we regret to say that we confused the two classes, a mistake which, as we understand, was committed by the judges, who originally made their awards on this basis. Mr. ELLIS was also awarded a Silver-gilt Medal for a non-competitive group.

ABERDEEN AND NORTH OF SCOTLAND COLLEGE OF AGRICULTURE.—The calendar of this college, just issued, gives details of the scheme of instruction for the session 1910-11. Included in the scheme is a course of 50 lectures in forestry, for the purpose of enabling the student to qualify for the B.Sc. (Agric.) degree. This course is specially recommended for intending factors, land stewards, landowners, and all who have to do with the management of land. It is also suitable for those who hope to enter the employment of proprietors or land companies abroad, as economic botanists, or in any similar capacity. For foresters or those who intend to make a special study of forestry, and those who wish to prepare for the forestry diploma granted by the Highland and Agricultural Society of Scotland, the farther course, extending over an additional 50 meetings for lectures and practical work, will be necessary. There is a considerable demand for forestry officials by the various Colonial Governments. Departments of forestry have been started by most of the colonies, and these are likely to develop extensively in the near future. For practical work, through the liberality of several landed proprietors, excellent facilities are afforded to intending students. The close proximity to Aberdeen of large wooded areas, place it in a very advantageous position for the teaching of forestry. Shorter courses of lectures are also to be provided, both at the college and at centres throughout the college district, where there are suitable and sufficient wooded areas. The college authorities are also prepared to give assistance to school boards and teachers in the matters of advice on the planning, laying-out, equipment, and general work and management of school gardens within their area. In this connection the members of the county staffs are prepared to visit schools to give personal assistance with the work of school gardens. In order to still further promote this work excursions for teachers will be arranged to schools where gardens are already in operation.

GRAPES AT THE RECENT SHREWSBURY SHOW.

I MADE a close inspection of the more prominent exhibits at the recent Shrewsbury Show, and it was evident to me that the excellence of the show was well maintained in all the chief classes. In the Grape classes, good quality was a predominating feature, and those Grapes not remarkable for their flavour were at a comparative discount. I did not, for instance, note any bunches of Black Alicante in the chief exhibits in the champion class, nor did I see any of Gros Colmar, nor yet, again, of that once much-lauded variety, Diamond Jubilee. In glancing over the names given in the *Gardeners' Chronicle* report on p. 147, I notice that Gros Maroc was the only variety the quality of which can be called into question. All the rest shown in both the 1st and 2nd prize stands are noted for their excellence. This was most gratifying to me, an old exhibitor and grower, who has always maintained that quality should predominate. This result has undoubtedly been brought about by allotting the maximum number of points to those only that are of the finest quality.

I did not, however, note any well-finished bunches of Mrs. Pince, one of the most difficult Grapes to grow to perfection. Neither was Appley Towers nor Alnwick Seedling prominent, so far as I could see, in any large collection. Neither of these varieties is really needed in August or in September. They are both easy to grow and the berries colour readily, but the quality is only second-rate. Of white Grapes other than Muscats, the best, to my mind, were Lady Hutt in Mr. Barnes's exhibit, and Buckland Sweetwater. Lady Hutt is a Grape well worthy of more extended culture, being handsome in appearance when shown as these were, and of most refreshing flavour. Those of Buckland Sweetwater were, I thought, the best I have ever seen as regards finish, but I doubt if their flavour equalled their good looks. I was sorry not to observe any good examples of either Mrs. Pearson or Dr. Hogg. Both are splendid white Grapes when well grown, much better in every sense than either Foster's Seedling or Buckland Sweetwater; neither of the latter can be compared to them, though they are easier to grow, hence they are more often shown. It is a pleasure to record the presence of so many well-finished examples of Black Hamburgh, but not one bunch appears to have been staged in either the 1st or 2nd prize exhibits in the champion class. This is regrettable, and does not put this fine old Grape in its proper position. No excuse could be urged on the ground of unfavourable season, for it has been quite suitable in every respect. Madresfield Court was also staged in splendid condition: it is evident that the requirements of this grand Grape are now thoroughly well understood. If I were restricted to growing one black Grape only I should select Madresfield Court Black Muscat. Chasselas Napoleon won the 1st prize for "any other white Grape," a poor variety at its best. It was gratifying to note that there were not any outstanding bunches remarkable for their individual size. Perhaps the largest were those of Madresfield Court, the berries of which were well coloured and of good size. Referring more particularly to white Grapes, both Muscat of Alexandria and Canon Hall Muscat were staged in splendid condition, the berries being in most cases of full size, and the colour in many instances all that one could wish. There was also an absence of shrivelling, as is sometimes seen in Muscat of Alexandria. I do not remember to have seen so many good bunches of Muscat Grapes at Shrewsbury for some years past. Lovers of quality in flavour would like to see some encouragement given to such high-class Grapes as Muscat Champion, Ascot Citronelle, Grizzly Frontignan, Ferdinand de Lesseps, Dr. Hogg, White Frontignan and Royal Muscadine. If a class were devoted to, say, four of these varieties, it would be possible for present-day growers to see upon the show-

boards some of the finely-flavoured and most refreshing Grapes of a quarter of a century back. One is led to think also of those Grapes that came forth with much flourishing of trumpets, e.g., Duke of Buccleuch, Golden Champion, Diamond Jubilee and Melton Constable. Two old black Grapes not needed are Barbarossa and Black Prince, nor do we require either White Tokay or Trebbiano of the white kinds. West's St. Peter's appears to have dropped out of cultivation, which is to be regretted, for it was an excellent Grape in October and November. I am hoping to see good results from Prince of Wales when its culture is better understood. It should be a fitting companion to Lady Downes. *Fitis.*

HOME CORRESPONDENCE.

(The Editors do not hold themselves responsible for the opinions expressed by correspondents.)

STORM AT NASEBY HALL.—A severe storm, accompanied by thunder and lightning, occurred here on August 29, about mid-day. From half-past 1 p.m. till about five minutes past 2 p.m. close upon half an inch of rain fell. *A. Gooden, Naseby Hall.*

THE NEW "GROUP" CLASS AT SHREWSBURY.—The illustration in fig. 57 of the first-prize exhibit in the new "group" class at Shrewsbury does not suggest any striking or novel features. That was the opinion of all who saw the new groups. Modelled, as they were, on the older decorative plant groups, and with no lack of similar material, they were distinctly disappointing to all who looked for something original, not only in arrangement, but also largely in material. The committee should withdraw their class for 15 large specimen plants, as these are out-of-date. They could add the prizes in that class, amounting to £42, to the £57 10s. offered in the new group class, making, roughly, a sum of £100, and divide this into prizes of £30, £25, £20, £15, and £10, at the same time greatly increasing the spaces allotted to each group, and require that aquatic, semi-aquatic, and hardy plants with water effects, should be the dominant features, so as to induce some of our leading hardy plant growers to enter. Such a class would then provide scope for exhibits which would indeed interest and delight all who saw them. But it should be a condition that between each group there should be footways of at least 4 feet, so that the public could see them from all sides. *Visitor.*

JUDGING AT SHREWSBURY FLOWER SHOW.—As usual, I read with much interest the report of this exhibition. Having acted as a judge on and off for more than 40 years, I was keenly interested in the remarks on the decorated fruit tables. Three hours and a half may seem a long time for adjudicating, yet when it is considered that there were 150 separate decisions to come to, apart from the decorations, a trifle under one and a half minutes for each dish is not too much. Whatever may be said against point judging, it is clear that in classes such as this no other method is so applicable. Your reporter hit the right nail on the head in insisting that judging should begin earlier. In large classes, it is wise to have three judges, one to write the points and act as referee. Seven points are ample in any class, and there is no need for hair-splitting by having half points. In cases of equality a general look after pointing would settle the matter. For decorations, I would suggest as a maximum double the number for each dish, viz., 14 points. The cards to be placed on the tables should be so printed that each dish has a consecutive number up to 30. As showing that the principle underlying point judging is not new, the following may be mentioned. My first experience in judging was in 1866 at Old Basing, a well-known village in Hampshire. My colleague was the late Mr. James Smith, of Basingstoke. In the cottage garden classes there was a keen competition. Mr. Smith came prepared with a penny memorandum book, with the names of the vegetables and small fruits alphabetically written therein, as many pages as there were entries. A space was provided for herbs and the general condition of the exhibit at the

end of the tables. Instead of numbers, g., v.g., v.v.g., i.e., good, very good, very very good, were allotted, and many gardens have since been judged by myself and others on the same principle. *Yorkshire Gardener.*

JUDGING AT LOCAL FLOWER SHOWS.—The subject referred to by *Kingston Hill*, on p. 166, is worth discussing. In my opinion, too much importance is attached to Leeks at the summer flower shows, and, in a lesser degree, to Celery. *Kingston Hill* says: "Surely it is to a gardener's credit to produce things out of season." But how many employers would appreciate a dish of Leeks in June or July? I make bold to say not one in ten. While a dish of Peas might be appreciated as a luxury in mid-winter, the average employer would not thank his gardener for producing Leeks, Celery, and Parsnips for use in midsummer. Celery and Leeks are favoured by exhibitors more for effect in an exhibit, or as a background to their collections, than for their usefulness in that particular season. In the same way, Tomatoes add colour and attractiveness to an exhibit. My experience is that the demand for Leeks as a culinary vegetable is very limited at any season of the year. Again, Beet is more in demand all the year round for salads than is Celery. *J. P. Brantley.*

—If it is asked "When is a vegetable out of season?" it is equally pertinent to ask "When is it not in season?" Green Peas, French Beans, new Potatoes, or Asparagus may not be in season at Christmas, but who would dream of rejecting them on that account? If under cool storage, Seakale was so retarded as to furnish delicious blanched heads in July and August, would judges disqualify a collection of vegetables in those months if it was included? If the conditions of a class absolutely forbid not only forcing, but any form of glass culture, even to the raising of seedlings, then the objection referred to could be understood; but conditions so absurd are never imposed. If Leeks are of good quality, being long, even, well blanched, and perfectly fit for the table, they are in season at any time of the year. *A. D.*

PLANE TREES AND THROAT TROUBLES (see p. 105).—Men engaged in these nurseries have complained on several occasions that Plane trees are injurious to health. The first time it was brought to my notice was some five years ago, when two men were trimming the stems of young Planes. It was either in late June or early July, and there was a considerable number of young stem-growths to cut away. The weather was hot and close, and after the first day both men were in a condition much resembling a bad attack of hay-fever. The eyes were red, swollen, and painful, and the nose and throat very sore and inflamed. Their complaints of a pricking sensation in these organs first led to a suspicion that the Planes were responsible, and subsequent examination confirmed it. After they had been away from the Plane trees for two or three days both got as well as ever again. Since that time, the work of trimming the branches has been left until after the fall of the leaf. The hairs on the leaf of the Plane are very minute, and in the mass are like a lot of down, but their pointed character can easily be seen by an ordinary magnifying glass. They are most plentiful at the time the leaves reach their full development. *J. Clark, Messrs. J. Waterer & Sons' Nursery, Bagshot, Surrey.*

NANDINA DOMESTICA.—I was pleased to read in the report of the Shrewsbury Flower Show that this bright-foliage plant was employed in some of the exhibits in the new "group" class. Its value appears to be little appreciated, but when cultivated as a pot plant for conservatory decoration, or planted out in a warm, well-drained soil, it always claims attention. This new class opens up a wide scope for exhibiting many hardy plants, which can be cultivated to greater perfection by affording them a little protection in winter. *W. H. Clark, Hampton, Middlesex.*

DODDER.—Referring to Mr. H. S. Thompson's note on p. 166, if this plant is more abundant than usual in Hampshire and Dorset it must be abundant indeed; for I have never seen it so plentiful as in suitable country within a 20 mile radius of Bournemouth. *Harold Evans, Llanishen, Cardiff.*

QUEEN WASPS.—I beg to confirm Mr. A. Groves's note. Many years of observation have convinced me that the number of queens of the social wasps appearing in spring is no indication of the strength of the swarms to be expected in autumn. That seems to be regulated by some conditions, meteorological or other, which have not yet been detected. *Herbert Maxwell, Monmouth.*

EARTHWORMS. The all too brief article on earthworms on p. 157, from Mr. J. Willis, is most instructive. Great ignorance exists as to the valuable work done in the soil by common worms. From all sorts of people who possess gardens, and especially those who have lawns, complaints as to the action of worms and requests for information as to how to get rid of them are common. Not one of these people have any knowledge of the beneficial work done in the soil by worms. These creatures may be a nuisance when they get into flower-pots containing plants, and must be expelled; but in the open ground, or on lawns, they are of great benefit. Mr. Willis rightly mentions how frequently their casts on lawns are swept up and taken away. It is far wiser to have them evenly distributed by using a long birch broom backward and forward, as then the casts soon become food for the grasses. *J.*

LARGE GOOSEBERRIES (see p. 172).—May I correct a slight error in reference to the fruit of the variety London, weighing 37 dwt. 7 grains, grown by John Flower, who was my grandfather? This berry was grown at Little Stoke, a village near Stone, Staffordshire, and the same berry was shown at Cheddle, Boodle, Staffordshire, and at Birmingham, where it won a cup. Gooseberries weighing over 30 dwt. are quite common in and around the district of Stone, Staffordshire. *Harry Smith, Castlerigg Manor Gardens, Keswick.*

SOCIETIES.

ROYAL HORTICULTURAL.

AUGUST 30.—The exhibition at the meeting held on Tuesday last in the Society's Hall provided a very pretty display. Hardy flowers were the most numerous, including large exhibits of Dahlias and border flowers, especially Delphiniums, Phloxes, Pentstemons, and early-flowering Chrysanthemums. But the most noteworthy exhibit was a collection of new plants raised from seeds sent home by Mr. E. H. Wilson during his last expedition to China, and shown by the Hon. VICARY GIBBS (see fig. 72). There were about 700 plants in all, representing 200 species and 400 varieties. This outstanding exhibit was awarded a Gold Medal. The FLORAL COMMITTEE granted 12 Awards of Merit, six being given to new Dahlias. There were several good groups of Orchids; the ORCHID COMMITTEE recommended one First-class Certificate, three Awards of Merit, and one Botanical Certificate. There was very little before the FRUIT AND VEGETABLE COMMITTEE beyond a group of hardy fruits and a collection of Melons, but the Committee granted four Awards of Merit, one to a Melon and three to varieties of Tomatos that had been grown at Wisley for trial. At the afternoon meeting in the Lecture Room, Mr. J. H. Priestley read a paper on "The Effect of Overhead Electrical Discharge upon Plant Growth," a subject to which reference was made in these columns on June 18, p. 406.

Floral Committee.

Present: W. Marshall, Esq. (in the Chair), and Messrs. Chas. T. Drury, James Walker, T. W. Turner, Geo. Reathe, John Green, George Gordon, J. W. Barr, J. F. McLeod, Arthur Turner, Chas. E. Pearson, W. P. Thomson, W. J. James, E. H. Jenkins, Geo. Paul, A. Kingsmill, E. A. Bowles, W. B. Cranfield, Jas. Hudson, and Herbert J. Cutbush.

The collection of new and rare species of Chinese plants (see fig. 72), shown by the Hon. VICARY GIBBS, Aldenham House, Elstree (gr. Mr. Edwin Beckett), was the outstanding feature of the exhibition. The seeds, collected by Mr. E. H. Wilson in Western China, were sown 52 months ago, and many of the subjects were already of large proportions. The 700 plants included many which are new to science and unnamed. Amongst the more striking were:—

Vitis megalophylla, with large, pinnate, handsome foliage, quite distinct from *V. armata*; varieties of *V. sinensis*; *Vitis* (154) and (235), both handsome species, with striking silvery reverse to the foliage; *Vitis* (603), a strong grower and quite distinct; *V. Delavayi*; *Rubus coreanus*, *R. immominatus*, *R. conduplicatus*, *R. lasiostylus*, all strong growers; *R. ireneus*, a prostrate plant, suitable for planting in the shade; *R. omiense*; and *R. polytrichus*, quite distinct, and one of the handsomest of all vines. Cotonasters were represented in great variety, including *C. applanata*, *C. rugosa* Henryi, *C. acutifolia*, and *C. humifusa*, a particularly handsome, trailing plant; *Viburnums*, including *V. rhytidophyllum*, and an unnamed, striking plant, numbered 1288. *Clematis Soulieana* has pale-yellow, tubular flowers, possessing a sweet perfume; *C. Armandii* has deep-green, glossy foliage. *Liriodendron chinense* has very large leaves; *Piptanthus* (885), of which Mr. Wilson speaks highly; *Styrax* (884), *Hydrangea* (772) which Wilson describes as the best in China; *Stranvæsia undulata* and *S.* (1064), both shown in fruit. *Liquidambar formosana* possesses deep-bronze foliage. Of *Rubuses* there were *Rubus Lambertianus*, an excellent subject for pillars or massing in beds, as is *R. Playfairi*, with leaves similar in outline to those of *R. bambusarum*, but totally distinct; the densely tomentose *R. Parkeri*; and *R. ichangensis*, with a glaucous metallic lustre. *Berberis* were shown in great variety, many being useful for the margins of shrubberies and the rock-garden. *Berberis* 564 is, apparently, a fine form of *B. Wallichiana*. Other genera noticed were *Pyrus*, *Poliothyrsis sinensis*, *Schizandra* (a fine climber), *Cercis chinensis*, *Rosa*, including *R. sericea* (179), with very elegant leafage, *Chimonanthus*, *Ailanthus*, *Prunus*, *Spiræa*, *Ptelea*, *Schizophragma*, *Ehretia*, *Zanthoxylum*, *Acer*, *Cocculus*, and *Staphylea*. (Gold Medal.)

ROSES.

Messrs. FRANK CANT & CO., Rose Gardens, Braiswick, Colchester, showed blooms in considerable numbers, and considering the unfavourable character of the weather of late, these were in most instances in very good condition. There were pyramidal stands 3 to 4 feet in height of the Lyon Rose, Frau Karl Druschki, Gottfried Keller, Mme. Caroline Testout, Mme. Melanie Soupert, and others. Among the vases of less height there were to be observed blooms of Mrs. J. Laing, Edouard Meyer, Earl of Warwick, Mme. Abel Chatenay, Prince de Bulgarie, Farben Konigin, Harry Kirk, La Tosca, Lady Ursula, Papa Gontier, Mrs. John Bateman, and Konigin Karola. (Silver Flora Medal.)

A bright stand of Roses was put up by Messrs. W. & J. BROWN, Stamford and Peterborough. The blooms were remarkably bright and fresh, and embraced a good selection of popular kinds. (Bronze Flora Medal.)

FERNS.

Messrs. H. B. MAY & SONS, Upper Edmonton, exhibited exotic species in large numbers and in the best cultural condition. *Nephrolepis exaltata* in variety occurred frequently. Other remarkable species were *Lomaria ciliata princeps*, a garden form, *Nephrolepis Duffii*, *Davallia filipensis elegans*, *D. tenuifolia*, *Adiantum Mayi* (dwarf and distinct), and *Lomaria discolor*. (Silver-gilt Banksian Medal.)

DAHLIAS.

Messrs. JAMES STREDWICK & SON, St. Leonards, Sussex, exhibited a stand of new varieties of Cactus Dahlias. Showy blooms were observed in Viscount, a flower of a deep scarlet colour; New York, coppery red, the tint being most intense in the outer florets; Inesistible, a very large flower, having a canary-yellow centre with a rosy tint towards the margin; and Beauty of Sussex, a flower of a lovely rosy purple colour.

Messrs. CARTER, PAGE & CO., London Wall, had the largest group of flowers in their display of Dahlias. The varieties were principally of a Cactus type, but all the other sections were represented. The method of staging was very pleasing, the blooms being interspersed with *Kochia scoparia*, *Asparagus Sprengeri* and trails of *Ampelopsis*, with vases of grasses and sedges at intervals. (Silver-gilt Flora Medal.)

Mr. H. SHOESMITH, Woking, showed a stand of Cactus Dahlias of the variety Prima Donna, a

white flower with a tinge of green at the base of the florets.

Mr. S. MORTIMER, The Nurseries, Rowledge, Farnham, was an exhibitor of Cactus varieties and a few show varieties.

Messrs. J. CHEAL & SONS, Lowfield-Crawley, had many Peony-flowered Dahlias, also single, and small and large Cactus varieties; these last, being of the thread-floreted section and of large size, made an imposing show. (Silver Flora Medal.)

Messrs. H. CANNELL & SONS, Swanley, Kent, showed large numbers of Cactus and Peony-flowered Dahlias. (Silver Flora Medal.)

Messrs. T. S. WARE, LTD., The Nurseries, Feltham, exhibited very fine Peony-flowered and thread-petalled Cactus Dahlias. (Bronze Flora Medal.)

Mr. CHAS. TURNER, Royal Nurseries, Slough, exhibited a large number of single and double-flowered varieties of the Peony section (Bronze Flora Medal); and Mr. BRAZIER, Nurseryman, Caterham, showed Cactus-flowered varieties, together with a display of perennial hardy flowers. (Silver Flora Medal.)

Messrs. BAKERS, Wolverhampton, exhibited large numbers of Dahlias, and these consisted mainly of Peony-flowered varieties. The colour effect of the large display of blooms was gorgeous, and would have been more pleasing had some greenery been employed as a foil. (Silver-gilt Flora Medal.)

GREENHOUSE PLANTS.

Messrs. J. VEITCH & SONS, Royal Exotic Nursery, Chelsea, showed in flower several varieties of their Javanic-jasminiflorum hybrid Rhododendrons, viz., Hercules, Balsaminiflorum Rajah, Indian Yellow, Primrose, President; cut blooms of nine distinct varieties of Streptocarpus, a new and much-improved type, having larger flowers, and finer colours and markings; the selfs in particular were great improvements. Plants in flower of the fine new varieties of *Canna indica* gave a blaze of colour. *Bouvardia* Mrs. R. Green, *B. jasminiflora paniculata*, *B. Maiden's Blush*, *B. The Bride*, *B. Vreelandii*, and *B. Reine des Roses* were very pretty looking after the surfeit of colour in the Dahlia exhibits. (Silver Flora Medal.)

Messrs. STUART LOW & CO, Bush Hill Park, Enfield, showed plants of *Rochea falcata*, finely flowered; *Diplacis glutinosa*, *Grevillea Preissii*, *Ceanothus Gloire de Versailles*, a dwarf species of Pomegranate from Japan with flowers externally of a scarlet colour, *Tremandra verticillata*, and others.

A group of a yellow-ground, border Carnation with red markings was exhibited under the name of The Dowson, by the raiser, Mr. CHAS. DOWSON, Middlesbrough.

HARDY HERBACEOUS PERENNIALS.

Mr. W. H. YOUNG, Mercury Nursery, Romford, showed a fine, bright-crimson-coloured Pentstemon named Southgate Gem, the flowering portion of the stalk having a length of 18 inches.

Messrs. PAUL & SON, the Old Nurseries, Chessington, N., showed extensively. The finer subjects included *Rudbeckia atropurpurea*, a flower that has a distinct, rich tint; *Senecio clivorum*, a new introduction; a *Physalis*, somewhat resembling the larger-fruited *P. Franchetti*, but less vivid in colour; *Helenium magnificum*, *H. grandicephalum striatum*, with gold-yellow and brown-coloured flowers; *H. aurantiacum*, *Eryngium*, *Chelone obliqua*, and a quantity of shrubby Phloxes. (Bronze Flora Medal.)

Messrs. BAKERS, Wolverhampton, showed summer Asters in bewildering variety, mostly possessing distinct colours. Especially fine blooms were those of Giant Perfection, of a bright carmine tint; some compact, dwarf-bedding varieties in crimson, blue, rose, and bright cerise, also Migration Asters in various colours, Incurred Giant, Peony-flowered, and several more.

Mr. L. R. RUSSELL, Richmond, showed a large collection of hardy Heaths, including *Erica vulgaris*, *E. cinerea*, and *E. vagaris*, together with *Menziesia polifolia*. In all there were 21 varieties. Opposite to these, on the floor, Mr. RUSSELL arranged a fine group of red and yellow-flowered *Celosias*, staged in an attractive manner, with a bank of fine standard Fuchsias at one end. (Silver gilt Flora Medal.)

Mr. G. REUTHE, Keston, Kent, exhibited some uncommon shrubs and a selection of interesting

garden flowers. Amongst the former were *Berberidopsis corallina*, *Eucryphia pinnatifolia*, and *Tamarix hispida*. The sweetly-scented *Artemisia lactiflora*, also *Gloriosa superba* were introduced in the group. (Bronze Flora Medal.)

Messrs. B. LADHAM & SONS, Southampton, showed varieties of *Lobelia siphilitica*, the most striking being *Pink Bedder*. The variety *Salamander* has flowers of an intense scarlet hue.

Messrs. BARR & SONS, King Street, Covent Garden, showed *Phloxes* in variety, likewise *Pentstemons*, *Lobelia cardinalis* *Queen Victoria*, an improvement on the type, *Delphiniums*, *Summer Asters*, *Pansies*, and *Gladiolus gandavensis* varieties. (Silver Banksian Medal.)

THE GUILDFORD HARDY PLANT NURSERY had a pretty exhibit of hardy Alpine plants, including the blue-flowered *Platycodon grandiflora*,

and a large assortment of border *Phloxes*. (Silver Flora Medal.)

Messrs. GUNN & SONS, Olton, Birmingham, had a very attractive exhibit of perennial *Phloxes*, in most of the newer and best varieties. Very pleasing is the soft mauve variety named after Miss Ellen Willmott. *Le Mahdi* is a fine purple variety, and others that were especially good are *King Edward VII.*, reddish carmine; *Elizabeth Campbell*, white with a rose-pink centre; *Lilian*, a good white variety; *Wilbur Wright*, new, with reddish orange flowers; *Josephine Gerbeaux*, one of the finest of old sorts; and *Lord Bayleigh*, the best blue *Phlox*. (Silver-gilt Banksian Medal.)

Messrs. W. WELLS & Co., Merstham, also showed border *Phloxes* largely, in addition to *Pentstemons*, border *Chrysanthemums*, peren-

tone with buff shading, the petals being much frilled at the margins and stained with crimson near the base. From M. VILMORIN, Paris.

Gladiolus Le Luna.—A variety of the *G. nanciams* section. The creamy blossoms are heavily marked with crimson and flushed with rose in the upper petals. Shown by Messrs. BARR & SONS.

Dahlia Leander (single).—A shapely flower of moderate size, coloured maroon and crimson in flakes and stripes. Exhibited by Messrs. J. CHEAL & SONS, Crawley.

Dahlia Theresa (Cactus).—The florets are cream and blush.

Dahlia Guinevere (Pompon).—A model flower of rosy salmon hue, the florets at the base being of a buff shade. It is one of the most distinct

(Photograph by John Gregory.)

FIG. 72.—COLLECTION OF NEW CHINESE PLANTS EXHIBITED BY THE HON. VICARY GIBBS AT THE R.H.S. MEETING ON AUGUST 30.

Cimicifuga cordifolia with elegant spikes of cream flowers, and *Rudbeckia pinnata* with pale yellow flowers and a conical black disc. *Phloxes* were well shown by this firm, especially good being *Jeanne d'Arc*, white, and *Josephine Gerbeaux*, white with a crimson eye.

Messrs. WHITELEGG & PAGE, Chislehurst, showed fine spikes of *Gladiolus breuchleyensis*, also the beautiful *King of Delphiniums*, *Lilium auratum* and *L. Wallichianum sulphureum*, these latter being extremely beautiful. Other novelties included a double-flowered *Scarlet Gem* named *Mrs. J. Bradshaw* and a bright-red *Pentstemon* called *Southgate Gem*.

Messrs. JAMES BOX, Lindfield, Sussex, staged some extra good inflorescences of *Watsonia Ardeni alba*, in a group of other hardy flowers that embraced good *Delphiniums*, *Gladioli*, *Liliums*,

and other seasonal garden flowers. (Bronze Flora Medal.)

Mr. AMOS PERRY, Enfield, Middlesex, again made a handsome group with blue and dark-flowered *Delphiniums*, set off by banks of *Artemisia lactiflora* and a few other hardy subjects, such as *Lythrum roseum*. Notable varieties of *Delphiniums* were *Madame Violet Geslin*, blue; *King of Delphiniums*, blue, double white centre; *Lizzie van Veen*, pale blue with a white eye; *Belladonna grandiflora*, opal blue; *Amos Perry*, rosy mauve, with a black eye; *Lamartin*, turquoise blue and snow-white centre, and *Duke of Comaught*, crimson purple, with a white eye. (Silver Flora Medal.)

AWARDS OF MERIT.

Gladiolus Saffiano.—The flowers are of yellow

of its race. These two Dahlias were shown by Mr. CHARLES TURNER, Slough.

Dahlia Mrs. Douglas Fleming (Cactus).—The long, narrow, incurving florets are creamy white, the flower-head being of good exhibition standard.

Dahlia Crystal (Cactus).—A distinct and refined variety; the florets are coloured rose-pink and tipped with white. Both these were shown by Messrs. J. STREBOWICK & SON, St. Leonards.

Dahlia Garden Yellow (Cactus).—The name is suggestive of a decorative variety, though the variety belongs to the true Cactus type. It is a self-coloured flower of much merit. Exhibited by Mr. H. SIMONSMITH, Woking.

Lobelia Sam Barlow.—A variety of the *L. cardinalis* section. The refined-looking blossoms,

which are freely borne on tall spikes, are of a rose-salmon shade. It is very distinct and a fine acquisition amongst *Lobelias*. Exhibited by Messrs. BARR & SONS, Covent Garden.

Phlox Elizabeth Campbell (see fig. 73).—A distinct and effective variety of *P. decussata*, the handsome blossoms being of a clear salmon-pink flushed and starred with white at centre. From Messrs. W.M. WELLS & Co., LTD., Merstham.

Rose Daphne.—A Polyantha variety said to be perpetual flowering and mildew-proof. A card stated that it flowered from June to autumn, and there was a certain freshness in the exhibited sprays which carried conviction. The colour is delicate and pleasing, of the shade known as pale apple-blossom. Exhibited by the Rev. J. H. PEMBERTON, Havering-atte-Bower.

Bulbilia variabilis gigantea.—The inflorescences are very large—in all probability the largest yet exhibited, but the flowers do not differ materially in colour-effect from some others in cultivation. Exhibited by Hon. VICARY GIBBS, Aldenham House, Elstree (gr. Mr. E. Beckett).

Orchid Committee.

Present: J. Gurney Fowler, Esq. (in the Chair), and Messrs. Jas. O'Brien (hon. sec.), Harry J. Veitch, de B. Crawshay, Henry Little, R. G. Thwaites, F. J. Hanbury, Walter Cobb, J. Charlesworth, H. G. Alexander, W. H. Hatcher, A. Dye, W. H. White and Gurney Wilson.

Sir JEREMIAH COLMAN, Bart., Gattton Park (gr. Mr. Collier), staged an interesting group of pretty species, in the centre of which were two fine specimens of the orange-scarlet *Laelia monophylla*, each with many flowers. With them were several fine forms of *Masdevallia Chimera*, *Cryptophoranthus Dayanus* with unusually fine flowers, *Cirrhopetalum guttulatum*, the pretty *Maxillaria striata*, *Sigmatostalix radicans*, and the new *Polystachya paniculata*.

Lieut.-Col. Sir GEORGE L. HOLFORD, K.C.V.O. (gr. Mr. H. G. Alexander), sent the very handsome *Laelio-Cattleya Lestre magnifica* and other fine hybrids. (See Awards.)

DE B. CRAWSHAY, Esq., Rosefield, Sevenoaks (gr. Mr. Stables), showed a selection of fine *Odontoglossums*, including his new and very remarkable *Odontoglossum Theodora* (Rossii × triumphans), with showily marked flowers, the influences of the diverse characters of the parents being manifest in the peculiar manner of the elongation of the inflorescence. Mr. CRAWSHAY also showed a finely-blotched *O. crispum* near to the variety Queen of the Earth, a peculiar form of *Odontoda Bradshawiae*, the very beautiful white *Odontoglossum crispum* Mrs. de B. Crawshay, and the extraordinary *O. Lambanianum* Starlight, the flowers of which are dotted with small rose spots.

J. GURNEY FOWLER, Esq., Glebelands, South Woodford (gr. Mr. J. Davis), showed *Cattleya Rhoda* Fowler's variety (Iris × *Hardyana*), an unique plant, quite different from the ordinary forms in that its flowers are shaped like those of *C. Hardyana*, and of the same size. The sepals and petals are pale primrose yellow, the lip being almost entirely deep rose-purple.

H. S. GOODSON, Esq., Fairlawn, Putney (gr. Mr. G. E. Day), was awarded a Silver Flora Medal for a select group, in which the finest plant was *Cattleya Rhoda* Fairlawn variety (see fig. 67), which secured the only First-class Certificate awarded. With it were several very fine forms of *Cattleya Adula*, a good white *Anguloa uniflora clurica*, *Cattleya Atalanta* with a fine spike, *C. Gaskelliana alba* with six flowers, *Cypripedium Wurtzianum* having a fine show of bloom on three spikes, the prettily-marked *Odontoglossum Goodsoniae*, *O. ramosissimum*, *Miltonia spectabilis* Morehana, *Cypripedium Rossetti*, and some *Sophras*.

FRANCIS WELLESLEY, Esq., Westfield, Woking (gr. Mr. Hopkins), showed *Cattleya Lady Chance* with bronzy sepals and petals and clear purple front to the lip, *Laelio-Cattleya Mrs. Philip Henrique*, an intensely dark coloured flower of the L.C. Dominiana class; and L.C. Mrs. Phayre (L.C. *Norba* × *C. Dowiana aurea*), with creamy-yellow sepals and petals, and rose-tinted lip with gold veining.

Messrs. CHARLESWORTH & Co., Haywards Heath, were awarded a Silver Flora Medal for a showy group, in the centre of which were several grand specimens of the beautiful *Vanda carulea*.

There was also a good selection of hybrid Orchids, including *Laelio-Cattleya Elva* of fine colour, L.C. *Elvina*, very dark and attractive; L.C. *Venus Leeana*, a distinct hybrid, as well as *Sophras*—*Laelio-Cattleya Marathon* and other hybrids with *Sophronis grandiflora*, and the very interesting *Oncidioda Charlesworthii* (*Oncidium incurvum* × *Cochlioda Noezliana*), with slender, scape like the *Oncidium* parent, and pale mauve flowers, more nearly resembling *Cochlioda vulcanica* in colour and form than the orange-scarlet *C. Noezliana*. Other choice plants noted were *Bollea Lalindei pallida*, *Odontoglossum bio-*

spikes of spotted flowers being furnished with large, similarly-coloured bracts; various *Odontodas*, *Cattleya superba*, *C. Hardyana*, *C. Gaskelliana Princess*, a pretty white form; *Miltonia vexillaria Leopoldii*, a selection of showy *Laelio-Cattleyas*, the forms of L.C. *callistoglossa* being specially attractive; the pretty white and fragrant *Brasso-Cattleya Pocahontas*, *Pilumna nobilis*, *Sophras*—*Laelio-Cattleya Danae*, and others.

Messrs. JAS. VEITCH & SONS, LTD., Royal Exotic Nursery, King's Road, Chelsea, showed a large form of *Cattleya Hardyana*, which was specially interesting in that the yellow on the

Photograph by John Gregory.

FIG. 73.—PHLOX ELIZABETH CAMPBELL; COLOUR SALMON PINK WITH WHITE CENTRE.

(Award of Merit at R.H.S. meeting on Tuesday last.)

toniense album, various hybrid *Odontoglossums*, *Brasso-Cattleyas*, and *Stanhopea tigrina*.

Messrs. STUART LOW & Co., Rush Hill Park, Enfield, were awarded a Silver Flora Medal for an extensive and well-arranged group, in which were many interesting species. The centre of the exhibit contained the very handsome yellow *Oncidium Marshallianum*, and in front of this were *Cirrhopetalum Mastersianum*, the feather-lipped *Bulbophyllum barbigerum*, *B. papillosum* with long racemes of purple flowers, *B. Godseffianum*, *Cyrtopodium punctatum*, the branched

lip of each flower varied, one being veined, as in *C. aurea*, and another with blotches on each side of the lip, as in the other parent—*C. Warscewiczii*.

Mr. E. V. Low, Vale Bridge, Haywards Heath, was awarded a Silver Banksian Medal for a group in which were several fine varieties of *Cattleya Adula*, the Vale Bridge variety securing an Award of Merit. Others noted were *Cypripedium Maudiae*, *Odontoglossum Fro-Skinneri album*, and a light-coloured hybrid between *C. Gaskelliana alba* and *C. Harrisoniana*.

Messrs. J. & A. A. McBEAN, Cooksbridge, sent the pure-white *Odontoglossum ardentissimum* album, with large and finely-formed flowers.

Messrs. SANDER & SONS, St. Albans, staged a fine group, for which a Silver Flora Medal was awarded. The central plants were three of the large, white *Dendrobium Sandere*, which is one of the finest of recent introductions. Other rare plants noted were *Lelio-Cattleya Gaston Doin*, with yellowish sepals and petals, and rose-purple lip; a very fine *L.-C. Hy. Greenwood*; *Cattleya Chamberlainiana*; the pretty and extremely rare blue-veined, natural hybrid *Vanda amena*; *Cattleya fulvescens*; *Coelogyne Micholitzii*; the dark-scarlet *Odontodia Devossiana*; and some pretty, hybrid *Odontoglossums*.

Messrs. MANSELL & HATCHER, Rawdon, Yorks., showed *Eria bractescens*, a pretty species, with whitish flowers and purple-tinted lip, the bracts at the base of the flowers being conspicuously displayed.

The TRUSTEES of the late E. ROGERSON, Esq., Didsbury, Manchester (gr. Mr. W. C. Price), showed *Cattleya Wavriniana*, with a very fine spike; *Mitonia Rogersonii*, like a large, pale *M. vexillaria*; *M. Bleuana*; and the small form of *M. vexillaria*, with a very dark base to the lip.

AWARDS.

FIRST-CLASS CERTIFICATE.

Cattleya Rhoda Fairlawn variety (Iris × Hardyana) (see fig. 67), from H. S. GOODSON, Esq., Fairlawn, Putney (gr. Mr. G. E. Day). A very finely-coloured hybrid. Sepals and petals reddish-purple, with a bronzy hue; lip broad and openly displayed, claret-crimson, with gold lines from the base; column white.

AWARDS OF MERIT.

Lalio Cattleya Golden Oriole var. tygrina (L.-C. Charlesworthii × C. Dowiana), from Lt.-Col. SIR GEORGE L. HOLFORD, K.C.V.O. (gr. Mr. H. G. Alexander). A very handsome hybrid, with very richly-coloured flowers, six of which were on the one spike. The ground colour is chrome-yellow, the spaces between the veining being dark Indian red. The lip is ruby-crimson with gold veins from the base. The combination of colours and arrangement of the flowers is most attractive.

Cattleya Hardyana Holford's variety, from Lt.-Col. SIR GEORGE L. HOLFORD, K.C.V.O. The broad sepals and petals are rosy-lilac; the labellum, which is reddish-claret colour, being among the darkest in tint of any of this favourite natural hybrid. There is a bright yellow veining at the base of the lip, and yellow patches on either side of the tube.

Cattleya Adula Vale Bridge variety, from Mr. E. V. Low, Vale Bridge, Haywards Heath. A very large flower, the lip especially being unusually broad. The sepals and petals are pale rose-pink on a cream ground; lip magenta-rose.

BOTANICAL CERTIFICATE.

Dendrobium Karoense, from SIR TREVOR LAWRENCE, Bart., K.C.V.O., Burford (gr. Mr. W. H. White). A singular little species from the region of New Guinea, and with features widely separated from *Dendrobium* as generally known, although the flowers seem to agree therewith. The habit of the plants is that of a small *Pleurothallis* or *Stelis*, the single flowers appearing at the apex of the growth and the base of the leaf. The flowers are small, white, the upper sepal narrow, the lower two broad, and arranged beside the lip; petals linear.

CULTURAL COMMENDATION.

To Mr. W. H. White (Orchid grower to Sir Trevor Lawrence, Bart., K.C.V.O.) for a very large specimen of *Platyclinis filiformis*, with a large number of its slender racemes of yellow flowers.

The chairman referred to the great loss which the Orchid Committee had sustained since the last meeting a fortnight ago by the death of two of its members, Mr. H. A. Tracy and Mr. W. Boxall, and also by the death of Mr. Jas. McBean, who, although not a member of the Orchid Committee, was respected by all its members and whose son, Mr. A. A. McBean, was a member of the Committee. A vote of condolence and sympathy with the widows and relatives was passed.

Fruit and Vegetable Committee.

Present: G. BUNYARD, Esq. (in the Chair), and Messrs. A. H. PEARSON, C. G. A. NIX, W. PONPART, H. S. RIVERS, W. BATES, J. DAVIS, G. WYTHES, OWEN THOMAS, J. JAGUES, A. R. ALLAN, G. HOBDAV, W. FYFE, C. FOSTER, E. BECKETT, A. DEAN, G. GIBSON, and H. MARKHAM.

Mr. STEWART LLOYD, Wychbold Hall Gardens, Droitwich, showed a dish of a useful, medium-sized Kidney Potato named Hale's Early. It was decided to ask Mr. LLOYD to send tubers to Wisley for trial next year.

The Hon. VICARY GIBBS, Aldenham House, Elstree (gr. Mr. E. Beckett), showed shoots of the tall and handsome *Chenopodium amaranticolor*, a coloured, branching Spinach-like vegetable. As plants are growing at Wisley, it was agreed to have some leaves cooked for the Committee to taste on the 9th inst. Mr. BECKETT spoke in high terms of the plant as a vegetable.

Mr. E. DYKE, Melbourne Park, Somerset, sent a dish of an Apple said to be a seedling from Annie Elisabeth. The Committee desired to see fruits again later in the season.

SIR ROBERT HARVEY, Langley Park, Slough, exhibited two fruits of the Mango about the size of large Pears. The flesh was of most delicious flavour. A Cultural Commendation was recommended by the Committee, but the Council afterwards changed the award to a Silver Banksian Medal.

Messrs. S. SPOONER & SONS, The Nurseries, Hounslow, staged a collection of 30 dishes and baskets of Apples, the fruits being remarkably clean and well grown; also a dish of fine Monarch Plums. The cooking Apples included Lord Suffield, Frogmore Prolific, Early Victoria, Castle Major, Golden Spire, Ecklinville Seedling, Domino, Grenadier, Lord Grosvenor, Stirling Castle, Potts's Seedling, Ruzer, and Early Rivers, resembling Lord Suffield. The dessert varieties included very fine Lady Sudeley, Williams's Favourite, a conical, red-striped fruit; Worcester Pearmain, and Duchess of Gloucester. (Silver-gilt Banksian Medal.)

A batch of medium-sized bunches of Black Hamburgh Grapes was shown by C. G. A. NIX, Esq., Tilgate House, Crawley. These had been grown on one rod of 15 feet length, the vine being 15 years planted. The berries were well coloured and finished. (Silver Knightian Medal.)

Mr. G. W. MILLER, Wisbech, staged a number of his richly-coloured Apple Red Victoria, which is fast becoming a popular market variety.

LORD NORTHCLIFFE, Sutton Place, Surrey (gr. Mr. Goatley), showed 18 fine Melons, all well coloured. The largest fruits were those of Universal. There were also good fruits of Hero of Lockinge and the Peer. (Silver Knightian Medal.)

Messrs. JAS. VEITCH & SONS, LTD., King's Road, Chelsea, staged an interesting collection of well-grown and fruited Capsicum plants, which showed, in addition to their edible value, great decorative beauty, especially some of the smaller-fruited ones. The larger-fruited varieties were Mammoth Red Scarlet Beauty, Early Belle, Chinese, Early Dwarf Red, Long Red, Long Yellow, whilst the smaller ones included Yellow Cherry, Small Round Yellow, the pretty, pointed Cayenne Red, and the very ornamental Little Gem. (Silver Banksian Medal.)

AWARDS OF MERIT

Melon Golden Beauty.—A smooth-skinned variety with very solid, scarlet flesh of pleasant flavour. Grown at Wisley from seeds sent by Messrs. BARR & SONS.

Tomatos Ailsa Craig, Carrick and Ayrshire, all round-fruited and of deep-red colour, with solid flesh. They all proved great croppers when grown under trial at Wisley. From Mr. BALCH, Girvan, N.B.

HORTICULTURAL TRADES ASSOCIATION.

AUGUST 22, 23, 24, 25.—The annual meeting took place in London on these dates, and was one of the most successful, and numerously attended of the series. Nearly a hundred nurserymen and seedsmen from all parts of Great Britain were present. An excursion took place on August 23 to Woking and Wisley. Woking is well known as a centre of the nursery industry, the soil and climate being especially suited to the

culture of Conifers and other shrubs and trees. Messrs. Jackson & Sons and Mr. Charles Slack, who entertained the party at lunch and tea, have between them some 500 acres of nursery land in the district planted with all kinds of shrubs, trees, Roses, &c. The visit to Wisley Gardens was also much enjoyed, and great interest taken in the trials of various subjects.

The second day was devoted to pleasure, some 90 members joining in a trip up the Thames, landing at Chiveden for lunch (permission having been kindly given by Mr. Astor), and spending the afternoon in enjoyment of the glorious scenery there. Some of the party crossed over to Dropmore to inspect the famous collection of Conifers.

The evenings were devoted to the election of officers for the ensuing year and the discussion of matters of trade interest, such as land taxation and valuation and Gooseberry-mildew. Mr. Peter Veitch (head of the firm of Messrs. R. Veitch & Son, Exeter) was elected president for the coming year.

ABERDEEN ROYAL HORTICULTURAL.

AUGUST 25, 26, 27.—In charming weather, and amid ideal surroundings, in the Duthie Public Park, Aberdeen, the 86th annual show of this admirable organisation was opened by Dr. George Adam Smith, Principal of Aberdeen University. Unfortunately, the weather was unfavourable on the succeeding days, causing a loss on the receipts. It was, however, a splendid display, and one which has never been excelled in the long history of the society. This year the Malcolm Dunn Memorial Medal in Horticulture—a prize given yearly at one of the largest shows in the country—was offered at Aberdeen for the best collection of vegetables. The usual plan of erecting large marquees for the various divisions was again adopted, and all the arrangements were admirably carried out by the secretary, Mr. J. B. Remitt, Advocate, Aberdeen, ably assisted by a large and enthusiastic committee.

PLANTS IN POTS.—Although these were somewhat fewer than usual, the display made was an exceedingly fine one. In the class for a specimen plant in flower, Mr. ALEXANDER BRENNER, Dalhelbitz Gardens, won the 1st prize with a grand plant of *Disa grandiflora*; Mr. J. LEGGAT, Balgowrie House Gardens, being 2nd, with a fine specimen of *Statice profusa*. Foliage plants, if not numerous, were good. Mr. JOHN ELDER, Norwood Gardens, was the most successful exhibitor. Mr. ELDER and Mr. DOUGLAS, Kepplestone House Gardens, had the best Palms. In Ferns, there was very strong competition. They were mostly *Adiantums*, and Mr. BRENNER, with fine specimens of *Adiantum cuneatum*, *A. Victoria*, and *A. gracillimum*, was awarded the 1st prize. The plant of *Adiantum cuneatum* was nearly 5 feet in width, very dense and well grown. *Pelargoniums*, although not quite so good as those shown last year, were very healthy-looking plants, with fine foliage. Mr. J. W. BRECHIN, Ardoe Gardens, Belhelvie, won handsomely. *Fuchsias* were poorly shown. Mr. JOHN YULE, Woodside, having the best plants. *Begonias* and *Petunias* could only be characterised as fair compared with what has been seen at Aberdeen in previous years. Mr. J. D. SMITH, Union Grove, and Mr. BRECHIN, Ardoe, shared the principal honours. In the class for six plants suitable for table decoration, Mr. JOHN PETRIE, Crathes Castle Gardens, won the 1st prize. Mr. GEORGE MAITLAND, Woodside, gained, for the second time, the Society's Challenge Silver Cup offered for the best table of greenhouse plants. It must, however, be won three times, not necessarily in succession, before it becomes an exhibitor's absolute property.

CUT FLOWERS.—A marquee was devoted to these, and they formed the out-standing feature of the exhibition. For 24 Rose blooms, H.P. and H.T., or either, named, distinct varieties, Mr. DOUGLAS, Kepplestone House, had a most meritorious win. Mr. BRENNER, Dalhelbitz, won the Society's Silver Medal offered for 12 blooms. Mr. ELDER, Norwood, gained a similar award for an exceptionally fine display of Tea or Noisette varieties. Some fine Dahlias were staged by Mr. BRECHIN, Ardoe. This gardener also excelled with *Gladioli* and *Asters*. The latter flowers were generally very good, and there was a large entry. *Marigolds* were good, but much better and more

distinctly-marked specimens have been seen at previous Aberdeen shows. They were of a good depth, however, and Mr. JOHN GRIEVE, Woodside, richly deserved the premier place. The class for a collection of 20 varieties of cut flowers and fine foliage bedding plants, including annuals, arranged on a space 3 feet by 3 feet, proved a delightful feature. Mr. DOUGLAS, Keppelstone House, and Mr. W. SCORGIE, Springhill Gardens, won the 1st and 2nd prizes respectively. Mr. BRENNER, Dalhelly, was awarded the 1st prize for 12 cut trusses of Zonal Pelargoniums. In the class for six bunches, trusses or blooms of stove or greenhouse plants, some exquisite Lapaerarias were included, and Mr. ALEXANDER DUNCAN, Rubislaw Den House, gained the 1st prize easily. Orchids included fine specimens of *Miltonia spectabilis*, *Cattleya labiata*, *Cypripedium Lawrenceanum* and *C. Veitchii*. Pansies, both show and fancy, were shown splendidly, as the cool season has suited these flowers. The 1st prize was won by Mr. J. M. DUNN, Nelfield; 2nd, Mr. G. C. MINTY, Hilton. The Violas shown by Mr. JAMES McLENNAN, Elden House Gardens, Banffshire, were much admired, and easily gained the 1st place. Mr. JOHN A. GRIGOR, Seapark, Forres, had the best exhibit of Sweet Peas. In the classes for bouquets, baskets of flowers, sprays, button-holes, and other florists' work, the principal prize-winners were: Mr. J. D. SMITH, Union Grove; Mr. ALEX. CUMMING, Granitehill, and Mr. STRACHAN, Aberdeen Botanic Gardens.

FRUIT CLASSES.—There was a capital display, especially of hardy fruits, an outstanding feature being the fine specimens of Gooseberries. Langley Green, which is considered one of the best dessert varieties in the North, is still a favourite. For the best collection of hardy fruits, six dishes, not more than two dishes of any species, Mr. GRIGOR, Seapark, led. Strawberries were well shown, Mr. JOHN SELBIE, Morken, taking the 1st prize. Mr. PETRIE, Crathes Castle, had the best Cherries and Raspberries. The best Black Currants were shown by Mr. J. FERGUSON, Linton Gardens, Cluny, whilst Mr. W. HARPER, Tulliebelton Gardens, Perthshire, excelled with Red Currants. Grapes proved an exceptionally good display, and Mr. W. CAMPBELL, Brahan Castle Gardens, Ross-shire, had capital wins, both for white and black varieties. The fine finish of his berries took Mr. CAMPBELL far ahead of his opponents. Black Morocco, Black Hamburg, Black Alicante, and Muscat of Alexandria were his leading samples. Melons, Peaches, Nectarines, Apples, Pears, Plums and Tomatos were all well shown, the chief prize-winners for these being Mr. SCORGIE, Springhill; Mr. CAMPBELL, Brahan Castle; Mr. LEGGAT, Balgowrie House; Mr. H. B. SMITH, Burdshangh; Mr. GRIGOR, Seapark, and Mr. JAMES S. BENZIE, Woodside.

VEGETABLES.—It is questionable if finer vegetables have been shown in Aberdeen. For the best collection arranged on a table 4 feet by 3 feet, consisting of 10 kinds, the Malcolm Dunn Memorial Medal in Horticulture was, as already stated, offered. It was worthily won by Mr. WILLIAM HARPER, Tulliebelton, Perthshire. His Cauliflowers, Lyon Leeks, gigantic White Celery, Red Intermediate Carrots, Double Purple Beet-root, Glasstone Peas, Sharpe's Express Potatos, Canadian Wonder French Beans, and Tomatos were superb. Mr. GRIGOR, Seapark, was a good 2nd, but his produce lacked the fine finish seen in the Tulliebelton collection. He had, however, the best Onions. Salads were well shown, Mr. SCORGIE, Springhill, securing the 1st prize. Mr. JOHN KINNAIRD, Hazlehead, took the premier honours for both Cabbages and Cauliflowers. Cucumbers were exceedingly well shown, Mr. SCORGIE, Springhill, taking 1st place with very good samples. Leeks were best shown by Mr. ELLIS, Raeden Gardens.

Mr. WILLIAM LAWSON, Cornhill; Mr. FERGUSON, Linton, Cluny; and Rev. C. G. MACKENZIE, Methlick, Aberdeenshire, all showed grandly in the classes for Potatos. Mr. FERGUSON took both the 1st and 2nd prizes for Turnips; whilst Beet-root from Tulliebelton worthily merited the 1st place.

MARKET GARDENERS.—The display made by the market gardens, both fruit and vegetables, was exceedingly good. For the best collection of hardy fruits Mr. KINNAIRD, Burnisboozle, won the 1st prize. Mr. WILLIAM ELLIS, Raeden Gardens, Aberdeen, carried off premier honours for

a collection of vegetables comprising nine varieties.

NURSERYMEN'S CLASSES.—There were fine entries in all sections. Messrs. JAMES COCKER & SON, Rose-growers, Aberdeen, led finely for 36 Rose blooms. Messrs. ADAM & CRAIGMILL, Rubislaw Nurseries, Aberdeen, were placed 1st for 24 Tea or Noisette (or either) Roses with a greatly-admired exhibit. In the decorative classes Mr. ALEX. BURNS, junr., New Market, Aberdeen, and his daughter, Miss ALICE BURNS, Victoria Road, Torry, Aberdeen, won most of the principal prizes.

NON-COMPETITIVE EXHIBITS.—As usual at the Aberdeen Show, these formed a splendid feature. Messrs. BLACKMORE & LANGDON, Twerton Hill Nursery, Bath, showed tuberous-rooted Begonias; Messrs. COCKER, Aberdeen, Roses; Messrs. WILLIAM SMITH & SON, Burnside and Silverhillock Nurseries, Aberdeen, floral devices; Mr. BURNS, junr., New Market, miscellaneous flowers; Messrs. BEN, REID & CO., Pinewood Park Nurseries, Aberdeen, Roses and Sweet Peas; Mr. M. H. SINCLAIR, seedsman, Aberdeen, French produce—peppers, egg fruits, Cantaloupe Melons, Carnations, &c.; and Mr. WILLIAM A. DUNSTAN, Holburn Nurseries, Aberdeen, Dahlias and Chrysanthemums.

ROYAL ENGLISH ARBORICULTURAL.

THE Irish meeting of this Society, briefly noticed in the last issue (see p. 163), was concluded on Saturday, the 20th ult., after a full programme. The annual dinner was held at the Gresham Hotel, Dublin, on August 17, about 60 members being present. The toast of the evening was "The Department of Agriculture and Technical Instruction for Ireland," proposed by Principal J. Smith Hill, B.A., of Aspatia. Mr. T. W. Russell, representing the Department, responded, and portended good times for both agriculture and forestry in Ireland.

The itinerary during the latter part of the week embraced Carton Park, Hamwood Park, and Phoenix Park, including the grounds of the Vice-regal Lodge. In each place, the most interest was evinced in the specimen trees and shrubs rather than forest plantations, and such trees, particularly Coniferous ones, are not often seen in such magnitude on this side of the Channel.

Viscount de Vesce's estate at Abbeyleix provided forest plantations in all stages. The estate contains 2,000 acres of woods. Interesting experiments on bog land were inspected. Exceedingly fine Scotch Fir was growing on this unpromising medium. Thuja Lobbi, too (whether planted or accidental seedlings is not known), grow well on the high bog, and at another place this plant had actually beaten *Abies Douglasii* in a mixed wood in its upward race. Several members favoured this tree for commercial forestry.

Many interesting subjects presented themselves in the gardens and pleasure grounds at Abbeyleix, including *Quercus Turneri*, *Q. diversifolia*, forms of the Lucombe Oak and a Poplar from the Mississippi name *angulata*, its foliage being very attractive.

Cumragmore, the extensive property of the Marquis of Waterford, furnished a good day's ramble. Several extensive plantations of pure and mixed wood, extending in dates from the early 'sixties to the present time, afforded most interesting data. Evidence of system and method in all the planting was manifest, the woods being treated in sections of 20 to 30 acres. As in other demesnes visited, the shrubs and ornamental trees were singularly interesting to the visitors from England on account of their luxuriance. To enumerate a few only: *Encyphia punctifolia* formed a bush 6 feet high covered with its lovely flowers; *Grevillea sulphurea* was in flower; *Garrya Thuretii*, 9 feet high and 6 feet through; *Pavia macrostachya*, *Styrax japonica*, *Escallonia Phillipiana*, *Andromeda formosa*, and, amongst trees, *Magnolias* (over 50 feet high), Tulip trees, Scarlet Oaks, Catalpas, and *Paulownias* were growing in perfection; *Cryptomeria elegans* had, Banyan-like, formed a small forest by depending and throwing up numerous leaders. Other fine trees were *Abies Menziesii*, 110 feet high; *A. Nordmanniana*, nearly as tall; Oaks and Beech, with clean, perfect boles 30, 90, and 100 feet tall; *Pinus Pinea*, the Stone Pine, 45 feet high; and *P. Pinaster*, on the river bank, a fitting companion to a num-

ber of Scotch Pines, which, at a rough measurement, appear to be 130 feet high.

The Duke of Devonshire's estate at Lismore and Sir John Keane's estates at Cappoquin and Derriban were the last places visited officially. The home nursery, some recent plantings of *Abies* (*Pseudotsuga*) *Douglasii*, older Larch woods, and the home grounds in the former case furnished an interesting morning's work. A Yew avenue, said to be 700 years old, with its arched, natural roof and monster stems, spoke of a long-past tree-planter on the banks of the lovely Blackwater. A fine plant of *Calycanthus floridus* in the Castle Court completely filled a wall space 35 feet high and 30 feet spread; whilst near by grows a plant of *Myrtus Ugni*, 15 to 16 feet high. Among other noteworthy subjects may be mentioned a Tulip tree with many stems towering to a height of 90 feet, and near by a Judas tree, 16 feet tall, with a diameter of 20 ft.

At Cappoquin was found an enthusiastic forester, Sir John Keane, whose seat overlooks the winding tidal Blackwater. Here, after tramping through varied woodlands, were encountered huge Ashes, Cedars and Beeches; *Cryptomeria elegans*, 30 feet; *Cordylines*, 20 feet; *Ozothamnus rosmarinifolius* (*Helichrysum diosmefolium*), *Coronilla*, a group of *Yuccas* in flower, *Griselinia littoralis*, *Pittosporum Mayi*, 12 feet high, and *Erica arborea* were all growing in healthy exuberance. Unofficial visits were also made by individual members to several other interesting collections. The meeting was one of the most successful held by the Society.

NATIONAL VEGETABLE.

AUGUST 30.—A meeting of the committee was held at Vincent Square on Tuesday last. The treasurer (Mr. G. Wythes, V.M.H.), gave a satisfactory statement of accounts. Names of various persons were submitted as judges for the show on the 23rd inst., and these will be invited to adjudicate. It was agreed to allot a table space for honorary exhibits of 12 feet run, with a further space not exceeding another 12 feet on the exhibitor's subscription being increased. The various donors of special prizes are to be allotted spaces free of charge. In view of the anticipated great competitions, and the many applications for space already made, such table spaces must be severely limited. A Staging Committee of five members was appointed. It was agreed to invite seeds for a trial of early Cauliflowers now, and later of early Peas, Beet, Spring Onions and early Carrots.

ROTHESAY HORTICULTURAL.

AUGUST 25.—The annual exhibition was held on this date and proved a record show. The entries in the Horticultural Section showed an increase of 81 over last year, but there were fewer nurserymen's exhibits than usual. The John Reid Challenge Cup and Medal, offered for the most successful competitor in the cut flower classes, was won easily by Mr. D. I. MORRIS. Mr. M. CUTHBERTSON was again successful in winning the 1st prize for a table of hardy herbaceous flowers, and Messrs. A. LISTER & SONS were placed 1st for Dahlias, Pansies and Roses. Other successful exhibitors were:—Mr. DAVIDSON, Ardencraig, for greenhouse plants and Grapes; Mr. D. PENNEY, Glenburn, for a magnificent group of pot plants, which was one of the features of the show, also for Carnations; Mr. S. THORBURN, Kyles Hydro, for Chrysanthemums, Pompon Dahlias, and pot plants; and Mr. JOHN CAMPBELL, Lochfyne, for Asters, French Marigolds, and culinary Apples.

Among non-competitive exhibits, Messrs. DOBBIE & Co. made a fine display of Sweet Peas and Begonias; Messrs. DOBBIE, STEWART & Co., Chapelhill Nursery, showed a fine group of Pelargoniums, *Glabrii*, Chrysanthemums, Sweet Peas, and other flowers; and Messrs. A. LISTER & SONS, Meadow Bank Nurseries, arranged many well-executed floral devices.

GARDENING APPOINTMENTS.

Mr. W. F. STEWART, for the past 6½ years Kitchen Garden and Hardy Fruit Foreman at Mentmore, Leighton Buzzard, Bucks., and previously Inside Foreman at Dunkeith, N.B., as Gardener to the Baroness von SCHROEDER, The Rookery, Nantwich.

Mr. CHARLES FORD, as Gardener to Lt.-General Hon. SOMERSET J. GOUGH-CALTHORPE, K.C.B., Percy Hall, Perry Barr, Birmingham.

LAW NOTE.

FRUIT PICKING IN PAILS.

An interesting case regarding the net weight of pails used in fruit picking came before a Justice of the Peace Court, held at Perth, on August 25, when a partner of a firm of farmers and fruit-growers at Blairgowrie was charged with having on August 2, by the hands of an assistant, wilfully defrauded the berry-pickers on one of the firm's fields by having in use pails for which 4 lbs. were deducted in the weighing of the berries, but which were found to be deficient in weight. The accused pleaded not guilty. From the evidence it appeared that a surprise visit was paid to the field by an inspector of weights, when 53 pails were weighed and all found to be deficient in the asserted weight, some of them as much 1 lb. The defence was to the effect that the pickers had accepted a rule by which the weight of the pails was to be taken as 4 lbs., although they were admittedly less than that, this rule being adopted, as the soil of the field frequently adhered to the pail and thus added to the weight. The charge was found proved, but, under the circumstances, the modified penalty of £1, with costs amounting to £1 16s. 6d., was imposed. The decision is one of importance, as the practice has been in operation for some time in the district, and has been frequently followed without any intention to reduce the pay of the pickers.

DEBATING SOCIETIES.

READING AND DISTRICT GARDENERS' ASSOCIATION.—More than 100 of the members paid an evening visit to Park Place, Henley-on-Thames, on August 16. The visitors were met at Shiplake Station by Mr. T. J. Powell, the head gardener, who conducted them through the Bolney Court Estate to the river, over which they were ferried. Immediately on arrival tea was provided by Mrs. Noble, and afterwards the gardens and grounds were inspected.

BATH GARDENERS.—The usual monthly meeting of this society was held on Monday, August 22, at the Foresters' Hall, Bath; Mr. J. Parrott presided. A paper on "Vegetables for Exhibition" was read by Mr. H. Sparry. The lecturer in his opening remarks alluded to the marked improvements that had been made in horticulture during the past 30 years.

WATFORD AMATEURS' AND GARDENERS.—The 18th monthly meeting of the above society was held at the St. Andrew's School, on Friday, the 12th ult.; Mr. Hardenberg occupied the chair. A paper was read by Mr. A. Stone dealing with the "Formation and Treatment of Rock Gardens." The paper gave rise to a lengthy discussion. Mr. F. E. Newman exhibited on the lantern screen a collection of slides, made by himself, of Alpines and rock plants generally.

BRISTOL AND DISTRICT GARDENERS.—A well-attended meeting was held on August 25, at St. John's Parish Rooms. Mr. Hayball occupied the chair. A paper on "Melons" was read by Mr. Wilkinson, gardener to Col. Gibbs, M.P., Tyntesfield. The lecturer said plenty of heat is required to grow Melons successfully, a night temperature of from 65° to 70° being the minimum. Mr. Wilkinson advised the use of a good stiff loam, placed as a ridge 10 inches in depth and 14 inches wide. The cordon system is the best method of training, allowing a space of 18 inches between the plants, and not more than two fruits on each. Mr. Wilkinson has produced fruits weighing 9½ lbs. each by this system. When the fruits are of the size of Walnuts, feeding should be commenced, but manure is not necessary when the Melons show signs of the skin netting. Three new members were elected. Mr. Morse was awarded the 1st prize offered for two plants of Begonias.

THE WEATHER.

THE WEATHER IN WEST HERTS.

Week ending August 31.

A cold, wet, dull and windy week.—During the past week the days remained persistently cold. The nights also, with two exceptions, have been below the average in temperature. The ground temperatures have fallen, and are now 1° colder at 2 feet deep, and 2° colder at 1 foot deep, than are seasonable. On both the 28th and 29th, half-an-inch of rain was deposited. Rain has fallen on all but two days of the last fortnight, and to the aggregate depth of 2 inches. During the last six days 3½ gallons of rainwater have come through the bare soil gauge, and on one day a little came through the gauge on which short grass is growing. The sun shone on an average for 4 hours a day, which is 13 hours a day short of the average duration at this period in August. The winds have been as a rule high, but in no hour did the mean velocity exceed 16 miles—direction W.S.W. The average amount of moisture in the air at 3 p.m. exceeded a season-quantity for that hour by as much as 12 per cent. E. M., Berkhamsted, August 31, 1910.

SCHEDULE RECEIVED.

Weston-super-Mare and District Chrysanthemum Society's 24th exhibition and floral display will be held on Thursday, November 10, in the Knightstone Pavilion. Secretary, Mr. J. Lee, 7, Victoria Buildings, Weston-super-Mare.

MARKETS.

COVENT GARDEN, August 31.

[We cannot accept any responsibility for the subjoined reports. They are furnished to us regularly every Wednesday, by the kindness of several of the principal salesmen, who are responsible for the quotations. It must be remembered that these quotations do not represent the prices on any particular day, but only the general averages for the week preceding the date of our report. The prices depend upon the quality of the samples, the way in which they are packed, the supply in the market, and the demand, and they may fluctuate, not only from day to day, but occasionally several times in one day.—E.N.]

Cut Flowers, &c.: Average Wholesale Prices.

Table listing various cut flowers and their prices, including Asters (Chinese), Carnations, Poppies, and various other floral varieties.

Cut Foliage, &c.: Average Wholesale Prices.

Table listing various cut foliage and plants, including Adiantum, Asparagus plumosus, and various ferns.

Plants in Pots, &c.: Average Wholesale Prices.

Table listing various potted plants and their prices, including Aralia Sieboldii, Aspidistras, and various other indoor plants.

Fruit: Average Wholesale Prices.

Table listing various fruits and their prices, including Apples (English), Blackberries, Grapes, Lemons, and various other fruit varieties.

Vegetables: Average Wholesale Prices.

Table listing various vegetables and their prices, including Artichokes, Beans, Broccoli, and various other vegetable varieties.

REMARKS.—A consignment of Mangoes arrived from Jamaica last week, and met with a small demand. English Peaches and Nectarines of best selected varieties are a shortage. English Apples are a poor trade and the market is well supplied with them; Worcester Pearman is especially abundant. Grapes are a poor demand and very plentiful. Foreign Gages are numerous and a fair trade. Both English and Foreign Plums are a poor trade. Scarlet Runners are a plentiful supply and cheap. Peas are a bad trade. Prices for Tomatoes are firmer. Trade both in vegetables and fruits is quiet. E. H. R., Covent Garden, August 31, 1910.

Edward J. Newborn, Covent Garden and St. Pancras, August 31, 1910.

COVENT GARDEN FLOWER MARKET.

The flower market presents a dull appearance. There is but little trade for pot plants, and cut flowers do not sell readily. We are reminded of the approach of autumn by seeing plants of *Solanum capsicastrum* with well-ripened berries. *Chrysanthemum* in pots are very good. Some plants are taken up from the ground, but those grown in pots are the best, as they last much longer. Some growers lift and pot them when the flowers are in the bud stage; these become re-established before the flowers open. Varieties of the Marie Massie type are of the most service for early blooming. *Madame Des-grang* is another that is useful for early flowering. Some good *Liliums* of various sorts are procurable, but there is little demand for them. Plants of *Campanula isophylla*, both white and blue varieties, are well flowered. *Pelargoniums* are practically over for the season; a few *Zonals* are seen, but they are not in demand. Fobage plants are well supplied, and those who can, will do well to buy early for winter use, for prices are now low and supplies are plentiful. There will also be less risk of damage from cold than there will be later on. It is the same with *Azaleas*: if these are subjected to a slight frost the buds do not open well; also other autumn and winter-flowering plants and even *Chrysanthemums* suffer from a slight frost when they are in bud, especially after showery weather. Hardy shrubs will soon be in demand; some growers are already sending *Luonymus* and various *Conifers* to the market.

CUT FLOWERS.

Hardy flowers are the most prominent feature. Asters are seen in large quantities: their prices vary considerably. White, pink and purple are most in demand. Roses from the open are a great feature. Those who grow specially for market cut their blooms with long stems, but even the best blooms with clean foliage are sold very cheaply. Dahlias are seen in large quantities. Gladioli are plentiful; the *Scarlet trenchleyensis* is most in demand. Sweet Peas are nearly over for the season. *Liliums* are well supplied, and their prices are below the average. Carnations vary considerably in quality, and the best do not command very good prices.

For the next few weeks trade will be very uncertain, and prices may fluctuate considerably. A. H., Covent Garden August 31, 1910.

Obituary.

WILLIAM BOXALL.—The death of this well-known Orchidist occurred on Sunday, August 23, at his home, 186, Brooke Road, Clapton, in his 66th year. His health had been failing for some years, the trouble being diabetes, and about three years since he had a paralytic stroke from which he only partially recovered. Notwithstanding these infirmities, he was a regular attendant at the meetings of the Royal Horticultural Society, and was a member of the Orchid Committee for many years. He was one of the first to receive the Victoria Medal of Honour in Horticulture. The late Mr. Boxall was a great lover of all plants, but Orchids were his favourites, and he travelled over many parts of the world in search of them. In the early 'sixties he was employed in the firms of Messrs. Hugh Low & Co., Clapton, and Messrs. James Veitch & Sons, Chelsea, also in the gardens of Leigh Park, Havant, and Earl Radnor's garden at Highwood, under the late Mr. Henry Eckford. Later, he was employed as foreman of the Orchid department in Messrs. Hugh Low & Co.'s Nurseries. He was sent by the firm to Burma, where he soon seemed as much at home as in England, and was not long before he forged ahead to the borders of China, being the first to send home the now world-famous *Dendrobium Warliana Lowianum*. Some of these plants sold in Messrs. Steven's sale room for as much as 100 guineas each. *Cymbidium Lowianum* was one of his special finds. *Cypripedium Boxallii*, *Dendrobium Boxallii*, and *Vanda Boxallii* will serve to perpetuate his name. He subsequently went to the Philippines, and sent home, in specially-prepared cases, glazed with ground oyster shells, large quantities of *Phalaenopsis amabilis* and *P. Schilleriana*, the difficulties of transit being far greater than they are now. Borneo, Java, Brazil, Central and South America were all traversed by him, and many are the tales he told of things seen and heard in those countries. He was a most entertaining conversationalist, and nothing de-

lighted him more than to gather around him the children of his friends, amongst whom he was ever welcome. He was married in August, 1874, to Miss Evans, of Cheltenham, who survives him. He leaves no family, his only child, a daughter, having died in infancy.

A GARDENER'S NOTICE: A. W. M. It is customary for a head gardener to receive and give a month's notice before terminating an engagement, notwithstanding that the wages are paid weekly. In the case of under-gardeners, a week's notice is usual.

AMERICAN FRUIT JOURNAL: *Subscriber, Ware.* We do not know the publication you refer to.

APPLE SHOOTS DISEASED: *Anxious One.* The trouble is due to canker (*Nectria ditissima*). This disease obtains an entry through a wound, and often follows attacks of American blight. Some varieties of Apple, such as King of the Pippins, are more susceptible to the disease than others. Cut out and burn the diseased

THE LATE WILLIAM BOXALL.

branches. In slight attacks, cut out the affected parts and cover the wound over with tar. Take out badly-cankered and valueless trees from the ground, else they will become a source of infection for others.

APPLE TREES: *Winkfield.* There is a "sooty" fungus, *Cladosporium*, growing on the under-surface of the Apple leaves over the brown places, but it is probable that this came after the injury was caused. The leaves of Apple trees frequently turn brown at the edges in wet seasons, in the case of those varieties not suited to the soil or locality. In some cases it indicates a lack of potash in the soil.

ASTERS: *C. Bros.* There are no signs of any insect or fungus attack on the Aster leaves sent. If the trouble continues, send us further leaves, packed in a small tin or wooden box.

AVOCADO PEAR AND ORANGE TREES: *Avocata.* The plant you refer to is the Avocado Pear (*Persea gratissima*), a native of Tropical America, and cultivated largely in that and other countries for the sake of its fruits, which contain about 8 per cent. of oil. It is doubtful if the plant will withstand the cold of winter in a living room. Your best plan is to get a friend who possesses a warm greenhouse to house it for you during the winter months. With ordinary care, in a warm greenhouse, this plant will quickly assume the dimensions of a small tree. It thrives in any ordinary soil, and delights in full exposure to all the sun possible in this country. Very little pruning is required unless you wish to keep the plant to a small size. Orange plants will thrive

in an ordinary window, as they are much harder than the Avocado Pear. You should remove the glass from the top of the pot at once, as it is quite unnecessary. It is best to place Oranges outdoors during the summer months, in order to well ripen the growths. As you have raised them successfully from seeds, you should have no further difficulty in their culture.

COCONUT GERMINATING: *S. B.* It is not unusual to find, at this season, coconuts containing the germinating embryo.

CUTTINGS OF TEA ROSES: *Anxious.* Short, stubby, flowering shoots, taken off with a heel of the old wood attached, should now strike freely if inserted in sandy soil under hand lights outside. The cuttings, when inserted, should be well watered and shaded from strong sunlight. As a makeshift, a square, wooden box, with the bottom knocked out, and covered with a sheet of glass would answer the purpose, and, in this case, it would not be necessary to stand them under a north wall, as shading would be unnecessary. Further information on rooting Rose cuttings is given on p. 178. The Pillar Roses should be re-potted at once, and the old flowering wood cut away. If, however, the trees have not made much growth, the old wood should be pruned less severely.

GROWTH ON ROSE: *Jas. W.* The outgrowth is a gall caused by *Rhodites rose*. The galls are popularly known as "Robin's Pincushion," "Moss galls," "Bedeguar galls," &c. They appear to grow from a twig or stem, but this is apparent only. They originate from a leaf.

NAMES OF FRUITS: *A. Herbert.* Pear Citron des Carmes.—*R. M. Lamb.* The small fruit is Fern's Pippin, the large one Minchul Crab.—*H. Henderson.* The small Apple was decayed. We cannot undertake to name unsound specimens. The other Apple is Peasgood's Nonesuch, the Nectarine Elruge, and the Pear Clapp's Favourite.—*F. C.* Please state if the Peach and Nectarine have small or large flowers, and also the shape of the glands, and whether the trees are grown under glass.

NAMES OF PLANTS: *W. E. B. R.* 1, *Eupatorium ageratoides*; 2, *Rudbeckia speciosa*; 3, *Cunninghamia sinensis*; 4, *Helianthus multiflorus* fl. pl.; 5, *Helianthus giganteus*; 6, *Veronica longifolia*; 7, *Rudbeckia laciniata* fl. pl.—*E. Perkins.* 1, *Helianthus multiflorus*; 2, *Rudbeckia speciosa*; 3, *Spiraea Menziesii*; 4, *Inula helenium*; 5 and 6, garden varieties of *Phlox decussata*.—*H. Child.* 1, *Polygonum sachalinense*; 2, *P. cuspidatum*; 3, *Poterium canadense*; 4, *Spiraea japonica* alba; 5, *Lysimachia punctata*.—*A. T.* 1, *Abies nobilis*; 2, *Taxus baccata*; 3, *Hypericum quadrangulum*; 4, *Solidago virgaurea*; 5, *Hypericum androsæmum*; 6, *Galeopsis Tetrahit*; 7, *Stachys betonica*; 8, *Crepis virens*; 9, *Hieracium umbellatum*; 10, *Polypodium vulgare*.—*C. AUGUST FRUIT NOTES.

MORE FINANCIAL DETAILS.

ON August the 6th some statements as to the improved prices of certain kinds of fruit were given and compared with those of 1909. It is gratifying to be able to add that the price of Plums kept up well to the end of August, and that there is every reason to expect still higher rates for the very scanty supplies of late varieties. There is much comfort in the thought that growers can get partial compensation for scanty crops of fruit, in spite of foreign competition, and I have taken the trouble to extract from my delivery books the prices returned by salesmen for three varieties of Plums in three seasons. Early Prolific made 2s. 6d. to 3s. net per half-sieve of 28lb. in 1908, 1s. 6d. to 4s. in 1909, and 4s. 6d. to 6s. 6d. in 1910. Czar sold at 2s. 3d. to 3s. in 1908, 3s. to 4s. 6d. in 1909, and 4s. 6d. to 5s. in 1910. Victoria made 1s. 9d. to 2s. in the first year named, 2s. 6d. to 3s. 6d. in the second, and 5s. to 6s. in the third. As a rule, the greatest quantities were sold at the lowest price quoted, or at a rate nearer to the lowest than to the highest, though this does not apply to Prolific, which usually sell well. There was commission, as well as rail carriage, to deduct; but this makes no difference to the comparison, except that high prices bear these burdens better than low ones. The greatest proportion of compensation for a short crop was in relation to Victorias, which are usually very cheap after they are in full supply, with Pershore Egg Plums to glut the markets. In 1909, my crop of Victoria amounted to 302 half-sieves, which realised £30 12s. 6d. free of

commission, but not of rail carriage. The average was 2s. 7½d. per half-sieve. In 1910 less than half as good a crop, or 140 half-sieves and one peck realised £35 7s. 5d., averaging 5s. 0½d. per half-sieve. As my late varieties, Pond's Seedling and Monarch, almost always make high or fair prices, the comparison is not likely to be as remarkable for them as it is for Victorias. Nor was it so for early sorts.

Apples have not at present made any approach to the extra prices necessary to afford any substantial portion of compensation for the shortness of the crop. Dessert varieties alone have sold remarkably well, and as they usually make somewhat high rates the increases this season are only about 6d. per half-sieve compared with those of 1909, and 1s. compared with those of 1908. Culinary Apples have gone down in price considerably since last month's article was written, the bulk of them having made in the latter part of August only 2s. to 2s. 9d. for firsts, with 3s. for extra large and good fruit, and 1s. 3d. to 1s. 6d. for seconds. These prices are no better than those of last season for the corresponding period, though much higher than the extremely low rates of 1908. The dullness of the market for cooking Apples is due, not to large supplies, but to a very slack demand. Consumers have not been satiated with cheap mid-season plums, as they usually have been by the end of August, and they have not yet shown a disposition to buy Apples freely. Moreover, it happens that the best crops of Apples are those of early varieties, besides which many growers have been "slaughtering" their crops of late keepers, such as Lane's Prince Albert and Bismarck, which should be left on the trees for weeks to come. That English cooking Apples will be a very scanty supply in October may be regarded as a certainty, and growers may be recommended with confidence to keep their late varieties at least so long.

BIRDS AND FRUIT.

Never in my experience have birds been more troublesome in pecking Apples and Plums than they have been during the past month. To keep Gladstone and Beauty of Bath Apples from very extensive damage, it was necessary for someone to go among them with a gun about once an hour every day. There has been the same trouble with Victoria Plums, although these were gathered before they were ripe. On several occasions, I have scared fifty or sixty blackbirds out of a plantation of only a little over three-quarters of an acre in one field, while the fruits of young trees in a more distant field were gathered when barely coloured because the birds had begun to attack them. Blackbirds have been the chief, if not the only offenders. Thrushes in my case have not been found pecking either Apples or Plums. There have been smaller birds on the trees; but whether for the fruit or not has not been clear. If I had the power of exterminating blackbirds, which are the greatest depredators among Black and Red Currants, ripe Gooseberries, and Cherries, as well as among Apples and Plums, I should have no hesitation in doing so. Starlings are about as bad delinquents among Cherries, but not in the case of any other fruit, and they are such valuable insectivorous birds that they receive complete mercy at my hands. Thrushes are gluttons for Strawberries and Raspberries,

but these crops are not grown by me for market. Now that all ripe dessert Apples have been gathered, culinary varieties are receiving attention from blackbirds, and some varieties have been gathered sooner than they otherwise would have been to save them from damage.

THE COLOURING OF APPLES.

Results in the present season confirm the opinion of many growers that rainy weather promotes the colouring of Apples, as it is seldom that there has been more brilliance in such varieties as Worcester Pearmain, Queen, and Bismarck than there is this season. But growing Apples in grass has the greatest of all effects in promoting colouring. When my oldest plantation became mature, and all bushes had been grubbed up, the grass was allowed to grow, mainly because the land is such an inveterate grass-grower that it could not be kept clean in a rainy season by any practicable amount of hoeing. The grass is mown twice in the season, and used as a mulch, on the American system, with cow or London manure in addition. Fruits of Domino, not yet gathered, are of a bright yellow colour, tinged with red where the sun shines on the fruit; whereas, in a young plantation of arable land, the same variety is green and reddish brown. Similarly, Allington Pippin on the grass is of a brilliant crimson colour, and only tinged with a comparatively dull red on the arable land. There is the same difference in the cases of Worcester Pearmain, Lane's Prince Albert and a few other varieties grown in both fields. The fruit is much larger on the arable than on the grass land, but that is at least partly owing to the former trees being several years younger than the latter and to their bearing only light crops. Still, I think that growing Apples in grass tends to reduce the size, while promoting the colouring of the fruit. Such strong-growing varieties as Bramley's Seedling, Warner's King, Queen, and Royal Jubilee produce very fine Apples, however, on grass land, while Allington Pippin and Worcester Pearmain do not take kindly to the change from arable land.

SCAB INCREASING.

This season's experience convinces me of the advantage of the American system of spraying against scab up to nearly the time of gathering Apples. Varieties badly affected have grown more and more scabby as they ripened, although the trees were sprayed once just before the buds burst, and twice after the blossom fell. It would be a serious increase of labour and expense to spray twice more at intervals, but probably it would pay well, and it will be tried at least on a small scale next season. It is comparatively easy for American growers to find time for their numerous sprayings, because most of them have only the Apple crop to attend to, whereas we in this country have bush fruits and Plums also, and some growers have Strawberries in addition. Again, Americans, with only 30 to 40 trees to the acre, have very little hand-hoeing to do, whereas we have an immense amount to perform.

PESTS OF BLACK CURRANTS.

Writing on extra spraying reminds me of the need of treating Black Currant bushes where they are subject to leaf rust (Gloeosporium ribis). This is a serious cause of deterioration in the bushes, as the leaves drop

prematurely. Spraying with Bordeaux mixture as soon as the leaves are mature is recommended by Mr. George Massee in his new book, *Diseases of Cultivated Plants and Trees* (Duckworth). By the way, the index of host plants in this book is not full enough, as a great number of diseases common to fruits of different classes are not named under the headings of those fruits.

An insect pest of Black Currants which has been referred to on previous occasions is an aphid black to the naked eye, but olive-green under the microscope. This pest, which has not yet been identified by one of our best entomologists to whom it has been sent in two

growths issues from the cut ends of the shoots, which is an undesirable development, since these growths become the subjects of a fresh infestation late in the season. *J. Southern Grower.*

ANOPTERUS GLANDULOSUS.

ANOPTERUS GLANDULOSUS is an old garden plant, although not commonly met with. The inflorescences (see fig. 75) bear some external resemblance, at first sight, to those of an *Andromeda*, or some other member of the *Ericaceae*; but the plant belongs to the *Saxifragaceae*, and is a native of Tasmania. It first bloomed in this country in 1816, at Messrs. Loddiges' nursery.

[Photograph by John Gregory.]

FIG. 75.—ANOPTERUS GLANDULOSUS: FLOWERS WHITE, ROSE-TINTED.

seasons, although it appears to be common, attacks the ends of shoots, causing the terminal leaves to curve umbrella fashion over the insects. This is mentioned in order to provide the opportunity of stating that, of two methods of destroying the pests, one is by far the better. The better method consists in women with small vessels filled with a strong mixture of quassia and soft soap going through the plantations, and bending over every affected shoot so as to immerse the insects completely in the mixture. The other plan, which is that of pinching or cutting off the infested ends of shoots and burning them, is objectionable, because a bunch of fresh

and at Kew Gardens. The flowers are white, with a tinting of rose colour, the large racemes being erect, simple, and terminal. The species forms a very handsome evergreen shrub, with leathery, almost sessile, toothed leaves. The plant requires the protection of a greenhouse, except in very favoured parts of this country. Planted in sandy loam and peat, it grows well, and produces a display of flowers during April and May. Propagation may be effected by means of cuttings, which require to be rooted under a bell glass in a cool house, after the manner of most hard-wooded cuttings. The photograph from which the illustration was prepared is of a plant growing in the gardens at Nymans, Crawley, Sussex.

NURSERY NOTES.

HARDY FLOWERS AT YORK.

THE Nurseries of Messrs. James Backhouse & Son, Ltd., at York, are always a source of great pleasure to lovers of hardy plants. On the occasion of a recent visit, I found much that was of interest, although it was not my first inspection of the nursery. The more popular hardy border flowers are cultivated extensively, including large numbers of *Delphiniums*, embracing the best of the newer varieties of British and foreign origin. *Pyrethrums*, also, are grown largely, although the plants had passed out of flower, or almost so, at the time of my visit. There is a large and choice collection of bearded *Irises*, including the new varieties raised by Mr. George Yeld. Many of these are exceedingly chaste and beautiful. There are also numbers of Japanese *Irises*, with a representative collection of other sections of this charming family.

Potentillas, also, are numerous; in addition to an unusually good collection of the border varieties, the Alpine section is well represented, among these being three forms of *P. nepalensis*—the type; Miss Willmott's fine dwarf, deep-coloured variety; and Gibson's Scarlet, the colour of which is well indicated by the name.

Campanulas of all sections are largely grown; it was in this nursery that the handsome *C. persicifolia alba* Backhousei originated. Other tall *Campanulas* are also extensively cultivated, as well as the dwarfer Alpine forms. *C. Tommasiniana*, *C. pulloides*, *C. pulla*, *C. garganica*, *C. g. hirsuta*, *C. carpatica*, in several varieties, and many other species are included in the collection. Hardy *Geraniums* are also plentiful; among those in bloom was the old, blue, double-flowered *G. pratense*, once a common plant in gardens. *Scabiosa caucasica*, with the allied *Centaureas* and *Cephalarias*, were doing well, the former being finer than usual. The *Centaureas* embraced *C. dealbata*, a good garden plant, not so frequently met with now as some 20 or more years ago. *Helium autumnale*, *H. pumilum* magnificentum, and *H. cupreum* were noticed among the representatives of this genus. *Inulas* comprised a good form of *I. glandulosa*, and some of the best of the other *Elecampanes*. *Geum Hel-dreichii*, *G. montanum*, *G. miniatum*, and other species were remarked, together with *Helianthus*, *Rudbeckias*, and other yellow-flowered Composites. A large stock of *Eremuri* had flowered well. A collection of *Helianthemum* included, among named varieties, Golden Queen, *venustum plenum*, *tigrinum*, Ruby Gem, *croctinum*, *Perfection*, and *Garibaldi*.

Mention of these leads me to refer to the large collection of Alpines, mainly grown in pots. *Saxifrages* are very numerous, as is to be expected in a nursery where Alpines have for many years been a speciality. *Sedums*, also, and *Sempervivums* are seen in great variety, and the large genus *Primula* has its claims well considered in the extensive collection cultivated at York. The somewhat scarce *Phyteuma comosum* was doing well; it is a more charming species than the taller *P. orbiculare*. *Convolvulus Soldanella* was covered in bloom; also the rather uncommon white variety of *Ononis arvensis*. *Jasione perennis*, *Lychnis pyrenaica*, *Gypsophila cerastoides*, *G. repens*, and *Alyssum repens* were also seen. A scarce plant was noticed in *Saponaria Weidmanniana*, after the style of *S. ocymoides*, but having white flowers shaded with pink.

Tunica Saxifraga, *Cheiranthus Allionii*, *Edelweiss*, *Acantholimon glumacens*, a large number of the *Primula* species, several *Thymes*, such as *Thymus azoricus*, the best *Ramondias* and *Haberleas*, and a large number of other Alpines were well grown. Bamboos are largely cultivated in pots, also such useful rock-garden shrubs as *Muehlenbeckias*, *Cytisus shipkaensis*, and *C. kewensis*.

The rock-garden was furnished with plants of a suitable character, presenting a natural

appearance, heightened by the water plants which occupy the pools at its base. This rock-garden has formed a model for many of a less extensive character, constructed by Messrs. Backhouse. Less vigorous and choice species are carefully planted in the rock-garden, and most of them have become well established. Time did not admit of a full examination of the other extensive departments of the nurseries, but enough was seen to show that the reputation of these famous nurseries is being well maintained. *S. Arnott.*

NOTICES OF BOOKS.

MAKING HORTICULTURE PAY.*

As the sub-title of this book and the reference to compilation indicate, it is made up mainly of extracts from the writings of persons engaged in fruit-growing or gardening. The extracts are of very unequal merit, and the Editor does not appear to recognise the fact that, whereas some are excellent, others are no better than examples of "how not to do it." All have reference to American practices, which, in many respects, are not suitable to this country. For example, the American practice as to cultivation in fruit plantations is based largely upon the dread of injury from drought, which is not a primary consideration in this country in relation at least to tree fruits. Hence we have much about cover crops in orchards, which are foreign to English practice. Then, in the United States, ploughing is usual between rows of fruit trees, except where the "sod and mulch" system prevails. Here we should never think of letting a plough be used in a fruit plantation. The difference in practice is based upon climatic differences. In the United States, the deep rooting of trees is desired, as a security against injury from drought, and apparently the destruction of surface roots by ploughing is not regarded as disadvantageous. In this country, on the other hand, we encourage our fruit trees to root near to the surface of the soil, and often have reason to dread their entry into the cold and unfertile subsoil. Apple trees are commonly 30 ft. or more apart in the United States, and this affords plenty of room for the plough, and possibly care is taken not to let the implement work too close to the trees. At any rate, the great Apple crops grown on the big trees of the United States show that the system of cultivation pursued is not harmful. But when ploughing between rows of small fruit bushes and Raspberry canes is mentioned, we have no hesitation in condemning it, no matter where the practice is pursued. How ploughing can be done, as described, in a plantation with Gooseberry bushes 6 ft. by 4 ft. as a bottom crop, we cannot imagine. With respect to mulching, when this is done with farmyard manure, it is akin to English practice. But many American fruit farmers cart any kind of green rubbish they can collect into their orchards to place around their trees. If the practice were pursued here, the result would be to lead to more expense in destroying the weeds that would grow around the trees than the mulch would be worth. Very little farmyard manure, however, is obtainable in most parts of the United States, and green crops ploughed in are relied upon mainly for manure in arable fruit orchards, supplemented by artificial manures in some cases. As for the numerous grass orchards, the mulching system is the chief manurial agency.

The book is devoted partly to culinary vegetables, and to a very small extent to flowers. There is much in it to interest an English reader, and some of the practices described as successful in the United States are worth the consideration of cultivators of fruit and other crops in this country. But there is a lack of systematic and authoritative instruction, whilst discrimination is needed in deciding between the good and the bad methods described.

* *Making Horticulture Pay.* Experiences in Gardening and Fruit-Growing. Compiled and edited by Mr. G. Kain. (New York: Orange Judd Company.)

A JOURNEY TO JAPAN.

(Continued from page 177.)

EASTER brought us up country to Nuwara Eliya, and to the park and fine garden at Hakgala. Nuwara Eliya, about 6,200 feet above sea-level, has quite a different climate from that of Peradeniya. At about 2,000 feet Palms disappear from the landscape. The cooler up-country begins, and plantations of Tea prevail, covering vast areas. Species of Eucalyptus, Tree Ferns, and *Aralia papyrifera* are conspicuous. The air is fresh and cool, being quite agreeable. Frosts may prevail, and at this time of the year tender flowers have to be covered every night. The park is under the same management as Peradeniya. *Cupressus macrocarpa*, the Monterey Cypress, is doing exceedingly well, also *Acacia decurrens*, and others. The neighbourhood abounds in streamlets, covered with the pretty, white flowers of *Apongeton crispum*, which is also to be found in the large lake, the latter lying naturally between the hills. *Apongeton distachyum* is planted, and, like most plants of the Cape, does well. *Richardia aethiopica*, besides many other introduced plants, such as *Ulex europaeus*, grow wild. The trade in flowers of *Richardia* is con-

At this high elevation, the evergreen forests, with trees of magnificently coloured foliage, storm-beaten and sunburnt tops, and groups of Tree Ferns in the ravines, on the slopes, or in the shade of high trees near the water of the streamlets, are prominent features.

The undergrowth is very thick, it being impossible to pass without cutting a way through. Orchids, Ferns, as well as climbing plants, abound on the trees; *Selaginellas* cover the ground; and growing up the stems and leaves are mosses and lichens. Ferns are very plentiful, and epiphytes and parasitic plants of all kinds are, as in all parts of Ceylon, much in evidence.

Geniosporum elongatum is a very pretty flowering plant of the patanas; it belongs to the Labiate, and this, as well as *Apongeton crispum*, of the rivulets, already mentioned, are worth introducing to gardens. I was able to collect seed of the latter, but the former was only in flower. There is a rich collection of plants in the botanic garden at Hakgala. It is called after the mountain which backs it, and should be seen by everyone visiting Ceylon. The scenery from this high elevation, amongst steep rocks, embraces a large part of Ceylon. Far out are the eastern mountains, and below the deep valleys, with paddy-

FIG. 76.—NATIVES VISITING A FLOWER SHOW IN CEYLON.
